If you do not want to require routine creators to have the `SUPER` privilege (for example, if all users with the `CREATE ROUTINE` privilege on your system are experienced application developers), set the global `log_bin_trust_routine_creators` system variable to 1. You can also set this variable by using the `--log-bin-trust-routine-creators=1` option when starting the server. If binary logging is not enabled, `log_bin_trust_routine_creators` does not apply and `SUPER` is not required for routine creation.

- If a routine that performs updates is non-deterministic, it is not repeatable. This can have two undesirable effects:
 - It will make a slave different from the master.
 - Restored data will be different from the original data.

To deal with these problems, MySQL enforces the following requirement: On a master server, creation and alteration of a routine is refused unless you declare the routine to be deterministic or to not modify data. Two sets of routine characteristics apply here:

- The `DETERMINISTIC` and `NOT DETERMINISTIC` characteristics indicate whether a routine always produces the same result for given inputs. The default is `NOT DETERMINISTIC` if neither characteristic is given. To declare that a routine is deterministic, you must specify `DETERMINISTIC` explicitly.
- The `CONTAINS SQL`, `NO SQL`, `READS SQL DATA`, and `MODIFIES SQL DATA` characteristics provide information about whether the routine reads or writes data. Either `NO SQL` or `READS SQL DATA` indicates that a routine does not change data, but you must specify one of these explicitly because the default is `CONTAINS SQL` if no characteristic is given.

By default, for a `CREATE PROCEDURE` or `CREATE FUNCTION` statement to be accepted, at least one of `DETERMINISTIC`, `NO SQL`, or `READS SQL DATA` must be specified explicitly. Otherwise an error occurs:

```
ERROR 1418 (HY000): This routine has none of DETERMINISTIC, NO SQL,
or READS SQL DATA in its declaration and binary logging is enabled
(you *might* want to use the less safe log_bin_trust_routine_creators
variable)
```

If you set `log_bin_trust_routine_creators` to 1, the requirement that routines be deterministic or not modify data is dropped.

- A `CALL` statement is written to the binary log if the routine returns no error, but not otherwise. When a routine that modifies data fails, you get this warning:

```
ERROR 1417 (HY000): A routine failed and has neither NO SQL nor
READS SQL DATA in its declaration and binary logging is enabled; if
non-transactional tables were updated, the binary log will miss their
changes
```

This logging behavior has the potential to cause problems. If a routine partly modifies a non-transactional table (such as a `MyISAM` table) and returns an error, the binary log will not reflect these changes. To protect against this, you should use transactional tables in the routine and modify the tables within transactions.

If you use the `IGNORE` keyword with `INSERT`, `DELETE`, or `UPDATE` to ignore errors within a routine, a partial update might occur but no error will result. Such statements are logged and they replicate normally.

- Although statements normally are not written to the binary log if they are rolled back, `CALL` statements are logged even when they occur within a rolled-back transaction. This can result in a `CALL` being rolled back on the master but executed on slaves.
- If a stored function is invoked within a statement such as `SELECT` that does not modify data, execution of the function is not written to the binary log, even if the function itself modifies data. This logging behavior has the potential to cause problems. Suppose that a function `myfunc()` is defined as follows:

```
CREATE FUNCTION myfunc () RETURNS INT DETERMINISTIC
BEGIN
  INSERT INTO t (i) VALUES(1);
  RETURN 0;
END;
```

Given that definition, the following statement is not written to the binary log because it is a `SELECT`. Nevertheless, it modifies the table `t` because `myfunc()` modifies `t`:

```
SELECT myfunc();
```

A workaround for this problem is to invoke functions that do updates only within statements that do updates (and which therefore are written to the binary log). Note that although the `DO` statement sometimes is executed for the side effect of evaluating an expression, `DO` is not a workaround here because it is not written to the binary log.

- On slave servers, `--replicate-*-table` rules do not apply to `CALL` statements or to statements within stored routines. These statements are always replicated. If such statements contain references to tables that do not exist on the slave, they could have undesirable effects when executed on the slave.

Routine logging changes in MySQL 5.0.12: The changes in 5.0.12 address several problems that were present in earlier versions:

- Stored function invocations in non-logged statements such as `SELECT` were not being logged, even when a function itself changed data.
- Stored procedure logging at the `CALL` level could cause different effects on a master and slave if a procedure took different execution paths on the two machines.
- `CALL` statements were logged even when they occurred within a rolled-back transaction.

To deal with these issues, MySQL 5.0.12 implements the following changes to function and procedure logging:

- A stored function invocation is logged as a `DO` statement if the function changes data and occurs within a statement that would not otherwise be logged. This corrects the problem of non-replication of data changes that result from use of stored functions in non-logged statements. For example, `SELECT` statements are not written to the binary log, but a `SELECT` might invoke a stored function that makes changes. To handle this, a `DO func_name()` statement is written to the binary log when the given function makes a change. Suppose that the following statements are executed on the master:

```
CREATE FUNCTION f1(a INT) RETURNS INT
BEGIN
  IF (a < 3) THEN
    INSERT INTO t2 VALUES (a);
  END IF;
  RETURN 0;
END;

CREATE TABLE t1 (a INT);
INSERT INTO t1 VALUES (1),(2),(3);

SELECT f1(a) FROM t1;
```

When the `SELECT` statement executes, the function `f1()` is invoked three times. Two of those invocations insert a row, and MySQL logs a `DO` statement for each of them. That is, MySQL writes the following statements to the binary log:

```
DO f1(1);
DO f1(2);
```

The server also logs a `DO` statement for a stored function invocation when the function invokes a stored procedure that causes an error. In this case, the server writes the `DO` statement to the log along with the expected error code. On the slave, if the same error occurs, that is the expected result and replication continues. Otherwise, replication stops.

Note: See later in this section for changes made in MySQL 5.0.19: These logged `DO func_name()` statements are logged as `SELECT func_name()` statements instead.

- Stored procedure calls are logged at the statement level rather than at the `CALL` level. That is, the server does not log the `CALL` statement, it logs those statements within the procedure that actually execute. As a result, the same changes that occur on the master will be observed on slave servers. This eliminates the problems that could result from a procedure having different execution paths on different machines. For example, the `DROP DATABASE` problem shown earlier for the `unsafe_sp()` procedure does not occur and the routine is no longer replication-unsafe because it has the same effect on master and slave servers.

In general, statements executed within a stored procedure are written to the binary log using the same rules that would apply were the statements to be executed in standalone fashion. Some special care is taken when logging procedure statements because statement execution within procedures is not quite the same as in non-procedure context:

- A statement to be logged might contain references to local procedure variables. These variables do not exist outside of stored procedure context, so a statement that refers to such a variable cannot be logged literally. Instead, each reference to a local variable is replaced by this construct for logging purposes:

```
NAME_CONST(var_name, var_value)
```

`var_name` is the local variable name, and `var_value` is a constant indicating the value that the variable has at the time the statement is logged. `NAME_CONST()` has a value of `var_value`, and a “name” of `var_name`. Thus, if you invoke this function directly, you get a result like this:

```
mysql> SELECT NAME_CONST('myname', 14);
+-----+
| myname |
+-----+
|      14 |
+-----+
```

`NAME_CONST()` allows a logged standalone statement to be executed on a slave with the same effect as the original statement that was executed on the master within a stored procedure.

- A statement to be logged might contain references to user-defined variables. To handle this, MySQL writes a `SET` statement to the binary log to make sure that the variable exists on the slave with the same value as on the master. For example, if a statement refers to a variable `@my_var`, that statement will be preceded in the binary log by the following statement, where `value` is the value of `@my_var` on the master:

```
SET @my_var = value;
```

- Procedure calls can occur within a committed or rolled-back transaction. Previously, `CALL` statements were logged even if they occurred within a rolled-back transaction. As of MySQL 5.0.12, transactional context is accounted for so that the transactional aspects of procedure execution are replicated correctly. That is, the server logs those statements within the procedure that actually execute and modify data, and also logs `BEGIN`, `COMMIT`, and `ROLLBACK` statements as necessary. For example, if a procedure updates only transactional tables and is executed within a transaction that is rolled back, those updates are not logged. If the procedure occurs within a committed transaction, `BEGIN` and `COMMIT` statements are logged with the updates. For a procedure that executes within a rolled-back transaction, its statements are logged using the same rules that would apply if the statements were executed in standalone fashion:
 - Updates to transactional tables are not logged.
 - Updates to non-transactional tables are logged because rollback does not cancel them.
 - Updates to a mix of transactional and non-transactional tables are logged surrounded by `BEGIN` and `ROLLBACK` so that slaves will make the same changes and rollbacks as on the master.
- A stored procedure call is *not* written to the binary log at the statement level if the procedure is invoked from within a stored function. In that case, the only thing logged is the statement that invokes the function (if it occurs within a statement that is logged) or a `DO` statement (if it occurs within a statement that is not logged). For this reason, care still should be exercised in the use of stored functions that invoke a procedure, even if the procedure is otherwise safe in itself.
- Because procedure logging occurs at the statement level rather than at the `CALL` level, interpretation of the `-repliate-*table` options is revised to apply only to stored functions. They no longer apply to stored procedures, except those procedures that are invoked from within functions.

Routine logging changes in MySQL 5.0.16: In 5.0.12, a change was introduced to log stored procedure calls at the statement level rather than at the `CALL` level. This change eliminates the requirement that procedures be identified as safe. The requirement now exists only for stored functions, because they still appear in the binary log as function invocations rather than as the statements executed within the function. To reflect the lifting of the restriction on stored procedures, the

`log_bin_trust_routine_creators` system variable is renamed to `log_bin_trust_function_creators` and the `--log-bin-trust-routine-creators` server option is renamed to `--log-bin-trust-function-creators`. (For backward compatibility, the old names are recognized but result in a warning.) Error messages that now apply only to functions and not to routines in general are re-worded.

Routine logging changes in MySQL 5.0.19: In 5.0.12, a change was introduced to log a stored function invocation as `DO func_name()` if the invocation changes data and occurs within a non-logged statement, or if the function invokes a stored procedure that produces an error. In 5.0.19, these invocations are logged as `SELECT func_name()` instead. The change to `SELECT` was made because use of `DO` was found to yield insufficient control over error code checking.

Chapter 22. INFORMATION_SCHEMA Tables

`INFORMATION_SCHEMA` provides access to database metadata.

Metadata is data about the data, such as the name of a database or table, the data type of a column, or access privileges. Other terms that sometimes are used for this information are *data dictionary* and *system catalog*.

`INFORMATION_SCHEMA` is the information database, the place that stores information about all the other databases that the MySQL server maintains. Inside `INFORMATION_SCHEMA` there are several read-only tables. They are actually views, not base tables, so there are no files associated with them.

In effect, we have a database named `INFORMATION_SCHEMA`, although the server does not create a database directory with that name. It is possible to select `INFORMATION_SCHEMA` as the default database with a `USE` statement, but it is possible only to read the contents of tables. You cannot insert into them, update them, or delete from them.

Here is an example of a statement that retrieves information from `INFORMATION_SCHEMA`:

```
mysql> SELECT table_name, table_type, engine
-> FROM information_schema.tables
-> WHERE table_schema = 'db5'
-> ORDER BY table_name DESC;
```

table_name	table_type	engine
v56	VIEW	NULL
v3	VIEW	NULL
v2	VIEW	NULL
v	VIEW	NULL
tables	BASE TABLE	MyISAM
t7	BASE TABLE	MyISAM
t3	BASE TABLE	MyISAM
t2	BASE TABLE	MyISAM
t	BASE TABLE	MyISAM
pk	BASE TABLE	InnoDB
loop	BASE TABLE	MyISAM
kurs	BASE TABLE	MyISAM
k	BASE TABLE	MyISAM
into	BASE TABLE	MyISAM
goto	BASE TABLE	MyISAM
fk2	BASE TABLE	InnoDB
fk	BASE TABLE	InnoDB

```
17 rows in set (0.01 sec)
```

Explanation: The statement requests a list of all the tables in database `db5`, in reverse alphabetical order, showing just three pieces of information: the name of the table, its type, and its storage engine.

Each MySQL user has the right to access these tables, but can see only the rows in the tables that correspond to objects for which the user has the proper access privileges. In some cases (for example, the `ROUTINE_DEFINITION` column in the `INFORMATION_SCHEMA.ROUTINES` table), users who have insufficient privileges will see `NULL`.

The `SELECT . . . FROM INFORMATION_SCHEMA` statement is intended as a more consistent way to provide access to the information provided by the various `SHOW` statements that MySQL supports (`SHOW DATABASES`, `SHOW TABLES`, and so forth). Using `SELECT` has these advantages, compared to `SHOW`:

- It conforms to Codd's rules. That is, all access is done on tables.
- Nobody needs to learn a new statement syntax. Because they already know how `SELECT` works, they only need to learn the object names.
- The implementor need not worry about adding keywords.
- There are millions of possible output variations, instead of just one. This provides more flexibility for applications that have varying requirements about what metadata they need.
- Migration is easier because every other DBMS does it this way.

However, because `SHOW` is popular with MySQL employees and users, and because it might be confusing were it to disappear, the advantages of conventional syntax are not a sufficient reason to eliminate `SHOW`. In fact, along with the implementation of `INFORMATION_SCHEMA`, there are enhancements to `SHOW` as well. These are described in [Section 22.19, "Extensions to SHOW Statements"](#).

There is no difference between the privileges required for `SHOW` statements and those required to select information from `INFORMATION_SCHEMA`. In either case, you have to have some privilege on an object in order to see information about it.

The implementation for the `INFORMATION_SCHEMA` table structures in MySQL follows the ANSI/ISO SQL:2003 standard Part 11 *Schemata*. Our intent is approximate compliance with SQL:2003 core feature F021 *Basic information schema*.

Users of SQL Server 2000 (which also follows the standard) may notice a strong similarity. However, MySQL has omitted many columns that are not relevant for our implementation, and added columns that are MySQL-specific. One such column is the `ENGINE` column in the `INFORMATION_SCHEMA.TABLES` table.

Although other DBMSs use a variety of names, like `syscat` or `system`, the standard name is `INFORMATION_SCHEMA`.

The following sections describe each of the tables and columns that are in `INFORMATION_SCHEMA`. For each column, there are three pieces of information:

- “`INFORMATION_SCHEMA Name`” indicates the name for the column in the `INFORMATION_SCHEMA` table. This corresponds to the standard SQL name unless the “Remarks” field says “MySQL extension.”
- “`SHOW Name`” indicates the equivalent field name in the closest `SHOW` statement, if there is one.
- “Remarks” provides additional information where applicable. If this field is `NULL`, it means that the value of the column is always `NULL`. If this field says “MySQL extension,” the column is a MySQL extension to standard SQL.

To avoid using any name that is reserved in the standard or in DB2, SQL Server, or Oracle, we changed the names of some columns marked “MySQL extension”. (For example, we changed `COLLATION` to `TABLE_COLLATION` in the `TABLES` table.) See the list of reserved words near the end of this article: <http://web.archive.org/web/20030201202307/www.dbazine.com/gulutzan5.html>.

The definition for character columns (for example, `TABLES.TABLE_NAME`) is generally `VARCHAR(N) CHARACTER SET utf8` where `N` is at least 64. MySQL uses the default collation for this character set (`utf8_general_ci`) for all searches, sorts, comparisons, and other string operations on such columns. If the default collation is not correct for your needs, you can force a suitable collation with a `COLLATE` clause (Section 9.1.5.1, “Using `COLLATE` in SQL Statements”).

Each section indicates what `SHOW` statement is equivalent to a `SELECT` that retrieves information from `INFORMATION_SCHEMA`, if there is such a statement. For `SHOW` statements that display information for the current database if you omit a `FROM db_name` clause, you can often select information for the current database by adding an `AND TABLE_SCHEMA = CURRENT_DATABASE()` condition to the `WHERE` clause of a query that retrieves information from an `INFORMATION_SCHEMA` table.

Note

At present, there are some missing columns and some columns out of order. We are working on this and updating the documentation as changes are made.

For answers to questions that are often asked concerning the `INFORMATION_SCHEMA` database, see Section A.7, “MySQL 5.0 FAQ — `INFORMATION_SCHEMA`”.

22.1. The `INFORMATION_SCHEMA.SCHEMATA` Table

A schema is a database, so the `SCHEMATA` table provides information about databases.

<code>INFORMATION_SCHEMA Name</code>	<code>SHOW Name</code>	Remarks
<code>CATALOG_NAME</code>		<code>NULL</code>
<code>SCHEMA_NAME</code>		Database
<code>DEFAULT_CHARACTER_SET_NAME</code>		
<code>DEFAULT_COLLATION_NAME</code>		
<code>SQL_PATH</code>		<code>NULL</code>

Notes:

- `DEFAULT_COLLATION_NAME` was added in MySQL 5.0.6.

The following statements are equivalent:

```
SELECT SCHEMA_NAME AS `Database`
FROM INFORMATION_SCHEMA.SCHEMATA
[WHERE SCHEMA_NAME LIKE 'wild']
```

```
SHOW DATABASES
  [LIKE 'wild']
```

22.2. The INFORMATION_SCHEMA TABLES Table

The `TABLES` table provides information about tables in databases.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
TABLE_CATALOG		NULL
TABLE_SCHEMA	Table_...	
TABLE_NAME	Table_...	
TABLE_TYPE		
ENGINE	Engine	MySQL extension
VERSION	Version	The version number of the table's <code>.frm</code> file, MySQL extension
ROW_FORMAT	Row_format	MySQL extension
TABLE_ROWS	Rows	MySQL extension
AVG_ROW_LENGTH	Avg_row_length	MySQL extension
DATA_LENGTH	Data_length	MySQL extension
MAX_DATA_LENGTH	Max_data_length	MySQL extension
INDEX_LENGTH	Index_length	MySQL extension
DATA_FREE	Data_free	MySQL extension
AUTO_INCREMENT	Auto_increment	MySQL extension
CREATE_TIME	Create_time	MySQL extension
UPDATE_TIME	Update_time	MySQL extension
CHECK_TIME	Check_time	MySQL extension
TABLE_COLLATION	Collation	MySQL extension
CHECKSUM	Checksum	MySQL extension
CREATE_OPTIONS	Create_options	MySQL extension
TABLE_COMMENT	Comment	MySQL extension

Notes:

- `TABLE_SCHEMA` and `TABLE_NAME` are a single field in a `SHOW` display, for example `Table_in_db1`.
- `TABLE_TYPE` should be `BASE TABLE` or `VIEW`. Currently, the `TABLES` table does not list `TEMPORARY` tables.
- The `TABLE_ROWS` column is `NULL` if the table is in the `INFORMATION_SCHEMA` database. For `InnoDB` tables, the row count is only a rough estimate used in SQL optimization.
- We have nothing for the table's default character set. `TABLE_COLLATION` is close, because collation names begin with a character set name.

The following statements are equivalent:

```
SELECT table_name FROM INFORMATION_SCHEMA.TABLES
  WHERE table_schema = 'db_name'
  [AND table_name LIKE 'wild']

SHOW TABLES
  FROM db_name
  [LIKE 'wild']
```

22.3. The INFORMATION_SCHEMA COLUMNS Table

The `COLUMNS` table provides information about columns in tables.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
TABLE_CATALOG		NULL
TABLE_SCHEMA		
TABLE_NAME		
COLUMN_NAME	Field	
ORDINAL_POSITION		see notes
COLUMN_DEFAULT	Default	
IS_NULLABLE	Null	
DATA_TYPE	Type	
CHARACTER_MAXIMUM_LENGTH	Type	
CHARACTER_OCTET_LENGTH		
NUMERIC_PRECISION	Type	
NUMERIC_SCALE	Type	
CHARACTER_SET_NAME		
COLLATION_NAME	Collation	
COLUMN_TYPE	Type	MySQL extension
COLUMN_KEY	Key	MySQL extension
EXTRA	Extra	MySQL extension
PRIVILEGES	Privileges	MySQL extension
COLUMN_COMMENT	Comment	MySQL extension

Notes:

- In `SHOW`, the `Type` display includes values from several different `COLUMNS` columns.
- `ORDINAL_POSITION` is necessary because you might want to say `ORDER BY ORDINAL_POSITION`. Unlike `SHOW, SELECT` does not have automatic ordering.
- `CHARACTER_OCTET_LENGTH` should be the same as `CHARACTER_MAXIMUM_LENGTH`, except for multi-byte character sets.
- `CHARACTER_SET_NAME` can be derived from `Collation`. For example, if you say `SHOW FULL COLUMNS FROM t`, and you see in the `Collation` column a value of `latin1_swedish_ci`, the character set is what's before the first underscore: `latin1`.

The following statements are nearly equivalent:

```
SELECT COLUMN_NAME, DATA_TYPE, IS_NULLABLE, COLUMN_DEFAULT
FROM INFORMATION_SCHEMA.COLUMNS
WHERE table_name = 'tbl_name'
[AND table_schema = 'db_name']
[AND column_name LIKE 'wild']

SHOW COLUMNS
FROM tbl_name
[FROM db_name]
[LIKE 'wild']
```

22.4. The INFORMATION_SCHEMA STATISTICS Table

The `STATISTICS` table provides information about table indexes.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
TABLE_CATALOG		NULL
TABLE_SCHEMA		= Database
TABLE_NAME	Table	
NON_UNIQUE	Non_unique	
INDEX_SCHEMA		= Database

INDEX_NAME	Key_name	
SEQ_IN_INDEX	Seq_in_index	
COLUMN_NAME	Column_name	
COLLATION	Collation	
CARDINALITY	Cardinality	
SUB_PART	Sub_part	MySQL extension
PACKED	Packed	MySQL extension
NULLABLE	Null	MySQL extension
INDEX_TYPE	Index_type	MySQL extension
COMMENT	Comment	MySQL extension

Notes:

- There is no standard table for indexes. The preceding list is similar to what SQL Server 2000 returns for `sp_statistics`, except that we replaced the name `QUALIFIER` with `CATALOG` and we replaced the name `OWNER` with `SCHEMA`.

Clearly, the preceding table and the output from `SHOW INDEX` are derived from the same parent. So the correlation is already close.

The following statements are equivalent:

```
SELECT * FROM INFORMATION_SCHEMA.STATISTICS
  WHERE table_name = 'tbl_name'
  AND table_schema = 'db_name'

SHOW INDEX
  FROM tbl_name
  FROM db_name
```

22.5. The INFORMATION_SCHEMA USER_PRIVILEGES Table

The `USER_PRIVILEGES` table provides information about global privileges. This information comes from the `mysql.user` grant table.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
GRANTEE		'user_name'@'host_name' value, MySQL extension
TABLE_CATALOG		NULL, MySQL extension
PRIVILEGE_TYPE		MySQL extension
IS_GRANTABLE		MySQL extension

Notes:

- This is a non-standard table. It takes its values from the `mysql.user` table.

22.6. The INFORMATION_SCHEMA SCHEMA_PRIVILEGES Table

The `SCHEMA_PRIVILEGES` table provides information about schema (database) privileges. This information comes from the `mysql.db` grant table.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
GRANTEE		'user_name'@'host_name' value, MySQL extension
TABLE_CATALOG		NULL, MySQL extension
TABLE_SCHEMA		MySQL extension
PRIVILEGE_TYPE		MySQL extension

IS_GRANTABLE		MySQL extension
--------------	--	-----------------

Notes:

- This is a non-standard table. It takes its values from the `mysql.db` table.

22.7. The INFORMATION_SCHEMA TABLE_PRIVILEGES Table

The `TABLE_PRIVILEGES` table provides information about table privileges. This information comes from the `mysql.tables_priv` grant table.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
GRANTEE		'user_name'@'host_name' value
TABLE_CATALOG		NULL
TABLE_SCHEMA		
TABLE_NAME		
PRIVILEGE_TYPE		
IS_GRANTABLE		

Notes:

- `PRIVILEGE_TYPE` can contain one (and only one) of these values: `SELECT`, `INSERT`, `UPDATE`, `REFERENCES`, `ALTER`, `INDEX`, `DROP`, `CREATE VIEW`.

The following statements are *not* equivalent:

```
SELECT ... FROM INFORMATION_SCHEMA.TABLE_PRIVILEGES
SHOW GRANTS ...
```

22.8. The INFORMATION_SCHEMA COLUMN_PRIVILEGES Table

The `COLUMN_PRIVILEGES` table provides information about column privileges. This information comes from the `mysql.columns_priv` grant table.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
GRANTEE		'user_name'@'host_name' value
TABLE_CATALOG		NULL
TABLE_SCHEMA		
TABLE_NAME		
COLUMN_NAME		
PRIVILEGE_TYPE		
IS_GRANTABLE		

Notes:

- In the output from `SHOW FULL COLUMNS`, the privileges are all in one field and in lowercase, for example, `select, insert, update, references`. In `COLUMN_PRIVILEGES`, there is one privilege per row, in uppercase.
- `PRIVILEGE_TYPE` can contain one (and only one) of these values: `SELECT`, `INSERT`, `UPDATE`, `REFERENCES`.
- If the user has `GRANT OPTION` privilege, `IS_GRANTABLE` should be `YES`. Otherwise, `IS_GRANTABLE` should be `NO`. The output does not list `GRANT OPTION` as a separate privilege.

The following statements are *not* equivalent:

```
SELECT ... FROM INFORMATION_SCHEMA.COLUMN_PRIVILEGES
SHOW GRANTS ...
```

22.9. The INFORMATION_SCHEMA CHARACTER_SETS Table

The `CHARACTER_SETS` table provides information about available character sets.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
<code>CHARACTER_SET_NAME</code>	Charset	
<code>DEFAULT_COLLATE_NAME</code>	Default collation	
<code>DESCRIPTION</code>	Description	MySQL extension
<code>MAXLEN</code>	Maxlen	MySQL extension

The following statements are equivalent:

```
SELECT * FROM INFORMATION_SCHEMA.CHARACTER_SETS
  [WHERE name LIKE 'wild']

SHOW CHARACTER SET
  [LIKE 'wild']
```

22.10. The INFORMATION_SCHEMA COLLATIONS Table

The `COLLATIONS` table provides information about collations for each character set.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
<code>COLLATION_NAME</code>	Collation	
<code>CHARACTER_SET_NAME</code>	Charset	MySQL extension
<code>ID</code>	Id	MySQL extension
<code>IS_DEFAULT</code>	Default	MySQL extension
<code>IS_COMPILED</code>	Compiled	MySQL extension
<code>SORTLEN</code>	Sortlen	MySQL extension

The following statements are equivalent:

```
SELECT COLLATION_NAME FROM INFORMATION_SCHEMA.COLLATIONS
  [WHERE collation_name LIKE 'wild']

SHOW COLLATION
  [LIKE 'wild']
```

22.11. The INFORMATION_SCHEMA COLLATION_CHARACTER_SET_APPLICABILITY Table

The `COLLATION_CHARACTER_SET_APPLICABILITY` table indicates what character set is applicable for what collation. The columns are equivalent to the first two display fields that we get from `SHOW COLLATION`.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
<code>COLLATION_NAME</code>	Collation	
<code>CHARACTER_SET_NAME</code>	Charset	

22.12. The INFORMATION_SCHEMA TABLE_CONSTRAINTS Table

The `TABLE_CONSTRAINTS` table describes which tables have constraints.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
CONSTRAINT_CATALOG		NULL
CONSTRAINT_SCHEMA		
CONSTRAINT_NAME		
TABLE_SCHEMA		
TABLE_NAME		
CONSTRAINT_TYPE		

Notes:

- The `CONSTRAINT_TYPE` value can be `UNIQUE`, `PRIMARY KEY`, or `FOREIGN KEY`.
- The `UNIQUE` and `PRIMARY KEY` information is about the same as what you get from the `Key_name` field in the output from `SHOW INDEX` when the `Non_unique` field is 0.
- The `CONSTRAINT_TYPE` column can contain one of these values: `UNIQUE`, `PRIMARY KEY`, `FOREIGN KEY`, `CHECK`. This is a `CHAR` (not `ENUM`) column. The `CHECK` value is not available until we support `CHECK`.

22.13. The INFORMATION_SCHEMA KEY_COLUMN_USAGE Table

The `KEY_COLUMN_USAGE` table describes which key columns have constraints.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
CONSTRAINT_CATALOG		NULL
CONSTRAINT_SCHEMA		
CONSTRAINT_NAME		
TABLE_CATALOG		
TABLE_SCHEMA		
TABLE_NAME		
COLUMN_NAME		
ORDINAL_POSITION		
POSITION_IN_UNIQUE_CONSTRAINT		
REFERENCED_TABLE_SCHEMA		
REFERENCED_TABLE_NAME		
REFERENCED_COLUMN_NAME		

Notes:

- If the constraint is a foreign key, then this is the column of the foreign key, not the column that the foreign key references.
- The value of `ORDINAL_POSITION` is the column's position within the constraint, not the column's position within the table. Column positions are numbered beginning with 1.
- The value of `POSITION_IN_UNIQUE_CONSTRAINT` is `NULL` for unique and primary-key constraints. For foreign-key constraints, it is the ordinal position in key of the table that is being referenced.

For example, suppose that there are two tables name `t1` and `t3` that have the following definitions:

```
CREATE TABLE t1
(
  s1 INT,
  s2 INT,
  s3 INT,
  PRIMARY KEY(s3)
) ENGINE=InnoDB;

CREATE TABLE t3
(
  s1 INT,
  s2 INT,
```

```
s3 INT,
KEY(s1),
CONSTRAINT CO FOREIGN KEY (s2) REFERENCES t1(s3)
) ENGINE=InnoDB;
```

For those two tables, the `KEY_COLUMN_USAGE` table has two rows:

- One row with `CONSTRAINT_NAME = 'PRIMARY'`, `TABLE_NAME = 't1'`, `COLUMN_NAME = 's3'`, `ORDINAL_POSITION = 1`, `POSITION_IN_UNIQUE_CONSTRAINT = NULL`.
- One row with `CONSTRAINT_NAME = 'CO'`, `TABLE_NAME = 't3'`, `COLUMN_NAME = 's2'`, `ORDINAL_POSITION = 1`, `POSITION_IN_UNIQUE_CONSTRAINT = 1`.
- `REFERENCED_TABLE_SCHEMA`, `REFERENCED_TABLE_NAME`, and `REFERENCED_COLUMN_NAME` were added in MySQL 5.0.6.

22.14. The INFORMATION_SCHEMA ROUTINES Table

The `ROUTINES` table provides information about stored routines (both procedures and functions). The `ROUTINES` table does not include user-defined functions (UDFs) at this time.

The column named “`mysql.proc name`” indicates the `mysql.proc` table column that corresponds to the `INFORMATION_SCHEMA.ROUTINES` table column, if any.

INFORMATION_SCHEMA Name	mysql.proc Name	Remarks
<code>SPECIFIC_NAME</code>	<code>specific_name</code>	
<code>ROUTINE_CATALOG</code>		NULL
<code>ROUTINE_SCHEMA</code>	<code>db</code>	
<code>ROUTINE_NAME</code>	<code>name</code>	
<code>ROUTINE_TYPE</code>	<code>type</code>	{PROCEDURE FUNCTION}
<code>DTD_IDENTIFIER</code>		data type descriptor
<code>ROUTINE_BODY</code>		SQL
<code>ROUTINE_DEFINITION</code>	<code>body</code>	
<code>EXTERNAL_NAME</code>		NULL
<code>EXTERNAL_LANGUAGE</code>	<code>language</code>	NULL
<code>PARAMETER_STYLE</code>		SQL
<code>IS_DETERMINISTIC</code>	<code>is_deterministic</code>	
<code>SQL_DATA_ACCESS</code>	<code>sql_data_access</code>	
<code>SQL_PATH</code>		NULL
<code>SECURITY_TYPE</code>	<code>security_type</code>	
<code>CREATED</code>	<code>created</code>	
<code>LAST_ALTERED</code>	<code>modified</code>	
<code>SQL_MODE</code>	<code>sql_mode</code>	MySQL extension
<code>ROUTINE_COMMENT</code>	<code>comment</code>	MySQL extension
<code>DEFINER</code>	<code>definer</code>	MySQL extension

Notes:

- MySQL calculates `EXTERNAL_LANGUAGE` thus:
 - If `mysql.proc.language = 'SQL'`, `EXTERNAL_LANGUAGE` is NULL
 - Otherwise, `EXTERNAL_LANGUAGE` is what is in `mysql.proc.language`. However, we do not have external languages yet, so it is always NULL.

22.15. The INFORMATION_SCHEMA VIEWS Table

The `VIEWS` table provides information about views in databases. You must have the `SHOW VIEW` privilege to access this table.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
TABLE_CATALOG		NULL
TABLE_SCHEMA		
TABLE_NAME		
VIEW_DEFINITION		
CHECK_OPTION		
IS_UPDATABLE		
DEFINER		
SECURITY_TYPE		

Notes:

- The `VIEW_DEFINITION` column has most of what you see in the `Create Table` field that `SHOW CREATE VIEW` produces. Skip the words before `SELECT` and skip the words `WITH CHECK OPTION`. Suppose that the original statement was:

```
CREATE VIEW v AS
SELECT s2,s1 FROM t
WHERE s1 > 5
ORDER BY s1
WITH CHECK OPTION;
```

Then the view definition looks like this:

```
SELECT s2,s1 FROM t WHERE s1 > 5 ORDER BY s1
```

- The `CHECK_OPTION` column has a value of `NONE`, `CASCADE`, or `LOCAL`.
- MySQL sets a flag, called the view updatability flag, at `CREATE VIEW` time. The flag is set to `YES` (true) if `UPDATE` and `DELETE` (and similar operations) are legal for the view. Otherwise, the flag is set to `NO` (false). The `IS_UPDATABLE` column in the `VIEWS` table displays the status of this flag. It means that the server always knows whether a view is updatable. If the view is not updatable, statements such `UPDATE`, `DELETE`, and `INSERT` are illegal and will be rejected. (Note that even if a view is updatable, it might not be possible to insert into it; for details, refer to [Section 12.1.11, “CREATE VIEW Syntax”](#).)
- The `DEFINER` and `SECURITY_TYPE` columns were added in MySQL 5.0.14. `DEFINER` indicates who defined the view. `SECURITY_TYPE` has a value of `DEFINER` or `INVOKER`.

22.16. The INFORMATION_SCHEMA TRIGGERS Table

The `TRIGGERS` table provides information about triggers. You must have the `SUPER` privilege to access this table.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
TRIGGER_CATALOG		NULL
TRIGGER_SCHEMA		
TRIGGER_NAME	Trigger	
EVENT_MANIPULATION	Event	
EVENT_OBJECT_CATALOG		NULL
EVENT_OBJECT_SCHEMA		
EVENT_OBJECT_TABLE	Table	
ACTION_ORDER		0
ACTION_CONDITION		NULL
ACTION_STATEMENT	Statement	
ACTION_ORIENTATION		ROW
ACTION_TIMING	Timing	

ACTION_REFERENCE_OLD_TABLE		NULL
ACTION_REFERENCE_NEW_TABLE		NULL
ACTION_REFERENCE_OLD_ROW		OLD
ACTION_REFERENCE_NEW_ROW		NEW
CREATED		NULL (0)
SQL_MODE		MySQL extension
DEFINER		MySQL extension

Notes:

- The `TRIGGERS` table was added in MySQL 5.0.10.
- The `TRIGGER_SCHEMA` and `TRIGGER_NAME` columns contain the name of the database in which the trigger occurs and the trigger name, respectively.
- The `EVENT_MANIPULATION` column contains one of the values 'INSERT', 'DELETE', or 'UPDATE'.
- As noted in [Section 21.3, “Using Triggers”](#), every trigger is associated with exactly one table. The `EVENT_OBJECT_SCHEMA` and `EVENT_OBJECT_TABLE` columns contain the database in which this table occurs, and the table's name.
- The `ACTION_ORDER` statement contains the ordinal position of the trigger's action within the list of all similar triggers on the same table. Currently, this value is always 0, because it is not possible to have more than one trigger with the same `EVENT_MANIPULATION` and `ACTION_TIMING` on the same table.
- The `ACTION_STATEMENT` column contains the statement to be executed when the trigger is invoked. This is the same as the text displayed in the `Statement` column of the output from `SHOW TRIGGERS`. Note that this text uses UTF-8 encoding.
- The `ACTION_ORIENTATION` column always contains the value 'ROW'.
- The `ACTION_TIMING` column contains one of the two values 'BEFORE' or 'AFTER'.
- The columns `ACTION_REFERENCE_OLD_ROW` and `ACTION_REFERENCE_NEW_ROW` contain the old and new column identifiers, respectively. This means that `ACTION_REFERENCE_OLD_ROW` always contains the value 'OLD' and `ACTION_REFERENCE_NEW_ROW` always contains the value 'NEW'.
- The `SQL_MODE` column shows the server SQL mode that was in effect at the time when the trigger was created (and thus which remains in effect for this trigger whenever it is invoked, *regardless of the current server SQL mode*). The possible range of values for this column is the same as that of the `sql_mode` system variable. See [Section 5.1.7, “SQL Modes”](#).
- The `DEFINER` column was added in MySQL 5.0.17. `DEFINER` indicates who defined the trigger.
- The following columns currently always contain NULL: `TRIGGER_CATALOG`, `EVENT_OBJECT_CATALOG`, `ACTION_CONDITION`, `ACTION_REFERENCE_OLD_TABLE`, `ACTION_REFERENCE_NEW_TABLE`, and `CREATED`.

Example, using the `ins_sum` trigger defined in [Section 21.3, “Using Triggers”](#):

```
mysql> SELECT * FROM INFORMATION_SCHEMA.TRIGGERS\G
***** 1. row *****
      TRIGGER_CATALOG: NULL
      TRIGGER_SCHEMA: test
      TRIGGER_NAME:   ins_sum
      EVENT_MANIPULATION: INSERT
      EVENT_OBJECT_CATALOG: NULL
      EVENT_OBJECT_SCHEMA: test
      EVENT_OBJECT_TABLE: account
      ACTION_ORDER: 0
      ACTION_CONDITION: NULL
      ACTION_STATEMENT: SET @sum = @sum + NEW.amount
      ACTION_ORIENTATION: ROW
      ACTION_TIMING: BEFORE
      ACTION_REFERENCE_OLD_TABLE: NULL
      ACTION_REFERENCE_NEW_TABLE: NULL
      ACTION_REFERENCE_OLD_ROW: OLD
      ACTION_REFERENCE_NEW_ROW: NEW
      CREATED: NULL
      SQL_MODE:
      DEFINER: me@localhost
```

See also [Section 12.5.5.31, “SHOW TRIGGERS Syntax”](#).

22.17. The INFORMATION_SCHEMA PROFILING Table

This section does not apply to MySQL Enterprise Server users.

The `PROFILING` table provides statement profiling information. Its contents correspond to the information produced by the `SHOW PROFILES` and `SHOW PROFILE` statements (see [Section 12.5.5.25](#), “`SHOW PROFILES` and `SHOW PROFILE` Syntax”). The table is empty unless the `profiling` session variable is set to 1.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
QUERY_ID	Query_ID	
SEQ		
STATE	Status	
DURATION	Duration	
CPU_USER	CPU_user	
CPU_SYSTEM	CPU_system	
CONTEXT_VOLUNTARY	Context_voluntary	
CONTEXT_INVOLUNTARY	Context_involuntary	
BLOCK_OPS_IN	Block_ops_in	
BLOCK_OPS_OUT	Block_ops_out	
MESSAGES_SENT	Messages_sent	
MESSAGES_RECEIVED	Messages_received	
PAGE_FAULTS_MAJOR	Page_faults_major	
PAGE_FAULTS_MINOR	Page_faults_minor	
SWAPS	Swaps	
SOURCE_FUNCTION	Source_function	
SOURCE_FILE	Source_file	
SOURCE_LINE	Source_line	

Notes:

- The `PROFILING` table was added in MySQL 5.0.37.
- `QUERY_ID` is a numeric statement identifier.
- `SEQ` is a sequence number indicating the display order for rows with the same `QUERY_ID` value.
- `STATE` is the profiling state to which the row measurements apply.
- `DURATION` indicates how long statement execution remained in the given state, in seconds.
- `CPU_USER` and `CPU_SYSTEM` indicate user and system CPU use, in seconds.
- `CONTEXT_VOLUNTARY` and `CONTEXT_INVOLUNTARY` indicate how many voluntary and involuntary context switches occurred.
- `BLOCK_OPS_IN` and `BLOCK_OPS_OUT` indicate the number of block input and output operations.
- `MESSAGES_SENT` and `MESSAGES_RECEIVED` indicate the number of communication messages sent and received.
- `PAGE_FAULTS_MAJOR` and `PAGE_FAULTS_MINOR` indicate the number of major and minor page faults.
- `SWAPS` indicates how many swaps occurred.
- `SOURCE_FUNCTION`, `SOURCE_FILE`, and `SOURCE_LINE` provide information indicating where in the source code the profiled state executes.

22.18. Other INFORMATION_SCHEMA Tables

We intend to implement additional `INFORMATION_SCHEMA` tables. In particular, we acknowledge the need for the `PARAMET-`

ERS and REFERENTIAL_CONSTRAINTS tables. (REFERENTIAL_CONSTRAINTS is implemented in MySQL 5.1, and PARAMETERS is implemented in MySQL 6.0.)

22.19. Extensions to SHOW Statements

Some extensions to SHOW statements accompany the implementation of INFORMATION_SCHEMA:

- SHOW can be used to get information about the structure of INFORMATION_SCHEMA itself.
- Several SHOW statements accept a WHERE clause that provides more flexibility in specifying which rows to display.

These extensions are available beginning with MySQL 5.0.3.

INFORMATION_SCHEMA is an information database, so its name is included in the output from SHOW DATABASES. Similarly, SHOW TABLES can be used with INFORMATION_SCHEMA to obtain a list of its tables:

```
mysql> SHOW TABLES FROM INFORMATION_SCHEMA;
+-----+
| Tables_in_information_schema |
+-----+
| CHARACTER_SETS              |
| COLLATIONS                  |
| COLLATION_CHARACTER_SET_APPLICABILITY |
| COLUMNS                    |
| COLUMN_PRIVILEGES           |
| KEY_COLUMN_USAGE            |
| ROUTINES                    |
| SCHEMATA                    |
| SCHEMA_PRIVILEGES           |
| STATISTICS                  |
| TABLES                     |
| TABLE_CONSTRAINTS          |
| TABLE_PRIVILEGES           |
| TRIGGERS                    |
| USER_PRIVILEGES             |
| VIEWS                        |
+-----+
16 rows in set (0.00 sec)
```

SHOW COLUMNS and DESCRIBE can display information about the columns in individual INFORMATION_SCHEMA tables.

SHOW statements that accept a LIKE clause to limit the rows displayed have been extended to allow a WHERE clause that enables specification of more general conditions that selected rows must satisfy:

```
SHOW CHARACTER SET
SHOW COLLATION
SHOW COLUMNS
SHOW DATABASES
SHOW FUNCTION STATUS
SHOW INDEX
SHOW OPEN TABLES
SHOW PROCEDURE STATUS
SHOW STATUS
SHOW TABLE STATUS
SHOW TABLES
SHOW VARIABLES
```

The WHERE clause, if present, is evaluated against the column names displayed by the SHOW statement. For example, the SHOW CHARACTER SET statement produces these output columns:

```
mysql> SHOW CHARACTER SET;
+-----+-----+-----+-----+
| Charset | Description | Default collation | Maxlen |
+-----+-----+-----+-----+
| big5    | Big5 Traditional Chinese | big5_chinese_ci | 2 |
| dec8    | DEC West European | dec8_swedish_ci | 1 |
| cp850   | DOS West European | cp850_general_ci | 1 |
| hp8     | HP West European | hp8_english_ci | 1 |
| koi8r   | KOI8-R Relcom Russian | koi8r_general_ci | 1 |
| latin1  | cp1252 West European | latin1_swedish_ci | 1 |
| latin2  | ISO 8859-2 Central European | latin2_general_ci | 1 |
| ...     | ... | ... | ... |
```

To use a WHERE clause with SHOW CHARACTER SET, you would refer to those column names. As an example, the following statement displays information about character sets for which the default collation contains the string 'japanese':

```
mysql> SHOW CHARACTER SET WHERE `Default collation` LIKE '%japanese%';
+-----+-----+-----+-----+
| Charset | Description | Default collation | Maxlen |
+-----+-----+-----+-----+
| ujis    | EUC-JP Japanese | ujis_japanese_ci | 3 |
```

sjis	Shift-JIS Japanese	sjis_japanese_ci	2
cp932	SJIS for Windows Japanese	cp932_japanese_ci	2
eucjpms	UJIS for Windows Japanese	eucjpms_japanese_ci	3

This statement displays the multi-byte character sets:

```
mysql> SHOW CHARACTER SET WHERE Maxlen > 1;
```

Charset	Description	Default collation	Maxlen
big5	Big5 Traditional Chinese	big5_chinese_ci	2
ujis	EUC-JP Japanese	ujis_japanese_ci	3
sjis	Shift-JIS Japanese	sjis_japanese_ci	2
euckr	EUC-KR Korean	euckr_korean_ci	2
gb2312	GB2312 Simplified Chinese	gb2312_chinese_ci	2
gbk	GBK Simplified Chinese	gbk_chinese_ci	2
utf8	UTF-8 Unicode	utf8_general_ci	3
ucs2	UCS-2 Unicode	ucs2_general_ci	2
cp932	SJIS for Windows Japanese	cp932_japanese_ci	2
eucjpms	UJIS for Windows Japanese	eucjpms_japanese_ci	3

Chapter 23. Precision Math

MySQL 5.0 introduces precision math: numeric value handling that results in more accurate results and more control over invalid values than in earlier versions of MySQL. Precision math is based on two implementation changes:

- The introduction of SQL modes in MySQL 5.0 that control how strict the server is about accepting or rejecting invalid data.
- The introduction in MySQL 5.0.3 of a library for fixed-point arithmetic.

These changes have several implications for numeric operations:

- **More precise calculations:** For exact-value numbers, calculations do not introduce floating-point errors. Instead, exact precision is used. For example, a number such as `.0001` is treated as an exact value rather than as an approximation, and summing it 10,000 times produces a result of exactly `1`, not a value that merely “close” to 1.
- **Well-defined rounding behavior:** For exact-value numbers, the result of `ROUND()` depends on its argument, not on environmental factors such as how the underlying C library works.
- **Improved platform independence:** Operations on exact numeric values are the same across different platforms such as Windows and Unix.
- **Control over handling of invalid values:** Overflow and division by zero are detectable and can be treated as errors. For example, you can treat a value that is too large for a column as an error rather than having the value truncated to lie within the range of the column's data type. Similarly, you can treat division by zero as an error rather than as an operation that produces a result of `NULL`. The choice of which approach to take is determined by the setting of the `sql_mode` system variable.

An important result of these changes is that MySQL provides improved compliance with standard SQL.

The following discussion covers several aspects of how precision math works (including possible incompatibilities with older applications). At the end, some examples are given that demonstrate how MySQL 5.0 handles numeric operations precisely. For information about using the `sql_mode` system variable to control the SQL mode, see [Section 5.1.7, “SQL Modes”](#).

23.1. Types of Numeric Values

The scope of precision math for exact-value operations includes the exact-value data types (`DECIMAL` and integer types) and exact-value numeric literals. Approximate-value data types and numeric literals still are handled as floating-point numbers.

Exact-value numeric literals have an integer part or fractional part, or both. They may be signed. Examples: `1`, `.2`, `3.4`, `-5`, `-6.78`, `+9.10`.

Approximate-value numeric literals are represented in scientific notation with a mantissa and exponent. Either or both parts may be signed. Examples: `1.2E3`, `1.2E-3`, `-1.2E3`, `-1.2E-3`.

Two numbers that look similar need not be both exact-value or both approximate-value. For example, `2.34` is an exact-value (fixed-point) number, whereas `2.34E0` is an approximate-value (floating-point) number.

The `DECIMAL` data type is a fixed-point type and calculations are exact. In MySQL, the `DECIMAL` type has several synonyms: `NUMERIC`, `DEC`, `FIXED`. The integer types also are exact-value types.

The `FLOAT` and `DOUBLE` data types are floating-point types and calculations are approximate. In MySQL, types that are synonymous with `FLOAT` or `DOUBLE` are `DOUBLE PRECISION` and `REAL`.

23.2. `DECIMAL` Data Type Changes

This section discusses the characteristics of the `DECIMAL` data type (and its synonyms) as of MySQL 5.0.3, with particular regard to the following topics:

- Maximum number of digits
- Storage format
- Storage requirements
- The non-standard MySQL extension to the upper range of `DECIMAL` columns

Some of these changes result in possible incompatibilities for applications that are written for older versions of MySQL. These incompatibilities are noted throughout this section.

The declaration syntax for a `DECIMAL` column remains `DECIMAL(M,D)`, although the range of values for the arguments has changed somewhat:

- *M* is the maximum number of digits (the precision). It has a range of 1 to 65. This introduces a possible incompatibility for older applications, because previous versions of MySQL allow a range of 1 to 254. (The precision of 65 digits actually applies as of MySQL 5.0.6. From 5.0.3 to 5.0.5, the precision is 64 digits.)
- *D* is the number of digits to the right of the decimal point (the scale). It has a range of 0 to 30 and must be no larger than *M*.

The maximum value of 65 for *M* means that calculations on `DECIMAL` values are accurate up to 65 digits. This limit of 65 digits of precision also applies to exact-value numeric literals, so the maximum range of such literals is different from before. (Prior to MySQL 5.0.3, decimal values could have up to 254 digits. However, calculations were done using floating-point and thus were approximate, not exact.) This change in the range of literal values is another possible source of incompatibility for older applications.

Values for `DECIMAL` columns no longer are represented as strings that require one byte per digit or sign character. Instead, a binary format is used that packs nine decimal digits into four bytes. This change to `DECIMAL` storage format changes the storage requirements as well. The storage requirements for the integer and fractional parts of each value are determined separately. Each multiple of nine digits requires four bytes, and any digits left over require some fraction of four bytes. For example, a `DECIMAL(18,9)` column has nine digits on either side of the decimal point, so the integer part and the fractional part each require four bytes. A `DECIMAL(20,10)` column has ten digits on either side of the decimal point. Each part requires four bytes for nine of the digits, and one byte for the remaining digit.

The storage required for leftover digits is given by the following table:

Leftover Digits	Number of Bytes
0	0
1	1
2	1
3	2
4	2
5	3
6	3
7	4
8	4
9	4

As a result of the change from string to numeric format for `DECIMAL` storage, `DECIMAL` columns no longer store a leading + or - character or leading 0 digits. Before MySQL 5.0.3, if you inserted `+0003.1` into a `DECIMAL(5,1)` column, it was stored as `+0003.1`. As of MySQL 5.0.3, it is stored as `3.1`. For negative numbers, a literal - character is no longer stored. Applications that rely on the older behavior must be modified to account for this change.

The change of storage format also means that `DECIMAL` columns no longer support the non-standard extension that allowed values larger than the range implied by the column definition. Formerly, one byte was allocated for storing the sign character. For positive values that needed no sign byte, MySQL allowed an extra digit to be stored instead. For example, a `DECIMAL(3,0)` column must support a range of at least `-999` to `999`, but MySQL would allow storing values from `1000` to `9999` as well, by using the sign byte to store an extra digit. This extension to the upper range of `DECIMAL` columns no longer is allowed. In MySQL 5.0.3 and up, a `DECIMAL(M,D)` column allows at most *M* - *D* digits to the left of the decimal point. This can result in an incompatibility if an application has a reliance on MySQL allowing “too-large” values.

The SQL standard requires that the precision of `NUMERIC(M,D)` be *exactly* *M* digits. For `DECIMAL(M,D)`, the standard requires a precision of at least *M* digits but allows more. In MySQL, `DECIMAL(M,D)` and `NUMERIC(M,D)` are the same, and both have a precision of exactly *M* digits.

Summary of incompatibilities:

The following list summarizes the incompatibilities that result from changes to `DECIMAL` column and value handling. You can use it as guide when porting older applications for use with MySQL 5.0.3 and up.

- For `DECIMAL(M,D)`, the maximum *M* is 65, not 254.

- Calculations involving exact-value decimal numbers are accurate to 65 digits. This is fewer than the maximum number of digits allowed before MySQL 5.0.3 (254 digits), but the exact-value precision is greater. Calculations formerly were done with double-precision floating-point, which has a precision of 52 bits (about 15 decimal digits).
- The non-standard MySQL extension to the upper range of `DECIMAL` columns no longer is supported.
- Leading “+” and “0” characters are not stored.

The behavior used by the server for `DECIMAL` columns in a table depends on the version of MySQL used to create the table. If your server is from MySQL 5.0.3 or higher, but you have `DECIMAL` columns in tables that were created before 5.0.3, the old behavior still applies to those columns. To convert the tables to the newer `DECIMAL` format, dump them with `mysqldump` and reload them.

23.3. Expression Handling

With precision math, exact-value numbers are used as given whenever possible. For example, numbers in comparisons are used exactly as given without a change in value. In strict SQL mode, for `INSERT` into a column with an exact data type (`DECIMAL` or integer), a number is inserted with its exact value if it is within the column range. When retrieved, the value should be the same as what was inserted. (Without strict mode, truncation for `INSERT` is allowable.)

Handling of a numeric expression depends on what kind of values the expression contains:

- If any approximate values are present, the expression is approximate and is evaluated using floating-point arithmetic.
- If no approximate values are present, the expression contains only exact values. If any exact value contains a fractional part (a value following the decimal point), the expression is evaluated using `DECIMAL` exact arithmetic and has a precision of 65 digits. (The term “exact” is subject to the limits of what can be represented in binary. For example, $1.0/3.0$ can be approximated in decimal notation as $.333\dots$, but not written as an exact number, so $(1.0/3.0)*3.0$ does not evaluate to exactly 1.0 .)
- Otherwise, the expression contains only integer values. The expression is exact and is evaluated using integer arithmetic and has a precision the same as `BIGINT` (64 bits).

If a numeric expression contains any strings, they are converted to double-precision floating-point values and the expression is approximate.

Inserts into numeric columns are affected by the SQL mode, which is controlled by the `sql_mode` system variable. (See [Section 5.1.7, “SQL Modes”](#).) The following discussion mentions strict mode (selected by the `STRICT_ALL_TABLES` or `STRICT_TRANS_TABLES` mode values) and `ERROR_FOR_DIVISION_BY_ZERO`. To turn on all restrictions, you can simply use `TRADITIONAL` mode, which includes both strict mode values and `ERROR_FOR_DIVISION_BY_ZERO`:

```
mysql> SET sql_mode='TRADITIONAL';
```

If a number is inserted into an exact type column (`DECIMAL` or integer), it is inserted with its exact value if it is within the column range.

If the value has too many digits in the fractional part, rounding occurs and a warning is generated. Rounding is done as described in [Section 23.4, “Rounding Behavior”](#).

If the value has too many digits in the integer part, it is too large and is handled as follows:

- If strict mode is not enabled, the value is truncated to the nearest legal value and a warning is generated.
- If strict mode is enabled, an overflow error occurs.

Underflow is not detected, so underflow handling is undefined.

By default, division by zero produces a result of `NULL` and no warning. With the `ERROR_FOR_DIVISION_BY_ZERO` SQL mode enabled, MySQL handles division by zero differently:

- If strict mode is not enabled, a warning occurs.
- If strict mode is enabled, inserts and updates involving division by zero are prohibited, and an error occurs.

In other words, inserts and updates involving expressions that perform division by zero can be treated as errors, but this requires `ERROR_FOR_DIVISION_BY_ZERO` in addition to strict mode.

Suppose that we have this statement:

```
INSERT INTO t SET i = 1/0;
```

This is what happens for combinations of strict and `ERROR_FOR_DIVISION_BY_ZERO` modes:

sql_mode Value	Result
' ' (Default)	No warning, no error; <code>i</code> is set to <code>NULL</code> .
strict	No warning, no error; <code>i</code> is set to <code>NULL</code> .
<code>ERROR_FOR_DIVISION_BY_ZERO</code>	Warning, no error; <code>i</code> is set to <code>NULL</code> .
strict, <code>ERROR_FOR_DIVISION_BY_ZERO</code>	Error condition; no row is inserted.

For inserts of strings into numeric columns, conversion from string to number is handled as follows if the string has non-numeric contents:

- A string that does not begin with a number cannot be used as a number and produces an error in strict mode, or a warning otherwise. *This includes the empty string.*
- A string that begins with a number can be converted, but the trailing non-numeric portion is truncated. If the truncated portion contains anything other than spaces, this produces an error in strict mode, or a warning otherwise.

23.4. Rounding Behavior

This section discusses precision math rounding for the `ROUND()` function and for inserts into columns with exact-value types (`DECIMAL` and integer).

The `ROUND()` function rounds differently depending on whether its argument is exact or approximate:

- For exact-value numbers, `ROUND()` uses the “round half up” rule: A value with a fractional part of .5 or greater is rounded up to the next integer if positive or down to the next integer if negative. (In other words, it is rounded away from zero.) A value with a fractional part less than .5 is rounded down to the next integer if positive or up to the next integer if negative.
- For approximate-value numbers, the result depends on the C library. On many systems, this means that `ROUND()` uses the “round to nearest even” rule: A value with any fractional part is rounded to the nearest even integer.

The following example shows how rounding differs for exact and approximate values:

```
mysql> SELECT ROUND(2.5), ROUND(25E-1);
+-----+-----+
| ROUND(2.5) | ROUND(25E-1) |
+-----+-----+
| 3          | 2            |
+-----+-----+
```

For inserts into a `DECIMAL` or integer column, the target is an exact data type, so rounding uses “round half up,” regardless of whether the value to be inserted is exact or approximate:

```
mysql> CREATE TABLE t (d DECIMAL(10,0));
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t VALUES(2.5),(2.5E0);
Query OK, 2 rows affected, 2 warnings (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 2

mysql> SELECT d FROM t;
+-----+
| d    |
+-----+
| 3    |
| 3    |
+-----+
```

23.5. Precision Math Examples

This section provides some examples that show how precision math improves query results in MySQL 5 compared to older versions.

Example 1. Numbers are used with their exact value as given when possible.

Before MySQL 5.0.3, numbers that are treated as floating-point values produce inexact results:

```
mysql> SELECT .1 + .2 = .3;
+-----+
| .1 + .2 = .3 |
+-----+
|              0 |
+-----+
```

As of MySQL 5.0.3, numbers are used as given when possible:

```
mysql> SELECT .1 + .2 = .3;
+-----+
| .1 + .2 = .3 |
+-----+
|              1 |
+-----+
```

For floating-point values, results are inexact:

```
mysql> SELECT .1E0 + .2E0 = .3E0;
+-----+
| .1E0 + .2E0 = .3E0 |
+-----+
|                    0 |
+-----+
```

Another way to see the difference in exact and approximate value handling is to add a small number to a sum many times. Consider the following stored procedure, which adds `.0001` to a variable 1,000 times.

```
CREATE PROCEDURE p ()
BEGIN
  DECLARE i INT DEFAULT 0;
  DECLARE d DECIMAL(10,4) DEFAULT 0;
  DECLARE f FLOAT DEFAULT 0;
  WHILE i < 10000 DO
    SET d = d + .0001;
    SET f = f + .0001E0;
    SET i = i + 1;
  END WHILE;
  SELECT d, f;
END;
```

The sum for both `d` and `f` logically should be 1, but that is true only for the decimal calculation. The floating-point calculation introduces small errors:

```
+-----+-----+
| d      | f      |
+-----+-----+
| 1.0000 | 0.999999999999991 |
+-----+-----+
```

Example 2. Multiplication is performed with the scale required by standard SQL. That is, for two numbers `X1` and `X2` that have scale `S1` and `S2`, the scale of the result is `S1 + S2`:

Before MySQL 5.0.3, this is what happens:

```
mysql> SELECT .01 * .01;
+-----+
| .01 * .01 |
+-----+
|          0.00 |
+-----+
```

The displayed value is incorrect. The value was calculated correctly in this case, but not displayed to the required scale. To see that the calculated value actually was `.0001`, try this:

```
mysql> SELECT .01 * .01 + .0000;
+-----+
| .01 * .01 + .0000 |
+-----+
|                0.0001 |
+-----+
```

As of MySQL 5.0.3, the displayed scale is correct:

```
mysql> SELECT .01 * .01;
+-----+
| .01 * .01 |
+-----+
| 0.0001    |
+-----+
```

Example 3. Rounding behavior is well-defined.

Before MySQL 5.0.3, rounding behavior (for example, with the `ROUND()` function) is dependent on the implementation of the underlying C library. This results in inconsistencies from platform to platform. For example, you might get a different value on Windows than on Linux, or a different value on x86 machines than on PowerPC machines.

As of MySQL 5.0.3, rounding happens like this:

Rounding for exact-value columns (`DECIMAL` and integer) and exact-valued numbers uses the “round half up” rule. Values with a fractional part of .5 or greater are rounded away from zero to the nearest integer, as shown here:

```
mysql> SELECT ROUND(2.5), ROUND(-2.5);
+-----+-----+
| ROUND(2.5) | ROUND(-2.5) |
+-----+-----+
| 3          | -3          |
+-----+-----+
```

However, rounding for floating-point values uses the C library, which on many systems uses the “round to nearest even” rule. Values with any fractional part on such systems are rounded to the nearest even integer:

```
mysql> SELECT ROUND(2.5E0), ROUND(-2.5E0);
+-----+-----+
| ROUND(2.5E0) | ROUND(-2.5E0) |
+-----+-----+
| 2            | -2            |
+-----+-----+
```

Example 4. In strict mode, inserting a value that is too large results in overflow and causes an error, rather than truncation to a legal value.

Before MySQL 5.0.2 (or in 5.0.2 and later, without strict mode), truncation to a legal value occurs:

```
mysql> CREATE TABLE t (i TINYINT);
Query OK, 0 rows affected (0.01 sec)

mysql> INSERT INTO t SET i = 128;
Query OK, 1 row affected, 1 warning (0.00 sec)

mysql> SELECT i FROM t;
+-----+
| i    |
+-----+
| 127  |
+-----+
1 row in set (0.00 sec)
```

As of MySQL 5.0.2, overflow occurs if strict mode is in effect:

```
mysql> SET sql_mode='STRICT_ALL_TABLES';
Query OK, 0 rows affected (0.00 sec)

mysql> CREATE TABLE t (i TINYINT);
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t SET i = 128;
ERROR 1264 (22003): Out of range value adjusted for column 'i' at row 1

mysql> SELECT i FROM t;
Empty set (0.00 sec)
```

Example 5: In strict mode and with `ERROR_FOR_DIVISION_BY_ZERO` set, division by zero causes an error, and not a result of `NULL`.

Before MySQL 5.0.2 (or when not using strict mode in 5.0.2 or a later version), division by zero has a result of `NULL`:

```
mysql> CREATE TABLE t (i TINYINT);
Query OK, 0 rows affected (0.01 sec)

mysql> INSERT INTO t SET i = 1 / 0;
Query OK, 1 row affected (0.00 sec)
```

```
mysql> SELECT i FROM t;
+-----+
| i     |
+-----+
| NULL |
+-----+
1 row in set (0.00 sec)
```

As of MySQL 5.0.2, division by zero is an error if the proper SQL modes are in effect:

```
mysql> SET sql_mode='STRICT_ALL_TABLES,ERROR_FOR_DIVISION_BY_ZERO';
Query OK, 0 rows affected (0.00 sec)

mysql> CREATE TABLE t (i TINYINT);
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t SET i = 1 / 0;
ERROR 1365 (22012): Division by 0

mysql> SELECT i FROM t;
Empty set (0.01 sec)
```

Example 6. Prior to MySQL 5.0.3 (before precision math was introduced), exact-value and approximate-value literals both are converted to double-precision floating-point values:

```
mysql> SELECT VERSION();
+-----+
| VERSION() |
+-----+
| 4.1.18-log |
+-----+
1 row in set (0.01 sec)

mysql> CREATE TABLE t SELECT 2.5 AS a, 25E-1 AS b;
Query OK, 1 row affected (0.07 sec)
Records: 1 Duplicates: 0 Warnings: 0

mysql> DESCRIBE t;
+-----+-----+-----+-----+-----+-----+
| Field | Type           | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
| a     | double(3,1)   |      |     | 0.0     |      |
| b     | double        |      |     | 0       |      |
+-----+-----+-----+-----+-----+-----+
2 rows in set (0.04 sec)
```

As of MySQL 5.0.3, the approximate-value literal still is converted to floating-point, but the exact-value literal is handled as **DECIMAL**:

```
mysql> SELECT VERSION();
+-----+
| VERSION() |
+-----+
| 5.0.19-log |
+-----+
1 row in set (0.17 sec)

mysql> CREATE TABLE t SELECT 2.5 AS a, 25E-1 AS b;
Query OK, 1 row affected (0.19 sec)
Records: 1 Duplicates: 0 Warnings: 0

mysql> DESCRIBE t;
+-----+-----+-----+-----+-----+-----+
| Field | Type           | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
| a     | decimal(2,1) unsigned | NO  |     | 0.0     |      |
| b     | double        | NO  |     | 0       |      |
+-----+-----+-----+-----+-----+-----+
2 rows in set (0.02 sec)
```

Example 7. If the argument to an aggregate function is an exact numeric type, the result is also an exact numeric type, with a scale at least that of the argument.

Consider these statements:

```
mysql> CREATE TABLE t (i INT, d DECIMAL, f FLOAT);
mysql> INSERT INTO t VALUES(1,1,1);
mysql> CREATE TABLE y SELECT AVG(i), AVG(d), AVG(f) FROM t;
```

Result before MySQL 5.0.3 (prior to the introduction of precision math in MySQL):

```
mysql> DESCRIBE y;
+-----+-----+-----+-----+-----+-----+
| Field | Type           | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
|      |      |      |     |      |      |
+-----+-----+-----+-----+-----+-----+
```

AVG(i)	double(17,4)	YES		NULL	
AVG(d)	double(17,4)	YES		NULL	
AVG(f)	double	YES		NULL	

The result is a double no matter the argument type.

Result as of MySQL 5.0.3:

```
mysql> DESCRIBE y;
```

Field	Type	Null	Key	Default	Extra
AVG(i)	decimal(14,4)	YES		NULL	
AVG(d)	decimal(14,4)	YES		NULL	
AVG(f)	double	YES		NULL	

The result is a double only for the floating-point argument. For exact type arguments, the result is also an exact type. (From MySQL 5.0.3 to 5.0.6, the first two columns are `DECIMAL(64,0)`.)

Chapter 24. Connectors and APIs

MySQL Connectors provide connectivity to the MySQL server for client programs. APIs provide low-level access to the MySQL protocol and MySQL resources. Both Connectors and the APIs enable you to connect and execute MySQL statements from another language or environment, including Java (JDBC), ODBC, Perl, Python, PHP, Ruby, and native C and embedded MySQL instances.

A number of connectors are developed by MySQL:

- Connector/ODBC provides driver support for connecting to a MySQL server using the Open Database Connectivity (ODBC) API. Support is available for ODBC connectivity from Windows, Unix and Mac OS X platforms.
- Connector/NET enables developers to create .NET applications that use data stored in a MySQL database. Connector/NET implements a fully-functional ADO.NET interface and provides support for use with ADO.NET aware tools. Applications that want to use Connector/NET can be written in any of the supported .NET languages.

The MySQL Visual Studio Plugin works with Connector/NET and Visual Studio 2005. The plugin is a MySQL DDEX Provider, which means that you can use the schema and data manipulation tools within Visual Studio to create and edit objects within a MySQL database.

- Connector/J provides driver support for connecting to MySQL from a Java application using the standard Java Database Connectivity (JDBC) API.
- Connector/MXJ is a tool that enables easy deployment and management of MySQL server and database through your Java application.

There are two direct access methods for using MySQL natively within a C application:

- The C API provides low-level access to the MySQL protocol through the `libmysqlclient` library; this is the primary method used to connect to an instance of the MySQL server, and is used both by MySQL command line clients and many of the APIs also detailed in this section.
- `libmysqld` is an embedded MySQL server library that enables you to embed an instance of the MySQL server into your C applications.

If you need to access MySQL from a C application, or build an interface to MySQL for a language not supported by the Connectors or APIs in this chapter, the C API is where you would start. A number of programmer utilities are available to help with the process, and also covered in this section.

The remaining APIs provide an interface to MySQL from specific application languages. These solutions are not developed or supported by MySQL. Basic information on their usage and abilities is provided here for reference purposes only.

All the language APIs are developed using one of two methods, using `libmysql` or by building a *native driver*. The two solutions offer different benefits:

- Using `libmysql` offers complete compatibility with MySQL as it uses the same libraries as the MySQL client applications. However, the feature set is limited to the implementation and interfaces exposed through `libmysql` and the performance may be lower as data is copied between the native language, and the MySQL API components.
- *Native drivers* are an implementation of the MySQL network protocol entirely within the host language or environment. Native drivers are fast, as there is less copying of data between components, and they can offer advanced functionality not available through the standard MySQL API. Native drivers are also easier to build and deploy, as you do not need a copy of the MySQL client libraries to build the native driver components.

A list of many of the libraries and interfaces available for MySQL are shown in the table. See [Table 24.1, “MySQL APIs and Interfaces”](#).

Table 24.1. MySQL APIs and Interfaces

Environment	API	Type	Notes
Ada	MySQL Bindings for GNU Ada	<code>libmysql</code>	See MySQL Bindings for GNU Ada
C++	Connector C++	<code>libmysql</code>	See Connector C++ .

Environment	API	Type	Notes
	MySQL++	<code>libmysql</code>	See Section 24.10, “MySQL C++ API” .
	MySQL wrapped	<code>libmysql</code>	See MySQL wrapped .
Cocoa	MySQL-Cocoa	<code>libmysql</code>	Compatible with the Objective-C Cocoa environment. See http://mysql-cocoa.sourceforge.net/
D	MySQL for D	<code>libmysql</code>	See MySQL for D .
Eiffel	Eiffel MySQL	<code>libmysql</code>	See Section 24.14, “MySQL Eiffel Wrapper” .
Erlang	<code>erlang-mysql-driver</code>	<code>libmysql</code>	See erlang-mysql-driver .
Haskell	Haskell MySQL Bindings	Native Driver	See Brian O'Sullivan's pure Haskell MySQL bindings .
	<code>hsqldb-mysql</code>	<code>libmysql</code>	See MySQL driver for Haskell .
Java/JDBC	Connector/J	Native Driver	See Section 24.4, “MySQL Connector/J” .
Kaya	MyDB	<code>libmysql</code>	See MyDB .
Lua	LuaSQL	<code>libmysql</code>	See LuaSQL .
.NET/Mono	Connector/NET	Native Driver	See Section 24.2, “MySQL Connector/NET” .
Objective Caml	MySQL Bindings for Objective Caml	<code>libmysql</code>	See MySQL Bindings for Objective Caml .
Octave	Database bindings for GNU Octave	<code>libmysql</code>	See Database bindings for GNU Octave .
ODBC	Connector/ODBC	<code>libmysql</code>	See Section 24.1, “MySQL Connector/ODBC” .
OpenOffice	MySQL Connector/OpenOffice.org	<code>libmysql</code>	Direct connectivity, without using JDBC/ODBC. See MySQL Connector/OpenOffice.org .
Perl	<code>DBI/DBD::mysql</code>	<code>libmysql</code>	See Section 24.9, “MySQL Perl API” .
	<code>Net::MySQL</code>	Native Driver	See Net::MySQL at CPAN
PHP	<code>mysql</code> , <code>ext/mysql</code> interface (deprecated)	<code>libmysql</code>	See Section 24.8.1, “MySQL” .
	<code>mysqli</code> , <code>ext/mysqli</code> interface	<code>libmysql</code>	See Section 24.8.2, “MySQL Improved Extension (Mysqli)” .
	<code>PDO_MYSQL</code>	<code>libmysql</code>	See Section 24.8.3, “MySQL Functions (PDO_MYSQL)” .
	PDO <code>mysqlnd</code>	Native Driver	See PHP PDO <code>mysqlnd</code> .
Python	MySQLdb	<code>libmysql</code>	See Section 24.11, “MySQL Python API” .
Ruby	MySQL/Ruby	<code>libmysql</code>	Uses <code>libmysql</code> . See Section 24.12.1, “The MySQL/Ruby API” .
	Ruby/MySQL	Native Driver	See Section 24.12.2, “The Ruby/MySQL API” .
Scheme	<code>Myscsh</code>	<code>libmysql</code>	See Myscsh .
SPL	<code>sql_mysql</code>	<code>libmysql</code>	See sql_mysql for SPL.
Tcl	MySQLtcl	<code>libmysql</code>	See Section 24.13, “MySQL Tcl API” .

24.1. MySQL Connector/ODBC

The MySQL Connector/ODBC is the name for the family of MySQL ODBC drivers (previously called MyODBC drivers) that provide access to a MySQL database using the industry standard Open Database Connectivity (ODBC) API. This reference covers Connector/ODBC 3.51 and Connector/ODBC 5.1. Both releases provide an ODBC compliant interface to MySQL Server.

MySQL Connector/ODBC provides both driver-manager based and native interfaces to the MySQL database, which full support for MySQL functionality, including stored procedures, transactions and, with Connector/ODBC 5.1, full Unicode compliance.

For more information on the ODBC API standard and how to use it, refer to <http://support.microsoft.com/kb/110093>.

The application development part of this reference assumes a good working knowledge of C, general DBMS knowledge, and finally, but not least, familiarity with MySQL. For more information about MySQL functionality and its syntax, refer to <http://dev.mysql.com/doc/>.

Typically, you need to install Connector/ODBC only on Windows machines. For Unix and Mac OS X you can use the native MySQL network or named pipe to communicate with your MySQL database. You may need Connector/ODBC for Unix or Mac

OS X if you have an application that requires an ODBC interface to communicate with the database. Applications that require ODBC to communicate with MySQL include ColdFusion, Microsoft Office, and Filemaker Pro.

Key topics:

- For help installing Connector/ODBC see [Section 24.1.3, “Connector/ODBC Installation”](#).
- For information on the configuration options, see [Section 24.1.4.2, “Connector/ODBC Connection Parameters”](#).
- For more information on connecting to a MySQL database from a Windows host using Connector/ODBC see [Section 24.1.5.2, “Step-by-step Guide to Connecting to a MySQL Database through Connector/ODBC”](#).
- If you want to use Microsoft Access as an interface to a MySQL database using Connector/ODBC see [Section 24.1.5.4, “Using Connector/ODBC with Microsoft Access”](#).
- General tips on using Connector/ODBC, including obtaining the last auto-increment ID see [Section 24.1.7.1, “Connector/ODBC General Functionality”](#).
- For tips and common questions on using Connector/ODBC with specific application see [Section 24.1.7.2, “Connector/ODBC Application Specific Tips”](#).
- For a general list of Frequently Asked Questions see [Section 24.1.7.3, “Connector/ODBC Errors and Resolutions \(FAQ\)”](#).
- Additional support when using Connector/ODBC is available, see [Section 24.1.8, “Connector/ODBC Support”](#).

MySQL Enterprise

MySQL Enterprise subscribers will find more information about MySQL and ODBC in the Knowledge Base articles about [ODBC](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

24.1.1. Connector/ODBC Versions

There are currently two version of Connector/ODBC available:

- Connector/ODBC 5.1, currently in GA status, is a partial rewrite of the of the 3.51 code base and is designed to work all versions of MySQL from 4.1. Connector/ODBC 5.1 will be a complete implementation of the ODBC Core interface, plus more Level 1 and Level 2 functionality of the ODBC specification than that currently supported by Connector/ODBC 3.51. See [Section 24.1.2.1, “Connector/ODBC Roadmap”](#).

Connector/ODBC 5.1 also includes the following changes and improvements over the 3.51 release:

- Improved support on Windows 64-bit platforms.
- Full Unicode support at the driver level. This includes support for the `SQL_WCHAR` datatype, and support for Unicode login, password and DSN configurations. For more information, see [Microsoft Knowledgebase Article #716246](#).
- Support for the `SQL_NUMERIC_STRUCT` datatype, which provides easier access to the precise definition of numeric values. For more information, see [Microsoft Knowledgebase Article #714556](#)
- Native Windows setup library. This replaces the Qt library based interface for configuring DSN information within the ODBC Data Sources application.
- Support for the ODBC descriptor, which improves the handling and metadata of columns and parameter data. For more information, see [Microsoft Knowledgebase Article #716339](#).
- Connector/ODBC 3.51 is the current release of the 32-bit ODBC driver, also known as the MySQL ODBC 3.51 driver. Connector/ODBC 3.51 has support for ODBC 3.5x specification level 1 (complete core API + level 2 features) in order to continue to provide all functionality of ODBC for accessing MySQL.

The manual for versions of Connector/ODBC older than 3.51 can be located in the corresponding binary or source distribution. Please note that versions of Connector/ODBC earlier than the 3.51 revision were not fully compliant with the ODBC specification.

Note

Development on Connector/ODBC 5.0 was stopped due to development issues. Connector/ODBC 5.1 is now the current development release.

Note

From this section onward, the primary focus of this guide is the Connector/ODBC 3.51 and Connector/ODBC 5.1 drivers.

Note

Version numbers for MySQL products are formatted as X.X.X. However, Windows tools (Control Panel, properties display) may show the version numbers as XX.XX.XX. For example, the official MySQL formatted version number 5.0.9 may be displayed by Windows tools as 5.00.09. The two versions are the same; only the number display format is different.

24.1.2. Connector/ODBC Introduction

ODBC (Open Database Connectivity) provides a way for client programs to access a wide range of databases or data sources. ODBC is a standardized API that allows connections to SQL database servers. It was developed according to the specifications of the SQL Access Group and defines a set of function calls, error codes, and data types that can be used to develop database-independent applications. ODBC usually is used when database independence or simultaneous access to different data sources is required.

For more information about ODBC, refer to <http://support.microsoft.com/kb/110093>.

24.1.2.1. Connector/ODBC Roadmap

Connector/ODBC 5.1 is currently in development and will be a complete implementation of the ODBC Core interface, plus more Level 1 and Level 2 functionality of the ODBC specification than that currently supported by Connector/ODBC 3.51.

The following functionality was added or changed as part of 5.1:

- Add support for SQL_NUMERIC_STRUCT: [MSDN Article 714556](#).
- Replace installer library with new implementation (from v5 tree).
- Implement native Windows setup library.
- Implement SQLCancel() ([Bug#15601](#)): [MSDN Article 714112](#).

The following functionality will be added in a version after 5.1:

- Implement native Mac OS X setup library.
- Replace OPTIONS flags with individual DSN settings (but support OPTIONS for backwards-compatibility).
- Fix support for SQLBIGINT ([Bug#28887](#)): [MSDN Article 714121](#).
- Make diagnostics support standards-compliant: [MSDN Article 711021](#).
- Add support for SQL_ATTR_METADATA_ID: [MSDN Article 716447](#).
- Implement SQLBrowseConnect(): [MSDN Article 714565](#), [MSDN Article 712446](#).
- Implement arrays of parameters: [MSDN Article 711818](#).

24.1.2.2. General Information About ODBC and Connector/ODBC

Open Database Connectivity (ODBC) is a widely accepted application-programming interface (API) for database access. It is based on the Call-Level Interface (CLI) specifications from X/Open and ISO/IEC for database APIs and uses Structured Query Language (SQL) as its database access language.

A survey of ODBC functions supported by Connector/ODBC is given at [Section 24.1.6.1, "Connector/ODBC API Reference"](#). For general information about ODBC, see <http://support.microsoft.com/kb/110093>.

24.1.2.2.1. Connector/ODBC Architecture

The Connector/ODBC architecture is based on five components, as shown in the following diagram:

- **Application:**

The Application uses the ODBC API to access the data from the MySQL server. The ODBC API in turn uses the communicates with the Driver Manager. The Application communicates with the Driver Manager using the standard ODBC calls. The Application does not care where the data is stored, how it is stored, or even how the system is configured to access the data. It needs to know only the Data Source Name (DSN).

A number of tasks are common to all applications, no matter how they use ODBC. These tasks are:

- Selecting the MySQL server and connecting to it
- Submitting SQL statements for execution
- Retrieving results (if any)
- Processing errors
- Committing or rolling back the transaction enclosing the SQL statement
- Disconnecting from the MySQL server

Because most data access work is done with SQL, the primary tasks for applications that use ODBC are submitting SQL statements and retrieving any results generated by those statements.

- **Driver manager:**

The Driver Manager is a library that manages communication between application and driver or drivers. It performs the following tasks:

- Resolves Data Source Names (DSN). The DSN is a configuration string that identifies a given database driver, database, database host and optionally authentication information that enables an ODBC application to connect to a database using a standardized reference.

Because the database connectivity information is identified by the DSN, any ODBC compliant application can connect to the data source using the same DSN reference. This eliminates the need to separately configure each application that needs access to a given database; instead you instruct the application to use a pre-configured DSN.

- Loading and unloading of the driver required to access a specific database as defined within the DSN. For example, if you have configured a DSN that connects to a MySQL database then the driver manager will load the Connector/ODBC driver to enable the ODBC API to communicate with the MySQL host.
- Processes ODBC function calls or passes them to the driver for processing.

- **Connector/ODBC Driver:**

The Connector/ODBC driver is a library that implements the functions supported by the ODBC API. It processes ODBC function calls, submits SQL requests to MySQL server, and returns results back to the application. If necessary, the driver modifies an application's request so that the request conforms to syntax supported by MySQL.

- **DSN Configuration:**

The ODBC configuration file stores the driver and database information required to connect to the server. It is used by the Driver Manager to determine which driver to be loaded according to the definition in the DSN. The driver uses this to read connection parameters based on the DSN specified. For more information, [Section 24.1.4, “Connector/ODBC Configuration”](#).

- **MySQL Server:**

The MySQL database where the information is stored. The database is used as the source of the data (during queries) and the destination for data (during inserts and updates).

24.1.2.2.2. ODBC Driver Managers

An ODBC Driver Manager is a library that manages communication between the ODBC-aware application and any drivers. Its main functionality includes:

- Resolving Data Source Names (DSN).
- Driver loading and unloading.
- Processing ODBC function calls or passing them to the driver.

Both Windows and Mac OS X include ODBC driver managers with the operating system. Most ODBC Driver Manager implementations also include an administration application that makes the configuration of DSN and drivers easier. Examples and information on these managers, including Unix ODBC driver managers are listed below:

- Microsoft Windows ODBC Driver Manager (`odbc32.dll`), <http://support.microsoft.com/kb/110093>.
- Mac OS X includes [ODBC Administrator](#), a GUI application that provides a simpler configuration mechanism for the Unix iODBC Driver Manager. You can configure DSN and driver information either through ODBC Administrator or through the iODBC configuration files. This also means that you can test ODBC Administrator configurations using the `iodbctest` command. <http://www.apple.com>.
- [unixODBC Driver Manager for Unix](#) (`libodbc.so`). See <http://www.unixodbc.org>, for more information. The [unixODBC Driver Manager](#) includes the Connector/ODBC driver 3.51 in the installation package, starting with version [unixODBC 2.1.2](#).
- [iODBC ODBC Driver Manager for Unix](#) (`libiodbc.so`), see <http://www.iodbc.org>, for more information.

24.1.3. Connector/ODBC Installation

You can install the Connector/ODBC drivers using two different methods, a binary installation and a source installation. The binary

installation is the easiest and most straightforward method of installation. Using the source installation methods should only be necessary on platforms where a binary installation package is not available, or in situations where you want to customize or modify the installation process or Connector/ODBC drivers before installation.

Where to Get Connector/ODBC

MySQL AB distributes all its products under the General Public License (GPL). You can get a copy of the latest version of Connector/ODBC binaries and sources from the MySQL AB Web site <http://dev.mysql.com/downloads/>.

For more information about Connector/ODBC, visit <http://www.mysql.com/products/myodbc/>.

For more information about licensing, visit <http://www.mysql.com/company/legal/licensing/>.

Supported Platforms

Connector/ODBC can be used on all major platforms supported by MySQL. You can install it on:

- Windows 95, 98, Me, NT, 2000, XP, and 2003
- All Unix-like Operating Systems, including: AIX, Amiga, BSDI, DEC, FreeBSD, HP-UX 10/11, Linux, NetBSD, OpenBSD, OS/2, SGI Irix, Solaris, SunOS, SCO OpenServer, SCO UnixWare, Tru64 Unix
- Mac OS X and Mac OS X Server

Using a binary distribution offers the most straightforward method for installing Connector/ODBC. If you want more control over the driver, the installation location and or to customize elements of the driver you will need to build and install from the source.

If a binary distribution is not available for a particular platform build the driver from the original source code. You can contribute the binaries you create to MySQL by sending a mail message to [<myodbc@lists.mysql.com>](mailto:myodbc@lists.mysql.com), so that it becomes available for other users.

For further instructions:

Platform	Binary	Source
Windows	Installation Instructions	Build Instructions
Unix/Linux	Installation Instructions	Build Instructions
Mac OS X	Installation Instructions	

24.1.3.1. Installing Connector/ODBC from a Binary Distribution on Windows

Before installing the Connector/ODBC drivers on Windows you should ensure that your Microsoft Data Access Components (MDAC) are up to date. You can obtain the latest version from the [Microsoft Data Access and Storage](#) Web site.

There are three available distribution types to use when installing for Windows. The contents in each case are identical, it is only the installation method which is different.

- Zipped installer consists of a Zipped package containing a standalone installation application. To install from this package, you must unzip the installer, and then run the installation application. See [Section 24.1.3.1.1, “Installing the Windows Connector/ODBC Driver using an installer”](#) to complete the installation.
- MSI installer, an installation file that can be used with the installer included in Windows 2000, Windows XP and Windows Server 2003. See [Section 24.1.3.1.1, “Installing the Windows Connector/ODBC Driver using an installer”](#) to complete the installation.
- Zipped DLL package, containing the DLL files that need must be manually installed. See [Section 24.1.3.1.2, “Installing the Windows Connector/ODBC Driver using the Zipped DLL package”](#) to complete the installation.

Note

An OLEDB/ODBC driver for Windows 64-bit is available from [Microsoft Downloads](#).

24.1.3.1.1. Installing the Windows Connector/ODBC Driver using an installer

The installer packages offer a very simple method for installing the Connector/ODBC drivers. If you have downloaded the zipped

installer then you must extract the installer application. The basic installation process is identical for both installers.

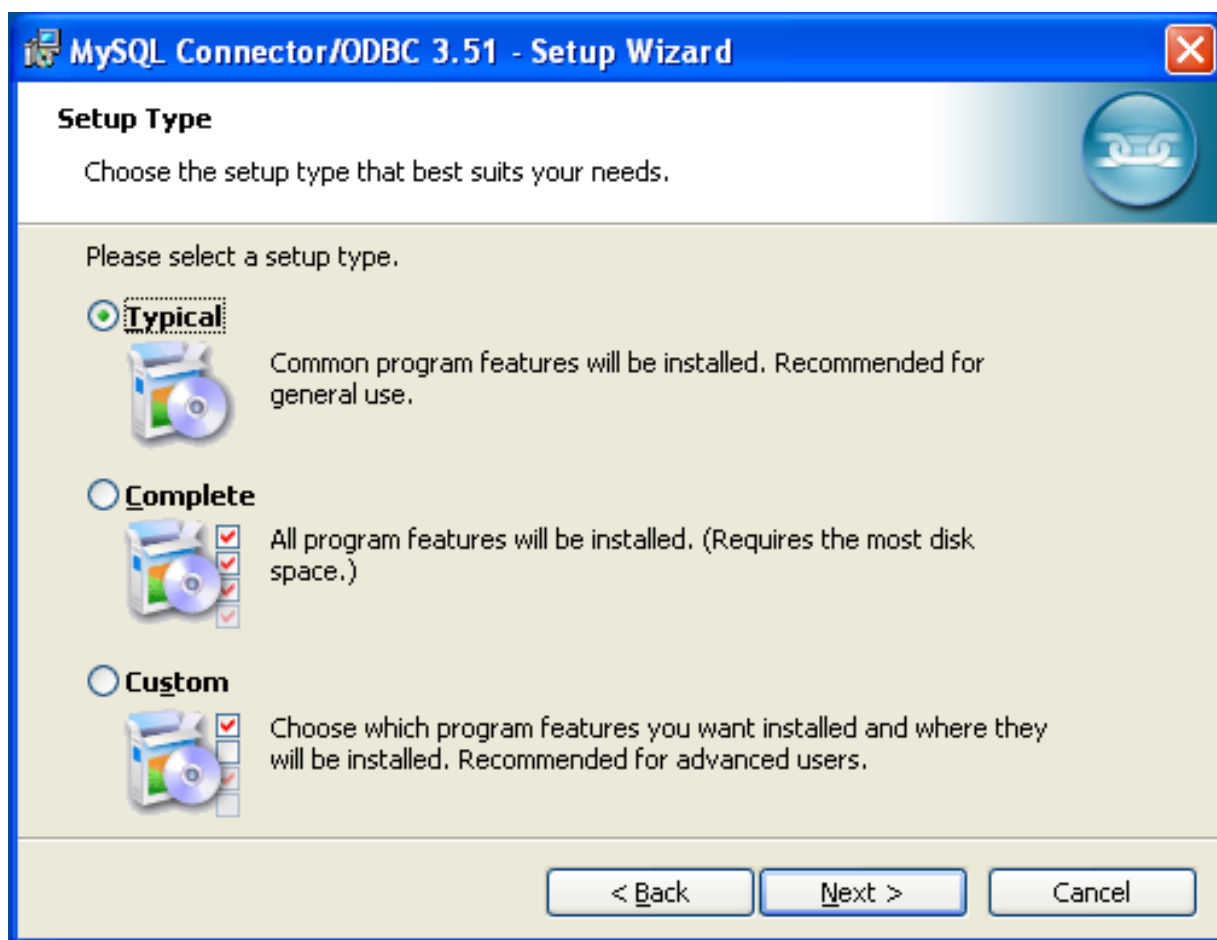

You should follow these steps to complete the installation:

1. Double click on the standalone installer that you extracted, or the MSI file you downloaded.
2. The MySQL Connector/ODBC 3.51 - Setup Wizard will start. Click the NEXT button to begin the installation process.

3. You will need to choose the installation type. The Typical installation provides the standard files you will need to connect to a MySQL database using ODBC. The Complete option installs all the available files, including debug and utility components. It is recommended you choose one of these two options to complete the installation. If choose one of these methods, click NEXT and then proceed to step 5.

You may also choose a Custom installation, which enables you to select the individual components that you want to install. You have chosen this method, click NEXT and then proceed to step 4.

4. If you have chosen a custom installation, use the pop-ups to select which components to install and then click NEXT to install the necessary files.

5. Once the files have copied to your machine, the installation is complete. Click FINISH to exit the installer.

Now the installation is complete, you can continue to configure your ODBC connections using [Section 24.1.4, “Connector/ODBC Configuration”](#).

24.1.3.1.2. Installing the Windows Connector/ODBC Driver using the Zipped DLL package

If you have downloaded the Zipped DLL package then you must install the individual files required for Connector/ODBC operation manually. Once you have unzipped the installation files, you can either perform this operation by hand, executing each statement individually, or you can use the included Batch file to perform an installation to the default locations.

To install using the Batch file:

1. Unzip the Connector/ODBC Zipped DLL package.
2. Open a Command Prompt.
3. Change to the directory created when you unzipped the Connector/ODBC Zipped DLL package.
4. Run `Install.bat`:

```
c:\> Install.bat
```

This will copy the necessary files into the default location, and then register the Connector/ODBC driver with the Windows ODBC manager.

If you want to copy the files to an alternative location - for example, to run or test different versions of the Connector/ODBC driver on the same machine, then you must copy the files by hand. It is however not recommended to install these files in a non-standard location. To copy the files by hand to the default installation location use the following steps:

1. Unzip the Connector/ODBC Zipped DLL package.

2. Open a Command Prompt.
3. Change to the directory created when you unzipped the Connector/ODBC Zipped DLL package.
4. Copy the library files to a suitable directory. The default is to copy them into the default Windows system directory `\Windows\System32`:

```
C:\> copy lib\myodbc3S.dll \Windows\System32
C:\> copy lib\myodbc3S.lib \Windows\System32
C:\> copy lib\myodbc3.dll \Windows\System32
C:\> copy lib\myodbc3.lib \Windows\System32
```

5. Copy the Connector/ODBC tools. These must be placed into a directory that is in the system `PATH`. The default is to install these into the Windows system directory `\Windows\System32`:

```
C:\> copy bin\myodbc3i.exe \Windows\System32
C:\> copy bin\myodbc3m.exe \Windows\System32
C:\> copy bin\myodbc3c.exe \Windows\System32
```

6. Optionally copy the help files. For these files to be accessible through the help system, they must be installed in the Windows system directory:

```
C:\> copy doc\*.hlp \Windows\System32
```

7. Finally, you must register the Connector/ODBC driver with the ODBC manager:

```
C:\> myodbc3i -a -d -t"MySQL ODBC 3.51 Driver;\
DRIVER=myodbc3.dll;SETUP=myodbc3S.dll"
```

You must change the references to the DLL files and command location in the above statement if you have not installed these files into the default location.

24.1.3.2. Installing Connector/ODBC from a Binary Distribution on Unix

There are two methods available for installing Connector/ODBC on Unix from a binary distribution. For most Unix environments you will need to use the tarball distribution. For Linux systems, there is also an RPM distribution available.

24.1.3.2.1. Installing Connector/ODBC from a Binary Tarball Distribution

To install the driver from a tarball distribution (`.tar.gz` file), download the latest version of the driver for your operating system and follow these steps that demonstrate the process using the Linux version of the tarball:

```
shell> su root
shell> gunzip mysql-connector-odbc-3.51.11-i686-pc-linux.tar.gz
shell> tar xvf mysql-connector-odbc-3.51.11-i686-pc-linux.tar
shell> cd mysql-connector-odbc-3.51.11-i686-pc-linux
```

Read the installation instructions in the `INSTALL-BINARY` file and execute these commands.

```
shell> cp libmyodbc* /usr/local/lib
shell> cp odbc.ini /usr/local/etc
shell> export ODBCINI=/usr/local/etc/odbc.ini
```

Then proceed on to [Section 24.1.4.5, "Configuring a Connector/ODBC DSN on Unix"](#), to configure the DSN for Connector/ODBC. For more information, refer to the `INSTALL-BINARY` file that comes with your distribution.

24.1.3.2.2. Installing Connector/ODBC from an RPM Distribution

To install or upgrade Connector/ODBC from an RPM distribution on Linux, simply download the RPM distribution of the latest version of Connector/ODBC and follow the instructions below. Use `su root` to become `root`, then install the RPM file.

If you are installing for the first time:

```
shell> su root
shell> rpm -ivh mysql-connector-odbc-3.51.12.i386.rpm
```

If the driver exists, upgrade it like this:

```
shell> su root
shell> rpm -Uvh mysql-connector-odbc-3.51.12.i386.rpm
```

If there is any dependency error for MySQL client library, `libmysqlclient`, simply ignore it by supplying the `--nodeps` option, and then make sure the MySQL client shared library is in the path or set through `LD_LIBRARY_PATH`.

This installs the driver libraries and related documents to `/usr/local/lib` and `/usr/share/doc/MyODBC`, respectively. Proceed onto [Section 24.1.4.5, “Configuring a Connector/ODBC DSN on Unix”](#).

To **uninstall** the driver, become `root` and execute an `rpm` command:

```
shell> su root
shell> rpm -e mysql-connector-odbc
```

24.1.3.3. Installing Connector/ODBC from a Binary Distribution on Mac OS X

Mac OS X is based on the FreeBSD operating system, and you can normally use the MySQL network port for connecting to MySQL servers on other hosts. Installing the Connector/ODBC driver enables you to connect to MySQL databases on any platform through the ODBC interface. You should only need to install the Connector/ODBC driver when your application requires an ODBC interface. Applications that require or can use ODBC (and therefore the Connector/ODBC driver) include ColdFusion, Filemaker Pro, 4th Dimension and many other applications.

Mac OS X includes its own ODBC manager, based on the `iODBC` manager. Mac OS X includes an administration tool that provides easier administration of ODBC drivers and configuration, updating the underlying `iODBC` configuration files.

The method for installing Connector/ODBC on Mac OS X depends on the version on Connector/ODBC you are using. For Connector/ODBC 3.51.14 and later, the package is provided as a compress tar archive that you must manually install. For Connector/ODBC 3.51.13 and earlier the software was provided on a compressed disk image (`.dmg`) file and included an installer.

In either case, the driver is designed to work with the `iODBC` driver manager included with Mac OS X.

To install Connector/ODBC 3.51.14 and later:

1. Download the installation file. Note that versions are available for both PowerPC and Intel platforms.
2. Extract the archive:

```
$ tar xzf mysql-connector-odbc-3.51.16-osx10.4-x86-32bit.tar.gz
```

3. The directory created will contain two subdirectories, `lib` and `bin`. You need to copy these to a suitable location such as `/usr/local`:

```
$ cp bin/* /usr/local/bin
$ cp lib/* /usr/local/lib
```

4. Finally, you must register the driver with `iODBC` using the `myodbc3i` tool you just installed:

```
$ myodbc3i -a -d -t"MySQL ODBC 3.51 Driver;Driver=/usr/local/lib/libmyodbc3.so;Setup=/usr/local/lib/libmyodbc3S.so"
```

You can verify the installed drivers either by using the ODBC Administrator application or the `myodbc3i` utility:

```
$ myodbc3i -q -d
```

To install Connector/ODBC 3.51.13 and earlier, follow these steps:

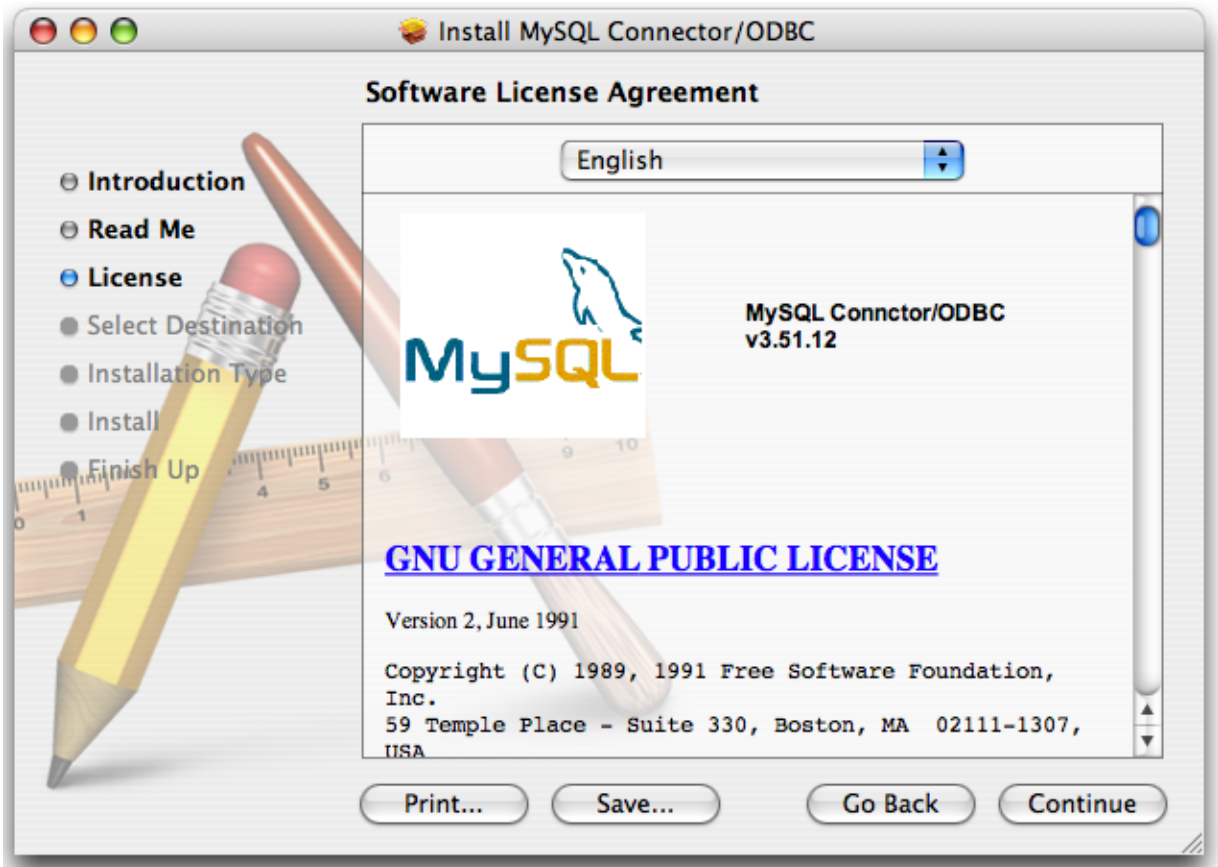

1. Download the file to your computer and double-click on the downloaded image file.
2. Within the disk image you will find an installer package (with the `.pkg` extension). Double click on this file to start the Mac OS X installer.
3. You will be presented with the installer welcome message. Click the `CONTINUE` button to begin the installation process.

4. Please take the time to read the Important Information as it contains guidance on how to complete the installation process. Once you have read the notice and collected the necessary information, click CONTINUE.

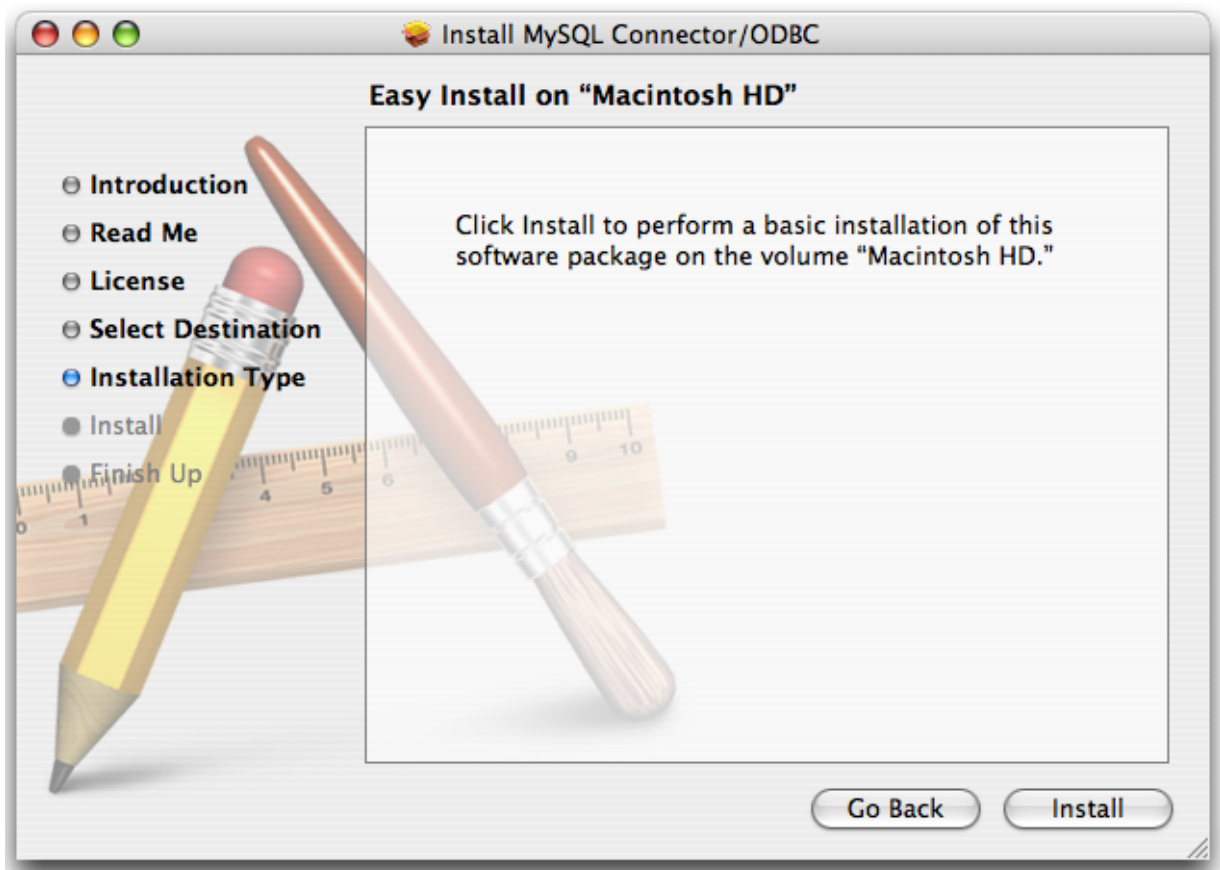

- Connector/ODBC drivers are made available under the GNU General Public License. Please read the license if you are not familiar with it before continuing installation. Click CONTINUE to approve the license (you will be asked to confirm that decision) and continue the installation.

- Choose a location to install the Connector/ODBC drivers and the ODBC Administrator application. You must install the files onto a drive with an operating system and you may be limited in the choices available. Select the drive you want to use, and then click CONTINUE.

7. The installer will automatically select the files that need to be installed on your machine. Click **INSTALL** to continue. The installer will copy the necessary files to your machine. A progress bar will be shown indicating the installation progress.

8. When installation has been completed you will get a window like the one shown below. Click CLOSE to close and quit the installer.

24.1.3.4. Installing Connector/ODBC from a Source Distribution on Windows

You should only need to install Connector/ODBC from source on Windows if you want to change or modify the source or installation. If you are unsure whether to install from source, please use the binary installation detailed in [Section 24.1.3.1, “Installing Connector/ODBC from a Binary Distribution on Windows”](#).

Installing Connector/ODBC from source on Windows requires a number of different tools and packages:

- MDAC, Microsoft Data Access SDK from <http://support.microsoft.com/kb/110093>.
- Suitable C compiler, such as Microsoft Visual C++ or the C compiler included with Microsoft Visual Studio.
- Compatible `make` tool. Microsoft's `nmake` is used in the examples in this section.
- MySQL client libraries and include files from MySQL 4.0.0 or higher. (Preferably MySQL 4.0.16 or higher). This is required because Connector/ODBC uses new calls and structures that exist only starting from this version of the library. To get the client libraries and include files, visit <http://dev.mysql.com/downloads/>.

24.1.3.4.1. Building Connector/ODBC 3.51

Connector/ODBC source distributions include `Makefiles` that require the `nmake` or other `make` utility. In the distribution, you can find `Makefile` for building the release version and `Makefile_debug` for building debugging versions of the driver libraries and DLLs.

To build the driver, use this procedure:

1. Download and extract the sources to a folder, then change directory into that folder. The following command assumes the folder is named `myodbc3-src`:

```
C:\> cd myodbc3-src
```

2. Edit `Makefile` to specify the correct path for the MySQL client libraries and header files. Then use the following commands to build and install the release version:

```
C:\> nmake -f Makefile
C:\> nmake -f Makefile install
```

`nmake -f Makefile` builds the release version of the driver and places the binaries in subdirectory called `Release`.

`nmake -f Makefile install` installs (copies) the driver DLLs and libraries (`myodbc3.dll`, `myodbc3.lib`) to your system directory.

3. To build the debug version, use `Makefile_Debug` rather than `Makefile`, as shown below:

```
C:\> nmake -f Makefile_debug
C:\> nmake -f Makefile_debug install
```

4. You can clean and rebuild the driver by using:

```
C:\> nmake -f Makefile clean
C:\> nmake -f Makefile install
```

Note

- Make sure to specify the correct MySQL client libraries and header files path in the Makefiles (set the `MYSQL_LIB_PATH` and `MYSQL_INCLUDE_PATH` variables). The default header file path is assumed to be `C:\mysql\include`. The default library path is assumed to be `C:\mysql\lib\opt` for release DLLs and `C:\mysql\lib\debug` for debug versions.
- For the complete usage of `nmake`, visit http://msdn.microsoft.com/library/default.asp?url=/library/en-us/dv_vcce4/html/evgrfRunningNMAKE.asp.
- If you are using the Subversion tree for compiling, all Windows-specific `Makefiles` are named as `Win_Makefile*`.

24.1.3.4.2. Testing

After the driver libraries are copied/installed to the system directory, you can test whether the libraries are properly built by using the samples provided in the `samples` subdirectory:

```
C:\> cd samples
C:\> nmake -f Makefile all
```

24.1.3.5. Installing Connector/ODBC from a Source Distribution on Unix

You need the following tools to build MySQL from source on Unix:

- A working ANSI C++ compiler. `gcc` 2.95.2 or later, SGI C++, and SunPro C++ are some of the compilers that are known to work.
- A good `make` program. GNU `make` is always recommended and is sometimes required.
- MySQL client libraries and include files from MySQL 4.0.0 or higher. (Preferably MySQL 4.0.16 or higher). This is required because Connector/ODBC uses new calls and structures that exist only starting from this version of the library. To get the client libraries and include files, visit <http://dev.mysql.com/downloads/>.

If you have built your own MySQL server and/or client libraries from source then you must have used the `-enable-thread-safe-client` option to `configure` when the libraries were built.

You should also ensure that the `libmysqlclient` library were built and installed as a shared library.

- A compatible ODBC manager must be installed. Connector/ODBC is known to work with the `iODBC` and `unixODBC` managers. See [Section 24.1.2.2.2, “ODBC Driver Managers”](#), for more information.
- If you are using a character set that isn't compiled into the MySQL client library then you need to install the MySQL character

definitions from the `charsets` directory into `SHAREDIR` (by default, `/usr/local/mysql/share/mysql/charsets`). These should be in place if you have installed the MySQL server on the same machine. See [Section 9.1, “Character Set Support”](#), for more information on character set support.

Once you have all the required files, unpack the source files to a separate directory, you then have to run `configure` and build the library using `make`.

24.1.3.5.1. Typical `configure` Options

The `configure` script gives you a great deal of control over how you configure your Connector/ODBC build. Typically you do this using options on the `configure` command line. You can also affect `configure` using certain environment variables. For a list of options and environment variables supported by `configure`, run this command:

```
shell> ./configure --help
```

Some of the more commonly used `configure` options are described here:

1. To compile Connector/ODBC, you need to supply the MySQL client include and library files path using the `--with-mysql-path=DIR` option, where `DIR` is the directory where MySQL is installed.

MySQL compile options can be determined by running `DIR/bin/mysql_config`.

2. Supply the standard header and library files path for your ODBC Driver Manager (`iODBC` or `unixODBC`).

- If you are using `iODBC` and `iODBC` is not installed in its default location (`/usr/local`), you might have to use the `--with-iodbc=DIR` option, where `DIR` is the directory where `iODBC` is installed.

If the `iODBC` headers do not reside in `DIR/include`, you can use the `--with-iodbc-includes=INCDIR` option to specify their location.

The applies to libraries. If they are not in `DIR/lib`, you can use the `--with-iodbc-libs=LIBDIR` option.

- If you are using `unixODBC`, use the `--with-unixODBC=DIR` option (case sensitive) to make `configure` look for `unixODBC` instead of `iODBC` by default, `DIR` is the directory where `unixODBC` is installed.

If the `unixODBC` headers and libraries aren't located in `DIR/include` and `DIR/lib`, use the `--with-unixODBC-includes=INCDIR` and `--with-unixODBC-libs=LIBDIR` options.

3. You might want to specify an installation prefix other than `/usr/local`. For example, to install the Connector/ODBC drivers in `/usr/local/odbc/lib`, use the `--prefix=/usr/local/odbc` option.

The final configuration command looks something like this:

```
shell> ./configure --prefix=/usr/local \
  --with-iodbc=/usr/local \
  --with-mysql-path=/usr/local/mysql
```

24.1.3.5.2. Additional `configure` Options

There are a number of other options that you need, or want, to set when configuring the Connector/ODBC driver before it is built.

- To link the driver with MySQL thread safe client libraries `libmysqlclient_r.so` or `libmysqlclient_r.a`, you must specify the following `configure` option:

```
--enable-thread-safe
```

and can be disabled (default) using

```
--disable-thread-safe
```

This option enables the building of the driver thread-safe library `libmyodbc3_r.so` from by linking with MySQL thread-safe client library `libmysqlclient_r.so` (The extensions are OS dependent).

If the compilation with the thread-safe option fails, it may be because the correct thread-libraries on the system could not be located. You should set the value of `LIBS` to point to the correct thread library for your system.

```
LIBS="-lpthread" ./configure ..
```

- You can enable or disable the shared and static versions of Connector/ODBC using these options:

```
--enable-shared[=yes/no]
--disable-shared
--enable-static[=yes/no]
--disable-static
```

- By default, all the binary distributions are built as non-debugging versions (configured with `--without-debug`).

To enable debugging information, build the driver from source distribution and use the `--with-debug` option when you run `configure`.

- This option is available only for source trees that have been obtained from the Subversion repository. This option does not apply to the packaged source distributions.

By default, the driver is built with the `--without-docs` option. If you would like the documentation to be built, then execute `configure` with:

```
--with-docs
```

24.1.3.5.3. Building and Compilation

To build the driver libraries, you have to just execute `make`.

```
shell> make
```

If any errors occur, correct them and continue the build process. If you aren't able to build, then send a detailed email to myodbc@lists.mysql.com for further assistance.

24.1.3.5.4. Building Shared Libraries

On most platforms, MySQL does not build or support `.so` (shared) client libraries by default. This is based on our experience of problems when building shared libraries.

In cases like this, you have to download the MySQL distribution and configure it with these options:

```
--without-server --enable-shared
```

To build shared driver libraries, you must specify the `--enable-shared` option for `configure`. By default, `configure` does not enable this option.

If you have configured with the `--disable-shared` option, you can build the `.so` file from the static libraries using the following commands:

```
shell> cd mysql-connector-odbc-3.51.01
shell> make
shell> cd driver
shell> CC=/usr/bin/gcc \
    $CC -bundle -flat_namespace -undefined error \
    -o .libs/libmyodbc3-3.51.01.so \
    catalog.o connect.o cursor.o dll.o error.o execute.o \
    handle.o info.o misc.o myodbc3.o options.o prepare.o \
    results.o transact.o utility.o \
    -L/usr/local/mysql/lib/mysql/ \
    -L/usr/local/iodbc/lib/ \
    -lz -lc -lmysqlclient -liodbcinst
```

Make sure to change `-liodbcinst` to `-lodbcinst` if you are using `unixODBC` instead of `iODBC`, and configure the library paths accordingly.

This builds and places the `libmyodbc3-3.51.01.so` file in the `.libs` directory. Copy this file to the Connector/ODBC library installation directory (`/usr/local/lib` (or the `lib` directory under the installation directory that you supplied with the `-prefix`)).

```
shell> cd .libs
shell> cp libmyodbc3-3.51.01.so /usr/local/lib
shell> cd /usr/local/lib
shell> ln -s libmyodbc3-3.51.01.so libmyodbc3.so
```

To build the thread-safe driver library:

```
shell> CC=/usr/bin/gcc \
      $CC -bundle -flat_namespace -undefined error
      -o .libs/libmyodbc3_r-3.51.01.so
      catalog.o connect.o cursor.o dll.o error.o execute.o
      handle.o info.o misc.o myodbc3.o options.o prepare.o
      results.o transact.o utility.o
      -L/usr/local/mysql/lib/mysql/
      -L/usr/local/iodbc/lib/
      -lz -lc -lmysqlclient_r -liodbcinst
```

24.1.3.5.5. Installing Driver Libraries

To install the driver libraries, execute the following command:

```
shell> make install
```

That command installs one of the following sets of libraries:

For Connector/ODBC 3.51:

- `libmyodbc3.so`
- `libmyodbc3-3.51.01.so`, where 3.51.01 is the version of the driver
- `libmyodbc3.a`

For thread-safe Connector/ODBC 3.51:

- `libmyodbc3_r.so`
- `libmyodbc3-3_r.51.01.so`
- `libmyodbc3_r.a`

For more information on build process, refer to the `INSTALL` file that comes with the source distribution. Note that if you are trying to use the `make` from Sun, you may end up with errors. On the other hand, GNU `gmake` should work fine on all platforms.

24.1.3.5.6. Testing Connector/ODBC on Unix

To run the basic samples provided in the distribution with the libraries that you built, use the following command:

```
shell> make test
```

Before running the tests, create the DSN 'myodbc3' in `odbc.ini` and set the environment variable `ODBCINI` to the correct `odbc.ini` file; and MySQL server is running. You can find a sample `odbc.ini` with the driver distribution.

You can even modify the `samples/run-samples` script to pass the desired DSN, UID, and PASSWORD values as the command-line arguments to each sample.

24.1.3.5.7. Building Connector/ODBC from Source on Mac OS X

To build the driver on Mac OS X (Darwin), make use of the following `configure` example:

```
shell> ./configure --prefix=/usr/local
      --with-unixODBC=/usr/local
      --with-mysql-path=/usr/local/mysql
      --disable-shared
      --enable-gui=no
      --host=powerpc-apple
```

The command assumes that the `unixODBC` and MySQL are installed in the default locations. If not, configure accordingly.

On Mac OS X, `--enable-shared` builds `.dylib` files by default. You can build `.so` files like this:

```
shell> make
shell> cd driver
shell> CC=/usr/bin/gcc \
      $CC -bundle -flat_namespace -undefined error
```

```
-o .libs/libmyodbc3-3.51.01.so *.o
-L/usr/local/mysql/lib/
-L/usr/local/iodbc/lib
-liodbcinst -lmysqlclient -lz -lc
```

To build the thread-safe driver library:

```
shell> CC=/usr/bin/gcc \
$CC -bundle -flat_namespace -undefined error
-o .libs/libmyodbc3-3.51.01.so *.o
-L/usr/local/mysql/lib/
-L/usr/local/iodbc/lib
-liodbcinst -lmysqlclient_r -lz -lc -lpthread
```

Make sure to change the `-liodbcinst` to `-lodbcinst` in case of using `unixODBC` instead of `iODBC` and configure the libraries path accordingly.

In Apple's version of GCC, both `cc` and `gcc` are actually symbolic links to `gcc3`.

Copy this library to the `$prefix/lib` directory and symlink to `libmyodbc3.so`.

You can cross-check the output shared-library properties using this command:

```
shell> otool -LD .libs/libmyodbc3-3.51.01.so
```

24.1.3.5.8. Building Connector/ODBC from Source on HP-UX

To build the driver on HP-UX 10.x or 11.x, make use of the following `configure` example:

If using `cc`:

```
shell> CC="cc" \
CFLAGS="+z" \
LDFLAGS="-Wl,+b:-Wl,+s" \
./configure --prefix=/usr/local
--with-unixodbc=/usr/local
--with-mysql-path=/usr/local/mysql/lib/mysql
--enable-shared
--enable-thread-safe
```

If using `gcc`:

```
shell> CC="gcc" \
LDFLAGS="-Wl,+b:-Wl,+s" \
./configure --prefix=/usr/local
--with-unixodbc=/usr/local
--with-mysql-path=/usr/local/mysql
--enable-shared
--enable-thread-safe
```

Once the driver is built, cross-check its attributes using `chatr .libs/libmyodbc3.sl` to determine whether you need to have set the MySQL client library path using the `SHLIB_PATH` environment variable. For static versions, ignore all shared-library options and run `configure` with the `--disable-shared` option.

24.1.3.5.9. Building Connector/ODBC from Source on AIX

To build the driver on AIX, make use of the following `configure` example:

```
shell> ./configure --prefix=/usr/local
--with-unixodbc=/usr/local
--with-mysql-path=/usr/local/mysql
--disable-shared
--enable-thread-safe
```

Note

For more information about how to build and set up the static and shared libraries across the different platforms refer to ['Using static and shared libraries across platforms'](#).

24.1.3.6. Installing Connector/ODBC from the Development Source Tree

Caution

You should read this section only if you are interested in helping us test our new code. If you just want to get MySQL Connector/ODBC up and running on your system, you should use a standard release distribution.

To be able to access the Connector/ODBC source tree, you must have Subversion installed. Subversion is freely available from <http://subversion.tigris.org/>.

To build from the source trees, you need the following tools:

- autoconf 2.52 (or newer)
- automake 1.4 (or newer)
- libtool 1.4 (or newer)
- m4

The most recent development source tree is available from our public Subversion trees at <http://dev.mysql.com/tech-resources/sources.html>.

To checkout out the Connector/ODBC sources, change to the directory where you want the copy of the Connector/ODBC tree to be stored, then use the following command:

```
shell> svn co http://svn.mysql.com/svnpublic/connector-odbc3
```

You should now have a copy of the entire Connector/ODBC source tree in the directory `connector-odbc3`. To build from this source tree on Unix or Linux follow these steps:

```
shell> cd connector-odbc3
shell> aclocal
shell> autoheader
shell> autoconf
shell> automake;
shell> ./configure # Add your favorite options here
shell> make
```

For more information on how to build, refer to the `INSTALL` file located in the same directory. For more information on options to `configure`, see [Section 24.1.3.5.1, “Typical configure Options”](#)

When the build is done, run `make install` to install the Connector/ODBC 3.51 driver on your system.

If you have gotten to the `make` stage and the distribution does not compile, please report it to [<myodbc@lists.mysql.com>](mailto:myodbc@lists.mysql.com).

On Windows, make use of Windows Makefiles `WIN-Makefile` and `WIN-Makefile_debug` in building the driver. For more information, see [Section 24.1.3.4, “Installing Connector/ODBC from a Source Distribution on Windows”](#).

After the initial checkout operation to get the source tree, you should run `svn update` periodically update your source according to the latest version.

24.1.4. Connector/ODBC Configuration

Before you connect to a MySQL database using the Connector/ODBC driver you must configure an ODBC *Data Source Name*. The DSN associates the various configuration parameters required to communicate with a database to a specific name. You use the DSN in an application to communicate with the database, rather than specifying individual parameters within the application itself. DSN information can be user specific, system specific, or provided in a special file. ODBC data source names are configured in different ways, depending on your platform and ODBC driver.

24.1.4.1. Data Source Names

A Data Source Name associates the configuration parameters for communicating with a specific database. Generally a DSN consists of the following parameters:

- Name
- Hostname
- Database Name
- Login
- Password

In addition, different ODBC drivers, including Connector/ODBC, may accept additional driver-specific options and parameters.

There are three types of DSN:

- A *System DSN* is a global DSN definition that is available to any user and application on a particular system. A System DSN can normally only be configured by a systems administrator, or by a user who has specific permissions that let them create System DSNs.
- A *User DSN* is specific to an individual user, and can be used to store database connectivity information that the user regularly uses.
- A *File DSN* uses a simple file to define the DSN configuration. File DSNs can be shared between users and machines and are therefore more practical when installing or deploying DSN information as part of an application across many machines.

DSN information is stored in different locations depending on your platform and environment.

24.1.4.2. Connector/ODBC Connection Parameters

You can specify the parameters in the following tables for Connector/ODBC when configuring a DSN. Users on Windows can use the Options and Advanced panels when configuring a DSN to set these parameters; see the table for information on which options relate to which fields and checkboxes. On Unix and Mac OS X, use the parameter name and value as the keyword/value pair in the DSN configuration. Alternatively, you can set these parameters within the `InConnectionString` argument in the `SQLDriverConnect()` call.

Parameter	Default Value	Comment
<code>user</code>	ODBC	The username used to connect to MySQL.
<code>uid</code>	ODBC	Synonymous with <code>user</code> . Added in 3.51.16.
<code>server</code>	<code>localhost</code>	The hostname of the MySQL server.
<code>database</code>		The default database.
<code>option</code>	0	Options that specify how Connector/ODBC should work. See below.
<code>port</code>	3306	The TCP/IP port to use if <code>server</code> is not <code>localhost</code> .
<code>stmt</code>		A statement to execute when connecting to MySQL.
<code>password</code>		The password for the <code>user</code> account on <code>server</code> .
<code>pwd</code>		Synonymous with <code>password</code> . Added in 3.51.16.
<code>socket</code>		The Unix socket file or Windows named pipe to connect to if <code>server</code> is <code>localhost</code> .
<code>sslca</code>		The path to a file with a list of trust SSL CAs. Added in 3.51.16.
<code>sslcapath</code>		The path to a directory that contains trusted SSL CA certificates in PEM format. Added in 3.51.16.
<code>sslcert</code>		The name of the SSL certificate file to use for establishing a secure connection. Added in 3.51.16.
<code>sslcipher</code>		A list of allowable ciphers to use for SSL encryption. The cipher list has the same format as the <code>openssl ciphers</code> command. Added in 3.51.16.
<code>sslkey</code>		The name of the SSL key file to use for establishing a secure connection. Added in 3.51.16.
<code>charset</code>		The character set to use for the connection. Added in 3.51.17.
<code>sslverify</code>		If set to 1, the SSL certificate will be verified when used with the MySQL connection. If not set, then the default behaviour is to ignore SSL certificate verification.

Note

The SSL configuration parameters can also be automatically loaded from a `my.ini` or `my.cnf` file.

The `option` argument is used to tell Connector/ODBC that the client isn't 100% ODBC compliant. On Windows, you normally select options by toggling the checkboxes in the connection screen, but you can also select them in the `option` argument. The following options are listed in the order in which they appear in the Connector/ODBC connect screen:

Value	Flagname	GUI Option	Description
1	<code>FLAG_FIELD_LENGT</code>	Don't Optimize Column	The client can't handle that Connector/ODBC returns the real

	H	Width	width of a column. This option was removed in 3.51.18.
2	FLAG_FOUND_ROWS	Return Matching Rows	The client can't handle that MySQL returns the true value of affected rows. If this flag is set, MySQL returns "found rows" instead. You must have MySQL 3.21.14 or newer to get this to work.
4	FLAG_DEBUG	Trace Driver Calls To myodbc.log	Make a debug log in <code>C:\myodbc.log</code> on Windows, or <code>/tmp/myodbc.log</code> on Unix variants. This option was removed in Connector/ODBC 3.51.18.
8	FLAG_BIG_PACKETS	Allow Big Results	Don't set any packet limit for results and bind parameters. Without this option, parameter binding will be truncated to 255 characters.
16	FLAG_NO_PROMPT	Don't Prompt Upon Connect	Don't prompt for questions even if driver would like to prompt.
32	FLAG_DYNAMIC_CURSOR	Enable Dynamic Cursor	Enable or disable the dynamic cursor support.
64	FLAG_NO_SCHEMA	Ignore # in Table Name	Ignore use of database name in <code>db_name.tbl_name.col_name</code> .
128	FLAG_NO_DEFAULT_CURSOR	User Manager Cursors	Force use of ODBC manager cursors (experimental).
256	FLAG_NO_LOCALE	Don't Use Set Locale	Disable the use of extended fetch (experimental).
512	FLAG_PAD_SPACE	Pad Char To Full Length	Pad <code>CHAR</code> columns to full column length.
1024	FLAG_FULL_COLUMN_NAMES	Return Table Names for SQLDescribeCol	<code>SQLDescribeCol()</code> returns fully qualified column names.
2048	FLAG_COMPRESSED_PROTO	Use Compressed Protocol	Use the compressed client/server protocol.
4096	FLAG_IGNORE_SPACE	Ignore Space After Function Names	Tell server to ignore space after function name and before "(" (needed by PowerBuilder). This makes all function names keywords.
8192	FLAG_NAMED_PIPE	Force Use of Named Pipes	Connect with named pipes to a <code>mysqld</code> server running on NT.
16384	FLAG_NO_BIGINT	Change BIGINT Columns to Int	Change <code>BIGINT</code> columns to <code>INT</code> columns (some applications can't handle <code>BIGINT</code>).
32768	FLAG_NO_CATALOG	No Catalog	Forces results from the catalog functions, such as <code>SQLTables</code> , to always return <code>NULL</code> and the driver to report that catalogs are not supported.
65536	FLAG_USE_MYCNF	Read Options From my.cnf	Read parameters from the <code>[client]</code> and <code>[odbc]</code> groups from <code>my.cnf</code> .
131072	FLAG_SAFE	Safe	Add some extra safety checks.
262144	FLAG_NO_TRANSACTIONS	Disable transactions	Disable transactions.
524288	FLAG_LOG_QUERY	Save queries to myodbc.sql	Enable query logging to <code>c:\myodbc.sql(/tmp/myodbc.sql)</code> file. (Enabled only in debug mode.)
1048576	FLAG_NO_CACHE	Don't Cache Result (forward only cursors)	Do not cache the results locally in the driver, instead read from server (<code>mysql_use_result()</code>). This works only for forward-only cursors. This option is very important in dealing with large tables when you don't want the driver to cache the entire result set.
2097152	FLAG_FORWARD_CURSOR	Force Use Of Forward Only Cursors	Force the use of <code>Forward-only</code> cursor type. In case of applications setting the default static/dynamic cursor type, and one wants the driver to use non-cache result sets, then this option ensures the forward-only cursor behavior.
4194304	FLAG_AUTO_RECONNECT	Enable auto-reconnect.	Enables auto-reconnection functionality. You should not use this option with transactions, since a auto reconnection during a incomplete transaction may cause corruption. Note that an auto-reconnected connection will not inherit the same settings and environment as the original. This option was added in Connector/ODBC 3.51.13.
8388608	FLAG_AUTO_IS_NULL	Flag Auto Is Null	When set, this option causes the connection to set the <code>SQL_AUTO_IS_NULL</code> option to 1. This disables the standard

			behavior, but may enable older applications to correctly identify AUTO_INCREMENT values. For more information. See IS NULL . This option was added in Connector/ODBC 3.51.13.
16777216	FLAG_ZERO_DATE_TO_MIN	Flag Zero Date to Min	Translates zero dates (XXXX-00-00) into the minimum date values supported by ODBC, XXXX-01-01 . This resolves an issue where some statements will not work because the date returned and the minimum ODBC date value are incompatible. This option was added in Connector/ODBC 3.51.17.
33554432	FLAG_MIN_DATE_TO_ZERO	Flag Min Date to Zero	Translates the minimum ODBC date value (XXXX-01-01) to the zero date format supported by MySQL (XXXX-00-00). This resolves an issue where some statements will not work because the date returned and the minimum ODBC date value are incompatible. This option was added in Connector/ODBC 3.51.17.
67108864	FLAG_MULTI_STATEMENTS	Allow multiple statements	Enables support for batched statements. This option was added in Connector/ODBC 3.51.18.
134217728	FLAG_COLUMN_SIZE_S32	Limit column size to 32-bit value	Limits the column size to a signed 32-bit value to prevent problems with larger column sizes in applications that do not support them. This option is automatically enabled when working with ADO applications. This option was added in Connector/ODBC 3.51.22.
268435456	FLAG_NO_BINARY_RESULT	Always handle binary function results as character data	When set this option disables charset 63 for columns with an empty org_table . This option was added in Connector/ODBC 3.51.26.

To select multiple options, add together their values. For example, setting `option` to 12 (4+8) gives you debugging without packet limits.

The following table shows some recommended `option` values for various configurations:

Configuration	Option Value
Microsoft Access, Visual Basic	3
Driver trace generation (Debug mode)	4
Microsoft Access (with improved DELETE queries)	35
Large tables with too many rows	2049
Sybase PowerBuilder	135168
Query log generation (Debug mode)	524288
Generate driver trace as well as query log (Debug mode)	524292
Large tables with no-cache results	3145731

24.1.4.3. Configuring a Connector/ODBC DSN on Windows

The [ODBC Data Source Administrator](#) within Windows enables you to create DSNs, check driver installation and configure ODBC systems such as tracing (used for debugging) and connection pooling.

Different editions and versions of Windows store the [ODBC Data Source Administrator](#) in different locations depending on the version of Windows that you are using.

To open the [ODBC Data Source Administrator](#) in Windows Server 2003:

Tip

Because it is possible to create DSN using either the 32-bit or 64-bit driver, but using the same DNS identifier, it is advisable to include the driver being used within the DSN identifier. This will help you to identify the DSN when using it from applications such as Excel that are only compatible with the 32-bit driver. For example, you might add [Using32bitCODBC](#) to the DSN identifier for the 32-bit interface and [Using64bitCODBC](#) for those using the 64-bit Connector/ODBC driver.

1. On the [Start](#) menu, choose [Administrative Tools](#), and then click [Data Sources \(ODBC\)](#).

To open the [ODBC Data Source Administrator](#) in Windows 2000 Server or Windows 2000 Professional:

1. On the [Start](#) menu, choose [Settings](#), and then click [Control Panel](#).
2. In [Control Panel](#), click [Administrative Tools](#).
3. In [Administrative Tools](#), click [Data Sources \(ODBC\)](#).

To open the [ODBC Data Source Administrator](#) on Windows XP:

1. On the [Start](#) menu, click [Control Panel](#).
2. In the [Control Panel](#) when in [Category View](#) click [Performance and Maintenance](#) and then click [Administrative Tools](#). If you are viewing the [Control Panel](#) in [Classic View](#), click [Administrative Tools](#).
3. In [Administrative Tools](#), click [Data Sources \(ODBC\)](#).

Irrespective of your Windows version, you should be presented the [ODBC Data Source Administrator](#) window:

Within Windows XP, you can add the [Administrative Tools](#) folder to your [START](#) menu to make it easier to locate the [ODBC Data Source Administrator](#). To do this:

1. Right click on the [START](#) menu.
2. Select [Properties](#).

3. Click CUSTOMIZE....
4. Select the ADVANCED tab.
5. Within [Start menu items](#), within the [System Administrative Tools](#) section, select [Display on the All Programs menu](#).

Within both Windows Server 2003 and Windows XP you may want to permanently add the [ODBC Data Source Administrator](#) to your START menu. To do this, locate the [Data Sources \(ODBC\)](#) icon using the methods shown, then right-click on the icon and then choose PIN TO START MENU.

The interfaces for the 3.51 and 5.1 versions of the Connector/ODBC driver are different, although the fields and information that you need to enter remain the same.

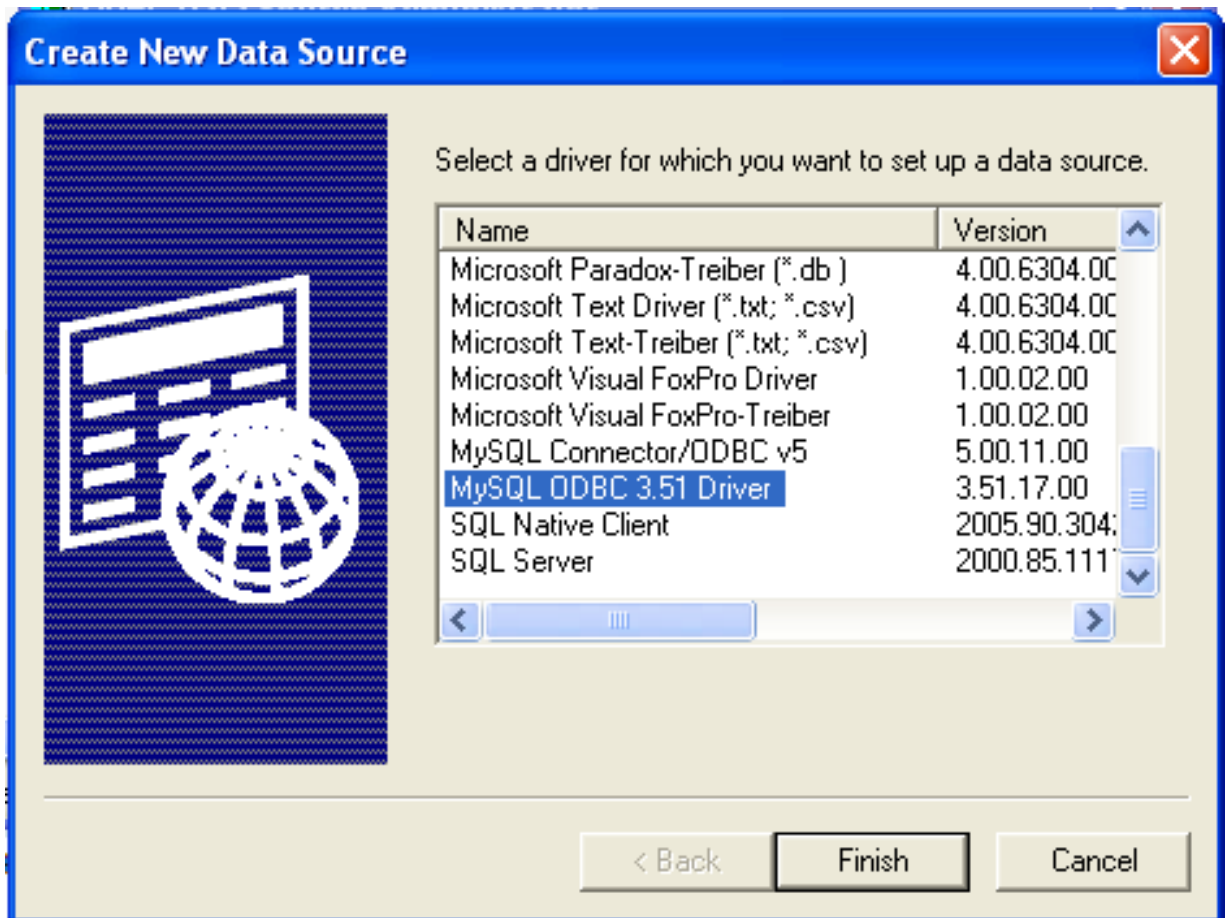

To configure a DSN using Connector/ODBC 3.51.x or Connector/ODBC 5.1.0, see [Section 24.1.4.3.1, “Configuring a Connector/ODBC 3.51 DSN on Windows”](#).

To configure a DSN using Connector/ODBC 5.1.1 or later, see [Section 24.1.4.3.2, “Configuring a Connector/ODBC 5.1 DSN on Windows”](#).

24.1.4.3.1. Configuring a Connector/ODBC 3.51 DSN on Windows

To add and configure a new Connector/ODBC data source on Windows, use the [ODBC Data Source Administrator](#):

1. Open the [ODBC Data Source Administrator](#).
2. To create a System DSN (which will be available to all users) , select the [System DSN](#) tab. To create a User DSN, which will be unique only to the current user, click the ADD... button.
3. You will need to select the ODBC driver for this DSN.

Select [MySQL ODBC 3.51 Driver](#), then click FINISH.

- You now need to configure the specific fields for the DSN you are creating through the [Add Data Source Name](#) dialog.

The screenshot shows the 'Connector/ODBC 3.51.17 - Add Data Source Name' dialog box. The 'Login' tab is active, displaying the following fields:

- Data Source Name:
- Description:
- Server:
- User:
- Password:
- Database: (dropdown menu)

The 'Connector/ODBC Configuration' section on the right contains the text: "This dialog is used to add a Data Source Name (DSN)."

Buttons at the bottom include: Test, Diagnostics >>, Ok, Cancel, and Help.

In the **DATA SOURCE NAME** box, enter the name of the data source you want to access. It can be any valid name that you choose.

- In the **DESCRIPTION** box, enter some text to help identify the connection.
- In the **SERVER** field, enter the name of the MySQL server host that you want to access. By default, it is `localhost`.
- In the **USER** field, enter the user name to use for this connection.
- In the **PASSWORD** field, enter the corresponding password for this connection.
- The **DATABASE** pop-up should automatically populate with the list of databases that the user has permissions to access.
- Click OK to save the DSN.

A completed DSN configuration may look like this:

You can verify the connection using the parameters you have entered by clicking the TEST button. If the connection could be made successfully, you will be notified with a `Success; connection was made!` dialog.

If the connection failed, you can obtain more information on the test and why it may have failed by clicking the DIAGNOSTICS... button to show additional error messages.

You can configure a number of options for a specific DSN by using either the CONNECT OPTIONS or ADVANCED tabs in the DSN configuration dialog.

The three options you can configure are:

- **PORT** sets the TCP/IP port number to use when communicating with MySQL. Communication with MySQL uses port 3306 by default. If your server is configured to use a different TCP/IP port, you must specify that port number here.
- **SOCKET** sets the name or location of a specific socket or Windows pipe to use when communicating with MySQL.
- **INITIAL STATEMENT** defines an SQL statement that will be executed when the connection to MySQL is opened. You can use this to set MySQL options for your connection, such as disabling autocommit.
- **CHARACTER SET** is a pop-up list from which you can select the default character set to be used with this connection. The Character Set option was added in 3.5.17.

The **ADVANCED** tab enables you to configure Connector/ODBC connection parameters. Refer to [Section 24.1.4.2, “Connector/ODBC Connection Parameters”](#), for information about the meaning of these options.

24.1.4.3.2. Configuring a Connector/ODBC 5.1 DSN on Windows

The DSN configuration when using Connector/ODBC 5.1.1 and later has a slightly different layout. Also, due to the native Unicode support within Connector/ODBC 5.1, you no longer need to specify the initial character set to be used with your connection.

To configure a DSN using the Connector/ODBC 5.1.1 or later driver:

1. Open the [ODBC Data Source Administrator](#).
2. To create a System DSN (which will be available to all users) , select the **SYSTEM DSN** tab. To create a User DSN, which will be unique only to the current user, click the **ADD...** button.
3. You will need to select the ODBC driver for this DSN.

Select [MySQL ODBC 3.51 Driver](#), then click FINISH.

4. You now need to configure the specific fields for the DSN you are creating through the [Connection Parameters](#) dialog.

MySQL Connector/ODBC Data Source Configuration

MySQL Connector/ODBC

Connection Parameters

Data Source Name:

Description:

Server: Port:

User:

Password:

Database:

In the **DATA SOURCE NAME** box, enter the name of the data source you want to access. It can be any valid name that you choose.

5. In the **DESCRIPTION** box, enter some text to help identify the connection.
6. In the **SERVER** field, enter the name of the MySQL server host that you want to access. By default, it is `localhost`.
7. In the **USER** field, enter the user name to use for this connection.
8. In the **PASSWORD** field, enter the corresponding password for this connection.
9. The **DATABASE** pop-up should automatically populate with the list of databases that the user has permissions to access.
10. To communicate over a different TCP/IP port than the default (3306), change the value of the **PORT**.
11. Click OK to save the DSN.

You can verify the connection using the parameters you have entered by clicking the **TEST** button. If the connection could be made successfully, you will be notified with a `Success; connection was made!` dialog.

You can configure a number of options for a specific DSN by using the **DETAILS** button.

MySQL Connector/ODBC Data Source Configuration

MySQL Connector/ODBC

Connection Parameters

Data Source Name:

Description:

Server: Port:

User:

Password:

Database:

Flags 1 | Flags 2 | Flags 3 | Debug | SSL Settings

- Return matched rows instead of affected rows
- Allow big result sets
- Use compression
- Treat BIGINT columns as INT columns
- Enable safe options (see documentation)
- Enable automatic reconnect
- Enable SQL_AUTO_IS_NULL

The **DETAILS** button opens a tabbed display which allows you to set additional options:

- **FLAGS 1**, **FLAGS 2**, and **FLAGS 3** enable you to select the additional flags for the DSN connection. For more information on these flags, see [Section 24.1.4.2, “Connector/ODBC Connection Parameters”](#).
- **DEBUG** allows you to enable ODBC debugging to record the queries you execute through the DSN to the `myodbc.sql` file. For more information, see [Section 24.1.4.8, “Getting an ODBC Trace File”](#).
- **SSL SETTINGS** configures the additional options required for using the Secure Sockets Layer (SSL) when communicating with MySQL server. Note that you must have enabled SSL and configured the MySQL server with suitable certificates to communicate over SSL.

The **ADVANCED** tab enables you to configure Connector/ODBC connection parameters. Refer to [Section 24.1.4.2, “Connector/ODBC Connection Parameters”](#), for information about the meaning of these options.

24.1.4.3.3. Errors and Debugging

This section answers Connector/ODBC connection-related questions.

- **While configuring a Connector/ODBC DSN, a [Could Not Load Translator or Setup Library](#) error occurs**

For more information, refer to [MS KnowledgeBase Article\(Q260558\)](#). Also, make sure you have the latest valid `ct13d32.dll` in your system directory.

- On Windows, the default `myodbc3.dll` is compiled for optimal performance. If you want to debug Connector/ODBC 3.51 (for example, to enable tracing), you should instead use `myodbc3d.dll`. To install this file, copy `myodbc3d.dll` over the installed `myodbc3.dll` file. Make sure to revert back to the release version of the driver DLL once you are done with the debugging because the debug version may cause performance issues. Note that the `myodbc3d.dll` isn't included in Connector/ODBC 3.51.07 through 3.51.11. If you are using one of these versions, you should copy that DLL from a previous version (for example, 3.51.06).

24.1.4.4. Configuring a Connector/ODBC DSN on Mac OS X

To configure a DSN on Mac OS X you can either use the `myodbc3i` utility, edit the `odbc.ini` file within the `Library/ODBC` directory of the user or the should use the ODBC Administrator. If you have Mac OS X 10.2 or earlier, refer to [Section 24.1.4.5, “Configuring a Connector/ODBC DSN on Unix”](#). Select whether you want to create a User DSN or a System DSN. If you want to add a System DSN, you may need to authenticate with the system. You must click the padlock and enter a user and password with administrator privileges.

For correct operation of ODBC Administrator, you should ensure that the `/Library/ODBC/odbc.ini` file used to set up ODBC connectivity and DSNs are writable by the `admin` group. If this file is not writable by this group then the ODBC Administrator may fail, or may appear to have worked but not generated the correct entry.

Warning

There are known issues with the OS X ODBC Administrator and Connector/ODBC that may prevent you from creating a DSN using this method. In this case you should use the command-line or edit the `odbc.ini` file directly. Note that existing DSNs or those that you create via the `myodbc3i` or `myodbc-installertool` can still be checked and edited using ODBC Administrator.

To create a DSN using the `myodbc3i` utility, you need only specify the DSN type and the DSN connection string. For example:

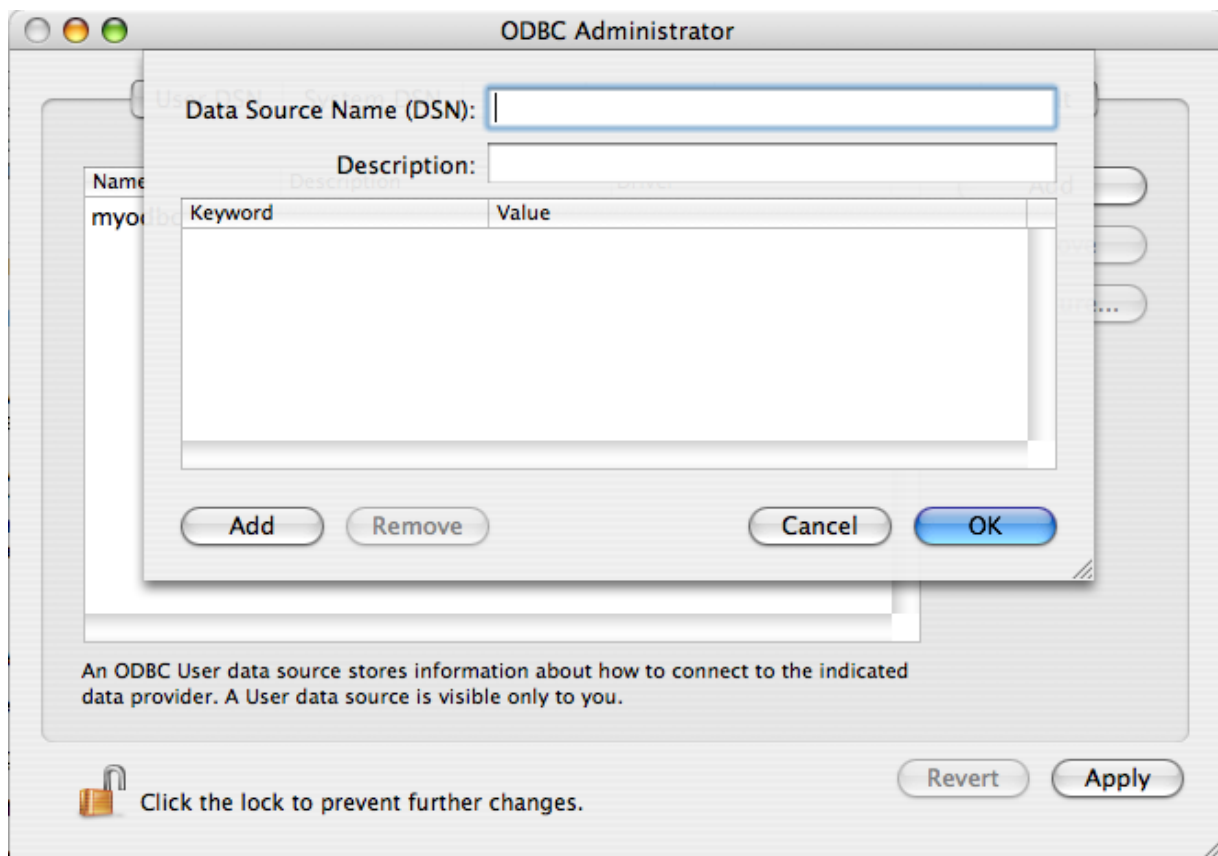

```
$ myodbc3i -a -s -t "DSN=mydb;DRIVER=MySQL ODBC 3.51 Driver;SERVER=mysql;USER=username;PASSWORD=pass"
```

To use ODBC Administrator:

1. Open the ODBC Administrator from the `Utilities` folder in the `Applications` folder.

2. On the User DSN or System DSN panel, click ADD.
3. Select the Connector/ODBC driver and click OK.
4. You will be presented with the `Data Source Name` dialog. Enter The `Data Source Name` and an optional `Description` for the DSN.

5. Click ADD to add a new keyword/value pair to the panel. You should configure at least four pairs to specify the `server`, `username`, `password` and `database` connection parameters. See [Section 24.1.4.2, “Connector/ODBC Connection Parameters”](#).
6. Click OK to add the DSN to the list of configured data source names.

A completed DSN configuration may look like this:

You can configure additional ODBC options to your DSN by adding further keyword/value pairs and setting the corresponding values. See [Section 24.1.4.2, “Connector/ODBC Connection Parameters”](#).

24.1.4.5. Configuring a Connector/ODBC DSN on Unix

On [Unix](#), you configure DSN entries directly in the `odbc.ini` file. Here is a typical `odbc.ini` file that configures `myodbc3` as the DSN name for Connector/ODBC 3.51:

```
;
; odbc.ini configuration for Connector/ODBC and Connector/ODBC 3.51 drivers
;

[ODBC Data Sources]
myodbc3      = MyODBC 3.51 Driver DSN

[myodbc3]
Driver       = /usr/local/lib/libmyodbc3.so
Description  = Connector/ODBC 3.51 Driver DSN
SERVER      = localhost
PORT        =
USER        = root
Password    =
Database    = test
OPTION      = 3
SOCKET      =

[Default]
Driver       = /usr/local/lib/libmyodbc3.so
Description  = Connector/ODBC 3.51 Driver DSN
SERVER      = localhost
PORT        =
USER        = root
Password    =
Database    = test
OPTION      = 3
SOCKET      =
```

Refer to the [Section 24.1.4.2, “Connector/ODBC Connection Parameters”](#), for the list of connection parameters that can be supplied.

Note

If you are using `unixODBC`, you can use the following tools to set up the DSN:

- ODBCConfig GUI tool([HOWTO: ODBCConfig](#))
- `odbcinst`

In some cases when using `unixODBC`, you might get this error:

```
Data source name not found and no default driver specified
```

If this happens, make sure the `ODBCINI` and `ODBCSYSINI` environment variables are pointing to the right `odbc.ini` file. For example, if your `odbc.ini` file is located in `/usr/local/etc`, set the environment variables like this:

```
export ODBCINI=/usr/local/etc/odbc.ini
export ODBCSYSINI=/usr/local/etc
```

24.1.4.6. Connecting Without a Predefined DSN

You can connect to the MySQL server using `SQLDriverConnect`, by specifying the `DRIVER` name field. Here are the connection strings for Connector/ODBC using DSN-Less connections:

For Connector/ODBC 3.51:

```
ConnectionString = "DRIVER={MySQL ODBC 3.51 Driver};\
SERVER=localhost;\
DATABASE=test;\
USER=venu;\
PASSWORD=venu;\
OPTION=3;"
```

If your programming language converts backslash followed by whitespace to a space, it is preferable to specify the connection string as a single long string, or to use a concatenation of multiple strings that does not add spaces in between. For example:

```
ConnectionString = "DRIVER={MySQL ODBC 3.51 Driver};"
```

```
"SERVER=localhost;"  
"DATABASE=test;"  
"USER=venu;"  
"PASSWORD=venu;"  
"OPTION=3;"
```

Note. Note that on Mac OS X you may need to specify the full path to the Connector/ODBC driver library.

Refer to the [Section 24.1.4.2, “Connector/ODBC Connection Parameters”](#), for the list of connection parameters that can be supplied.

24.1.4.7. ODBC Connection Pooling

Connection pooling enables the ODBC driver to re-use existing connections to a given database from a pool of connections, instead of opening a new connection each time the database is accessed. By enabling connection pooling you can improve the overall performance of your application by lowering the time taken to open a connection to a database in the connection pool.

For more information about connection pooling: <http://support.microsoft.com/default.aspx?scid=kb;EN-US;q169470>.

24.1.4.8. Getting an ODBC Trace File

If you encounter difficulties or problems with Connector/ODBC, you should start by making a log file from the [ODBC Manager](#) and Connector/ODBC. This is called *tracing*, and is enabled through the ODBC Manager. The procedure for this differs for Windows, Mac OS X and Unix.

24.1.4.8.1. Enabling ODBC Tracing on Windows

To enable the trace option on Windows:

1. The [Tracing](#) tab of the ODBC Data Source Administrator dialog box enables you to configure the way ODBC function calls are traced.

2. When you activate tracing from the [Tracing](#) tab, the [Driver Manager](#) logs all ODBC function calls for all subsequently run applications.
3. ODBC function calls from applications running before tracing is activated are not logged. ODBC function calls are recorded in a log file you specify.
4. Tracing ceases only after you click [Stop Tracing Now](#). Remember that while tracing is on, the log file continues to increase in size and that tracing affects the performance of all your ODBC applications.

24.1.4.8.2. Enabling ODBC Tracing on Mac OS X

To enable the trace option on Mac OS X 10.3 or later you should use the [Tracing](#) tab within ODBC Administrator .

1. Open the ODBC Administrator.
2. Select the [Tracing](#) tab.

3. Select the `Enable Tracing` checkbox.
4. Enter the location where you want to save the Tracing log. If you want to append information to an existing log file, click the `CHOOSE...` button.

24.1.4.8.3. Enabling ODBC Tracing on Unix

To enable the trace option on Mac OS X 10.2 (or earlier) or Unix you must add the `trace` option to the ODBC configuration:

1. On Unix, you need to explicitly set the `Trace` option in the `ODBC.INI` file.

Set the tracing `ON` or `OFF` by using `TraceFile` and `Trace` parameters in `odbc.ini` as shown below:

```
TraceFile = /tmp/odbc.trace
Trace     = 1
```

`TraceFile` specifies the name and full path of the trace file and `Trace` is set to `ON` or `OFF`. You can also use `1` or `YES` for `ON` and `0` or `NO` for `OFF`. If you are using `ODBCConfig` from `unixODBC`, then follow the instructions for tracing `unixODBC` calls at [HOWTO-ODBCConfig](#).

24.1.4.8.4. Enabling a Connector/ODBC Log

To generate a Connector/ODBC log, do the following:

1. Within Windows, enable the `Trace Connector/ODBC` option flag in the Connector/ODBC connect/configure screen. The log is written to file `C:\myodbc.log`. If the trace option is not remembered when you are going back to the above screen, it means that you are not using the `myodbc.dll` driver, see [Section 24.1.4.3.3, "Errors and Debugging"](#).

On Mac OS X, Unix, or if you are using DSN-Less connection, then you need to supply `OPTION=4` in the connection string or set the corresponding keyword/value pair in the DSN.

2. Start your application and try to get it to fail. Then check the Connector/ODBC trace file to find out what could be wrong.

If you need help determining what is wrong, see [Section 24.1.8.1, “Connector/ODBC Community Support”](#).

24.1.5. Connector/ODBC Examples

Once you have configured a DSN to provide access to a database, how you access and use that connection is dependent on the application or programming language. As ODBC is a standardized interface, any application or language that supports ODBC can use the DSN and connect to the configured database.

24.1.5.1. Basic Connector/ODBC Application Steps

Interacting with a MySQL server from an applications using the Connector/ODBC typically involves the following operations:

- Configure the Connector/ODBC DSN
- Connect to MySQL server
- Initialization operations
- Execute SQL statements
- Retrieve results
- Perform Transactions
- Disconnect from the server

Most applications use some variation of these steps. The basic application steps are shown in the following diagram:

24.1.5.2. Step-by-step Guide to Connecting to a MySQL Database through Connector/ODBC

A typical installation situation where you would install Connector/ODBC is when you want to access a database on a Linux or Unix host from a Windows machine.

As an example of the process required to set up access between two machines, the steps below take you through the basic steps. These instructions assume that you want to connect to system ALPHA from system BETA with a username and password of `my-user` and `mypassword`.

On system ALPHA (the MySQL server) follow these steps:

1. Start the MySQL server.
2. Use `GRANT` to set up an account with a username of `myuser` that can connect from system BETA using a password of `myuser` to the database `test`:

```
GRANT ALL ON test.* to 'myuser'@'BETA' IDENTIFIED BY 'mypassword';
```

For more information about MySQL privileges, refer to [Section 5.5, “MySQL User Account Management”](#).

On system BETA (the Connector/ODBC client), follow these steps:

1. Configure a Connector/ODBC DSN using parameters that match the server, database and authentication information that you have just configured on system ALPHA.

Parameter	Value	Comment
DSN	remote_test	A name to identify the connection.
SERVER	ALPHA	The address of the remote server.
DATABASE	test	The name of the default database.
USER	myuser	The username configured for access to this database.
PASSWORD	mypassword	The password for <code>myuser</code> .

2. Using an ODBC-capable application, such as Microsoft Office, connect to the MySQL server using the DSN you have just created. If the connection fails, use tracing to examine the connection process. See [Section 24.1.4.8, “Getting an ODBC Trace File”](#), for more information.

24.1.5.3. Connector/ODBC and Third-Party ODBC Tools

Once you have configured your Connector/ODBC DSN, you can access your MySQL database through any application that supports the ODBC interface, including programming languages and third-party applications. This section contains guides and help on using Connector/ODBC with various ODBC-compatible tools and applications, including Microsoft Word, Microsoft Excel and Adobe/Macromedia ColdFusion.

Connector/ODBC has been tested with the following applications:

Publisher	Application	Notes
Adobe	ColdFusion	Formerly Macromedia ColdFusion
Borland	C++ Builder	
	Builder 4	
	Delphi	
Business Objects	Crystal Reports	
Claris	Filemaker Pro	
Corel	Paradox	
Computer Associates	Visual Objects	Also known as CAVO
	AllFusion ERwin Data Modeler	
Gupta	Team Developer	Previously known as Centura Team Developer; Gupta SQL/Windows
Gensym	G2-ODBC Bridge	
Inline	iHTML	
Lotus	Notes	Versions 4.5 and 4.6
Microsoft	Access	
	Excel	
	Visio Enterprise	
	Visual C++	
	Visual Basic	

	ODBC.NET	Using C#, Visual Basic, C++
	FoxPro	
	Visual Interdev	
OpenOffice.org	OpenOffice.org	
Perl	DBD::ODBC	
Pervasive Software	DataJunction	
Sambar Technologies	Sambar Server	
SPSS	SPSS	
SoftVelocity	Clarion	
SQLExpress	SQLExpress for Xbase++	
Sun	StarOffice	
SunSystems	Vision	
Sybase	PowerBuilder	
	PowerDesigner	
theKompany.com	Data Architect	

If you know of any other applications that work with Connector/ODBC, please send mail to [<myodbc@lists.mysql.com>](mailto:myodbc@lists.mysql.com) about them.

24.1.5.4. Using Connector/ODBC with Microsoft Access

You can use MySQL database with Microsoft Access using Connector/ODBC. The MySQL database can be used as an import source, an export source, or as a linked table for direct use within an Access application, so you can use Access as the front-end interface to a MySQL database.

24.1.5.4.1. Exporting Access Data to MySQL

To export a table of data from an Access database to MySQL, follow these instructions:

1. When you open an Access database or an Access project, a Database window appears. It displays shortcuts for creating new database objects and opening existing objects.

2. Click the name of the [table](#) or [query](#) you want to export, and then in the **File** menu, select **Export**.
3. In the **Export Object Type Object name To** dialog box, in the **Save As Type** box, select **ODBC Databases ()** as shown here:

4. In the **Export** dialog box, enter a name for the file (or use the suggested name), and then select **OK**.
5. The **Select Data Source** dialog box is displayed; it lists the defined data sources for any ODBC drivers installed on your computer. Click either the **File Data Source** or **Machine Data Source** tab, and then double-click the **Connector/ODBC** or **Connector/ODBC 3.51** data source that you want to export to. To define a new data source for **Connector/ODBC**, please [Section 24.1.4.3, "Configuring a Connector/ODBC DSN on Windows"](#).

Note

Ensure that the information that you are exporting to the MySQL table is valid for the corresponding MySQL data types. Values that are outside of the supported range of the MySQL data type but valid within Access may trigger an "overflow" error during the export.

Microsoft Access connects to the MySQL Server through this data source and exports new tables and or data.

24.1.5.4.2. Importing MySQL Data to Access

To import a table or tables from MySQL to Access, follow these instructions:

1. Open a database, or switch to the Database window for the open database.
2. To import tables, on the **File** menu, point to **Get External Data**, and then click **Import**.
3. In the **Import** dialog box, in the Files Of Type box, select **ODBC DATABASES ()**. The Select Data Source dialog box lists the defined data sources **THE SELECT DATA SOURCE** dialog box is displayed; it lists the defined data source names.
4. If the ODBC data source that you selected requires you to log on, enter your login ID and password (additional information might also be required), and then click **OK**.
5. Microsoft Access connects to the MySQL server through **ODBC data source** and displays the list of tables that you can **import**.
6. Click each table that you want to **import**, and then click **OK**.

24.1.5.4.3. Using Microsoft Access as a Front-end to MySQL

You can use Microsoft Access as a front end to a MySQL database by linking tables within your Microsoft Access database to tables that exist within your MySQL database. When a query is requested on a table within Access, ODBC is used to execute the queries on the MySQL database instead.

To create a linked table:

1. Open the Access database that you want to link to MySQL.
2. From the **FILE**, choose **GET EXTERNAL DATA->LINK TABLES**.

3. From the browser, choose **ODBC DATABASES ()** from the **FILES OF TYPE** pop-up.
4. In the **SELECT DATA SOURCE** window, choose an existing DSN, either from a **FILE DATA SOURCE** or **MACHINE DATA SOURCE**. You can also create a new DSN using the **NEW...** button. For more information on creating a DSN see [Section 24.1.4.3, "Configuring a Connector/ODBC DSN on Windows"](#).

5. In the **LINK TABLES** dialog, select one or more tables from the MySQL database. A link will be created to each table that you select from this list.

- If Microsoft Access is unable to determine the unique record identifier for a table automatically then it may ask you to confirm the column, or combination of columns, to be used to uniquely identify each row from the source table. Select the columns you want to use and click OK.

Once the process has been completed, you can now build interfaces and queries to the linked tables just as you would for any Access database.

Use the following procedure to view or to refresh links when the structure or location of a linked table has changed. The Linked Table Manager lists the paths to all currently linked tables.

To view or refresh links:

- Open the database that contains links to MySQL tables.
- On the **Tools** menu, point to **Add-ins (Database Utilities)** in Access 2000 or newer, and then click **Linked Table Manager**.
- Select the check box for the tables whose links you want to refresh.
- Click OK to refresh the links.

Microsoft Access confirms a successful refresh or, if the table wasn't found, displays the **Select New Location of <table name>** dialog box in which you can specify its the table's new location. If several selected tables have moved to the new location that you specify, the Linked Table Manager searches that location for all selected tables, and updates all links in one step.

To change the path for a set of linked tables:

- Open the database that contains links to tables.
- On the **Tools** menu, point to **Add-ins (Database Utilities)** in Access 2000 or newer, and then click **Linked Table Manager**.
- Select the **Always Prompt For A New Location** check box.
- Select the check box for the tables whose links you want to change, and then click **OK**.
- In the **Select New Location of <table name>** dialog box, specify the new location, click **Open**, and then click **OK**.

24.1.5.5. Using Connector/ODBC with Microsoft Word or Excel

You can use Microsoft Word and Microsoft Excel to access information from a MySQL database using Connector/ODBC. Within Microsoft Word, this facility is most useful when importing data for mailmerge, or for tables and data to be included in reports. Within Microsoft Excel, you can execute queries on your MySQL server and import the data directly into an Excel Worksheet, presenting the data as a series of rows and columns.

With both applications, data is accessed and imported into the application using Microsoft Query, which enables you to execute a query through an ODBC source. You use Microsoft Query to build the SQL statement to be executed, selecting the tables, fields, selection criteria and sort order. For example, to insert information from a table in the World test database into an Excel spreadsheet, using the DSN samples shown in [Section 24.1.4, "Connector/ODBC Configuration"](#):

1. Create a new Worksheet.
2. From the **Data** menu, choose **Import External Data**, and then select **New Database Query**.
3. Microsoft Query will start. First, you need to choose the data source, by selecting an existing Data Source Name.

4. Within the **Query Wizard**, you must choose the columns that you want to import. The list of tables available to the user configured through the DSN is shown on the left, the columns that will be added to your query are shown on the right. The columns you choose are equivalent to those in the first section of a **SELECT** query. Click **NEXT** to continue.

5. You can filter rows from the query (the equivalent of a `WHERE` clause) using the `Filter Data` dialog. Click `NEXT` to continue.

6. Select an (optional) sort order for the data. This is equivalent to using a `ORDER BY` clause in your SQL query. You can select up to three fields for sorting the information returned by the query. Click `NEXT` to continue.

Query Wizard - Sort Order

Specify how you want your data sorted.
If you don't want to sort the data, click Next.

Sort by
Name Ascending Descending

Then by Ascending Descending

Then by Ascending Descending

7. Select the destination for your query. You can select to return the data Microsoft Excel, where you can choose a worksheet and cell where the data will be inserted; you can continue to view the query and results within Microsoft Query, where you can edit the SQL query and further filter and sort the information returned; or you can create an OLAP Cube from the query, which can then be used directly within Microsoft Excel. Click FINISH.

Query Wizard - Finish

What would you like to do next?

Return Data to Microsoft Office Excel

View data or edit query in Microsoft Query

Create an OLAP Cube from this query

The same process can be used to import data into a Word document, where the data will be inserted as a table. This can be used for mail merge purposes (where the field data is read from a Word table), or where you want to include data and reports within a report or other document.

24.1.5.6. Using Connector/ODBC with Crystal Reports

Crystal Reports can use an ODBC DSN to connect to a database from which you to extract data and information for reporting purposes.

Note

There is a known issue with certain versions of Crystal Reports where the application is unable to open and browse tables and fields through an ODBC connection. Before using Crystal Reports with MySQL, please ensure that you have update to the latest version, including any outstanding service packs and hotfixes. For more information on this issue, see the [Business\) Objects Knowledgebase](#) for more information.

For example, to create a simple crosstab report within Crystal Reports XI, you should follow these steps:

1. Create a DSN using the [Data Sources \(ODBC\)](#) tool. You can either specify a complete database, including username and password, or you can build a basic DSN and use Crystal Reports to set the username and password.

For the purposes of this example, a DSN that provides a connection to an instance of the MySQL Sakila sample database has been created.

2. Open Crystal Reports and create a new project, or an open an existing reporting project into which you want to insert data from your MySQL data source.
3. Start the Cross-Tab Report Wizard, either by clicking on the option on the Start Page. Expand the **CREATE NEW CONNECTION** folder, then expand the **ODBC (RDO)** folder to obtain a list of ODBC data sources.

You will be asked to select a data source.

4. When you first expand the **ODBC (RDO)** folder you will be presented the Data Source Selection screen. From here you can select either a pre-configured DSN, open a file-based DSN or enter and manual connection string. For this example, the **SAKILA** DSN will be used.

If the DSN contains a username/password combination, or you want to use different authentication credentials, click **NEXT** to enter the username and password that you want to use. Otherwise, click **FINISH** to continue the data source selection wizard.

5. You will be returned the Cross-Tab Report Creation Wizard. You now need to select the database and tables that you want to include in your report. For our example, we will expand the selected Sakila database. Click the `city` table and use the `>` button to add the table to the report. Then repeat the action with the `country` table. Alternatively you can select multiple tables and add them to the report.

Finally, you can select the parent **SAKILA** resource and add of the tables to the report.

Once you have selected the tables you want to include, click **NEXT** to continue.

6. Crystal Reports will now read the table definitions and automatically identify the links between the tables. The identification of links between tables enables Crystal Reports to automatically lookup and summarize information based on all the tables in the database according to your query. If Crystal Reports is unable to perform the linking itself, you can manually create the links between fields in the tables you have selected.

Click NEXT to continue the process.

7. You can now select the columns and rows that you wish to include within the Cross-Tab report. Drag and drop or use the > buttons to add fields to each area of the report. In the example shown, we will report on cities, organized by country, incorporating a count of the number of cities within each country. If you want to browse the data, select a field and click the BROWSE DATA... button.

Click NEXT to create a graph of the results. Since we are not creating a graph from this data, click FINISH to generate the report.

8. The finished report will be shown, a sample of the output from the Sakila sample database is shown below.

		Total
Total		600
Afghanistan	Total	1
	Kabul	1
Algeria	Total	3
	Batna	1
	Bchar	1
	Skikda	1
American Samoa	Total	1
	Tafuna	1
Angola	Total	2
	Benguela	1
	Namibe	1
Anguilla	Total	1
	South Hill	1
Argentina	Total	13
	Almirante Brow	1

Once the ODBC connection has been opened within Crystal Reports, you can browse and add any fields within the available tables into your reports.

24.1.5.7. Connector/ODBC Programming

With a suitable ODBC Manager and the Connector/ODBC driver installed, any programming language or environment that can support ODBC should be able to connect to a MySQL database through Connector/ODBC.

This includes, but is certainly not limited to, Microsoft support languages (including Visual Basic, C# and interfaces such as ODBC.NET), Perl (through the DBI module, and the DBD::ODBC driver).

24.1.5.7.1. Using Connector/ODBC with Visual Basic Using ADO, DAO and RDO

This section contains simple examples of the use of MySQL ODBC 3.51 Driver with ADO, DAO and RDO.

24.1.5.7.1.1. ADO: `rs.addNew`, `rs.delete`, and `rs.update`

The following ADO (ActiveX Data Objects) example creates a table `my_ado` and demonstrates the use of `rs.addNew`, `rs.delete`, and `rs.update`.

```
Private Sub myodbc_ado_Click()

Dim conn As ADODB.Connection
Dim rs As ADODB.Recordset
Dim fld As ADODB.Field
Dim sql As String

'connect to MySQL server using MySQL ODBC 3.51 Driver
Set conn = New ADODB.Connection
conn.ConnectionString = "DRIVER={MySQL ODBC 3.51 Driver};" _
& "SERVER=localhost;" _
& "DATABASE=test;" _
& "UID=venu;PWD=venu; OPTION=3"

conn.Open

'create table
conn.Execute "DROP TABLE IF EXISTS my_ado"
conn.Execute "CREATE TABLE my_ado(id int not null primary key, name varchar(20)," _
& "txt text, dt date, tm time, ts timestamp)"

'direct insert
conn.Execute "INSERT INTO my_ado(id,name,txt) values(1,100,'venu')"
conn.Execute "INSERT INTO my_ado(id,name,txt) values(2,200,'MySQL')"
conn.Execute "INSERT INTO my_ado(id,name,txt) values(3,300,'Delete')"

Set rs = New ADODB.Recordset
rs.CursorLocation = adUseServer

'fetch the initial table ..
rs.Open "SELECT * FROM my_ado", conn
Debug.Print rs.RecordCount
rs.MoveFirst
Debug.Print String(50, "-") & "Initial my_ado Result Set " & String(50, "-")
For Each fld In rs.Fields
Debug.Print fld.Name,
Next
Debug.Print

Do Until rs.EOF
For Each fld In rs.Fields
Debug.Print fld.Value,
Next
rs.MoveNext
Debug.Print
Loop
rs.Close

'rs insert
rs.Open "select * from my_ado", conn, adOpenDynamic, adLockOptimistic
rs.AddNew
rs!Name = "Monty"
rs!txt = "Insert row"
rs.Update
rs.Close

'rs update
rs.Open "SELECT * FROM my_ado"
rs!Name = "update"
rs!txt = "updated-row"
rs.Update
rs.Close

'rs update second time..
rs.Open "SELECT * FROM my_ado"
rs!Name = "update"
rs!txt = "updated-second-time"
rs.Update
rs.Close

'rs delete
rs.Open "SELECT * FROM my_ado"
rs.MoveNext
rs.MoveNext
rs.Delete
rs.Close

'fetch the updated table ..
rs.Open "SELECT * FROM my_ado", conn
Debug.Print rs.RecordCount
rs.MoveFirst
Debug.Print String(50, "-") & "Updated my_ado Result Set " & String(50, "-")
For Each fld In rs.Fields
Debug.Print fld.Name,
Next
Debug.Print

Do Until rs.EOF
For Each fld In rs.Fields
Debug.Print fld.Value,
```

```

Next
rs.MoveNext
Debug.Print
Loop
rs.Close
conn.Close
End Sub

```

24.1.5.7.1.2. DAO: `rs.addNew`, `rs.update`, and Scrolling

The following DAO (Data Access Objects) example creates a table `my_dao` and demonstrates the use of `rs.addNew`, `rs.update`, and result set scrolling.

```

Private Sub myodbc_dao_Click()

Dim ws As Workspace
Dim conn As Connection
Dim queryDef As queryDef
Dim str As String

'connect to MySQL using MySQL ODBC 3.51 Driver
Set ws = DBEngine.CreateWorkspace("", "venu", "venu", dbUseODBC)
str = "odbc;DRIVER={MySQL ODBC 3.51 Driver};_"
& "SERVER=localhost;_"
& "DATABASE=test;_"
& "UID=venu;PWD=venu; OPTION=3"
Set conn = ws.OpenConnection("test", dbDriverNoPrompt, False, str)

'Create table my_dao
Set queryDef = conn.CreateQueryDef("", "drop table if exists my_dao")
queryDef.Execute

Set queryDef = conn.CreateQueryDef("", "create table my_dao(Id INT AUTO_INCREMENT PRIMARY KEY, " _
& "Ts TIMESTAMP(14) NOT NULL, Name varchar(20), Id2 INT)")
queryDef.Execute

'Insert new records using rs.addNew
Set rs = conn.OpenRecordset("my_dao")
Dim i As Integer

For i = 10 To 15
rs.AddNew
rs!Name = "insert record" & i
rs!Id2 = i
rs.Update
Next i
rs.Close

'rs update..
Set rs = conn.OpenRecordset("my_dao")
rs.Edit
rs!Name = "updated-string"
rs.Update
rs.Close

'fetch the table back...
Set rs = conn.OpenRecordset("my_dao", dbOpenDynamic)
str = "Results:"
rs.MoveFirst
While Not rs.EOF
str = " " & rs!Id & " , " & rs!Name & " , " & rs!Ts & " , " & rs!Id2
Debug.Print "DATA:" & str
rs.MoveNext
Wend

'rs Scrolling
rs.MoveFirst
str = " FIRST ROW: " & rs!Id & " , " & rs!Name & " , " & rs!Ts & " , " & rs!Id2
Debug.Print str

rs.MoveLast
str = " LAST ROW: " & rs!Id & " , " & rs!Name & " , " & rs!Ts & " , " & rs!Id2
Debug.Print str

rs.MovePrevious
str = " LAST-1 ROW: " & rs!Id & " , " & rs!Name & " , " & rs!Ts & " , " & rs!Id2
Debug.Print str

'free all resources
rs.Close
queryDef.Close
conn.Close
ws.Close

End Sub

```

24.1.5.7.1.3. RDO: `rs.addNew` and `rs.update`

The following RDO (Remote Data Objects) example creates a table `my_rdo` and demonstrates the use of `rs.addNew` and `rs.update`.

```

Dim rs As rdoResultset
Dim cn As New rdoConnection
Dim cl As rdoColumn
Dim SQL As String

'cn.Connect = "DSN=test;"
cn.Connect = "DRIVER={MySQL ODBC 3.51 Driver};"_
& "SERVER=localhost;"_
& "DATABASE=test;"_
& "UID=venu;PWD=venu; OPTION=3"

cn.CursorDriver = rdUseOdbc
cn.EstablishConnection rdDriverPrompt

'drop table my_rdo
SQL = "drop table if exists my_rdo"
cn.Execute SQL, rdExecDirect

'create table my_rdo
SQL = "create table my_rdo(id int, name varchar(20))"
cn.Execute SQL, rdExecDirect

'insert - direct
SQL = "insert into my_rdo values (100,'venu')"
cn.Execute SQL, rdExecDirect

SQL = "insert into my_rdo values (200,'MySQL')"
cn.Execute SQL, rdExecDirect

'rs insert
SQL = "select * from my_rdo"
Set rs = cn.OpenResultset(SQL, rdOpenStatic, rdConcurRowVer, rdExecDirect)
rs.AddNew
rs!id = 300
rs!Name = "Insert1"
rs.Update
rs.Close

'rs insert
SQL = "select * from my_rdo"
Set rs = cn.OpenResultset(SQL, rdOpenStatic, rdConcurRowVer, rdExecDirect)
rs.AddNew
rs!id = 400
rs!Name = "Insert 2"
rs.Update
rs.Close

'rs update
SQL = "select * from my_rdo"
Set rs = cn.OpenResultset(SQL, rdOpenStatic, rdConcurRowVer, rdExecDirect)
rs.Edit
rs!id = 999
rs!Name = "updated"
rs.Update
rs.Close

'fetch back...
SQL = "select * from my_rdo"
Set rs = cn.OpenResultset(SQL, rdOpenStatic, rdConcurRowVer, rdExecDirect)
Do Until rs.EOF
For Each cl In rs.rdoColumns
Debug.Print cl.Value,
Next
rs.MoveNext
Debug.Print
Loop
Debug.Print "Row count="; rs.RowCount

'close
rs.Close
cn.Close

End Sub

```

24.1.5.7.2. Using Connector/ODBC with .NET

This section contains simple examples that demonstrate the use of Connector/ODBC drivers with ODBC.NET.

24.1.5.7.2.1. Using Connector/ODBC with ODBC.NET and C# (C sharp)

The following sample creates a table `my_odbc_net` and demonstrates its use in C#.

```

/**
 * @sample      : mycon.cs
 * @purpose     : Demo sample for ODBC.NET using Connector/ODBC
 * @author      : Venu, <myodbc@lists.mysql.com>
 *
 * (C) Copyright MySQL AB, 1995-2006
 *
 **/

```

```

/* build command
 *
 * csc /t:exe
 *      /out:mycon.exe mycon.cs
 *      /r:Microsoft.Data.Odbc.dll
 */

using Console = System.Console;
using Microsoft.Data.Odbc;

namespace myodbc3
{
    class mycon
    {
        static void Main(string[] args)
        {
            try
            {
                //Connection string for Connector/ODBC 3.51
                string MyConString = "DRIVER={MySQL ODBC 3.51 Driver};" +
                    "SERVER=localhost;" +
                    "DATABASE=test;" +
                    "UID=venu;" +
                    "PASSWORD=venu;" +
                    "OPTION=3";

                //Connect to MySQL using Connector/ODBC
                OdbcConnection MyConnection = new OdbcConnection(MyConString);
                MyConnection.Open();

                Console.WriteLine("\n !!! success, connected successfully !!!\n");

                //Display connection information
                Console.WriteLine("Connection Information:");
                Console.WriteLine("\tConnection String:" +
                    MyConnection.ConnectionString);
                Console.WriteLine("\tConnection Timeout:" +
                    MyConnection.ConnectionTimeout);
                Console.WriteLine("\tDatabase:" +
                    MyConnection.Database);
                Console.WriteLine("\tDataSource:" +
                    MyConnection.DataSource);
                Console.WriteLine("\tDriver:" +
                    MyConnection.Driver);
                Console.WriteLine("\tServerVersion:" +
                    MyConnection.ServerVersion);

                //Create a sample table
                OdbcCommand MyCommand =
                    new OdbcCommand("DROP TABLE IF EXISTS my_odbc_net",
                        MyConnection);
                MyCommand.ExecuteNonQuery();
                MyCommand.CommandText =
                    "CREATE TABLE my_odbc_net(id int, name varchar(20), idb bigint)";
                MyCommand.ExecuteNonQuery();

24.1.6. Connector/ODBC Reference

This section provides reference material for the Connector/ODBC API, showing supported functions and methods, supported MySQL column types and the corresponding native type in Connector/ODBC, and the error codes returned by Connector/ODBC when a fault occurs.

24.1.6.1. Connector/ODBC API Reference

This section summarizes ODBC routines, categorized by functionality.

For the complete ODBC API reference, please refer to the ODBC Programmer's Reference at <http://msdn.microsoft.com/en-us/library/ms714177.aspx>.

An application can call `SQLGetInfo` function to obtain conformance information about Connector/ODBC. To obtain information about support for a specific function in the driver, an application can call `SQLGetFunctions`.

Note

For backward compatibility, the Connector/ODBC 3.51 driver supports all deprecated functions.

The following tables list Connector/ODBC API calls grouped by task:

Connecting to a data source:

Function name	C/ODBC 3.51	Standard	Purpose
<code>SQLAllocHandle</code>	Yes	ISO 92	Obtains an environment, connection, statement, or descriptor handle.
<code>SQLConnect</code>	Yes	ISO 92	Connects to a specific driver by data source name, user ID, and password.
<code>SQLDriverConnect</code>	Yes	ODBC	Connects to a specific driver by connection string or requests that the Driver Manager and driver display connection dialog boxes for the user.

SQLAllocEnv	Yes	Deprecated	Obtains an environment handle allocated from driver.
SQLAllocConnect	Yes	Deprecated	Obtains a connection handle

Obtaining information about a driver and data source:

Function name	C/ODBC 3.51	Standard	Purpose
SQLDataSources	No	ISO 92	Returns the list of available data sources, handled by the Driver Manager
SQLDrivers	No	ODBC	Returns the list of installed drivers and their attributes, handles by Driver Manager
SQLGetInfo	Yes	ISO 92	Returns information about a specific driver and data source.
SQLGetFunctions	Yes	ISO 92	Returns supported driver functions.
SQLGetTypeInfo	Yes	ISO 92	Returns information about supported data types.

Setting and retrieving driver attributes:

Function name	C/ODBC 3.51	Standard	Purpose
SQLSetConnectAttr	Yes	ISO 92	Sets a connection attribute.
SQLGetConnectAttr	Yes	ISO 92	Returns the value of a connection attribute.
SQLSetConnectOption	Yes	Deprecated	Sets a connection option
SQLGetConnectOption	Yes	Deprecated	Returns the value of a connection option
SQLSetEnvAttr	Yes	ISO 92	Sets an environment attribute.
SQLGetEnvAttr	Yes	ISO 92	Returns the value of an environment attribute.
SQLSetStmtAttr	Yes	ISO 92	Sets a statement attribute.
SQLGetStmtAttr	Yes	ISO 92	Returns the value of a statement attribute.
SQLSetStmtOption	Yes	Deprecated	Sets a statement option
SQLGetStmtOption	Yes	Deprecated	Returns the value of a statement option

Preparing SQL requests:

Function name	C/ODBC 3.51	Standard	Purpose
SQLAllocStmt	Yes	Deprecated	Allocates a statement handle
SQLPrepare	Yes	ISO 92	Prepares an SQL statement for later execution.
SQLBindParameter	Yes	ODBC	Assigns storage for a parameter in an SQL statement.
SQLGetCursorName	Yes	ISO 92	Returns the cursor name associated with a statement handle.
SQLSetCursorName	Yes	ISO 92	Specifies a cursor name.
SQLSetScrollOptions	Yes	ODBC	Sets options that control cursor behavior.

Submitting requests:

Function name	C/ODBC 3.51	Standard	Purpose
SQLExecute	Yes	ISO 92	Executes a prepared statement.
SQLExecDirect	Yes	ISO 92	Executes a statement
SQLNativeSql	Yes	ODBC	Returns the text of an SQL statement as translated by the driver.
SQLDescribeParam	Yes	ODBC	Returns the description for a specific parameter in a statement.
SQLNumParams	Yes	ISO 92	Returns the number of parameters in a statement.
SQLParamData	Yes	ISO 92	Used in conjunction with SQLPutData to supply parameter data at execution time. (Useful for long data values.)

SQLPutData	Yes	ISO 92	Sends part or all of a data value for a parameter. (Useful for long data values.)
------------	-----	--------	---

Retrieving results and information about results:

Function name	C/ODBC 3.51	Standard	Purpose
SQLRowCount	Yes	ISO 92	Returns the number of rows affected by an insert, update, or delete request.
SQLNumResultCols	Yes	ISO 92	Returns the number of columns in the result set.
SQLDescribeCol	Yes	ISO 92	Describes a column in the result set.
SQLColAttribute	Yes	ISO 92	Describes attributes of a column in the result set.
SQLColAttributes	Yes	Deprecated	Describes attributes of a column in the result set.
SQLFetch	Yes	ISO 92	Returns multiple result rows.
SQLFetchScroll	Yes	ISO 92	Returns scrollable result rows.
SQLExtendedFetch	Yes	Deprecated	Returns scrollable result rows.
SQLSetPos	Yes	ODBC	Positions a cursor within a fetched block of data and allows an application to refresh data in the rowset or to update or delete data in the result set.
SQLBulkOperations	Yes	ODBC	Performs bulk insertions and bulk bookmark operations, including update, delete, and fetch by bookmark.

Retrieving error or diagnostic information:

Function name	C/ODBC 3.51	Standard	Purpose
SQLError	Yes	Deprecated	Returns additional error or status information
SQLGetDiagField	Yes	ISO 92	Returns additional diagnostic information (a single field of the diagnostic data structure).
SQLGetDiagRec	Yes	ISO 92	Returns additional diagnostic information (multiple fields of the diagnostic data structure).

Obtaining information about the data source's system tables (catalog functions) item:

Function name	C/ODBC 3.51	Standard	Purpose
SQLColumnPrivileges	Yes	ODBC	Returns a list of columns and associated privileges for one or more tables.
SQLColumns	Yes	X/Open	Returns the list of column names in specified tables.
SQLForeignKeys	Yes	ODBC	Returns a list of column names that make up foreign keys, if they exist for a specified table.
SQLPrimaryKeys	Yes	ODBC	Returns the list of column names that make up the primary key for a table.
SQLSpecialColumns	Yes	X/Open	Returns information about the optimal set of columns that uniquely identifies a row in a specified table, or the columns that are automatically updated when any value in the row is updated by a transaction.
SQLStatistics	Yes	ISO 92	Returns statistics about a single table and the list of indexes associated with the table.
SQLTablePrivileges	Yes	ODBC	Returns a list of tables and the privileges associated with each table.
SQLTables	Yes	X/Open	Returns the list of table names stored in a specific data source.

Performing transactions:

Function name	C/ODBC 3.51	Standard	Purpose
SQLTransact	Yes	Deprecated	Commits or rolls back a transaction
SQLEndTran	Yes	ISO 92	Commits or rolls back a transaction.

Terminating a statement:

Function name	C/ODBC 3.51	Standard	Purpose
SQLFreeStmt	Yes	ISO 92	Ends statement processing, discards pending results, and, optionally, frees all resources associated with the statement handle.
SQLCloseCursor	Yes	ISO 92	Closes a cursor that has been opened on a statement handle.
SQLCancel	Yes	ISO 92	Cancels an SQL statement.

Terminating a connection:

Function name	C/ODBC 3.51	Standard	Purpose
SQLDisconnect	Yes	ISO 92	Closes the connection.
SQLFreeHandle	Yes	ISO 92	Releases an environment, connection, statement, or descriptor handle.
SQLFreeConnect	Yes	Deprecated	Releases connection handle
SQLFreeEnv	Yes	Deprecated	Releases an environment handle

24.1.6.2. Connector/ODBC Data Types

The following table illustrates how driver maps the server data types to default SQL and C data types:

Native Value	SQL Type	C Type
<code>bigint unsigned</code>	SQL_BIGINT	SQL_C_UBIGINT
<code>bigint</code>	SQL_BIGINT	SQL_C_SBIGINT
<code>bit</code>	SQL_BIT	SQL_C_BIT
<code>bit</code>	SQL_CHAR	SQL_C_CHAR
<code>blob</code>	SQL_LONGVARBINARY	SQL_C_BINARY
<code>bool</code>	SQL_CHAR	SQL_C_CHAR
<code>char</code>	SQL_CHAR	SQL_C_CHAR
<code>date</code>	SQL_DATE	SQL_C_DATE
<code>datetime</code>	SQL_TIMESTAMP	SQL_C_TIMESTAMP
<code>decimal</code>	SQL_DECIMAL	SQL_C_CHAR
<code>double precision</code>	SQL_DOUBLE	SQL_C_DOUBLE
<code>double</code>	SQL_FLOAT	SQL_C_DOUBLE
<code>enum</code>	SQL_VARCHAR	SQL_C_CHAR
<code>float</code>	SQL_REAL	SQL_C_FLOAT
<code>int unsigned</code>	SQL_INTEGER	SQL_C_ULONG
<code>int</code>	SQL_INTEGER	SQL_C_SLONG
<code>integer unsigned</code>	SQL_INTEGER	SQL_C_ULONG
<code>integer</code>	SQL_INTEGER	SQL_C_SLONG
<code>long varbinary</code>	SQL_LONGVARBINARY	SQL_C_BINARY
<code>long varchar</code>	SQL_LONGVARCHAR	SQL_C_CHAR
<code>longblob</code>	SQL_LONGVARBINARY	SQL_C_BINARY
<code>longtext</code>	SQL_LONGVARCHAR	SQL_C_CHAR

mediumblob	SQL_LONGVARIABLE	SQL_C_BINARY
mediumint unsigned	SQL_INTEGER	SQL_C_ULONG
mediumint	SQL_INTEGER	SQL_C_SLONG
mediumtext	SQL_LONGVARCHAR	SQL_C_CHAR
numeric	SQL_NUMERIC	SQL_C_CHAR
real	SQL_FLOAT	SQL_C_DOUBLE
set	SQL_VARCHAR	SQL_C_CHAR
smallint unsigned	SQL_SMALLINT	SQL_C_USHORT
smallint	SQL_SMALLINT	SQL_C_SSHORT
text	SQL_LONGVARCHAR	SQL_C_CHAR
time	SQL_TIME	SQL_C_TIME
timestamp	SQL_TIMESTAMP	SQL_C_TIMESTAMP
tinyblob	SQL_LONGVARIABLE	SQL_C_BINARY
tinyint unsigned	SQL_TINYINT	SQL_C_UTINYINT
tinyint	SQL_TINYINT	SQL_C_STINYINT
tinytext	SQL_LONGVARCHAR	SQL_C_CHAR
varchar	SQL_VARCHAR	SQL_C_CHAR
year	SQL_SMALLINT	SQL_C_SHORT

24.1.6.3. Connector/ODBC Error Codes

The following tables lists the error codes returned by the driver apart from the server errors.

Native Code	SQLSTATE 2	SQLSTATE 3	Error Message
500	01000	01000	General warning
501	01004	01004	String data, right truncated
502	01S02	01S02	Option value changed
503	01S03	01S03	No rows updated/deleted
504	01S04	01S04	More than one row updated/deleted
505	01S06	01S06	Attempt to fetch before the result set returned the first row set
506	07001	07002	<code>SQLBindParameter</code> not used for all parameters
507	07005	07005	Prepared statement not a cursor-specification
508	07009	07009	Invalid descriptor index
509	08002	08002	Connection name in use
510	08003	08003	Connection does not exist
511	24000	24000	Invalid cursor state
512	25000	25000	Invalid transaction state
513	25S01	25S01	Transaction state unknown
514	34000	34000	Invalid cursor name
515	S1000	HY000	General driver defined error
516	S1001	HY001	Memory allocation error
517	S1002	HY002	Invalid column number
518	S1003	HY003	Invalid application buffer type
519	S1004	HY004	Invalid SQL data type
520	S1009	HY009	Invalid use of null pointer
521	S1010	HY010	Function sequence error
522	S1011	HY011	Attribute can not be set now
523	S1012	HY012	Invalid transaction operation code

524	S1013	HY013	Memory management error
525	S1015	HY015	No cursor name available
526	S1024	HY024	Invalid attribute value
527	S1090	HY090	Invalid string or buffer length
528	S1091	HY091	Invalid descriptor field identifier
529	S1092	HY092	Invalid attribute/option identifier
530	S1093	HY093	Invalid parameter number
531	S1095	HY095	Function type out of range
532	S1106	HY106	Fetch type out of range
533	S1117	HY117	Row value out of range
534	S1109	HY109	Invalid cursor position
535	S1C00	HYC00	Optional feature not implemented
0	21S01	21S01	Column count does not match value count
0	23000	23000	Integrity constraint violation
0	42000	42000	Syntax error or access violation
0	42S02	42S02	Base table or view not found
0	42S12	42S12	Index not found
0	42S21	42S21	Column already exists
0	42S22	42S22	Column not found
0	08S01	08S01	Communication link failure

24.1.7. Connector/ODBC Notes and Tips

Here are some common notes and tips for using Connector/ODBC within different environments, applications and tools. The notes provided here are based on the experiences of Connector/ODBC developers and users.

24.1.7.1. Connector/ODBC General Functionality

This section provides help with common queries and areas of functionality in MySQL and how to use them with Connector/ODBC.

24.1.7.1.1. Obtaining Auto-Increment Values

Obtaining the value of column that uses `AUTO_INCREMENT` after an `INSERT` statement can be achieved in a number of different ways. To obtain the value immediately after an `INSERT`, use a `SELECT` query with the `LAST_INSERT_ID()` function.

For example, using Connector/ODBC you would execute two separate statements, the `INSERT` statement and the `SELECT` query to obtain the auto-increment value.

```
INSERT INTO tbl (auto,text) VALUES(NULL,'text');
SELECT LAST_INSERT_ID();
```

If you do not require the value within your application, but do require the value as part of another `INSERT`, the entire process can be handled by executing the following statements:

```
INSERT INTO tbl (auto,text) VALUES(NULL,'text');
INSERT INTO tbl2 (id,text) VALUES(LAST_INSERT_ID(),'text');
```

Certain ODBC applications (including Delphi and Access) may have trouble obtaining the auto-increment value using the previous examples. In this case, try the following statement as an alternative:

```
SELECT * FROM tbl WHERE auto IS NULL;
```

See [Section 24.7.14.3, “How to Get the Unique ID for the Last Inserted Row”](#).

24.1.7.1.2. Dynamic Cursor Support

Support for the `dynamic cursor` is provided in Connector/ODBC 3.51, but dynamic cursors are not enabled by default. You can enable this function within Windows by selecting the `Enable Dynamic Cursor` checkbox within the ODBC Data Source Administrator.

On other platforms, you can enable the dynamic cursor by adding [32](#) to the `OPTION` value when creating the DSN.

24.1.7.1.3. Connector/ODBC Performance

The Connector/ODBC driver has been optimized to provide very fast performance. If you experience problems with the performance of Connector/ODBC, or notice a large amount of disk activity for simple queries, there are a number of aspects you should check:

- Ensure that `ODBC Tracing` is not enabled. With tracing enabled, a lot of information is recorded in the tracing file by the ODBC Manager. You can check, and disable, tracing within Windows using the TRACING panel of the ODBC Data Source Administrator. Within Mac OS X, check the TRACING panel of ODBC Administrator. See [Section 24.1.4.8, “Getting an ODBC Trace File”](#).
- Make sure you are using the standard version of the driver, and not the debug version. The debug version includes additional checks and reporting measures.
- Disable the Connector/ODBC driver trace and query logs. These options are enabled for each DSN, so make sure to examine only the DSN that you are using in your application. Within Windows, you can disable the Connector/ODBC and query logs by modifying the DSN configuration. Within Mac OS X and Unix, ensure that the driver trace (option value 4) and query logging (option value 524288) are not enabled.

24.1.7.1.4. Setting ODBC Query Timeout in Windows

For more information on how to set the query timeout on Microsoft Windows when executing queries through an ODBC connection, read the Microsoft knowledgebase document at <http://support.microsoft.com/default.aspx?scid=kb%3Ben-us%3B153756>.

24.1.7.2. Connector/ODBC Application Specific Tips

Most programs should work with Connector/ODBC, but for each of those listed here, there are specific notes and tips to improve or enhance the way you work with Connector/ODBC and these applications.

With all applications you should ensure that you are using the latest Connector/ODBC drivers, ODBC Manager and any supporting libraries and interfaces used by your application. For example, on Windows, using the latest version of Microsoft Data Access Components (MDAC) will improve the compatibility with ODBC in general, and with the Connector/ODBC driver.

24.1.7.2.1. Using Connector/ODBC with Microsoft Applications

The majority of Microsoft applications have been tested with Connector/ODBC, including Microsoft Office, Microsoft Access and the various programming languages supported within ASP and Microsoft Visual Studio.

24.1.7.2.1.1. Microsoft Access

To improve the integration between Microsoft Access and MySQL through Connector/ODBC:

- For all versions of Access, you should enable the Connector/ODBC `Return matching rows` option. For Access 2.0, you should additionally enable the `Simulate ODBC 1.0` option.
- You should have a `TIMESTAMP` column in all tables that you want to be able to update. For maximum portability, don't use a length specification in the column declaration (which is unsupported within MySQL in versions earlier than 4.1).
- You should have a primary key in each MySQL table you want to use with Access. If not, new or updated rows may show up as `#DELETED#`.
- Use only `DOUBLE` float fields. Access fails when comparing with single-precision floats. The symptom usually is that new or updated rows may show up as `#DELETED#` or that you can't find or update rows.
- If you are using Connector/ODBC to link to a table that has a `BIGINT` column, the results are displayed as `#DELETED#`. The work around solution is:
 - Have one more dummy column with `TIMESTAMP` as the data type.
 - Select the `Change BIGINT columns to INT` option in the connection dialog in ODBC DSN Administrator.
 - Delete the table link from Access and re-create it.

Old records may still display as `#DELETED#`, but newly added/updated records are displayed properly.

- If you still get the error [Another user has changed your data](#) after adding a `TIMESTAMP` column, the following trick may help you:

Don't use a `table` data sheet view. Instead, create a form with the fields you want, and use that `form` data sheet view. You should set the `DefaultValue` property for the `TIMESTAMP` column to `NOW()`. It may be a good idea to hide the `TIMESTAMP` column from view so your users are not confused.

- In some cases, Access may generate SQL statements that MySQL can't understand. You can fix this by selecting "`Query|SQLSpecific|Pass-Through`" from the Access menu.
- On Windows NT, Access reports `BLOB` columns as `OLE OBJECTS`. If you want to have `MEMO` columns instead, you should change `BLOB` columns to `TEXT` with `ALTER TABLE`.
- Access can't always handle the MySQL `DATE` column properly. If you have a problem with these, change the columns to `DATETIME`.
- If you have in Access a column defined as `BYTE`, Access tries to export this as `TINYINT` instead of `TINYINT UNSIGNED`. This gives you problems if you have values larger than 127 in the column.
- If you have very large (long) tables in Access, it might take a very long time to open them. Or you might run low on virtual memory and eventually get an `ODBC Query Failed` error and the table cannot open. To deal with this, select the following options:
 - Return Matching Rows (2)
 - Allow BIG Results (8).

These add up to a value of 10 (`OPTION=10`).

Some external articles and tips that may be useful when using Access, ODBC and Connector/ODBC:

- Read [How to Trap ODBC Login Error Messages in Access](#)
- [Optimizing Access ODBC Applications](#)
 - [Optimizing for Client/Server Performance](#)
 - [Tips for Converting Applications to Using ODBCdirect](#)
 - [Tips for Optimizing Queries on Attached SQL Tables](#)
- For a list of tools that can be used with Access and ODBC data sources, refer to [converters](#) section for list of available tools.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about using ODBC with Access in Knowledge Base articles such as [Use MySQL-Specific Syntax with Microsoft Access](#). To subscribe to MySQL Enterprise see <http://www.mysql.com/products/enterprise/advisors.html>.

24.1.7.2.1.2. Microsoft Excel and Column Types

If you have problems importing data into Microsoft Excel, particularly numerical, date, and time values, this is probably because of a bug in Excel, where the column type of the source data is used to determine the data type when that data is inserted into a cell within the worksheet. The result is that Excel incorrectly identifies the content and this affects both the display format and the data when it is used within calculations.

To address this issue, use the `CONCAT()` function in your queries. The use of `CONCAT()` forces Excel to treat the value as a string, which Excel will then parse and usually correctly identify the embedded information.

However, even with this option, some data may be incorrectly formatted, even though the source data remains unchanged. Use the [Format Cells](#) option within Excel to change the format of the displayed information.

24.1.7.2.1.3. Microsoft Visual Basic

To be able to update a table, you must define a primary key for the table.

Visual Basic with ADO can't handle big integers. This means that some queries like `SHOW PROCESSLIST` do not work properly. The fix is to use `OPTION=16384` in the ODBC connect string or to select the `Change BIGINT columns to INT` option in the Connector/ODBC connect screen. You may also want to select the `Return matching rows` option.

MySQL Enterprise

MySQL Enterprise subscribers can find a discussion about using VBA in the Knowledge Base article, [MySQL-Specific Syntax with VBA](http://www.mysql.com/products/enterprise/advisors.html). To subscribe to MySQL Enterprise see <http://www.mysql.com/products/enterprise/advisors.html>.

24.1.7.2.1.4. Microsoft Visual InterDev

If you have a `BIGINT` in your result, you may get the error `[Microsoft][ODBC Driver Manager] Driver does not support this parameter`. Try selecting the `Change BIGINT columns to INT` option in the Connector/ODBC connect screen.

24.1.7.2.1.5. Visual Objects

You should select the `Don't optimize column widths` option.

24.1.7.2.1.6. Microsoft ADO

When you are coding with the ADO API and Connector/ODBC, you need to pay attention to some default properties that aren't supported by the MySQL server. For example, using the `CursorLocation Property` as `adUseServer` returns a result of `-1` for the `RecordCount Property`. To have the right value, you need to set this property to `adUseClient`, as shown in the VB code here:

```
Dim myconn As New ADOConnection
Dim myrs As New Recordset
Dim mySQL As String
Dim myrows As Long

myconn.Open "DSN=MyODBCsample"
mySQL = "SELECT * from user"
myrs.Source = mySQL
Set myrs.ActiveConnection = myconn
myrs.CursorLocation = adUseClient
myrs.Open
myrows = myrs.RecordCount

myrs.Close
myconn.Close
```

Another workaround is to use a `SELECT COUNT(*)` statement for a similar query to get the correct row count.

To find the number of rows affected by a specific SQL statement in ADO, use the `RecordsAffected` property in the ADO `execute` method. For more information on the usage of `execute` method, refer to <http://msdn.microsoft.com/library/default.asp?url=/library/en-us/ado270/htm/mdmthcnnextexecute.asp>.

For information, see [ActiveX Data Objects\(ADO\) Frequently Asked Questions](#).

24.1.7.2.1.7. Using Connector/ODBC with Active Server Pages (ASP)

You should select the `Return matching rows` option in the DSN.

For more information about how to access MySQL via ASP using Connector/ODBC, refer to the following articles:

- [Using MyODBC To Access Your MySQL Database Via ASP](#)
- [ASP and MySQL at DWAM.NT](#)

A Frequently Asked Questions list for ASP can be found at <http://support.microsoft.com/default.aspx?scid=/Support/ActiveServer/faq/data/adofaq.asp>.

24.1.7.2.1.8. Using Connector/ODBC with Visual Basic (ADO, DAO and RDO) and ASP

Some articles that may help with Visual Basic and ASP:

- [MySQL BLOB columns and Visual Basic 6](#) by Mike Hillyer (<mike@openwin.org>).
- [How to map Visual basic data type to MySQL types](#) by Mike Hillyer (<mike@openwin.org>).

24.1.7.2.2. Using Connector/ODBC with Borland Applications

With all Borland applications where the Borland Database Engine (BDE) is used, follow these steps to improve compatibility:

- Update to BDE 3.2 or newer.
- Enable the `Don't optimize column widths` option in the DSN.
- Enabled the `Return matching rows` option in the DSN.

24.1.7.2.2.1. Using Connector/ODBC with Borland Builder 4

When you start a query, you can use the `Active` property or the `Open` method. Note that `Active` starts by automatically issuing a `SELECT * FROM ...` query. That may not be a good thing if your tables are large.

24.1.7.2.2.2. Using Connector/ODBC with Delphi

Also, here is some potentially useful Delphi code that sets up both an ODBC entry and a BDE entry for Connector/ODBC. The BDE entry requires a BDE Alias Editor that is free at a Delphi Super Page near you. (Thanks to Bryan Brunton <bryan@flesherfab.com> for this):

```
fReg:= TRegistry.Create;
fReg.OpenKey('\Software\ODBC\ODBC.INI\DocumentsFab', True);
fReg.WriteString('Database', 'Documents');
fReg.WriteString('Description', '');
fReg.WriteString('Driver', 'C:\WINNT\System32\myodbc.dll');
fReg.WriteString('Flag', '1');
fReg.WriteString('Password', '');
fReg.WriteString('Port', '');
fReg.WriteString('Server', 'xmark');
fReg.WriteString('User', 'winuser');
fReg.OpenKey('\Software\ODBC\ODBC.INI\ODBC Data Sources', True);
fReg.WriteString('DocumentsFab', 'MySQL');
fReg.CloseKey;
fReg.Free;

Memol.Lines.Add('DATABASE NAME=');
Memol.Lines.Add('USER NAME=');
Memol.Lines.Add('ODBC DSN=DocumentsFab');
Memol.Lines.Add('OPEN MODE=READ/WRITE');
Memol.Lines.Add('BATCH COUNT=200');
Memol.Lines.Add('LANGDRIVER=');
Memol.Lines.Add('MAX ROWS=-1');
Memol.Lines.Add('SCHEMA CACHE DIR=');
Memol.Lines.Add('SCHEMA CACHE SIZE=8');
Memol.Lines.Add('SCHEMA CACHE TIME=-1');
Memol.Lines.Add('SQLPASSTHRU MODE=SHARED AUTOCOMMIT');
Memol.Lines.Add('SQLQRYMODE=');
Memol.Lines.Add('ENABLE SCHEMA CACHE=FALSE');
Memol.Lines.Add('ENABLE BCD=FALSE');
Memol.Lines.Add('ROWSET SIZE=20');
Memol.Lines.Add('BLOBS TO CACHE=64');
Memol.Lines.Add('BLOB SIZE=32');

AliasEditor.Add('DocumentsFab', 'MySQL', Memol.Lines);
```

24.1.7.2.2.3. Using Connector/ODBC with C++ Builder

Tested with BDE 3.0. The only known problem is that when the table schema changes, query fields are not updated. BDE, however, does not seem to recognize primary keys, only the index named `PRIMARY`, although this has not been a problem.

24.1.7.2.3. Using Connector/ODBC with ColdFusion

The following information is taken from the ColdFusion documentation:

Use the following information to configure ColdFusion Server for Linux to use the `unixODBC` driver with Connector/ODBC for MySQL data sources. You can download Connector/ODBC at <http://dev.mysql.com/downloads/connector/odbc/>.

ColdFusion version 4.5.1 allows you to use the ColdFusion Administrator to add the MySQL data source. However, the driver is not included with ColdFusion version 4.5.1. Before the MySQL driver appears in the ODBC data sources drop-down list, you must build and copy the Connector/ODBC driver to `/opt/coldfusion/lib/libmyodbc.so`.

The Contrib directory contains the program `mysdn-xxx.zip` which allows you to build and remove the DSN registry file for the Connector/ODBC driver on ColdFusion applications.

For more information and guides on using ColdFusion and Connector/ODBC, see the following external sites:

- [Troubleshooting Data Sources and Database Connectivity for Unix Platforms](#).

24.1.7.2.4. Using Connector/ODBC with OpenOffice.org

Open Office (<http://www.openoffice.org>) [How-to: MySQL + OpenOffice](#). [How-to: OpenOffice + MyODBC + unixODBC](#).

24.1.7.2.5. Using Connector/ODBC with Sambar Server

Sambar Server (<http://www.sambarserver.info>) [How-to: MyODBC + SambarServer + MySQL](#).

24.1.7.2.6. Using Connector/ODBC with Pervasive Software DataJunction

You have to change it to output `VARCHAR` rather than `ENUM`, as it exports the latter in a manner that causes MySQL problems.

24.1.7.2.7. Using Connector/ODBC with SunSystems Vision

You should select the `Return matching rows` option.

24.1.7.3. Connector/ODBC Errors and Resolutions (FAQ)

The following section details some common errors and their suggested fix or alternative solution. If you are still experiencing problems, use the Connector/ODBC mailing list; see [Section 24.1.8.1, “Connector/ODBC Community Support”](#).

Many problems can be resolved by upgrading your Connector/ODBC drivers to the latest available release. On Windows, you should also make sure that you have the latest versions of the Microsoft Data Access Components (MDAC) installed.

Questions

- [25.1.7.3.1](#): I have installed Connector/ODBC on Windows XP x64 Edition or Windows Server 2003 R2 x64. The installation completed successfully, but the Connector/ODBC driver does not appear in `ODBC Data Source Administrator`.
- [25.1.7.3.2](#): When connecting or using the TEST button in `ODBC Data Source Administrator` I get error 10061 (Cannot connect to server)
- [25.1.7.3.3](#): The following error is reported when using transactions: `Transactions are not enabled`
- [25.1.7.3.4](#): Access reports records as `#DELETED#` when inserting or updating records in linked tables.
- [25.1.7.3.5](#): How do I handle Write Conflicts or Row Location errors?
- [25.1.7.3.6](#): Exporting data from Access 97 to MySQL reports a `Syntax Error`.
- [25.1.7.3.7](#): Exporting data from Microsoft DTS to MySQL reports a `Syntax Error`.
- [25.1.7.3.8](#): Using ODBC.NET with Connector/ODBC, while fetching empty string (0 length), it starts giving the `SQL_NO_DATA` exception.
- [25.1.7.3.9](#): Using `SELECT COUNT(*) FROM tbl_name` within Visual Basic and ASP returns an error.
- [25.1.7.3.10](#): Using the `AppendChunk()` or `GetChunk()` ADO methods, the `Multiple-step operation generated errors. Check each status value` error is returned.
- [25.1.7.3.11](#): Access Returns `Another user had modified the record that you have modified while editing records on a Linked Table`.
- [25.1.7.3.12](#): When linking an application directly to the Connector/ODBC library under Unix/Linux, the application crashes.
- [25.1.7.3.13](#): Applications in the Microsoft Office suite are unable to update tables that have `DATE` or `TIMESTAMP` columns.
- [25.1.7.3.14](#): When connecting Connector/ODBC 5.x (Beta) to a MySQL 4.x server, the error `1044 Access denied for user 'xxx'@'%' to database 'information_schema'` is returned.
- [25.1.7.3.15](#): When calling `SQLTables`, the error `S1T00` is returned, but I cannot find this in the list of error numbers for Connector/ODBC.
- [25.1.7.3.16](#): When linking to tables in Access 2000 and generating links to tables programmatically, rather than through the table designer interface, you may get errors about tables not existing.
- [25.1.7.3.17](#): When I try to use batched statements, the execution of the batched statements fails.
- [25.1.7.3.18](#): When connecting to a MySQL server using ADODB and Excel, occasionally the application fails to communicate with the server and the error `Got an error reading communication packets` appears in the error log.
- [25.1.7.3.19](#): When using some applications to access a MySQL server using C/ODBC and outer joins, an error is reported re-

garding the Outer Join Escape Sequence.

- [25.1.7.3.20](#): I can correctly store extended characters in the database (Hebrew/CJK) using C/ODBC 5.1, but when I retrieve the data, the text is not formatted correctly and I get garbled characters.
- [25.1.7.3.21](#): I have a duplicate MySQL Connector/ODBC entry within my **INSTALLED PROGRAMS** list, but I cannot delete one of them.
- [25.1.7.3.22](#): When submitting queries with parameter binding using `UPDATE`, my field values are being truncated to 255 characters.

Questions and Answers

25.1.7.3.1: I have installed Connector/ODBC on Windows XP x64 Edition or Windows Server 2003 R2 x64. The installation completed successfully, but the Connector/ODBC driver does not appear in ODBC Data Source Administrator.

This is not a bug, but is related to the way Windows x64 editions operate with the ODBC driver. On Windows x64 editions, the Connector/ODBC driver is installed in the `%SystemRoot%\SysWOW64` folder. However, the default `ODBC Data Source Administrator` that is available through the `Administrative Tools` or `Control Panel` in Windows x64 Editions is located in the `%SystemRoot%\system32` folder, and only searches this folder for ODBC drivers.

On Windows x64 editions, you should use the ODBC administration tool located at `%SystemRoot%\SysWOW64\odbcad32.exe`, this will correctly locate the installed Connector/ODBC drivers and enable you to create a Connector/ODBC DSN.

This issue was originally reported as [Bug#20301](#).

25.1.7.3.2: When connecting or using the TEST button in ODBC Data Source Administrator I get error 10061 (Cannot connect to server)

This error can be raised by a number of different issues, including server problems, network problems, and firewall and port blocking problems. For more information, see [Section B.1.2.2](#), “Can't connect to [local] MySQL server”.

25.1.7.3.3: The following error is reported when using transactions: Transactions are not enabled

This error indicates that you are trying to use transactions with a MySQL table that does not support transactions. Transactions are supported within MySQL when using the `InnoDB` database engine. In versions of MySQL before Mysql 5.1 you may also use the `BDB` engine.

You should check the following before continuing:

- Verify that your MySQL server supports a transactional database engine. Use `SHOW ENGINES` to obtain a list of the available engine types.
- Verify that the tables you are updating use a transaction database engine.
- Ensure that you have not enabled the `disable transactions` option in your DSN.

25.1.7.3.4: Access reports records as #DELETED# when inserting or updating records in linked tables.

If the inserted or updated records are shown as `#DELETED#` in the access, then:

- If you are using Access 2000, you should get and install the newest (version 2.6 or higher) Microsoft MDAC ([Microsoft Data Access Components](#)) from <http://support.microsoft.com/kb/110093>. This fixes a bug in Access that when you export data to MySQL, the table and column names aren't specified.

You should also get and apply the Microsoft Jet 4.0 Service Pack 5 (SP5) which can be found at <http://support.microsoft.com/default.aspx?scid=kb;EN-US;q239114>. This fixes some cases where columns are marked as `#DELETED#` in Access.

- For all versions of Access, you should enable the Connector/ODBC `Return matching rows` option. For Access 2.0, you should additionally enable the `Simulate ODBC 1.0` option.
- You should have a timestamp in all tables that you want to be able to update.
- You should have a primary key in the table. If not, new or updated rows may show up as `#DELETED#`.
- Use only `DOUBLE` float fields. Access fails when comparing with single-precision floats. The symptom usually is that new or

updated rows may show up as #DELETED# or that you can't find or update rows.

- If you are using Connector/ODBC to link to a table that has a `BIGINT` column, the results are displayed as #DELETED#. The work around solution is:
 - Have one more dummy column with `TIMESTAMP` as the data type.
 - Select the `Change BIGINT columns to INT` option in the connection dialog in ODBC DSN Administrator.
 - Delete the table link from Access and re-create it.

Old records still display as #DELETED#, but newly added/updated records are displayed properly.

25.1.7.3.5: How do I handle Write Conflicts or Row Location errors?

If you see the following errors, select the `Return Matching Rows` option in the DSN configuration dialog, or specify `OPTION=2`, as the connection parameter:

```
Write Conflict. Another user has changed your data.
Row cannot be located for updating. Some values may have been changed
since it was last read.
```

25.1.7.3.6: Exporting data from Access 97 to MySQL reports a Syntax Error.

This error is specific to Access 97 and versions of Connector/ODBC earlier than 3.51.02. Update to the latest version of the Connector/ODBC driver to resolve this problem.

25.1.7.3.7: Exporting data from Microsoft DTS to MySQL reports a Syntax Error.

This error occurs only with MySQL tables using the `TEXT` or `VARCHAR` data types. You can fix this error by upgrading your Connector/ODBC driver to version 3.51.02 or higher.

25.1.7.3.8: Using ODBC.NET with Connector/ODBC, while fetching empty string (0 length), it starts giving the SQL_NO_DATA exception.

You can get the patch that addresses this problem from <http://support.microsoft.com/default.aspx?scid=kb;EN-US;q319243>.

25.1.7.3.9: Using `SELECT COUNT(*) FROM tbl_name` within Visual Basic and ASP returns an error.

This error occurs because the `COUNT(*)` expression is returning a `BIGINT`, and ADO can't make sense of a number this big. Select the `Change BIGINT columns to INT` option (option value 16384).

25.1.7.3.10: Using the `AppendChunk()` or `GetChunk()` ADO methods, the Multiple-step operation generated errors. Check each status value error is returned.

The `GetChunk()` and `AppendChunk()` methods from ADO doesn't work as expected when the cursor location is specified as `adUseServer`. On the other hand, you can overcome this error by using `adUseClient`.

A simple example can be found from http://www.dwam.net/iishelp/ado/docs/adomth02_4.htm

25.1.7.3.11: Access Returns Another user had modified the record that you have modified while editing records on a Linked Table.

In most cases, this can be solved by doing one of the following things:

- Add a primary key for the table if one doesn't exist.
- Add a timestamp column if one doesn't exist.
- Only use double-precision float fields. Some programs may fail when they compare single-precision floats.

If these strategies don't help, you should start by making a log file from the ODBC manager (the log you get when requesting logs from ODBCADMIN) and a Connector/ODBC log to help you figure out why things go wrong. For instructions, see [Section 24.1.4.8, "Getting an ODBC Trace File"](#).

25.1.7.3.12: When linking an application directly to the Connector/ODBC library under Unix/Linux, the application crashes.

Connector/ODBC 3.51 under Unix/Linux is not compatible with direct application linking. You must use a driver manager, such as iODBC or unixODBC to connect to an ODBC source.

25.1.7.3.13: Applications in the Microsoft Office suite are unable to update tables that have `DATE` or `TIMESTAMP` columns.

This is a known issue with Connector/ODBC. You must ensure that the field has a default value (rather than `NULL` and that the default value is non-zero (i.e. the default value is not `0000-00-00 00:00:00`).

25.1.7.3.14: When connecting Connector/ODBC 5.x (Beta) to a MySQL 4.x server, the error `1044 Access denied for user 'xxx'@'%' to database 'information_schema'` is returned.

Connector/ODBC 5.x is designed to work with MySQL 5.0 or later, taking advantage of the `INFORMATION_SCHEMA` database to determine data definition information. Support for MySQL 4.1 is planned for the final release.

25.1.7.3.15: When calling `SQLTables`, the error `S1T00` is returned, but I cannot find this in the list of error numbers for Connector/ODBC.

The `S1T00` error indicates that a general timeout has occurred within the ODBC system and is not a MySQL error. Typically it indicates that the connection you are using is stale, the server is too busy to accept your request or that the server has gone away.

25.1.7.3.16: When linking to tables in Access 2000 and generating links to tables programmatically, rather than through the table designer interface, you may get errors about tables not existing.

There is a known issue with a specific version of the `msjet40.dll` that exhibits this issue. The version affected is 4.0.9025.0. Reverting to an older version will enable you to create the links. If you have recently updated your version, check your `WINDOWS` directory for the older version of the file and copy it to the drivers directory.

25.1.7.3.17: When I try to use batched statements, the execution of the batched statements fails.

Batched statement support was added in 3.51.18. Support for batched statements is not enabled by default. You must enable option `FLAG_MULTI_STATEMENTS`, value 67108864, or select the `ALLOW MULTIPLE STATEMENTS` flag within a GUI configuration.

25.1.7.3.18: When connecting to a MySQL server using `ADODB` and Excel, occasionally the application fails to communicate with the server and the error `Got an error reading communication packets` appears in the error log.

This error may be related to Keyboard Logger 1.1 from PanteraSoft.com, which is known to interfere with the network communication between MySQL Connector/ODBC and MySQL.

25.1.7.3.19: When using some applications to access a MySQL server using `C/ODBC` and outer joins, an error is reported regarding the Outer Join Escape Sequence.

This is a known issue with MySQL Connector/ODBC which is not correctly parsing the "Outer Join Escape Sequence", as per the specs at [Microsoft ODBC Specs](#). Currently, Connector/ODBC will return value `> 0` when asked for `SQL_OJ_CAPABILITIES` even though no parsing takes place in the driver to handle the outer join escape sequence.

25.1.7.3.20: I can correctly store extended characters in the database (Hebrew/CJK) using `C/ODBC 5.1`, but when I retrieve the data, the text is not formatted correctly and I get garbled characters.

When using ASP and UTF8 characters you should add the following to your ASP files to ensure that the data returned is correctly encoded:

```
Response.CodePage = 65001
Response.CharSet = "utf-8"
```

25.1.7.3.21: I have a duplicate MySQL Connector/ODBC entry within my `INSTALLED PROGRAMS` list, but I cannot delete one of them.

This problem can occur when you upgrade an existing Connector/ODBC installation, rather than removing and then installing the updated version.

Warning

To fix the problem you should use any working uninstallers to remove existing installations and then may have to edit the contents of the registry. Make sure you have a backup of your registry information before attempting any editing of the registry contents.

25.1.7.3.22: When submitting queries with parameter binding using `UPDATE`, my field values are being truncated to 255 characters.

You should ensure that the `FLAG_BIG_PACKETS` option is set for your connection. This removes the 255 character limitation on bound parameters.

24.1.8. Connector/ODBC Support

There are many different places where you can get support for using Connector/ODBC. You should always try the Connector/ODBC Mailing List or Connector/ODBC Forum. See [Section 24.1.8.1, “Connector/ODBC Community Support”](#), for help before reporting a specific bug or issue to MySQL.

24.1.8.1. Connector/ODBC Community Support

MySQL AB provides assistance to the user community by means of its mailing lists. For Connector/ODBC-related issues, you can get help from experienced users by using the `<myodbc@lists.mysql.com>` mailing list. Archives are available online at <http://lists.mysql.com/myodbc>.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See [Section 1.6.1, “MySQL Mailing Lists”](#).

Community support from experienced users is also available through the [ODBC Forum](#). You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See [Section 1.6.2, “MySQL Community Support at the MySQL Forums”](#).

24.1.8.2. How to Report Connector/ODBC Problems or Bugs

If you encounter difficulties or problems with Connector/ODBC, you should start by making a log file from the [ODBC Manager](#) (the log you get when requesting logs from [ODBC ADMIN](#)) and Connector/ODBC. The procedure for doing this is described in [Section 24.1.4.8, “Getting an ODBC Trace File”](#).

Check the Connector/ODBC trace file to find out what could be wrong. You should be able to determine what statements were issued by searching for the string `>mysql_real_query` in the `myodbc.log` file.

You should also try issuing the statements from the `mysql` client program or from `admindemo`. This helps you determine whether the error is in Connector/ODBC or MySQL.

If you find out something is wrong, please only send the relevant rows (maximum 40 rows) to the `myodbc` mailing list. See [Section 1.6.1, “MySQL Mailing Lists”](#). Please never send the whole Connector/ODBC or ODBC log file!

You should ideally include the following information with the email:

- Operating system and version
- Connector/ODBC version
- ODBC Driver Manager type and version
- MySQL server version
- ODBC trace from Driver Manager
- Connector/ODBC log file from Connector/ODBC driver
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem!

Also, before posting the bug, check the MyODBC mailing list archive at <http://lists.mysql.com/myodbc>.

If you are unable to find out what's wrong, the last option is to create an archive in `tar` or Zip format that contains a Connector/ODBC trace file, the ODBC log file, and a `README` file that explains the problem. You can send this to <ftp://ftp.mysql.com/pub/mysql/upload/>. Only MySQL engineers have access to the files you upload, and we are very discreet with the data.

If you can create a program that also demonstrates the problem, please include it in the archive as well.

If the program works with another SQL server, you should include an ODBC log file where you perform exactly the same SQL statements so that we can compare the results between the two systems.

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

24.1.8.3. How to Submit a Connector/ODBC Patch

You can send a patch or suggest a better solution for any existing code or problems by sending a mail message to

[<myodbc@lists.mysql.com>](mailto:myodbc@lists.mysql.com).

24.1.8.4. Connector/ODBC Change History

The Connector/ODBC Change History (Changelog) is located with the main Changelog for MySQL. See [Section E.3, “MySQL Connector/ODBC \(MyODBC\) Change History”](#).

24.1.8.5. Credits

These are the developers that have worked on the Connector/ODBC and Connector/ODBC 3.51 Drivers from MySQL AB.

- Michael (Monty) Widenius
- Venu Anuganti
- Peter Harvey

24.2. MySQL Connector/NET

Connector/NET enables developers to easily create .NET applications that require secure, high-performance data connectivity with MySQL. It implements the required ADO.NET interfaces and integrates into ADO.NET aware tools. Developers can build applications using their choice of .NET languages. Connector/NET is a fully managed ADO.NET driver written in 100% pure C#.

Connector/NET includes full support for:

- MySQL 5.0 features (such as stored procedures)
- MySQL 4.1 features (server-side prepared statements, Unicode, and shared memory access, and so forth)
- Large-packet support for sending and receiving rows and BLOBs up to 2 gigabytes in size.
- Protocol compression which allows for compressing the data stream between the client and server.
- Support for connecting using TCP/IP sockets, named pipes, or shared memory on Windows.
- Support for connecting using TCP/IP sockets or Unix sockets on Unix.
- Support for the Open Source Mono framework developed by Novell.
- Fully managed, does not utilize the MySQL client library.

This document is intended as a user's guide to Connector/NET and includes a full syntax reference. Syntax information is also included within the [Documentation.chm](#) file included with the Connector/NET distribution.

If you are using MySQL 5.0 or later, and Visual Studio as your development environment, you may want also want to use the MySQL Visual Studio Plugin. The plugin acts as a DDEX (Data Designer Extensibility) provider, enabling you to use the data design tools within Visual Studio to manipulate the schema and objects within a MySQL database. For more information, see [Section 24.3, “MySQL Visual Studio Plugin”](#).

Note

Connector/NET 5.1.2 and later include the Visual Studio Plugin by default.

Key topics:

- For connection string properties when using the `MySqlConnection` class, see [Section 24.2.3.3.3, “ConnectionString”](#).

24.2.1. Connector/NET Versions

There are currently three versions of Connector/NET available:

- Connector/NET 1.0 includes support for MySQL 4.0, and MySQL 5.0 features, and full compatibility with the ADO.NET driver interface.

Connector/NET 5.0 includes support for MySQL 4.0, MySQL 4.1, MySQL 5.0 and MySQL 5.1 features. Connector/NET 5.0 also includes full support for the ADO.Net 2.0 interfaces and subclasses, includes support for the usage advisor and performance monitor (PerfMon) hooks.

Connector/NET 5.1 includes support for MySQL 4.0, MySQL 5.0, MySQL 5.1 and MySQL 6.0 (Falcon Preview) features. Connector/NET 5.1 also includes support for a new membership/role provider, Compact Framework 2.0, a new stored procedure parser and improvements to `GetSchema`. Connector/NET 5.1 also includes the Visual Studio Plugin as a standard installable component.

Note

Version numbers for MySQL products are formatted as X.X.X. However, Windows tools (Control Panel, properties display) may show the version numbers as XX.XX.XX. For example, the official MySQL formatted version number 5.0.9 may be displayed by Windows tools as 5.00.09. The two versions are the same; only the number display format is different.

24.2.2. Connector/NET Installation

Connector/NET runs on any platform that supports the .NET framework. The .NET framework is primarily supported on recent versions of Microsoft Windows, and is supported on Linux through the Open Source Mono framework (see <http://www.mono-project.com>).

Connector/NET is available for download from <http://dev.mysql.com/downloads/connector/net/1.0.html>.

24.2.2.1. Installing Connector/NET on Windows

On Windows, installation is supported either through a binary installation process or by downloading a Zip file with the Connector/NET components.

Before installing, you should ensure that your system is up to date, including installing the latest version of the .NET Framework.

24.2.2.1.1. Installing Connector/NET using the Installer

Using the installer is the most straightforward method of installing Connector/NET on Windows and the installed components include the source code, test code and full reference documentation.

Connector/NET is installed through the use of a Windows Installer (.msi) installation package, which can be used to install Connector/NET on all Windows operating systems. The MSI package is contained within a ZIP archive named `mysql-connector-net-version.zip`, where `version` indicates the Connector/NET version.

To install Connector/NET:

1. Double click on the MSI installer file extracted from the Zip you downloaded. Click NEXT to start the installation.

2. You must choose the type of installation that you want to perform.

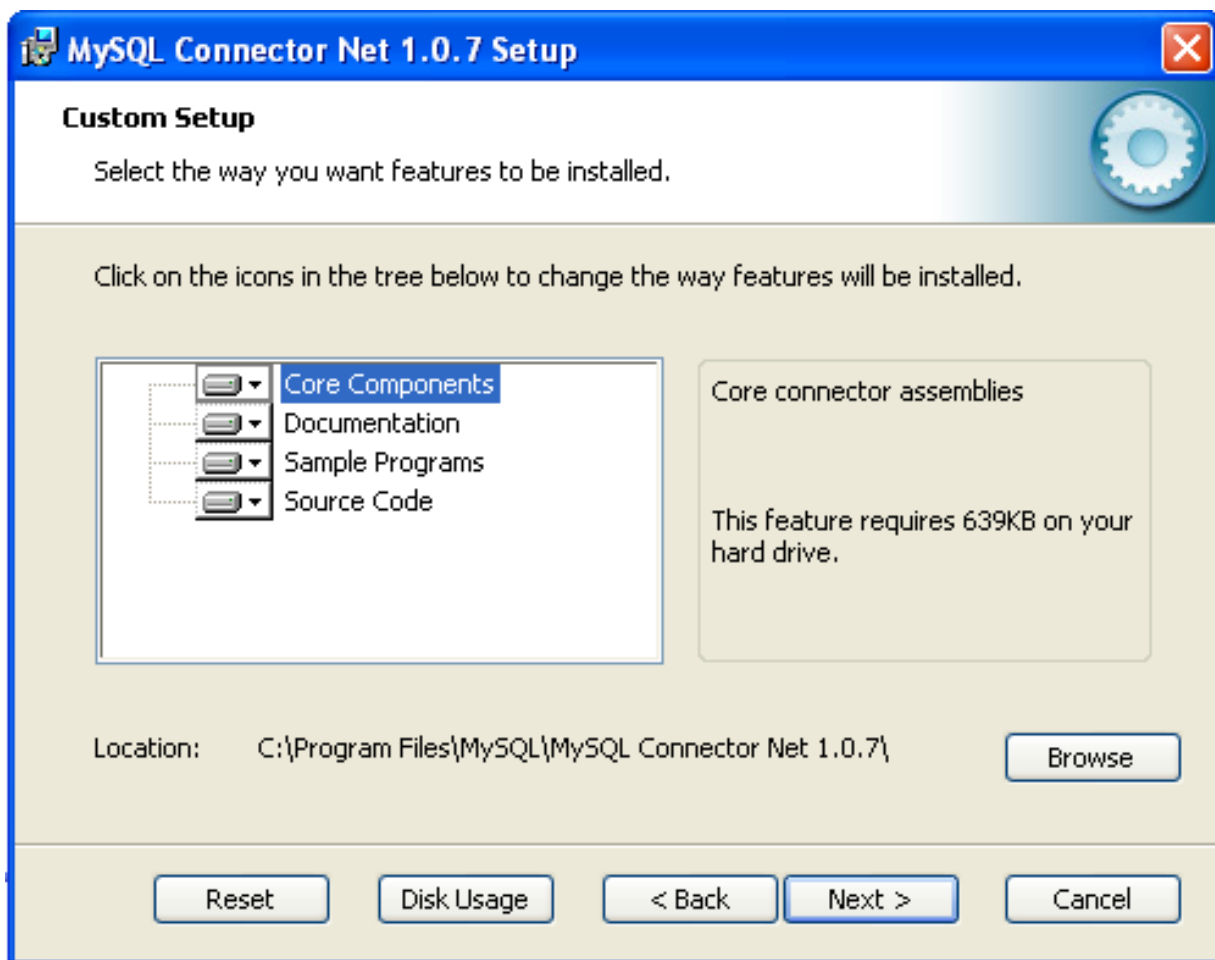

For most situations, the Typical installation will be suitable. Click the TYPICAL button and proceed to Step 5. A Complete installation installs all the available files. To conduct a Complete installation, click the COMPLETE button and proceed to step 5. If you want to customize your installation, including choosing the components to install and some installation options, click the CUSTOM button and proceed to Step 3.

The Connector/NET installer will register the connector within the Global Assembly Cache (GAC) - this will make the Connector/NET component available to all applications, not just those where you explicitly reference the Connector/NET component. The installer will also create the necessary links in the Start menu to the documentation and release notes.

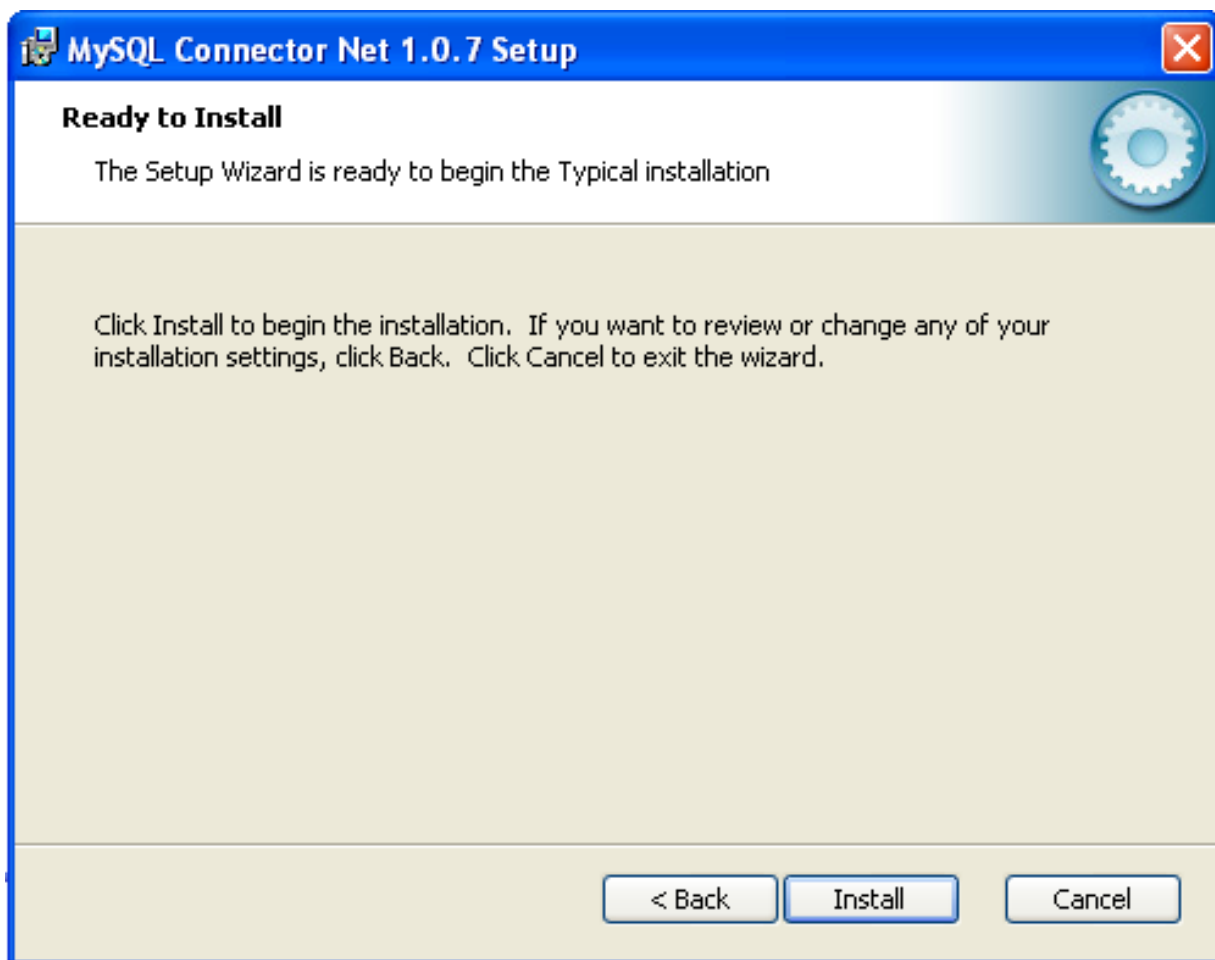

3. If you have chosen a custom installation, you can select the individual components that you want to install, including the core interface component, supporting documentation (a CHM file) samples and examples and the source code. Select the items, and their installation level, and then click NEXT to continue the installation.

Note

For Connector/NET 1.0.8 or lower and Connector 5.0.4 and lower the installer will attempt to install binaries for both 1.x and 2.x of the .NET Framework. If you only have one version of the framework installed, the connector installation may fail. If this happens, you can choose the framework version to be installed through the custom installation step.

4. You will be given a final opportunity to confirm the installation. Click **INSTALL** to copy and install the files onto your machine.

5. Once the installation has been completed, click FINISH to exit the installer.

Unless you choose otherwise, Connector/NET is installed in `C:\Program Files\MySQL\MySQL Connector Net X.X.X`, where `X.X.X` is replaced with the version of Connector/NET you are installing. New installations do not overwrite existing versions of Connector/NET.

Depending on your installation type, the installed components will include some or all of the following components:

- `bin` - Connector/NET MySQL libraries for different versions of the .NET environment.
- `docs` - contains a CHM of the Connector/NET documentation.
- `samples` - sample code and applications that use the Connector/NET component.
- `src` - the source code for the Connector/NET component.

You may also use the `/quiet` or `/q` command-line option with the `msiexec` tool to install the Connector/NET package automatically (using the default options) with no notification to the user. Using this option you cannot select options and no prompts, messages or dialog boxes will be displayed.

```
C:\> msiexec /package connector-net.msi /quiet
```

To provide a progress bar to the user during automatic installation, but still without presenting the user with a dialog box of the ability to select options, use the `/passive` option.

24.2.2.1.2. Installing Connector/NET using the Zip package

If you are having problems running the installer, you can download a .zip file without an installer as an alternative. That file is called `mysql-connector-net-version-noinstall.zip`. Once downloaded, you can extract the files to a location of

your choice.

The .zip file contains the following directories:

- `bin` - Connector/NET MySQL libraries for different versions of the .NET environment.
- `doc` - contains a CHM of the Connector/NET documentation.
- `Samples` - sample code and applications that use the Connector/NET component.
- `mysqlclient` - the source code for the Connector/NET component.
- `testsuite` - the test suite used to verify the operation of the Connector/NET component.

24.2.2.2. Installing Connector/NET on Unix with Mono

There is no installer available for installing the Connector/NET component on your Unix installation. However, the installation is very simple. Before installing, please ensure that you have a working Mono project installation.

Note that you should only install the Connector/NET component on Unix environments where you want to connect to a MySQL server through the Mono project. If you are deploying or developing on a different environment such as Java or Perl then you should use a more appropriate connectivity component. See [Chapter 24, Connectors and APIs](#).

To install Connector/NET on Unix/Mono:

1. Download the `mysql-connector-net-version-noinstall.zip` and extract the contents.
2. Copy the `MySQL.Data.dll` file to your Mono project installation folder.
3. You must register the Connector/NET component in the Global Assembly Cache using the `gacutil` command:

```
shell> gacutil /i MySQL.Data.dll
```

Once installed, applications that are compiled with the Connector/NET component need no further changes. However, you must ensure that when you compile your applications you include the Connector/NET component using the `-r:MySQLData.dll` command-line option.

24.2.2.3. Installing Connector/NET using the Source

Caution

You should read this section only if you are interested in helping us test our new code. If you just want to get Connector/NET up and running on your system, you should use a standard release distribution.

To be able to access the Connector/NET source tree, you must have Subversion installed. Subversion is freely available from <http://subversion.tigris.org/>.

The most recent development source tree is available from our public Subversion trees at <http://dev.mysql.com/tech-resources/sources.html>.

To checkout out the Connector/NET sources, change to the directory where you want the copy of the Connector/NET tree to be stored, then use the following command:

```
shell> svn co  
http://svn.mysql.com/svnpublic/connector-net
```

A Visual Studio project is included in the source which you can use to build Connector/NET.

24.2.3. Connector/NET Examples and Usage Guide

Connector/NET comprises several classes that are used to connect to the database, execute queries and statements, and manage query results.

The following are the major classes of Connector/NET:

- `MySQLCommand`: Represents an SQL statement to execute against a MySQL database.

- [MySqlCommandBuilder](#): Automatically generates single-table commands used to reconcile changes made to a DataSet with the associated MySQL database.
- [MySQLConnection](#): Represents an open connection to a MySQL Server database.
- [MySQLDataAdapter](#): Represents a set of data commands and a database connection that are used to fill a data set and update a MySQL database.
- [MySQLDataReader](#): Provides a means of reading a forward-only stream of rows from a MySQL database.
- [MySQLException](#): The exception that is thrown when MySQL returns an error.
- [MySQLHelper](#): Helper class that makes it easier to work with the provider.
- [MySQLTransaction](#): Represents an SQL transaction to be made in a MySQL database.

This section contains basic information and examples for each of the above classes. For a more detailed reference guide please see [Section 24.2.4, “Connector/NET Reference”](#).

24.2.3.1. Using MySqlCommand

Represents an SQL statement to execute against a MySQL database. This class cannot be inherited.

[MySQLCommand](#) features the following methods for executing commands at a MySQL database:

Item	Description
ExecuteReader	Executes commands that return rows.
ExecuteNonQuery	Executes commands such as SQL INSERT, DELETE, and UPDATE statements.
ExecuteScalar	Retrieves a single value (for example, an aggregate value) from a database.

You can reset the [CommandText](#) property and reuse the [MySQLCommand](#) object. However, you must close the [MySQLDataReader](#) before you can execute a new or previous command.

If a [MySQLException](#) is generated by the method executing a [MySQLCommand](#), the [MySQLConnection](#) remains open. It is the responsibility of the programmer to close the connection.

Note

Using the '@' symbol for parameters is now the preferred approach although the old pattern of using '?' is still supported.

Please be aware however that using '@' can cause conflicts when user variables are also used. To help with this situation please see the documentation on the [Allow User Variables](#) connection string option, which can be found here: [Section 24.2.3.3.3, “ConnectionString”](#). The [Old Syntax](#) connection string option has now been deprecated.

Examples

The following example creates a [MySQLCommand](#) and a [MySQLConnection](#). The [MySQLConnection](#) is opened and set as the [Connection](#) for the [MySQLCommand](#). The example then calls [ExecuteNonQuery](#), and closes the connection. To accomplish this, the [ExecuteNonQuery](#) is passed a connection string and a query string that is an SQL INSERT statement.

Visual Basic example:

```
Public Sub InsertRow(myConnectionString As String)
    " If the connection string is null, use a default.
    If myConnectionString = "" Then
        myConnectionString = "Database=Test;Data Source=localhost;User Id=username;Password=pass"
    End If
    Dim myConnection As New MySqlConnection(myConnectionString)
    Dim myInsertQuery As String = "INSERT INTO Orders (id, customerId, amount) Values(1001, 23, 30.66)"
    Dim myCommand As New MySqlCommand(myInsertQuery)
    myCommand.Connection = myConnection
    myConnection.Open()
    myCommand.ExecuteNonQuery()
    myCommand.Connection.Close()
End Sub
```

C# example:

```
public void InsertRow(string myConnectionString)
{
    // If the connection string is null, use a default.
    if(myConnectionString == "")
    {
        myConnectionString = "Database=Test;Data Source=localhost;User Id=username;Password=pass";
    }
    MySqlConnection myConnection = new MySqlConnection(myConnectionString);
    string myInsertQuery = "INSERT INTO Orders (id, customerId, amount) Values(1001, 23, 30.66)";
    MySqlCommand myCommand = new MySqlCommand(myInsertQuery);
    myCommand.Connection = myConnection;
    myConnection.Open();
    myCommand.ExecuteNonQuery();
    myCommand.Connection.Close();
}
```

24.2.3.1.1. Class MySqlCommand Constructor Form 1

Overload methods for MySqlCommand

Initializes a new instance of the MySqlCommand class.

Examples

The following example creates a MySqlCommand and sets some of its properties.

Note

This example shows how to use one of the overloaded versions of the [MySqlCommand](#) constructor. For other examples that might be available, see the individual overload topics.

Visual Basic example:

```
Public Sub CreateMySqlCommand()
    Dim myConnection As New MySqlConnection _
        ("Persist Security Info=False;database=test;server=myServer")
    myConnection.Open()
    Dim myTrans As MySqlTransaction = myConnection.BeginTransaction()
    Dim mySelectQuery As String = "SELECT * FROM MyTable"
    Dim myCommand As New MySqlCommand(mySelectQuery, myConnection, myTrans)
    myCommand.CommandTimeout = 20
End Sub
```

C# example:

```
public void CreateMySqlCommand()
{
    MySqlConnection myConnection = new MySqlConnection("Persist Security Info=False;
        database=test;server=myServer");
    myConnection.Open();
    MySqlTransaction myTrans = myConnection.BeginTransaction();
    string mySelectQuery = "SELECT * FROM myTable";
    MySqlCommand myCommand = new MySqlCommand(mySelectQuery, myConnection, myTrans);
    myCommand.CommandTimeout = 20;
}
```

C++ example:

```
public:
void CreateMySqlCommand()
{
    MySqlConnection* myConnection = new MySqlConnection(S"Persist Security Info=False;
        database=test;server=myServer");
    myConnection->Open();
    MySqlTransaction* myTrans = myConnection->BeginTransaction();
    String* mySelectQuery = S"SELECT * FROM myTable";
    MySqlCommand* myCommand = new MySqlCommand(mySelectQuery, myConnection, myTrans);
    myCommand->CommandTimeout = 20;
};
```

Initializes a new instance of the MySqlCommand class.

The base constructor initializes all fields to their default values. The following table shows initial property values for an instance of [MySqlCommand](#).

Properties	Initial Value
CommandText	empty string ("")
CommandTimeout	0
CommandType	CommandType.Text
Connection	Null

You can change the value for any of these properties through a separate call to the property.

Examples

The following example creates a [MySQLCommand](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySQLCommand()
    Dim myCommand As New MySQLCommand()
    myCommand.CommandType = CommandType.Text
End Sub
```

C# example:

```
public void CreateMySQLCommand()
{
    MySqlCommand myCommand = new MySqlCommand();
    myCommand.CommandType = CommandType.Text;
}
```

24.2.3.1.2. Class MySQLCommand Constructor Form 2

Initializes a new instance of the [MySQLCommand](#) class with the text of the query.

Parameters: The text of the query.

When an instance of [MySQLCommand](#) is created, the following read/write properties are set to initial values.

Properties	Initial Value
CommandText	cmdText
CommandTimeout	0
CommandType	CommandType.Text
Connection	Null

You can change the value for any of these properties through a separate call to the property.

Examples

The following example creates a [MySQLCommand](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySQLCommand()
    Dim sql as String = "SELECT * FROM mytable"
    Dim myCommand As New MySQLCommand(sql)
    myCommand.CommandType = CommandType.Text
End Sub
```

C# example:

```
public void CreateMySQLCommand()
{
    string sql = "SELECT * FROM mytable";
    MySqlCommand myCommand = new MySqlCommand(sql);
    myCommand.CommandType = CommandType.Text;
}
```

24.2.3.1.3. Class MySQLCommand Constructor Form 3

Initializes a new instance of the [MySQLCommand](#) class with the text of the query and a [MySQLConnection](#).

Parameters: The text of the query.

Parameters: A [MySQLConnection](#) that represents the connection to an instance of SQL Server.

When an instance of [MySQLCommand](#) is created, the following read/write properties are set to initial values.

Properties	Initial Value
CommandText	cmdText
CommandTimeout	0
CommandType	CommandType.Text
Connection	connection

You can change the value for any of these properties through a separate call to the property.

Examples

The following example creates a [MySQLCommand](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySQLCommand()
    Dim conn as new MySqlConnection("server=myServer")
    Dim sql as String = "SELECT * FROM mytable"
    Dim myCommand As New MySQLCommand(sql, conn)
    myCommand.CommandType = CommandType.Text
End Sub
```

C# example:

```
public void CreateMySQLCommand()
{
    MySqlConnection conn = new MySqlConnection("server=myserver")
    string sql = "SELECT * FROM mytable";
    MySQLCommand myCommand = new MySQLCommand(sql, conn);
    myCommand.CommandType = CommandType.Text;
}
```

24.2.3.1.4. Class MySQLCommand Constructor Form 4

Initializes a new instance of the [MySQLCommand](#) class with the text of the query, a [MySQLConnection](#), and the [MySQLTransaction](#).

Parameters: The text of the query.

Parameters: A [MySQLConnection](#) that represents the connection to an instance of SQL Server.

Parameters: The [MySQLTransaction](#) in which the [MySQLCommand](#) executes.

When an instance of [MySQLCommand](#) is created, the following read/write properties are set to initial values.

Properties	Initial Value
CommandText	cmdText
CommandTimeout	0
CommandType	CommandType.Text
Connection	connection

You can change the value for any of these properties through a separate call to the property.

Examples

The following example creates a [MySQLCommand](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySQLCommand()
    Dim conn as new MySqlConnection("server=myServer")
    conn.Open();
    Dim txn as MySQLTransaction = conn.BeginTransaction()
```

```
Dim sql as String = "SELECT * FROM mytable"
Dim myCommand As New MySqlCommand(sql, conn, txn)
myCommand.CommandType = CommandType.Text
End Sub
```

C# example:

```
public void CreateMySqlCommand()
{
    MySqlConnection conn = new MySqlConnection("server=myserver")
    conn.Open();
    MySqlTransaction txn = conn.BeginTransaction();
    string sql = "SELECT * FROM mytable";
    MySqlCommand myCommand = new MySqlCommand(sql, conn, txn);
    myCommand.CommandType = CommandType.Text;
}
```

24.2.3.1.5. ExecuteNonQuery

Executes an SQL statement against the connection and returns the number of rows affected.

Returns: Number of rows affected

You can use `ExecuteNonQuery` to perform any type of database operation, however any resultsets returned will not be available. Any output parameters used in calling a stored procedure will be populated with data and can be retrieved after execution is complete. For UPDATE, INSERT, and DELETE statements, the return value is the number of rows affected by the command. For all other types of statements, the return value is -1.

Examples

The following example creates a `MySqlCommand` and then executes it using `ExecuteNonQuery`. The example is passed a string that is an SQL statement (such as UPDATE, INSERT, or DELETE) and a string to use to connect to the data source.

Visual Basic example:

```
Public Sub CreateMySqlCommand(myExecuteQuery As String, myConnection As MySqlConnection)
    Dim myCommand As New MySqlCommand(myExecuteQuery, myConnection)
    myCommand.Connection.Open()
    myCommand.ExecuteNonQuery()
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySqlCommand(string myExecuteQuery, MySqlConnection myConnection)
{
    MySqlCommand myCommand = new MySqlCommand(myExecuteQuery, myConnection);
    myCommand.Connection.Open();
    myCommand.ExecuteNonQuery();
    myConnection.Close();
}
```

24.2.3.1.6. ExecuteReader1

Sends the `CommandText` to the `MySqlConnection`, and builds a `MySqlDataReader` using one of the `CommandBehavior` values.

Parameters: One of the `CommandBehavior` values.

When the `CommandType` property is set to `StoredProcedure`, the `CommandText` property should be set to the name of the stored procedure. The command executes this stored procedure when you call `ExecuteReader`.

The `MySqlDataReader` supports a special mode that enables large binary values to be read efficiently. For more information, see the `SequentialAccess` setting for `CommandBehavior`.

While the `MySqlDataReader` is in use, the associated `MySqlConnection` is busy serving the `MySqlDataReader`. While in this state, no other operations can be performed on the `MySqlConnection` other than closing it. This is the case until the `MySqlDataReader.Close` method of the `MySqlDataReader` is called. If the `MySqlDataReader` is created with `CommandBehavior` set to `CloseConnection`, closing the `MySqlDataReader` closes the connection automatically.

Note

When calling `ExecuteReader` with the `SingleRow` behavior, you should be aware that using a `limit` clause in

your SQL will cause all rows (up to the limit given) to be retrieved by the client. The `MySqlDataReader.Read` method will still return false after the first row but pulling all rows of data into the client will have a performance impact. If the `limit` clause is not necessary, it should be avoided.

Returns: A `MySqlDataReader` object.

24.2.3.1.7. Using `ExecuteReader`

Sends the `CommandText` to the `MySqlConnection` and builds a `MySqlDataReader`.

Returns: A `MySqlDataReader` object.

When the `CommandType` property is set to `StoredProcedure`, the `CommandText` property should be set to the name of the stored procedure. The command executes this stored procedure when you call `ExecuteReader`.

While the `MySqlDataReader` is in use, the associated `MySqlConnection` is busy serving the `MySqlDataReader`. While in this state, no other operations can be performed on the `MySqlConnection` other than closing it. This is the case until the `MySqlDataReader.Close` method of the `MySqlDataReader` is called.

Examples

The following example creates a `MySqlCommand`, then executes it by passing a string that is an SQL `SELECT` statement, and a string to use to connect to the data source.

Visual Basic example:

```
Public Sub CreateMySqlDataReader(mySelectQuery As String, myConnection As MySqlConnection)
    Dim myCommand As New MySqlCommand(mySelectQuery, myConnection)
    myConnection.Open()
    Dim myReader As MySqlDataReader
    myReader = myCommand.ExecuteReader()
    Try
        While myReader.Read()
            Console.WriteLine(myReader.GetString(0))
        End While
    Finally
        myReader.Close()
        myConnection.Close()
    End Try
End Sub
```

C# example:

```
public void CreateMySqlDataReader(string mySelectQuery, MySqlConnection myConnection)
{
    MySqlCommand myCommand = new MySqlCommand(mySelectQuery, myConnection);
    myConnection.Open();
    MySqlDataReader myReader;
    myReader = myCommand.ExecuteReader();
    try
    {
        while(myReader.Read())
        {
            Console.WriteLine(myReader.GetString(0));
        }
    }
    finally
    {
        myReader.Close();
        myConnection.Close();
    }
}
```

24.2.3.1.8. Using `Prepare`

Creates a prepared version of the command on an instance of MySQL Server.

Prepared statements are only supported on MySQL version 4.1 and higher. Calling prepare while connected to earlier versions of MySQL will succeed but will execute the statement in the same way as unprepared.

Examples

The following example demonstrates the use of the `Prepare` method.

Visual Basic example:

```
public sub PrepareExample()
    Dim cmd as New MySqlCommand("INSERT INTO mytable VALUES (?val)", myConnection)
    cmd.Parameters.Add(" ?val", 10 )
    cmd.Prepare()
end sub
```

```

cmd.ExecuteNonQuery()

cmd.Parameters(0).Value = 20
cmd.ExecuteNonQuery()
end sub

```

C# example:

```

private void PrepareExample()
{
    MySqlCommand cmd = new MySqlCommand("INSERT INTO mytable VALUES (@val)", myConnection);
    cmd.Parameters.Add( "@val", 10 );
    cmd.Prepare();
    cmd.ExecuteNonQuery();

    cmd.Parameters[0].Value = 20;
    cmd.ExecuteNonQuery();
}

```

24.2.3.1.9. ExecuteScalar

Executes the query, and returns the first column of the first row in the result set returned by the query. Extra columns or rows are ignored.

Returns: The first column of the first row in the result set, or a null reference if the result set is empty

Use the [ExecuteScalar](#) method to retrieve a single value (for example, an aggregate value) from a database. This requires less code than using the [ExecuteReader](#) method, and then performing the operations necessary to generate the single value using the data returned by a [MySqlDataReader](#)

A typical [ExecuteScalar](#) query can be formatted as in the following C# example:

C# example:

```

cmd.CommandText = "select count(*) from region";
Int32 count = (int32) cmd.ExecuteScalar();

```

Examples

The following example creates a [MySqlCommand](#) and then executes it using [ExecuteScalar](#). The example is passed a string that is an SQL statement that returns an aggregate result, and a string to use to connect to the data source.

Visual Basic example:

```

Public Sub CreateMySqlCommand(myScalarQuery As String, myConnection As MySqlConnection)
    Dim myCommand As New MySqlCommand(myScalarQuery, myConnection)
    myCommand.Connection.Open()
    myCommand.ExecuteScalar()
    myConnection.Close()
End Sub

```

C# example:

```

public void CreateMySqlCommand(string myScalarQuery, MySqlConnection myConnection)
{
    MySqlCommand myCommand = new MySqlCommand(myScalarQuery, myConnection);
    myCommand.Connection.Open();
    myCommand.ExecuteScalar();
    myConnection.Close();
}

```

C++ example:

```

public:
    void CreateMySqlCommand(String* myScalarQuery, MySqlConnection* myConnection)
    {
        MySqlCommand* myCommand = new MySqlCommand(myScalarQuery, myConnection);
        myCommand->Connection->Open();
        myCommand->ExecuteScalar();
        myConnection->Close();
    }

```

24.2.3.1.10. CommandText

Gets or sets the SQL statement to execute at the data source.

Value: The SQL statement or stored procedure to execute. The default is an empty string.

When the `CommandType` property is set to `StoredProcedure`, the `CommandText` property should be set to the name of the stored procedure. The user may be required to use escape character syntax if the stored procedure name contains any special characters. The command executes this stored procedure when you call one of the `Execute` methods.

Examples

The following example creates a `MySqlCommand` and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySqlCommand()
    Dim myCommand As New MySqlCommand()
    myCommand.CommandText = "SELECT * FROM Mytable ORDER BY id"
    myCommand.CommandType = CommandType.Text
End Sub
```

C# example:

```
public void CreateMySqlCommand()
{
    MySqlCommand myCommand = new MySqlCommand();
    myCommand.CommandText = "SELECT * FROM mytable ORDER BY id";
    myCommand.CommandType = CommandType.Text;
}
```

24.2.3.1.11. CommandTimeout

Gets or sets the wait time before terminating the attempt to execute a command and generating an error.

Value: The time (in seconds) to wait for the command to execute. The default is 0 seconds.

MySQL currently does not support any method of canceling a pending or executing operation. All commands issued against a MySQL server will execute until completion or until an exception occurs.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about `CommandTimeout` in the Knowledge Base article, [Why CommandTimeout is not Supported](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

24.2.3.1.12. CommandType

Gets or sets a value indicating how the `CommandText` property is to be interpreted.

Value: One of the `System.Data.CommandType` values. The default is `Text`.

When you set the `CommandType` property to `StoredProcedure`, you should set the `CommandText` property to the name of the stored procedure. The command executes this stored procedure when you call one of the `Execute` methods.

Examples

The following example creates a `MySqlCommand` and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySqlCommand()
    Dim myCommand As New MySqlCommand()
    myCommand.CommandType = CommandType.Text
End Sub
```

C# example:

```
public void CreateMySqlCommand()
{
    MySqlCommand myCommand = new MySqlCommand();
    myCommand.CommandType = CommandType.Text;
}
```

24.2.3.1.13. Connection

Gets or sets the [MySQLConnection](#) used by this instance of the [MySQLCommand](#).

Value: The connection to a data source. The default value is a null reference ([Nothing](#) in Visual Basic).

If you set [Connection](#) while a transaction is in progress and the [Transaction](#) property is not null, an [InvalidOperationException](#) is generated. If the [Transaction](#) property is not null and the transaction has already been committed or rolled back, [Transaction](#) is set to null.

Examples

The following example creates a [MySQLCommand](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySQLCommand()
    Dim mySelectQuery As String = "SELECT * FROM mytable ORDER BY id"
    Dim myConnectionString As String = "Persist Security Info=False;database=test;server=myServer"
    Dim myCommand As New MySQLCommand(mySelectQuery)
    myCommand.Connection = New MySQLConnection(myConnectionString)
    myCommand.CommandType = CommandType.Text
End Sub
```

C# example:

```
public void CreateMySQLCommand()
{
    string mySelectQuery = "SELECT * FROM mytable ORDER BY id";
    string myConnectionString = "Persist Security Info=False;database=test;server=myServer";
    MySQLCommand myCommand = new MySQLCommand(mySelectQuery);
    myCommand.Connection = new MySQLConnection(myConnectionString);
    myCommand.CommandType = CommandType.Text;
}
```

24.2.3.1.14. IsPrepared

Returns true if the statement is prepared.

24.2.3.1.15. Parameters

Get the [MySQLParameterCollection](#)

Value: The parameters of the SQL statement or stored procedure. The default is an empty collection.

Connector/Net does not support unnamed parameters. Every parameter added to the collection must have an associated name.

Examples

The following example creates a [MySQLCommand](#) and displays its parameters. To accomplish this, the method is passed a [MySQLConnection](#), a query string that is a SQL [SELECT](#) statement, and an array of [MySQLParameter](#) objects.

Visual Basic example:

```
Public Sub CreateMySQLCommand(myConnection As MySQLConnection, _
mySelectQuery As String, myParamArray() As MySQLParameter)
    Dim myCommand As New MySQLCommand(mySelectQuery, myConnection)
    myCommand.CommandText = "SELECT id, name FROM mytable WHERE age=@age"
    myCommand.UpdatedRowSource = UpdateRowSource.Both
    myCommand.Parameters.Add(myParamArray)
    Dim j As Integer
    For j = 0 To myCommand.Parameters.Count - 1
        myCommand.Parameters.Add(myParamArray(j))
    Next j
    Dim myMessage As String = ""
    Dim i As Integer
    For i = 0 To myCommand.Parameters.Count - 1
        myMessage += myCommand.Parameters(i).ToString() & ControlChars.Cr
    Next i
    Console.WriteLine(myMessage)
End Sub
```

C# example:

```
public void CreateMySQLCommand(MySQLConnection myConnection, string mySelectQuery,
MySQLParameter[] myParamArray)
{
    MySQLCommand myCommand = new MySQLCommand(mySelectQuery, myConnection);
    myCommand.CommandText = "SELECT id, name FROM mytable WHERE age=@age";
    myCommand.Parameters.Add(myParamArray);
    for (int j=0; j<myParamArray.Length; j++)
```

```

{
    myCommand.Parameters.Add(myParamArray[j]) ;
}
string myMessage = "";
for (int i = 0; i < myCommand.Parameters.Count; i++)
{
    myMessage += myCommand.Parameters[i].ToString() + "\n";
}
MessageBox.Show(myMessage);
}

```

24.2.3.1.16. Transaction

Gets or sets the [MySqlCommandTransaction](#) within which the [MySqlCommand](#) executes.

Value: The [MySqlCommandTransaction](#). The default value is a null reference ([Nothing](#) in Visual Basic).

You cannot set the [Transaction](#) property if it is already set to a specific value, and the command is in the process of executing. If you set the transaction property to a [MySqlCommandTransaction](#) object that is not connected to the same [MySqlConnection](#) as the [MySqlCommand](#) object, an exception will be thrown the next time you attempt to execute a statement.

24.2.3.1.17. UpdatedRowSource

Gets or sets how command results are applied to the [DataRow](#) when used by the [System.Data.Common.DbDataAdapter.Update](#) method of the [System.Data.Common.DbDataAdapter](#).

Value: One of the [UpdateRowSource](#) values.

The default [System.Data.UpdateRowSource](#) value is [Both](#) unless the command is automatically generated (as in the case of the [MySqlCommandBuilder](#)), in which case the default is [None](#).

24.2.3.2. Using MySqlCommandBuilder

Automatically generates single-table commands used to reconcile changes made to a [DataSet](#) with the associated MySQL database. This class cannot be inherited.

The [MySqlDataAdapter](#) does not automatically generate the SQL statements required to reconcile changes made to a [System.Data.DataSet](#) with the associated instance of MySQL. However, you can create a [MySqlCommandBuilder](#) object to automatically generate SQL statements for single-table updates if you set the [MySqlDataAdapter.SelectCommand](#) property of the [MySqlDataAdapter](#). Then, any additional SQL statements that you do not set are generated by the [MySqlCommandBuilder](#).

The [MySqlCommandBuilder](#) registers itself as a listener for [MySqlDataAdapter.OnRowUpdating](#) events whenever you set the [DataAdapter](#) property. You can only associate one [MySqlDataAdapter](#) or [MySqlCommandBuilder](#) object with each other at one time.

To generate INSERT, UPDATE, or DELETE statements, the [MySqlCommandBuilder](#) uses the [SelectCommand](#) property to retrieve a required set of metadata automatically. If you change the [SelectCommand](#) after the metadata has been retrieved (for example, after the first update), you should call the [RefreshSchema](#) method to update the metadata.

The [SelectCommand](#) must also return at least one primary key or unique column. If none are present, an [InvalidOperationException](#) exception is generated, and the commands are not generated.

When using [MySqlCommandBuilder](#) and [INSERT](#) you should set the [ReturnGeneratedIdentifiers](#) property to [true](#) to ensure that [AUTO_INCREMENT](#) fields in MySQL tables return the automatically generated value.

The [MySqlCommandBuilder](#) also uses the [MySqlCommand.Connection](#), [MySqlCommand.CommandTimeout](#), and [MySqlCommand.Transaction](#) properties referenced by the [SelectCommand](#). The user should call [RefreshSchema](#) if any of these properties are modified, or if the [SelectCommand](#) itself is replaced. Otherwise the [MySqlDataAdapter.InsertCommand](#), [MySqlDataAdapter.UpdateCommand](#), and [MySqlDataAdapter.DeleteCommand](#) properties retain their previous values.

If you call [Dispose](#), the [MySqlCommandBuilder](#) is disassociated from the [MySqlDataAdapter](#), and the generated commands are no longer used.

Note

Caution must be used when using [MySqlCommandBuilder](#) on MySQL 4.0 systems. With MySQL 4.0, database/schema information is not provided to the connector for a query. This means that a query that pulls columns from two identically named tables in two or more different databases will not cause an exception to be thrown but will not work correctly. Even more dangerous is the situation where your select statement references database X but is executed in

database Y and both databases have tables with similar layouts. This situation can cause unwanted changes or deletes. This note does not apply to MySQL versions 4.1 and later.

Examples

The following example uses the `MySqlCommand`, along `MySqlDataAdapter` and `MySqlConnection`, to select rows from a data source. The example is passed an initialized `System.Data.DataSet`, a connection string, a query string that is an SQL `SELECT` statement, and a string that is the name of the database table. The example then creates a `MySqlCommandBuilder`.

Visual Basic example:

```
Public Shared Function SelectRows(myConnection As String, mySelectQuery As String, myTableName As String) As DataSet
    Dim myConn As New MySqlConnection(myConnection)
    Dim myDataAdapter As New MySqlDataAdapter()
    myDataAdapter.SelectCommand = New MySqlCommand(mySelectQuery, myConn)
    Dim cb As SqlCommandBuilder = New MySqlCommandBuilder(myDataAdapter)
    myConn.Open()
    Dim ds As DataSet = New DataSet
    myDataAdapter.Fill(ds, myTableName)
    ' Code to modify data in DataSet here
    ' Without the MySqlCommandBuilder this line would fail.
    myDataAdapter.Update(ds, myTableName)
    myConn.Close()
End Function 'SelectRows
```

C# example:

```
public static DataSet SelectRows(string myConnection, string mySelectQuery, string myTableName)
{
    MySqlConnection myConn = new MySqlConnection(myConnection);
    MySqlDataAdapter myDataAdapter = new MySqlDataAdapter();
    myDataAdapter.SelectCommand = new MySqlCommand(mySelectQuery, myConn);
    MySqlCommandBuilder cb = new MySqlCommandBuilder(myDataAdapter);
    myConn.Open();
    DataSet ds = new DataSet();
    myDataAdapter.Fill(ds, myTableName);
    //code to modify data in DataSet here
    //Without the MySqlCommandBuilder this line would fail
    myDataAdapter.Update(ds, myTableName);
    myConn.Close();
    return ds;
}
```

24.2.3.2.1. Class MySqlCommandBuilder Constructor

Initializes a new instance of the `MySqlCommandBuilder` class.

24.2.3.2.2. Class MySqlCommandBuilder Constructor Form 1

Initializes a new instance of the `MySqlCommandBuilder` class and sets the last one wins property.

Parameters: False to generate change protection code. True otherwise.

The `lastOneWins` parameter indicates whether SQL code should be included with the generated DELETE and UPDATE commands that checks the underlying data for changes. If `lastOneWins` is true then this code is not included and data records could be overwritten in a multi-user or multi-threaded environments. Setting `lastOneWins` to false will include this check which will cause a concurrency exception to be thrown if the underlying data record has changed without our knowledge.

24.2.3.2.3. Class MySqlCommandBuilder Constructor Form 2

Initializes a new instance of the `MySqlCommandBuilder` class with the associated `MySqlDataAdapter` object.

Parameters: The `MySqlDataAdapter` to use.

The `MySqlCommandBuilder` registers itself as a listener for `MySqlDataAdapter.RowUpdating` events that are generated by the `MySqlDataAdapter` specified in this property.

When you create a new instance `MySqlCommandBuilder`, any existing `MySqlCommandBuilder` associated with this `MySqlDataAdapter` is released.

24.2.3.2.4. Class MySqlCommandBuilder Constructor Form 3

Initializes a new instance of the `MySqlCommandBuilder` class with the associated `MySqlDataAdapter` object.

Parameters: The `MySqlDataAdapter` to use.

Parameters: False to generate change protection code. True otherwise.

The `MySqlCommandBuilder` registers itself as a listener for `MySqlDataAdapter.RowUpdating` events that are generated by the `MySqlDataAdapter` specified in this property.

When you create a new instance `MySqlCommandBuilder`, any existing `MySqlCommandBuilder` associated with this `MySqlDataAdapter` is released.

The `lastOneWins` parameter indicates whether SQL code should be included with the generated DELETE and UPDATE commands that checks the underlying data for changes. If `lastOneWins` is true then this code is not included and data records could be overwritten in a multi-user or multi-threaded environments. Setting `lastOneWins` to false will include this check which will cause a concurrency exception to be thrown if the underlying data record has changed without our knowledge.

24.2.3.2.5. DataAdapter

Gets or sets a `MySqlDataAdapter` object for which SQL statements are automatically generated.

Value: A `MySqlDataAdapter` object.

The `MySqlCommandBuilder` registers itself as a listener for `MySqlDataAdapter.RowUpdating` events that are generated by the `MySqlDataAdapter` specified in this property.

When you create a new instance `MySqlCommandBuilder`, any existing `MySqlCommandBuilder` associated with this `MySqlDataAdapter` is released.

24.2.3.2.6. QuotePrefix

Gets or sets the beginning character or characters to use when specifying MySQL database objects (for example, tables or columns) whose names contain characters such as spaces or reserved tokens.

Value: The beginning character or characters to use. The default value is `.

Database objects in MySQL can contain special characters such as spaces that would make normal SQL strings impossible to correctly parse. Use of the `QuotePrefix` and the `QuoteSuffix` properties allows the `MySqlCommandBuilder` to build SQL statements that handle this situation.

24.2.3.2.7. QuoteSuffix

Gets or sets the beginning character or characters to use when specifying MySQL database objects (for example, tables or columns) whose names contain characters such as spaces or reserved tokens.

Value: The beginning character or characters to use. The default value is `.

Database objects in MySQL can contain special characters such as spaces that would make normal SQL strings impossible to correctly parse. Use of the `QuotePrefix` and the `QuoteSuffix` properties allows the `MySqlCommandBuilder` to build SQL statements that handle this situation.

24.2.3.2.8. DeriveParameters

24.2.3.2.9. GetDeleteCommand

Gets the automatically generated `MySqlCommand` object required to perform deletions on the database.

Returns: The `MySqlCommand` object generated to handle delete operations.

An application can use the `GetDeleteCommand` method for informational or troubleshooting purposes because it returns the `MySqlCommand` object to be executed.

You can also use `GetDeleteCommand` as the basis of a modified command. For example, you might call `GetDeleteCommand` and modify the `MySqlCommand.CommandTimeout` value, and then explicitly set that on the `MySqlDataAdapter`.

After the SQL statement is first generated, the application must explicitly call `RefreshSchema` if it changes the statement in any way. Otherwise, the `GetDeleteCommand` will be still be using information from the previous statement, which might not be correct. The SQL statements are first generated either when the application calls `System.Data.Common.DataAdapter.Update` or `GetDeleteCommand`.

24.2.3.2.10. GetInsertCommand

Gets the automatically generated `MySQLCommand` object required to perform insertions on the database.

Returns: The `MySQLCommand` object generated to handle insert operations.

An application can use the `GetInsertCommand` method for informational or troubleshooting purposes because it returns the `MySQLCommand` object to be executed.

You can also use the `GetInsertCommand` as the basis of a modified command. For example, you might call `GetInsertCommand` and modify the `MySQLCommand.CommandTimeout` value, and then explicitly set that on the `MySQLDataAdapter`.

After the SQL statement is first generated, the application must explicitly call `RefreshSchema` if it changes the statement in any way. Otherwise, the `GetInsertCommand` will be still be using information from the previous statement, which might not be correct. The SQL statements are first generated either when the application calls `System.Data.Common.DataAdapter.Update` or `GetInsertCommand`.

24.2.3.2.11. GetUpdateCommand

Gets the automatically generated `MySQLCommand` object required to perform updates on the database.

Returns: The `MySQLCommand` object generated to handle update operations.

An application can use the `GetUpdateCommand` method for informational or troubleshooting purposes because it returns the `MySQLCommand` object to be executed.

You can also use `GetUpdateCommand` as the basis of a modified command. For example, you might call `GetUpdateCommand` and modify the `MySQLCommand.CommandTimeout` value, and then explicitly set that on the `MySQLDataAdapter`.

After the SQL statement is first generated, the application must explicitly call `RefreshSchema` if it changes the statement in any way. Otherwise, the `GetUpdateCommand` will be still be using information from the previous statement, which might not be correct. The SQL statements are first generated either when the application calls `System.Data.Common.DataAdapter.Update` or `GetUpdateCommand`.

24.2.3.2.12. RefreshSchema

Refreshes the database schema information used to generate INSERT, UPDATE, or DELETE statements.

An application should call `RefreshSchema` whenever the `SELECT` statement associated with the `MySQLCommandBuilder` changes.

An application should call `RefreshSchema` whenever the `MySQLDataAdapter.SelectCommand` value of the `MySQLDataAdapter` changes.

MySQL Enterprise

MySQL Enterprise subscribers will find more information on this topic in the Knowledge Base article, [Understanding MySqlCommandBuilder and the LastOneWins Setting](#). For information about subscribing to MySQL Enterprise see <http://www.mysql.com/products/enterprise/advisors.html>.

24.2.3.3. Using MySqlConnection

Represents an open connection to a MySQL Server database. This class cannot be inherited.

A `MySqlConnection` object represents a session to a MySQL Server data source. When you create an instance of `MySqlConnection`, all properties are set to their initial values. For a list of these values, see the `MySqlConnection` constructor.

If the `MySqlConnection` goes out of scope, it is not closed. Therefore, you must explicitly close the connection by calling `MySqlConnection.Close` or `MySqlConnection.Dispose`.

Examples

The following example creates a `MySQLCommand` and a `MySqlConnection`. The `MySqlConnection` is opened and set as the `MySQLCommand.Connection` for the `MySQLCommand`. The example then calls `MySQLCommand.ExecuteNonQuery`, and closes the connection. To accomplish this, the `ExecuteNonQuery` is passed a connection string and a query string that is an SQL INSERT statement.

Visual Basic example:

```
Public Sub InsertRow(myConnectionString As String)
    ' If the connection string is null, use a default.
    If myConnectionString = "" Then
        myConnectionString = "Database=Test;Data Source=localhost;User Id=username;Password=pass"
    End If
    Dim myConnection As New MySqlConnection(myConnectionString)
```

```

Dim myInsertQuery As String = "INSERT INTO Orders (id, customerId, amount) Values(1001, 23, 30.66)"
Dim myCommand As New MySqlCommand(myInsertQuery)
myCommand.Connection = myConnection
myConnection.Open()
myCommand.ExecuteNonQuery()
myCommand.Connection.Close()
End Sub

```

C# example:

```

public void InsertRow(string myConnectionString)
{
    // If the connection string is null, use a default.
    if(myConnectionString == "")
    {
        myConnectionString = "Database=Test;Data Source=localhost;User Id=username;Password=pass";
    }
    MySqlConnection myConnection = new MySqlConnection(myConnectionString);
    string myInsertQuery = "INSERT INTO Orders (id, customerId, amount) Values(1001, 23, 30.66)";
    MySqlCommand myCommand = new MySqlCommand(myInsertQuery);
    myCommand.Connection = myConnection;
    myConnection.Open();
    myCommand.ExecuteNonQuery();
    myCommand.Connection.Close();
}

```

24.2.3.3.1. Class MySqlConnection Constructor (Default)

Initializes a new instance of the [MySqlConnection](#) class.

When a new instance of [MySqlConnection](#) is created, the read/write properties are set to the following initial values unless they are specifically set using their associated keywords in the [ConnectionString](#) property.

Properties	Initial Value
ConnectionString	empty string ("")
ConnectionTimeout	15
Database	empty string ("")
DataSource	empty string ("")
ServerVersion	empty string ("")

You can change the value for these properties only by using the [ConnectionString](#) property.

Examples

Overload methods for MySqlConnection

Initializes a new instance of the [MySqlConnection](#) class.

24.2.3.3.2. Class MySqlConnection Constructor Form 1

Initializes a new instance of the [MySqlConnection](#) class when given a string containing the connection string.

When a new instance of [MySqlConnection](#) is created, the read/write properties are set to the following initial values unless they are specifically set using their associated keywords in the [ConnectionString](#) property.

Properties	Initial Value
ConnectionString	empty string ("")
ConnectionTimeout	15
Database	empty string ("")
DataSource	empty string ("")
ServerVersion	empty string ("")

You can change the value for these properties only by using the [ConnectionString](#) property.

Examples

Parameters: The connection properties used to open the MySQL database.

24.2.3.3.3. ConnectionString

Gets or sets the string used to connect to a MySQL Server database.

The `ConnectionString` returned may not be exactly like what was originally set but will be identical in terms of keyword/value pairs. Security information will not be included unless the Persist Security Info value is set to true.

You can use the `ConnectionString` property to connect to a database. The following example illustrates a typical connection string.

```
"Persist Security Info=False;database=MyDB;»
server=MySqlServer;user id=myUser;Password=myPass"
```

The `ConnectionString` property can be set only when the connection is closed. Many of the connection string values have corresponding read-only properties. When the connection string is set, all of these properties are updated, except when an error is detected. In this case, none of the properties are updated. `MySQLConnection` properties return only those settings contained in the `ConnectionString`.

To connect to a local machine, specify "localhost" for the server. If you do not specify a server, localhost is assumed.

Resetting the `ConnectionString` on a closed connection resets all connection string values (and related properties) including the password. For example, if you set a connection string that includes "Database= MyDb", and then reset the connection string to "Data Source=myserver;User Id=myUser;Password=myPass", the `MySQLConnection.Database` property is no longer set to MyDb.

The connection string is parsed immediately after being set. If errors in syntax are found when parsing, a runtime exception, such as `ArgumentException`, is generated. Other errors can be found only when an attempt is made to open the connection.

The basic format of a connection string consists of a series of keyword/value pairs separated by semicolons. The equal sign (=) connects each keyword and its value. Additional notes on setting values for options:

- To include values that contain a semicolon, single-quote character, or double-quote character, the value must be enclosed in double quotes. If the value contains both a semicolon and a double-quote character, the value can be enclosed in single quotes. The single quote is also useful if the value begins with a double-quote character. Conversely, the double quote can be used if the value begins with a single quote. If the value contains both single-quote and double-quote characters, the quote character used to enclose the value must be doubled each time it occurs within the value.
- To include preceding or trailing spaces in the string value, the value must be enclosed in either single quotes or double quotes. Any leading or trailing spaces around integer, Boolean, or enumerated values are ignored, even if enclosed in quotes. However, spaces within a string literal keyword or value are preserved. Using .NET Framework version 1.1, single or double quotes may be used within a connection string without using delimiters (for example, Data Source= my'Server or Data Source= my"Server), unless a quote character is the first or last character in the value.
- To include an equal sign (=) in a keyword or value, it must be preceded by another equal sign. For example, in the hypothetical connection string

```
"key==word=value"
```

the keyword is "key=word" and the value is "value".

- If a specific keyword in a keyword= value pair occurs multiple times in a connection string, the last occurrence listed is used in the value set.
- Keywords are not case sensitive.

The following table lists the valid names for keyword values within the `ConnectionString`.

Name	Default	Description
<code>Connect Timeout</code> , <code>Connection Timeout</code>	15	The length of time (in seconds) to wait for a connection to the server before terminating the attempt and generating an error.
<code>Host</code> , <code>Server</code> , <code>Data Source</code> , <code>Data-Source</code> , <code>Address</code> , <code>Addr</code> , <code>Network Address</code>	localhost	The name or network address of the instance of MySQL to which to connect. Multiple hosts can be specified separated by &. This can be useful where multiple MySQL servers are configured for replication and you are not concerned about the precise server you are connecting to. No attempt is made by the provider to synchronize writes to the

		database so care should be taken when using this option. In Unix environment with Mono, this can be a fully qualified path to MySQL socket filename. With this configuration, the Unix socket will be used instead of TCP/IP socket. Currently only a single socket name can be given so accessing MySQL in a replicated environment using Unix sockets is not currently supported.
Ignore Prepare	true	When true, instructs the provider to ignore any calls to <code>MySqlCommand.Prepare()</code> . This option is provided to prevent issues with corruption of the statements when use with server side prepared statements. If you want to use server-side prepare statements, set this option to false. This option was added in Connector/NET 5.0.3 and Connector/NET 1.0.9.
Port	3306	The port MySQL is using to listen for connections. Specify -1 for this value to use a named pipe connection (Windows only). This value is ignored if Unix socket is used.
Protocol	socket	Specifies the type of connection to make to the server. Values can be: socket or tcp for a socket connection pipe for a named pipe connection unix for a Unix socket connection memory to use MySQL shared memory
CharSet, Character Set		Specifies the character set that should be used to encode all queries sent to the server. Resultsets are still returned in the character set of the data returned.
Logging	false	When true, various pieces of information is output to any configured TraceListeners.
Allow Batch	true	When true, multiple SQL statements can be sent with one command execution. -Note- Starting with MySQL 4.1.1, batch statements should be separated by the server-defined separator character. Commands sent to earlier versions of MySQL should be separated with ';'.
Encrypt	false	For Connector/NET 5.0.3 and later, when true, SSL encryption is used for all data sent between the client and server if the server has a certificate installed. Recognized values are true, false, yes, and no. In versions before 5.0.3, this option had no effect.
Initial Catalog, Database	mysql	The name of the database to use intially
Password, pwd		The password for the MySQL account being used.
Persist Security Info	false	When set to false or no (strongly recommended), security-sensitive information, such as the password, is not returned as part of the connection if the connection is open or has ever been in an open state. Re-setting the connection string resets all connection string values including the password. Recognized values are true, false, yes, and no.
User Id, Username, Uid, User name		The MySQL login account being used.
Shared Memory Name	MYSQL	The name of the shared memory object to use for communication if the connection protocol is set to memory.
Allow Zero Datetime	false	True to have <code>MySqlDataReader.GetValue()</code> return a <code>MySqlDateTime</code> for date or datetime columns that have illegal values. False will cause a <code>System.DateTime</code> object to be returned for legal values and an exception will be thrown for illegal values.
Convert Zero Datetime	false	True to have <code>MySqlDataReader.GetValue()</code> and <code>MySqlDataReader.GetDateTime()</code> return <code>DateTime.MinValue</code> for date or datetime columns that have illegal values.
Old Syntax, OldSyntax	false	Allows use of '@' symbol as a parameter marker. See <code>MySqlCommand</code> for more info. This option was deprecated in Connector/NET 5.2.2. All future code should be written using the '@' symbol.
Pipe Name, Pipe	mysql	When set to the name of a named pipe, the <code>MySqlConnection</code> will attempt to connect to MySQL on that named pipe. This settings only applies to the Windows platform.
Procedure Cache	25	Sets the size of the stored procedure cache. By default, Connector/NET will store the metadata (input/output datatypes) about the last 25 stored procedures used. To disable the stored procedure cache, set the value to zero (0). This option was added in Connector/NET 5.0.2 and Connector/NET 1.0.9.
Use Procedure Bodies	true	Setting this option to false indicates that the user connecting to the

		database does not have the <code>SELECT</code> privileges for the <code>mysql.proc</code> (stored procedures) table. When to set to <code>false</code> , Connector/NET will not rely on this information being available when the procedure is called. Because Connector/NET will be unable to determine this information, you should explicitly set the types of the all the parameters before the call and the parameters should be added to the command in the exact same order as they appear in the procedure definition. This option was added in Connector/NET 5.0.4 and Connector/NET 1.0.10.
<code>default command timeout</code>		Sets the default value of the command timeout to be used. This does not supercede the individual command timeout property on an individual command object. If you set the command timeout property, that will be used. This option was added in Connector/NET 5.1.4
<code>Treat Tiny As Boolean</code>	<code>true</code>	Setting this value to <code>false</code> indicates that <code>TINYINT(1)</code> will be treated as an <code>INT</code> . See also Section 10.1.1, "Overview of Numeric Types" for a further explanation of the <code>TINYINT</code> and <code>BOOL</code> data types.
<code>Allow User Variables</code>	<code>false</code>	Setting this to <code>true</code> indicates that the provider expects user variables in the SQL. This option was added in Connector/NET version 5.2.2.

The following table lists the valid names for connection pooling values within the `ConnectionString`. For more information about connection pooling, see [Connection Pooling for the MySQL Data Provider](#).

Name	Default	Description
<code>Connection Lifetime</code>	0	When a connection is returned to the pool, its creation time is compared with the current time, and the connection is destroyed if that time span (in seconds) exceeds the value specified by <code>Connection Lifetime</code> . This is useful in clustered configurations to force load balancing between a running server and a server just brought online. A value of zero (0) causes pooled connections to have the maximum connection timeout.
<code>Max Pool Size</code>	100	The maximum number of connections allowed in the pool.
<code>Min Pool Size</code>	0	The minimum number of connections allowed in the pool.
<code>Pooling</code>	<code>true</code>	When <code>true</code> , the <code>MySqlConnection</code> object is drawn from the appropriate pool, or if necessary, is created and added to the appropriate pool. Recognized values are <code>true</code> , <code>false</code> , <code>yes</code> , and <code>no</code> .
<code>Reset Pooled Connections, ResetConnections, ResetPooledConnections</code>	<code>true</code>	Specifies whether a ping and a reset should be sent to the server before a pooled connection is returned. Not resetting will yield faster connection opens but also will not clear out session items such as temp tables.
<code>Cache Server Configuration, CacheServerConfiguration, CacheServerConfig</code>	<code>false</code>	Specifies whether server variables should be updated when a pooled connection is returned. Turning this one will yeild faster opens but will also not catch any server changes made by other connections.

When setting keyword or connection pooling values that require a Boolean value, you can use 'yes' instead of 'true', and 'no' instead of 'false'.

Note

The MySQL Data Provider uses the native socket protocol to communicate with MySQL. Therefore, it does not support the use of an ODBC data source name (DSN) when connecting to MySQL because it does not add an ODBC layer.

Caution

In this release, the application should use caution when constructing a connection string based on user input (for example when retrieving user ID and password information from a dialog box, and appending it to the connection string). The application should ensure that a user cannot embed extra connection string parameters in these values (for example, entering a password as "validpassword;database=somedb" in an attempt to attach to a different database).

Examples

The following example creates a `MySqlConnection` and sets some of its properties

Visual Basic example:

```
Public Sub CreateConnection()
    Dim myConnection As New MySqlConnection()
    myConnection.ConnectionString = "Persist Security Info=False;database=myDB;server=myHost;Connect Timeout=30;user id=
myConnection.Open()
End Sub 'CreateConnection
```

C# example:

```
public void CreateConnection()
{
    MySqlConnection myConnection = new MySqlConnection();
    myConnection.ConnectionString = "Persist Security Info=False;database=myDB;server=myHost;Connect Timeout=30;user id=
myConnection.Open();
}
```

Examples

The following example creates a [MySqlConnection](#) in Unix environment with Mono installed. MySQL socket filename used in this example is `"/var/lib/mysql/mysql.sock"`. The actual filename depends on your MySQL configuration.

Visual Basic example:

```
Public Sub CreateConnection()
    Dim myConnection As New MySqlConnection()
    myConnection.ConnectionString = "database=myDB;server=/var/lib/mysql/mysql.sock;user id=myUser; pwd=myPass"
    myConnection.Open()
End Sub 'CreateConnection
```

C# example:

```
public void CreateConnection()
{
    MySqlConnection myConnection = new MySqlConnection();
    myConnection.ConnectionString = "database=myDB;server=/var/lib/mysql/mysql.sock;user id=myUser; pwd=myPass";
    myConnection.Open();
}
```

24.2.3.3.4. Open

Opens a database connection with the property settings specified by the `ConnectionString`.

Exception: Cannot open a connection without specifying a data source or server.

Exception: A connection-level error occurred while opening the connection.

The [MySqlConnection](#) draws an open connection from the connection pool if one is available. Otherwise, it establishes a new connection to an instance of MySQL.

Examples

The following example creates a [MySqlConnection](#), opens it, displays some of its properties, then closes the connection.

Visual Basic example:

```
Public Sub CreateMySqlConnection(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion _
+ ControlChars.Cr + "State: " + myConnection.State.ToString())
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySqlConnection(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion +
"\nState: " + myConnection.State.ToString());
    myConnection.Close();
}
```

24.2.3.3.5. Database

Gets the name of the current database or the database to be used after a connection is opened.

Returns: The name of the current database or the name of the database to be used after a connection is opened. The default value is an empty string.

The `Database` property does not update dynamically. If you change the current database using an SQL statement, then this property may reflect the wrong value. If you change the current database using the `ChangeDatabase` method, this property is updated to reflect the new database.

Examples

The following example creates a `MySqlConnection` and displays some of its read-only properties.

Visual Basic example:

```
Public Sub CreateMySQLConnection()
    Dim myConnString As String = _
        "Persist Security Info=False;database=test;server=localhost;user id=joeuser;pwd=pass"
    Dim myConnection As New MySqlConnection( myConnString )
    myConnection.Open()
    MessageBox.Show( "Server Version: " + myConnection.ServerVersion _
        + ControlChars.NewLine + "Database: " + myConnection.Database )
    myConnection.ChangeDatabase( "test2" )
    MessageBox.Show( "ServerVersion: " + myConnection.ServerVersion _
        + ControlChars.NewLine + "Database: " + myConnection.Database )
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySQLConnection()
{
    string myConnString =
        "Persist Security Info=False;database=test;server=localhost;user id=joeuser;pwd=pass";
    MySqlConnection myConnection = new MySqlConnection( myConnString );
    myConnection.Open();
    MessageBox.Show( "Server Version: " + myConnection.ServerVersion
        + "\nDatabase: " + myConnection.Database );
    myConnection.ChangeDatabase( "test2" );
    MessageBox.Show( "ServerVersion: " + myConnection.ServerVersion
        + "\nDatabase: " + myConnection.Database );
    myConnection.Close();
}
```

24.2.3.3.6. State

Gets the current state of the connection.

Returns: A bitwise combination of the `System.Data.ConnectionState` values. The default is `Closed`.

The allowed state changes are:

- From `Closed` to `Open`, using the `Open` method of the connection object.
- From `Open` to `Closed`, using either the `Close` method or the `Dispose` method of the connection object.

Examples

The following example creates a `MySqlConnection`, opens it, displays some of its properties, then closes the connection.

Visual Basic example:

```
Public Sub CreateMySQLConnection(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion _
        + ControlChars.Cr + "State: " + myConnection.State.ToString())
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySQLConnection(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion +
        "\nState: " + myConnection.State.ToString());
    myConnection.Close();
}
```

24.2.3.3.7. ServerVersion

Gets a string containing the version of the MySQL server to which the client is connected.

Returns: The version of the instance of MySQL.

Exception: The connection is closed.

Examples

The following example creates a [MySqlConnection](#), opens it, displays some of its properties, then closes the connection.

Visual Basic example:

```
Public Sub CreateMySQLConnection(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion _
        + ControlChars.Cr + "State: " + myConnection.State.ToString())
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySQLConnection(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion +
        "\nState: " + myConnection.State.ToString());
    myConnection.Close();
}
```

24.2.3.3.8. Close

Closes the connection to the database. This is the preferred method of closing any open connection.

The [Close](#) method rolls back any pending transactions. It then releases the connection to the connection pool, or closes the connection if connection pooling is disabled.

An application can call [Close](#) more than one time. No exception is generated.

Examples

The following example creates a [MySqlConnection](#), opens it, displays some of its properties, then closes the connection.

Visual Basic example:

```
Public Sub CreateMySQLConnection(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion _
        + ControlChars.Cr + "State: " + myConnection.State.ToString())
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySQLConnection(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion +
        "\nState: " + myConnection.State.ToString());
    myConnection.Close();
}
```

24.2.3.3.9. CreateCommand

Creates and returns a [MySqlCommand](#) object associated with the [MySqlConnection](#) .

Returns: A [MySqlCommand](#) object.

24.2.3.3.10. BeginTransaction

Begins a database transaction.

Returns: An object representing the new transaction.

Exception: Parallel transactions are not supported.

This command is equivalent to the MySQL `BEGIN TRANSACTION` command.

You must explicitly commit or roll back the transaction using the [MySqlCommand.Commit](#) or [MySqlCommand.Rollback](#) method.

Note

If you do not specify an isolation level, the default isolation level is used. To specify an isolation level with the [MySqlCommand.BeginTransaction](#) method, use the overload that takes the `iso` parameter.

Examples

The following example creates a [MySqlConnection](#) and a [MySqlCommand](#) . It also demonstrates how to use the [MySqlCommand.BeginTransaction](#) , a [MySqlCommand.Commit](#) , and [MySqlCommand.Rollback](#) methods.

Visual Basic example:

```
Public Sub RunTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

    Dim myCommand As MySqlCommand = myConnection.CreateCommand()
    Dim myTrans As MySqlTransaction

    ' Start a local transaction
    myTrans = myConnection.BeginTransaction()
    ' Must assign both transaction object and connection
    ' to Command object for a pending local transaction
    myCommand.Connection = myConnection
    myCommand.Transaction = myTrans

    Try
        myCommand.CommandText = "Insert into Test (id, desc) VALUES (100, 'Description')"
        myCommand.ExecuteNonQuery()
        myCommand.CommandText = "Insert into Test (id, desc) VALUES (101, 'Description')"
        myCommand.ExecuteNonQuery()
        myTrans.Commit()
        Console.WriteLine("Both records are written to database.")
    Catch e As Exception
        Try
            myTrans.Rollback()
        Catch ex As MySqlException
            If Not myTrans.Connection Is Nothing Then
                Console.WriteLine("An exception of type " + ex.GetType().ToString() + _
                    " was encountered while attempting to roll back the transaction.")
            End If
        End Try

        Console.WriteLine("An exception of type " + e.GetType().ToString() + _
            " was encountered while inserting the data.")
        Console.WriteLine("Neither record was written to database.")
    Finally
        myConnection.Close()
    End Try
End Sub
```

C# example:

```
public void RunTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();
    MySqlTransaction myTrans;
    // Start a local transaction
    myTrans = myConnection.BeginTransaction();
    // Must assign both transaction object and connection
    // to Command object for a pending local transaction
```

```

myCommand.Connection = myConnection;
myCommand.Transaction = myTrans;
    try
    {
        myCommand.CommandText = "insert into Test (id, desc) VALUES (100, 'Description')";
        myCommand.ExecuteNonQuery();
        myCommand.CommandText = "insert into Test (id, desc) VALUES (101, 'Description')";
        myCommand.ExecuteNonQuery();
        myTrans.Commit();
        Console.WriteLine("Both records are written to database.");
    }
    catch(Exception e)
    {
        try
        {
            myTrans.Rollback();
        }
        catch (SqlException ex)
        {
            if (myTrans.Connection != null)
            {
                Console.WriteLine("An exception of type " + ex.GetType() +
                    " was encountered while attempting to roll back the transaction.");
            }
        }

        Console.WriteLine("An exception of type " + e.GetType() +
            " was encountered while inserting the data.");
        Console.WriteLine("Neither record was written to database.");
    }
}
finally
{
    myConnection.Close();
}
}

```

24.2.3.3.11. BeginTransaction1

Begins a database transaction with the specified isolation level.

Parameters: The isolation level under which the transaction should run.

Returns: An object representing the new transaction.

Exception: Parallel exceptions are not supported.

This command is equivalent to the MySQL BEGIN TRANSACTION command.

You must explicitly commit or roll back the transaction using the [MySQLTransaction.Commit](#) or [MySQLTransaction.Rollback](#) method.

Note

If you do not specify an isolation level, the default isolation level is used. To specify an isolation level with the [BeginTransaction](#) method, use the overload that takes the `iso` parameter.

Examples

The following example creates a [MySQLConnection](#) and a [MySQLTransaction](#). It also demonstrates how to use the [BeginTransaction](#), a [MySQLTransaction.Commit](#), and [MySQLTransaction.Rollback](#) methods.

Visual Basic example:

```

Public Sub RunTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

    Dim myCommand As MySqlCommand = myConnection.CreateCommand()
    Dim myTrans As MySQLTransaction

    ' Start a local transaction
    myTrans = myConnection.BeginTransaction()
    ' Must assign both transaction object and connection
    ' to Command object for a pending local transaction
    myCommand.Connection = myConnection
    myCommand.Transaction = myTrans

    Try
        myCommand.CommandText = "Insert into Test (id, desc) VALUES (100, 'Description')"
        myCommand.ExecuteNonQuery()
        myCommand.CommandText = "Insert into Test (id, desc) VALUES (101, 'Description')"
        myCommand.ExecuteNonQuery()
        myTrans.Commit()
        Console.WriteLine("Both records are written to database.")
    Catch e As Exception
    End Try
End Sub

```

```

    Try
        myTrans.Rollback()
    Catch ex As MySqlException
        If Not myTrans.Connection Is Nothing Then
            Console.WriteLine("An exception of type " + ex.GetType().ToString() + _
                " was encountered while attempting to roll back the transaction.")
        End If
    End Try

    Console.WriteLine("An exception of type " + e.GetType().ToString() + _
        " was encountered while inserting the data.")
    Console.WriteLine("Neither record was written to database.")
Finally
    myConnection.Close()
End Try
End Sub

```

C# example:

```

public void RunTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();
    MySqlTransaction myTrans;
    // Start a local transaction
    myTrans = myConnection.BeginTransaction();
    // Must assign both transaction object and connection
    // to Command object for a pending local transaction
    myCommand.Connection = myConnection;
    myCommand.Transaction = myTrans;
    try
    {
        myCommand.CommandText = "insert into Test (id, desc) VALUES (100, 'Description')";
        myCommand.ExecuteNonQuery();
        myCommand.CommandText = "insert into Test (id, desc) VALUES (101, 'Description')";
        myCommand.ExecuteNonQuery();
        myTrans.Commit();
        Console.WriteLine("Both records are written to database.");
    }
    catch(Exception e)
    {
        try
        {
            myTrans.Rollback();
        }
        catch (SqlException ex)
        {
            if (myTrans.Connection != null)
            {
                Console.WriteLine("An exception of type " + ex.GetType() +
                    " was encountered while attempting to roll back the transaction.");
            }
        }

        Console.WriteLine("An exception of type " + e.GetType() +
            " was encountered while inserting the data.");
        Console.WriteLine("Neither record was written to database.");
    }
    finally
    {
        myConnection.Close();
    }
}

```

24.2.3.3.12. ChangeDatabase

Changes the current database for an open MySqlConnection.

Parameters: The name of the database to use.

The value supplied in the `database` parameter must be a valid database name. The `database` parameter cannot contain a null value, an empty string, or a string with only blank characters.

When you are using connection pooling against MySQL, and you close the connection, it is returned to the connection pool. The next time the connection is retrieved from the pool, the reset connection request executes before the user performs any operations.

MySQL Enterprise

MySQL Enterprise subscribers will find more information on this subject in the Knowledge Base article, [Understanding and Using Connection Pooling](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. To subscribe see <http://www.mysql.com/products/enterprise/advisors.html>.

Exception: The database name is not valid.

Exception: The connection is not open.

Exception: Cannot change the database.

Examples

The following example creates a [MySQLConnection](#) and displays some of its read-only properties.

Visual Basic example:

```
Public Sub CreateMySQLConnection()
    Dim myConnString As String = _
        "Persist Security Info=False;database=test;server=localhost;user id=joeuser;pwd=pass"
    Dim myConnection As New MySqlConnection( myConnString )
    myConnection.Open()
    MessageBox.Show( "Server Version: " + myConnection.ServerVersion _
        + ControlChars.NewLine + "Database: " + myConnection.Database )
    myConnection.ChangeDatabase( "test2" )
    MessageBox.Show( "ServerVersion: " + myConnection.ServerVersion _
        + ControlChars.NewLine + "Database: " + myConnection.Database )
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySQLConnection()
{
    string myConnString =
        "Persist Security Info=False;database=test;server=localhost;user id=joeuser;pwd=pass";
    MySqlConnection myConnection = new MySqlConnection( myConnString );
    myConnection.Open();
    MessageBox.Show( "Server Version: " + myConnection.ServerVersion
        + "\nDatabase: " + myConnection.Database );
    myConnection.ChangeDatabase( "test2" );
    MessageBox.Show( "ServerVersion: " + myConnection.ServerVersion
        + "\nDatabase: " + myConnection.Database );
    myConnection.Close();
}
```

24.2.3.3.13. StateChange

Occurs when the state of the connection changes.

The [StateChange](#) event fires whenever the [State](#) changes from closed to opened, or from opened to closed. [StateChange](#) fires immediately after the [MySQLConnection](#) transitions.

If an event handler throws an exception from within the [StateChange](#) event, the exception propagates to the caller of the [Open](#) or [Close](#) method.

The [StateChange](#) event is not raised unless you explicitly call [Close](#) or [Dispose](#).

The event handler receives an argument of type [System.Data.StateChangeEventArgs](#) containing data related to this event. The following [StateChangeEventArgs](#) properties provide information specific to this event.

Property	Description
System.Data.StateChangeEventArgs.CurrentState	Gets the new state of the connection. The connection object will be in the new state already when the event is fired.
System.Data.StateChangeEventArgs.OriginalState	Gets the original state of the connection.

24.2.3.3.14. InfoMessage

Occurs when MySQL returns warnings as a result of executing a command or query.

24.2.3.3.15. ConnectionTimeout

Gets the time to wait while trying to establish a connection before terminating the attempt and generating an error.

Exception: The value set is less than 0.

A value of 0 indicates no limit, and should be avoided in a [MySQLConnection.ConnectionString](#) because an attempt to

connect will wait indefinitely.

Examples

The following example creates a `MySqlConnection` and sets some of its properties in the connection string.

Visual Basic example:

```
Public Sub CreateSqlConnection()
    Dim myConnection As New MySqlConnection()
    myConnection.ConnectionString = "Persist Security Info=False;Username=user;Password=pass;database=test1;server=localhost"
    myConnection.Open()
End Sub
```

C# example:

```
public void CreateSqlConnection()
{
    MySqlConnection myConnection = new MySqlConnection();
    myConnection.ConnectionString = "Persist Security Info=False;Username=user;»
        Password=pass;database=test1;server=localhost;Connect Timeout=30";
    myConnection.Open();
}
```

24.2.3.4. Using `MySqlDataAdapter`

Represents a set of data commands and a database connection that are used to fill a data set and update a MySQL database. This class cannot be inherited.

The `MySqlDataAdapter`, serves as a bridge between a `System.Data.DataSet` and MySQL for retrieving and saving data. The `MySqlDataAdapter` provides this bridge by mapping `DbDataAdapter.Fill`, which changes the data in the `DataSet` to match the data in the data source, and `DbDataAdapter.Update`, which changes the data in the data source to match the data in the `DataSet`, using the appropriate SQL statements against the data source.

When the `MySqlDataAdapter` fills a `DataSet`, it will create the necessary tables and columns for the returned data if they do not already exist. However, primary key information will not be included in the implicitly created schema unless the `System.Data.MissingSchemaAction` property is set to `System.Data.MissingSchemaAction.AddWithKey`. You may also have the `MySqlDataAdapter` create the schema of the `DataSet`, including primary key information, before filling it with data using `System.Data.Common.DbDataAdapter.FillSchema`.

`MySqlDataAdapter` is used in conjunction with `MySqlConnection` and `MySqlCommand` to increase performance when connecting to a MySQL database.

The `MySqlDataAdapter` also includes the `MySqlDataAdapter.SelectCommand`, `MySqlDataAdapter.InsertCommand`, `MySqlDataAdapter.DeleteCommand`, `MySqlDataAdapter.UpdateCommand`, and `DataAdapter.TableMappings` properties to facilitate the loading and updating of data.

When an instance of `MySqlDataAdapter` is created, the read/write properties are set to initial values. For a list of these values, see the `MySqlDataAdapter` constructor.

Note

Please be aware that the `DataColumn` class in .NET only allows columns with type of `Int16`, `Int32`, or `Int64` to be autoincrement columns. If you plan to use autoincrement columns with MySQL, you should consider using signed integer columns.

Examples

The following example creates a `MySqlCommand` and a `MySqlConnection`. The `MySqlConnection` is opened and set as the `MySqlCommand.Connection` for the `MySqlCommand`. The example then calls `MySqlCommand.ExecuteNonQuery`, and closes the connection. To accomplish this, the `ExecuteNonQuery` is passed a connection string and a query string that is an SQL INSERT statement.

Visual Basic example:

```
Public Function SelectRows(dataSet As DataSet, connection As String, query As String) As DataSet
    Dim conn As New MySqlConnection(connection)
    Dim adapter As New MySqlDataAdapter()
    adapter.SelectCommand = new MySqlCommand(query, conn)
    adapter.Fill(dataset)
    Return dataset
End Function
```

C# example:

```

public DataSet SelectRows(DataSet dataset,string connection,string query)
{
    MySqlConnection conn = new MySqlConnection(connection);
    MySqlDataAdapter adapter = new MySqlDataAdapter();
    adapter.SelectCommand = new MySqlCommand(query, conn);
    adapter.Fill(dataset);
    return dataset;
}

```

24.2.3.4.1. Class `MySqlDataAdapter` Constructor

Overload methods for `MySqlDataAdapter`

Initializes a new instance of the `MySqlDataAdapter` class.

When an instance of `MySqlDataAdapter` is created, the following read/write properties are set to the following initial values.

Properties	Initial Value
<code>MissingMappingAction</code>	<code>MissingMappingAction.Passthrough</code>
<code>MissingSchemaAction</code>	<code>MissingSchemaAction.Add</code>

You can change the value of any of these properties through a separate call to the property.

Examples

The following example creates a `MySqlDataAdapter` and sets some of its properties.

Visual Basic example:

```

Public Sub CreateSqlDataAdapter()
    Dim conn As MySqlConnection = New MySqlConnection("Data Source=localhost;" & _
        "database=test")
    Dim da As MySqlDataAdapter = New MySqlDataAdapter
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey

    da.SelectCommand = New MySqlCommand("SELECT id, name FROM mytable", conn)
    da.InsertCommand = New MySqlCommand("INSERT INTO mytable (id, name) " & _
        "VALUES (@id, @name)", conn)
    da.UpdateCommand = New MySqlCommand("UPDATE mytable SET id=@id, name=@name " & _
        "WHERE id=@oldId", conn)
    da.DeleteCommand = New MySqlCommand("DELETE FROM mytable WHERE id=@id", conn)
    da.InsertCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id")
    da.InsertCommand.Parameters.Add("@name", MySqlDbType.VarChar, 40, "name")

    da.UpdateCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id")
    da.UpdateCommand.Parameters.Add("@name", MySqlDbType.VarChar, 40, "name")
    da.UpdateCommand.Parameters.Add("@oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
    da.DeleteCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
End Sub

```

C# example:

```

public static void CreateSqlDataAdapter()
{
    MySqlConnection conn = new MySqlConnection("Data Source=localhost;database=test");
    MySqlDataAdapter da = new MySqlDataAdapter();
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey;

    da.SelectCommand = new MySqlCommand("SELECT id, name FROM mytable", conn);
    da.InsertCommand = new MySqlCommand("INSERT INTO mytable (id, name) " +
        "VALUES (@id, @name)", conn);
    da.UpdateCommand = new MySqlCommand("UPDATE mytable SET id=@id, name=@name " +
        "WHERE id=@oldId", conn);
    da.DeleteCommand = new MySqlCommand("DELETE FROM mytable WHERE id=@id", conn);
    da.InsertCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id");
    da.InsertCommand.Parameters.Add("@name", MySqlDbType.VarChar, 40, "name");

    da.UpdateCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id");
    da.UpdateCommand.Parameters.Add("@name", MySqlDbType.VarChar, 40, "name");
    da.UpdateCommand.Parameters.Add("@oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
    da.DeleteCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
}

```

24.2.3.4.2. Class `MySqlDataAdapter` Constructor Form 1

Initializes a new instance of the `MySqlDataAdapter` class with the specified `MySqlCommand` as the `SelectCommand` property.

Parameters: [MySQLCommand](#) that is an SQL `SELECT` statement or stored procedure and is set as the [SelectCommand](#) property of the [MySQLDataAdapter](#).

When an instance of [MySQLDataAdapter](#) is created, the following read/write properties are set to the following initial values.

Properties	Initial Value
MissingMappingAction	MissingMappingAction.Passthrough
MissingSchemaAction	MissingSchemaAction.Add

You can change the value of any of these properties through a separate call to the property.

When [SelectCommand](#) (or any of the other command properties) is assigned to a previously created [MySQLCommand](#), the [MySQLCommand](#) is not cloned. The [SelectCommand](#) maintains a reference to the previously created [MySQLCommand](#) object.

Examples

The following example creates a [MySQLDataAdapter](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateSqlDataAdapter()
    Dim conn As MySqlConnection = New MySqlConnection("Data Source=localhost;" & _
        "database=test")
    Dim cmd as new MySQLCommand("SELECT id, name FROM mytable", conn)
    Dim da As MySQLDataAdapter = New MySQLDataAdapter(cmd)
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey

    da.InsertCommand = New MySQLCommand("INSERT INTO mytable (id, name) " & _
        "VALUES (@id, @name)", conn)
    da.UpdateCommand = New MySQLCommand("UPDATE mytable SET id=@id, name=@name " & _
        "WHERE id=@oldId", conn)
    da.DeleteCommand = New MySQLCommand("DELETE FROM mytable WHERE id=@id", conn)
    da.InsertCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id")
    da.InsertCommand.Parameters.Add("@name", MySqlDbType.VarChar, 40, "name")

    da.UpdateCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id")
    da.UpdateCommand.Parameters.Add("@name", MySqlDbType.VarChar, 40, "name")
    da.UpdateCommand.Parameters.Add("@oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
    da.DeleteCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
End Sub
```

C# example:

```
public static void CreateSqlDataAdapter()
{
    MySqlConnection conn = new MySqlConnection("Data Source=localhost;database=test");
    MySQLCommand cmd = new MySQLCommand("SELECT id, name FROM mytable", conn);
    MySQLDataAdapter da = new MySQLDataAdapter(cmd);
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey;

    da.InsertCommand = new MySQLCommand("INSERT INTO mytable (id, name) " +
        "VALUES (@id, @name)", conn);
    da.UpdateCommand = new MySQLCommand("UPDATE mytable SET id=@id, name=@name " +
        "WHERE id=@oldId", conn);
    da.DeleteCommand = new MySQLCommand("DELETE FROM mytable WHERE id=@id", conn);
    da.InsertCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id");
    da.InsertCommand.Parameters.Add("@name", MySqlDbType.VarChar, 40, "name");

    da.UpdateCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id");
    da.UpdateCommand.Parameters.Add("@name", MySqlDbType.VarChar, 40, "name");
    da.UpdateCommand.Parameters.Add("@oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
    da.DeleteCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
}
```

24.2.3.4.3. Class [MySQLDataAdapter](#) Constructor Form 2

Initializes a new instance of the [MySQLDataAdapter](#) class with a [SelectCommand](#) and a [MySQLConnection](#) object.

Parameters: A [String](#) that is an SQL `SELECT` statement or stored procedure to be used by the [SelectCommand](#) property of the [MySQLDataAdapter](#).

Parameters: A [MySQLConnection](#) that represents the connection.

This implementation of the [MySQLDataAdapter](#) opens and closes a [MySQLConnection](#) if it is not already open. This can be useful in an application that must call the [DbDataAdapter.Fill](#) method for two or more [MySQLDataAdapter](#) objects. If the [MySQLConnection](#) is already open, you must explicitly call [MySQLConnection.Close](#) or [MySQLConnection.Dispose](#) to close it.

When an instance of [MySQLDataAdapter](#) is created, the following read/write properties are set to the following initial values.

Properties	Initial Value
MissingMappingAction	MissingMappingAction.Passthrough
MissingSchemaAction	MissingSchemaAction.Add

You can change the value of any of these properties through a separate call to the property.

Examples

The following example creates a [MySQLDataAdapter](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateSqlDataAdapter()
    Dim conn As MySqlConnection = New MySqlConnection("Data Source=localhost;" & _
        "database=test")
    Dim da As MySQLDataAdapter = New MySQLDataAdapter("SELECT id, name FROM mytable", conn)
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey

    da.InsertCommand = New MySqlCommand("INSERT INTO mytable (id, name) " & _
        "VALUES (@id, @name)", conn)
    da.UpdateCommand = New MySqlCommand("UPDATE mytable SET id=@id, name=@name " & _
        "WHERE id=oldId", conn)
    da.DeleteCommand = New MySqlCommand("DELETE FROM mytable WHERE id=@id", conn)
    da.InsertCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id")
    da.InsertCommand.Parameters.Add("@name", MySqlDbType.VarChar, 40, "name")

    da.UpdateCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id")
    da.UpdateCommand.Parameters.Add("@name", MySqlDbType.VarChar, 40, "name")
    da.UpdateCommand.Parameters.Add("@oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
    da.DeleteCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
End Sub
```

C# example:

```
public static void CreateSqlDataAdapter()
{
    MySqlConnection conn = new MySqlConnection("Data Source=localhost;database=test");
    MySQLDataAdapter da = new MySQLDataAdapter("SELECT id, name FROM mytable", conn);
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey;

    da.InsertCommand = new MySqlCommand("INSERT INTO mytable (id, name) " +
        "VALUES (@id, @name)", conn);
    da.UpdateCommand = new MySqlCommand("UPDATE mytable SET id=@id, name=@name " +
        "WHERE id=oldId", conn);
    da.DeleteCommand = new MySqlCommand("DELETE FROM mytable WHERE id=@id", conn);
    da.InsertCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id");
    da.InsertCommand.Parameters.Add("@name", MySqlDbType.VarChar, 40, "name");

    da.UpdateCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id");
    da.UpdateCommand.Parameters.Add("@name", MySqlDbType.VarChar, 40, "name");
    da.UpdateCommand.Parameters.Add("@oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
    da.DeleteCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
}
```

24.2.3.4.4. Class MySQLDataAdapter Constructor Form 3

Initializes a new instance of the [MySQLDataAdapter](#) class with a [SelectCommand](#) and a connection string.

Parameters: A [string](#) that is an SQL [SELECT](#) statement or stored procedure to be used by the [SelectCommand](#) property of the [MySQLDataAdapter](#).

Parameters: The connection string

When an instance of [MySQLDataAdapter](#) is created, the following read/write properties are set to the following initial values.

Properties	Initial Value
MissingMappingAction	MissingMappingAction.Passthrough
MissingSchemaAction	MissingSchemaAction.Add

You can change the value of any of these properties through a separate call to the property.

Examples

The following example creates a [MySQLDataAdapter](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateSqlDataAdapter()
    Dim da As MySqlDataAdapter = New MySqlDataAdapter("SELECT id, name FROM mytable", "Data Source=localhost;database=test")
    Dim conn As MySqlConnection = da.SelectCommand.Connection
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey

    da.InsertCommand = New MySqlCommand("INSERT INTO mytable (id, name) " & _
        "VALUES (@id, @name)", conn)
    da.UpdateCommand = New MySqlCommand("UPDATE mytable SET id=@id, name=@name " & _
        "WHERE id=@oldId", conn)
    da.DeleteCommand = New MySqlCommand("DELETE FROM mytable WHERE id=@id", conn)
    da.InsertCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id")
    da.InsertCommand.Parameters.Add("@name", MySqlDbType.VarChar, 40, "name")

    da.UpdateCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id")
    da.UpdateCommand.Parameters.Add("@name", MySqlDbType.VarChar, 40, "name")
    da.UpdateCommand.Parameters.Add("@oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
    da.DeleteCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
End Sub
```

C# example:

```
public static void CreateSqlDataAdapter()
{
    MySqlDataAdapter da = new MySqlDataAdapter("SELECT id, name FROM mytable", "Data Source=localhost;database=test");
    MySqlConnection conn = da.SelectCommand.Connection;
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey;

    da.InsertCommand = new MySqlCommand("INSERT INTO mytable (id, name) " +
        "VALUES (@id, @name)", conn);
    da.UpdateCommand = new MySqlCommand("UPDATE mytable SET id=@id, name=@name " +
        "WHERE id=@oldId", conn);
    da.DeleteCommand = new MySqlCommand("DELETE FROM mytable WHERE id=@id", conn);
    da.InsertCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id");
    da.InsertCommand.Parameters.Add("@name", MySqlDbType.VarChar, 40, "name");

    da.UpdateCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id");
    da.UpdateCommand.Parameters.Add("@name", MySqlDbType.VarChar, 40, "name");
    da.UpdateCommand.Parameters.Add("@oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
    da.DeleteCommand.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
}
```

24.2.3.4.5. DeleteCommand

Gets or sets an SQL statement or stored procedure used to delete records from the data set.

Value: A [MySqlCommand](#) used during [System.Data.Common.DataAdapter.Update](#) to delete records in the database that correspond to deleted rows in the [DataSet](#).

During [System.Data.Common.DataAdapter.Update](#), if this property is not set and primary key information is present in the [DataSet](#), the [DeleteCommand](#) can be generated automatically if you set the [SelectCommand](#) property and use the [MySqlCommandBuilder](#). Then, any additional commands that you do not set are generated by the [MySqlCommandBuilder](#). This generation logic requires key column information to be present in the [DataSet](#).

When [DeleteCommand](#) is assigned to a previously created [MySqlCommand](#), the [MySqlCommand](#) is not cloned. The [DeleteCommand](#) maintains a reference to the previously created [MySqlCommand](#) object.

Examples

The following example creates a [MySQLDataAdapter](#) and sets the [SelectCommand](#) and [DeleteCommand](#) properties. It assumes you have already created a [MySQLConnection](#) object.

Visual Basic example:

```
Public Shared Function CreateCustomerAdapter(conn As MySqlConnection) As MySqlDataAdapter
    Dim da As MySqlDataAdapter = New MySqlDataAdapter()
    Dim cmd As MySqlCommand
    Dim parm As MySqlParameter
    ' Create the SelectCommand.
    cmd = New MySqlCommand("SELECT * FROM mytable WHERE id=@id AND name=@name", conn)
    cmd.Parameters.Add("@id", MySqlDbType.VarChar, 15)
    cmd.Parameters.Add("@name", MySqlDbType.VarChar, 15)
    da.SelectCommand = cmd
    ' Create the DeleteCommand.
    cmd = New MySqlCommand("DELETE FROM mytable WHERE id=@id", conn)
    parm = cmd.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id")
    parm.SourceVersion = DataRowVersion.Original
    da.DeleteCommand = cmd
    Return da
End Function
```

End Function

C# example:

```
public static MySqlDataAdapter CreateCustomerAdapter(MySqlConnection conn)
{
    MySqlDataAdapter da = new MySqlDataAdapter();
    MySqlCommand cmd;
    MySqlParameter parm;
    // Create the SelectCommand.
    cmd = new MySqlCommand("SELECT * FROM mytable WHERE id=@id AND name=@name", conn);
    cmd.Parameters.Add("@id", MySqlDbType.VarChar, 15);
    cmd.Parameters.Add("@name", MySqlDbType.VarChar, 15);
    da.SelectCommand = cmd;
    // Create the DeleteCommand.
    cmd = new MySqlCommand("DELETE FROM mytable WHERE id=@id", conn);
    parm = cmd.Parameters.Add("@id", MySqlDbType.VarChar, 5, "id");
    parm.SourceVersion = DataRowVersion.Original;
    da.DeleteCommand = cmd;
    return da;
}
```

24.2.3.4.6. InsertCommand

Gets or sets an SQL statement or stored procedure used to insert records into the data set.

Value: A [MySqlCommand](#) used during [System.Data.Common.DataAdapter.Update](#) to insert records into the database that correspond to new rows in the [DataSet](#).

During [System.Data.Common.DataAdapter.Update](#), if this property is not set and primary key information is present in the [DataSet](#), the [InsertCommand](#) can be generated automatically if you set the [SelectCommand](#) property and use the [MySqlCommandBuilder](#). Then, any additional commands that you do not set are generated by the [MySqlCommandBuilder](#). This generation logic requires key column information to be present in the [DataSet](#).

When [InsertCommand](#) is assigned to a previously created [MySqlCommand](#), the [MySqlCommand](#) is not cloned. The [InsertCommand](#) maintains a reference to the previously created [MySqlCommand](#) object.

Note

If execution of this command returns rows, these rows may be added to the [DataSet](#) depending on how you set the [MySqlCommand.UpdatedRowSource](#) property of the [MySqlCommand](#) object.

Examples

The following example creates a [MySqlDataAdapter](#) and sets the [SelectCommand](#) and [InsertCommand](#) properties. It assumes you have already created a [MySqlConnection](#) object.

Visual Basic example:

```
Public Shared Function CreateCustomerAdapter(conn As MySqlConnection) As MySqlDataAdapter
    Dim da As MySqlDataAdapter = New MySqlDataAdapter()
    Dim cmd As MySqlCommand
    Dim parm As MySqlParameter
    ' Create the SelectCommand.
    cmd = New MySqlCommand("SELECT * FROM mytable WHERE id=@id AND name=@name", conn)
    cmd.Parameters.Add("@id", MySqlDbType.VarChar, 15)
    cmd.Parameters.Add("@name", MySqlDbType.VarChar, 15)
    da.SelectCommand = cmd
    ' Create the InsertCommand.
    cmd = New MySqlCommand("INSERT INTO mytable (id,name) VALUES (@id, @name)", conn)
    cmd.Parameters.Add( "@id", MySqlDbType.VarChar, 15, "id" )
    cmd.Parameters.Add( "@name", MySqlDbType.VarChar, 15, "name" )
    da.InsertCommand = cmd

    Return da
End Function
```

C# example:

```
public static MySqlDataAdapter CreateCustomerAdapter(MySqlConnection conn)
{
    MySqlDataAdapter da = new MySqlDataAdapter();
    MySqlCommand cmd;
    MySqlParameter parm;
    // Create the SelectCommand.
    cmd = new MySqlCommand("SELECT * FROM mytable WHERE id=@id AND name=@name", conn);
    cmd.Parameters.Add("@id", MySqlDbType.VarChar, 15);
    cmd.Parameters.Add("@name", MySqlDbType.VarChar, 15);
    da.SelectCommand = cmd;
    // Create the InsertCommand.
```

```

cmd = new MySqlCommand("INSERT INTO mytable (id,name) VALUES (@id,@name)", conn);
cmd.Parameters.Add("@id", MySqlDbType.VarChar, 15, "id" );
cmd.Parameters.Add("@name", MySqlDbType.VarChar, 15, "name" );

da.InsertCommand = cmd;
return da;
}

```

24.2.3.4.7. UpdateCommand

Gets or sets an SQL statement or stored procedure used to updated records in the data source.

Value: A [MySqlCommand](#) used during [System.Data.Common.DataAdapter.Update](#) to update records in the database with data from the [DataSet](#).

During [System.Data.Common.DataAdapter.Update](#), if this property is not set and primary key information is present in the [DataSet](#), the [UpdateCommand](#) can be generated automatically if you set the [SelectCommand](#) property and use the [MySqlCommandBuilder](#). Then, any additional commands that you do not set are generated by the [MySqlCommandBuilder](#). This generation logic requires key column information to be present in the [DataSet](#).

When [UpdateCommand](#) is assigned to a previously created [MySqlCommand](#), the [MySqlCommand](#) is not cloned. The [UpdateCommand](#) maintains a reference to the previously created [MySqlCommand](#) object.

Note

If execution of this command returns rows, these rows may be merged with the [DataSet](#) depending on how you set the [MySqlCommand.UpdatedRowSource](#) property of the [MySqlCommand](#) object.

Examples

The following example creates a [MySqlDataAdapter](#) and sets the [SelectCommand](#) and [UpdateCommand](#) properties. It assumes you have already created a [MySqlConnection](#) object.

Visual Basic example:

```

Public Shared Function CreateCustomerAdapter(conn As MySqlConnection) As MySqlDataAdapter

    Dim da As MySqlDataAdapter = New MySqlDataAdapter()
    Dim cmd As MySqlCommand
    Dim parm As MySqlParameter
    ' Create the SelectCommand.
    cmd = New MySqlCommand("SELECT * FROM mytable WHERE id=@id AND name=@name", conn)
    cmd.Parameters.Add("@id", MySqlDbType.VarChar, 15)
    cmd.Parameters.Add("@name", MySqlDbType.VarChar, 15)
    da.SelectCommand = cmd
    ' Create the UpdateCommand.
    cmd = New MySqlCommand("UPDATE mytable SET id=@id, name=@name WHERE id=@oldId", conn)
    cmd.Parameters.Add( "@id", MySqlDbType.VarChar, 15, "id" )
    cmd.Parameters.Add( "@name", MySqlDbType.VarChar, 15, "name" )

    parm = cmd.Parameters.Add( "@oldId", MySqlDbType.VarChar, 15, "id" )
    parm.SourceVersion = DataRowVersion.Original

    da.UpdateCommand = cmd

    Return da
End Function

```

C# example:

```

public static MySqlDataAdapter CreateCustomerAdapter(MySqlConnection conn)
{
    MySqlDataAdapter da = new MySqlDataAdapter();
    MySqlCommand cmd;
    MySqlParameter parm;
    // Create the SelectCommand.
    cmd = new MySqlCommand("SELECT * FROM mytable WHERE id=@id AND name=@name", conn);
    cmd.Parameters.Add("@id", MySqlDbType.VarChar, 15);
    cmd.Parameters.Add("@name", MySqlDbType.VarChar, 15);
    da.SelectCommand = cmd;
    // Create the UpdateCommand.
    cmd = new MySqlCommand("UPDATE mytable SET id=@id, name=@name WHERE id=@oldId", conn);
    cmd.Parameters.Add("@id", MySqlDbType.VarChar, 15, "id" );
    cmd.Parameters.Add("@name", MySqlDbType.VarChar, 15, "name" );

    parm = cmd.Parameters.Add( "@oldId", MySqlDbType.VarChar, 15, "id" );
    parm.SourceVersion = DataRowVersion.Original;

    da.UpdateCommand = cmd;
    return da;
}

```

24.2.3.4.8. SelectCommand

Gets or sets an SQL statement or stored procedure used to select records in the data source.

Value: A `MySQLCommand` used during `System.Data.Common.DbDataAdapter.Fill` to select records from the database for placement in the `DataSet`.

When `SelectCommand` is assigned to a previously created `MySQLCommand`, the `MySQLCommand` is not cloned. The `SelectCommand` maintains a reference to the previously created `MySQLCommand` object.

If the `SelectCommand` does not return any rows, no tables are added to the `DataSet`, and no exception is raised.

Examples

The following example creates a `MySQLDataAdapter` and sets the `SelectCommand` and `InsertCommand` properties. It assumes you have already created a `MySQLConnection` object.

Visual Basic example:

```
Public Shared Function CreateCustomerAdapter(conn As MySQLConnection) As MySQLDataAdapter
    Dim da As MySQLDataAdapter = New MySQLDataAdapter()
    Dim cmd As MySQLCommand
    Dim parm As MySQLParameter
    ' Create the SelectCommand.
    cmd = New MySQLCommand("SELECT * FROM mytable WHERE id=@id AND name=@name", conn)
    cmd.Parameters.Add("@id", MySQLDbType.VarChar, 15)
    cmd.Parameters.Add("@name", MySQLDbType.VarChar, 15)
    da.SelectCommand = cmd
    ' Create the InsertCommand.
    cmd = New MySQLCommand("INSERT INTO mytable (id,name) VALUES (@id, @name)", conn)
    cmd.Parameters.Add("@id", MySQLDbType.VarChar, 15, "id" )
    cmd.Parameters.Add("@name", MySQLDbType.VarChar, 15, "name" )
    da.InsertCommand = cmd

    Return da
End Function
```

C# example:

```
public static MySQLDataAdapter CreateCustomerAdapter(MySQLConnection conn)
{
    MySQLDataAdapter da = new MySQLDataAdapter();
    MySQLCommand cmd;
    MySQLParameter parm;
    // Create the SelectCommand.
    cmd = new MySQLCommand("SELECT * FROM mytable WHERE id=@id AND name=@name", conn);
    cmd.Parameters.Add("@id", MySQLDbType.VarChar, 15);
    cmd.Parameters.Add("@name", MySQLDbType.VarChar, 15);
    da.SelectCommand = cmd;
    // Create the InsertCommand.
    cmd = new MySQLCommand("INSERT INTO mytable (id,name) VALUES (@id,@name)", conn);
    cmd.Parameters.Add("@id", MySQLDbType.VarChar, 15, "id" );
    cmd.Parameters.Add("@name", MySQLDbType.VarChar, 15, "name" );

    da.InsertCommand = cmd;
    return da;
}
```

24.2.3.5. Using MySQLDataReader

To create a `MySQLDataReader`, you must call the `MySQLCommand.ExecuteReader` method of the `MySQLCommand` object, rather than directly using a constructor.

While the `MySQLDataReader` is in use, the associated `MySQLConnection` is busy serving the `MySQLDataReader`, and no other operations can be performed on the `MySQLConnection` other than closing it. This is the case until the `MySQLDataReader.Close` method of the `MySQLDataReader` is called.

`MySQLDataReader.IsClosed` and `MySQLDataReader.RecordsAffected` are the only properties that you can call after the `MySQLDataReader` is closed. Though the `RecordsAffected` property may be accessed at any time while the `MySQLDataReader` exists, always call `Close` before returning the value of `RecordsAffected` to ensure an accurate return value.

For optimal performance, `MySQLDataReader` avoids creating unnecessary objects or making unnecessary copies of data. As a result, multiple calls to methods such as `MySQLDataReader.GetValue` return a reference to the same object. Use caution if you are modifying the underlying value of the objects returned by methods such as `GetValue`.

Examples

The following example creates a [MySQLConnection](#), a [MySQLCommand](#), and a [MySQLDataReader](#). The example reads through the data, writing it out to the console. Finally, the example closes the [MySQLDataReader](#), then the [MySQLConnection](#).

Visual Basic example:

```
Public Sub ReadMyData(myConnString As String)
    Dim mySelectQuery As String = "SELECT OrderID, CustomerID FROM Orders"
    Dim myConnection As New MySqlConnection(myConnString)
    Dim myCommand As New MySQLCommand(mySelectQuery, myConnection)
    myConnection.Open()
    Dim myReader As MySQLDataReader
    myReader = myCommand.ExecuteReader()
    ' Always call Read before accessing data.
    While myReader.Read()
        Console.WriteLine((myReader.GetInt32(0) & ", " & myReader.GetString(1)))
    End While
    ' always call Close when done reading.
    myReader.Close()
    ' Close the connection when done with it.
    myConnection.Close()
End Sub 'ReadMyData
```

C# example:

```
public void ReadMyData(string myConnString) {
    string mySelectQuery = "SELECT OrderID, CustomerID FROM Orders";
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    MySQLCommand myCommand = new MySQLCommand(mySelectQuery, myConnection);
    myConnection.Open();
    MySQLDataReader myReader;
    myReader = myCommand.ExecuteReader();
    // Always call Read before accessing data.
    while (myReader.Read()) {
        Console.WriteLine(myReader.GetInt32(0) + ", " + myReader.GetString(1));
    }
    // always call Close when done reading.
    myReader.Close();
    // Close the connection when done with it.
    myConnection.Close();
}
```

24.2.3.5.1. GetBytes

[GetBytes](#) returns the number of available bytes in the field. In most cases this is the exact length of the field. However, the number returned may be less than the true length of the field if [GetBytes](#) has already been used to obtain bytes from the field. This may be the case, for example, if the [MySQLDataReader](#) is reading a large data structure into a buffer. For more information, see the [SequentialAccess](#) setting for [MySQLCommand.CommandBehavior](#).

If you pass a buffer that is a null reference ([Nothing](#) in Visual Basic), [GetBytes](#) returns the length of the field in bytes.

No conversions are performed; therefore the data retrieved must already be a byte array.

24.2.3.5.2. GetTimeSpan

Gets the value of the specified column as a [TimeSpan](#) object.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.3. GetDateTime

Gets the value of the specified column as a [System.DateTime](#) object.

Note

MySQL allows date columns to contain the value '0000-00-00' and datetime columns to contain the value '0000-00-00 00:00:00'. The [DateTime](#) structure cannot contain or represent these values. To read a datetime value from a column that might contain zero values, use [GetMySQLDateTime](#). The behavior of reading a zero datetime column using this method is defined by the [ZeroDateTimeBehavior](#) connection string option. For more information on this option, please refer to [MySQLConnection.ConnectionString](#).

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.4. GetMySqlDateTime

Gets the value of the specified column as a `MySql.Data.Types.MySqlDateTime` object.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.5. GetString

Gets the value of the specified column as a `String` object.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.6. GetDecimal

Gets the value of the specified column as a `Decimal` object.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.7. GetDouble

Gets the value of the specified column as a double-precision floating point number.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.8. GetFloat

Gets the value of the specified column as a single-precision floating point number.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.9. GetGuid

Gets the value of the specified column as a globally-unique identifier (GUID).

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.10. GetInt16

Gets the value of the specified column as a 16-bit signed integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.11. GetInt32

Gets the value of the specified column as a 32-bit signed integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.12. GetInt64

Gets the value of the specified column as a 64-bit signed integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.13. GetUInt16

Gets the value of the specified column as a 16-bit unsigned integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.14. GetUInt32

Gets the value of the specified column as a 32-bit unsigned integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.5.15. GetUInt64

Gets the value of the specified column as a 64-bit unsigned integer.

Parameters: The zero-based column ordinal.

Returns: The value of the specified column.

24.2.3.6. Using [MySqlException](#)

This class is created whenever the MySQL Data Provider encounters an error generated from the server.

Any open connections are not automatically closed when an exception is thrown. If the client application determines that the exception is fatal, it should close any open [MySqlDataReader](#) objects or [MySqlConnection](#) objects.

Examples

The following example generates a [MySqlException](#) due to a missing server, and then displays the exception.

Visual Basic example:

```
Public Sub ShowException()  
    Dim mySelectQuery As String = "SELECT column1 FROM table1"  
    Dim myConnection As New MySqlConnection ("Data Source=localhost;Database=Sample;")  
    Dim myCommand As New MySqlCommand(mySelectQuery, myConnection)  
    Try  
        myCommand.Connection.Open()  
    Catch e As MySqlException  
        MessageBox.Show( e.Message )  
    End Try  
End Sub
```

C# example:

```
public void ShowException()  
{  
    string mySelectQuery = "SELECT column1 FROM table1";  
    MySqlConnection myConnection =  
        new MySqlConnection("Data Source=localhost;Database=Sample;");  
    MySqlCommand myCommand = new MySqlCommand(mySelectQuery, myConnection);  
    try  
    {  
        myCommand.Connection.Open();  
    }  
    catch (MySqlException e)  
    {  
        MessageBox.Show( e.Message );  
    }  
}
```

24.2.3.7. Using [MySqlParameter](#)

Parameter names are not case sensitive.

Examples

The following example creates multiple instances of [MySQLParameter](#) through the [MySQLParameterCollection](#) collection within the [MySQLDataAdapter](#). These parameters are used to select data from the data source and place the data in the [DataSet](#). This example assumes that a [DataSet](#) and a [MySQLDataAdapter](#) have already been created with the appropriate schema, commands, and connection.

Visual Basic example:

```
Public Sub AddSqlParameters()
    ' ...
    ' create myDataSet and myDataAdapter
    ' ...
    myDataAdapter.SelectCommand.Parameters.Add("@CategoryName", MySQLDbType.VarChar, 80).Value = "toasters"
    myDataAdapter.SelectCommand.Parameters.Add("@SerialNum", MySQLDbType.Long).Value = 239

    myDataAdapter.Fill(myDataSet)
End Sub 'AddSqlParameters
```

C# example:

```
public void AddSqlParameters()
{
    // ...
    // create myDataSet and myDataAdapter
    // ...
    myDataAdapter.SelectCommand.Parameters.Add("@CategoryName", MySQLDbType.VarChar, 80).Value = "toasters";
    myDataAdapter.SelectCommand.Parameters.Add("@SerialNum", MySQLDbType.Long).Value = 239;
    myDataAdapter.Fill(myDataSet);
}
```

24.2.3.8. Using [MySQLParameterCollection](#)

The number of the parameters in the collection must be equal to the number of parameter placeholders within the command text, or an exception will be generated.

Examples

The following example creates multiple instances of [MySQLParameter](#) through the [MySQLParameterCollection](#) collection within the [MySQLDataAdapter](#). These parameters are used to select data within the data source and place the data in the [DataSet](#). This code assumes that a [DataSet](#) and a [MySQLDataAdapter](#) have already been created with the appropriate schema, commands, and connection.

Visual Basic example:

```
Public Sub AddParameters()
    ' ...
    ' create myDataSet and myDataAdapter
    ' ...
    myDataAdapter.SelectCommand.Parameters.Add("@CategoryName", MySQLDbType.VarChar, 80).Value = "toasters"
    myDataAdapter.SelectCommand.Parameters.Add("@SerialNum", MySQLDbType.Long).Value = 239

    myDataAdapter.Fill(myDataSet)
End Sub 'AddSqlParameters
```

C# example:

```
public void AddSqlParameters()
{
    // ...
    // create myDataSet and myDataAdapter
    // ...
    myDataAdapter.SelectCommand.Parameters.Add("@CategoryName", MySQLDbType.VarChar, 80).Value = "toasters";
    myDataAdapter.SelectCommand.Parameters.Add("@SerialNum", MySQLDbType.Long).Value = 239;
    myDataAdapter.Fill(myDataSet);
}
```

24.2.3.9. Using [MySQLTransaction](#)

Represents an SQL transaction to be made in a MySQL database. This class cannot be inherited.

The application creates a [MySQLTransaction](#) object by calling [MySQLConnection.BeginTransaction](#) on the [MySQLConnection](#) object. All subsequent operations associated with the transaction (for example, committing or aborting the transaction), are performed on the [MySQLTransaction](#) object.

Note

Once you have started a transaction on a connection all subsequent commands on that connection are applied within the scope of the transaction. You cannot execute an SQL statement on the same connection outside of the transaction scope. If you need to do this while executing statements that are part of a transaction, open a second a connection to be used for execution the non-transaction statements.

Examples

The following example creates a `MySQLConnection` and a `MySQLTransaction`. It also demonstrates how to use the `MySQLConnection.BeginTransaction`, `MySQLTransaction.Commit`, and `MySQLTransaction.Rollback` methods.

Visual Basic example:

```
Public Sub RunTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

    Dim myCommand As MySqlCommand = myConnection.CreateCommand()
    Dim myTrans As MySQLTransaction

    ' Start a local transaction
    myTrans = myConnection.BeginTransaction()
    ' Must assign both transaction object and connection
    ' to Command object for a pending local transaction
    myCommand.Connection = myConnection
    myCommand.Transaction = myTrans

    Try
        myCommand.CommandText = "Insert into Region (RegionID, RegionDescription) VALUES (100, 'Description')"
        myCommand.ExecuteNonQuery()
        myCommand.CommandText = "Insert into Region (RegionID, RegionDescription) VALUES (101, 'Description')"
        myCommand.ExecuteNonQuery()
        myTrans.Commit()
        Console.WriteLine("Both records are written to database.")
    Catch e As Exception
        Try
            myTrans.Rollback()
        Catch ex As MySQLException
            If Not myTrans.Connection Is Nothing Then
                Console.WriteLine("An exception of type " & ex.GetType().ToString() & _
                    " was encountered while attempting to roll back the transaction.")
            End If
        End Try

        Console.WriteLine("An exception of type " & e.GetType().ToString() & _
            "was encountered while inserting the data.")
        Console.WriteLine("Neither record was written to database.")
    Finally
        myConnection.Close()
    End Try
End Sub 'RunTransaction
```

C# example:

```
public void RunTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();
    MySQLTransaction myTrans;
    // Start a local transaction
    myTrans = myConnection.BeginTransaction();
    // Must assign both transaction object and connection
    // to Command object for a pending local transaction
    myCommand.Connection = myConnection;
    myCommand.Transaction = myTrans;
    try
    {
        myCommand.CommandText = "Insert into Region (RegionID, RegionDescription) VALUES (100, 'Description')";
        myCommand.ExecuteNonQuery();
        myCommand.CommandText = "Insert into Region (RegionID, RegionDescription) VALUES (101, 'Description')";
        myCommand.ExecuteNonQuery();
        myTrans.Commit();
        Console.WriteLine("Both records are written to database.");
    }
    catch(Exception e)
    {
        try
        {
            myTrans.Rollback();
        }
        catch (MySQLException ex)
        {
            if (myTrans.Connection != null)
            {
                Console.WriteLine("An exception of type " + ex.GetType() +
```

```

        " was encountered while attempting to roll back the transaction.");
    }
}

Console.WriteLine("An exception of type " + e.GetType() +
    " was encountered while inserting the data.");
Console.WriteLine("Neither record was written to database.");
}
finally
{
    myConnection.Close();
}
}

```

24.2.3.9.1. Rollback

Rolls back a transaction from a pending state.

The Rollback method is equivalent to the MySQL statement ROLLBACK. The transaction can only be rolled back from a pending state (after BeginTransaction has been called, but before Commit is called).

Examples

The following example creates [MySqlConnection](#) and a [MySqlConnection](#). It also demonstrates how to use the [MySqlConnection.BeginTransaction](#), [Commit](#), and [Rollback](#) methods.

Visual Basic example:

```

Public Sub RunSqlTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

    Dim myCommand As MySqlCommand = myConnection.CreateCommand()
    Dim myTrans As MySqlTransaction

    ' Start a local transaction
    myTrans = myConnection.BeginTransaction()

    ' Must assign both transaction object and connection
    ' to Command object for a pending local transaction
    myCommand.Connection = myConnection
    myCommand.Transaction = myTrans

    Try
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (100, 'Description')"
        myCommand.ExecuteNonQuery()
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (101, 'Description')"
        myCommand.ExecuteNonQuery()
        myTrans.Commit()
        Console.WriteLine("Success.")
    Catch e As Exception
        Try
            myTrans.Rollback()
        Catch ex As MySqlException
            If Not myTrans.Connection Is Nothing Then
                Console.WriteLine("An exception of type " & ex.GetType().ToString() & _
                    " was encountered while attempting to roll back the transaction.")
            End If
        End Try

        Console.WriteLine("An exception of type " & e.GetType().ToString() & _
            " was encountered while inserting the data.")
        Console.WriteLine("Neither record was written to database.")
    Finally
        myConnection.Close()
    End Try
End Sub

```

C# example:

```

public void RunSqlTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();
    MySqlTransaction myTrans;
    // Start a local transaction
    myTrans = myConnection.BeginTransaction();
    // Must assign both transaction object and connection
    // to Command object for a pending local transaction
    myCommand.Connection = myConnection;
    myCommand.Transaction = myTrans;
    try
    {
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (100, 'Description')";
        myCommand.ExecuteNonQuery();
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (101, 'Description')";
    }
}

```

```

myCommand.ExecuteNonQuery();
myTrans.Commit();
Console.WriteLine("Both records are written to database.");
}
catch(Exception e)
{
    try
    {
        myTrans.Rollback();
    }
    catch (MySQLException ex)
    {
        if (myTrans.Connection != null)
        {
            Console.WriteLine("An exception of type " + ex.GetType() +
                " was encountered while attempting to roll back the transaction.");
        }
    }

    Console.WriteLine("An exception of type " + e.GetType() +
        " was encountered while inserting the data.");
    Console.WriteLine("Neither record was written to database.");
}
finally
{
    myConnection.Close();
}
}

```

24.2.3.9.2. Commit

Commits the database transaction.

The `Commit` method is equivalent to the MySQL SQL statement COMMIT.

Examples

The following example creates `MySQLConnection` and a `MySQLTransaction`. It also demonstrates how to use the `MySQLConnection.BeginTransaction`, `Commit`, and `Rollback` methods.

Visual Basic example:

```

Public Sub RunSqlTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

    Dim myCommand As MySqlCommand = myConnection.CreateCommand()
    Dim myTrans As MySQLTransaction

    ' Start a local transaction
    myTrans = myConnection.BeginTransaction()

    ' Must assign both transaction object and connection
    ' to Command object for a pending local transaction
    myCommand.Connection = myConnection
    myCommand.Transaction = myTrans

    Try
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (100, 'Description')"
        myCommand.ExecuteNonQuery()
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (101, 'Description')"
        myCommand.ExecuteNonQuery()
        myTrans.Commit()
        Console.WriteLine("Success.")
    Catch e As Exception
        Try
            myTrans.Rollback()
        Catch ex As MySQLException
            If Not myTrans.Connection Is Nothing Then
                Console.WriteLine("An exception of type " & ex.GetType().ToString() & _
                    " was encountered while attempting to roll back the transaction.")
            End If
        End Try

        Console.WriteLine("An exception of type " & e.GetType().ToString() & _
            " was encountered while inserting the data.")
        Console.WriteLine("Neither record was written to database.")
    Finally
        myConnection.Close()
    End Try
End Sub

```

C# example:

```

public void RunSqlTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();

```

```

MySQLTransaction myTrans;
// Start a local transaction
myTrans = myConnection.BeginTransaction();
// Must assign both transaction object and connection
// to Command object for a pending local transaction
myCommand.Connection = myConnection;
myCommand.Transaction = myTrans;
try
{
    myCommand.CommandText = "Insert into mytable (id, desc) VALUES (100, 'Description')";
    myCommand.ExecuteNonQuery();
    myCommand.CommandText = "Insert into mytable (id, desc) VALUES (101, 'Description')";
    myCommand.ExecuteNonQuery();
    myTrans.Commit();
    Console.WriteLine("Both records are written to database.");
}
catch(Exception e)
{
    try
    {
        myTrans.Rollback();
    }
    catch (MySqlException ex)
    {
        if (myTrans.Connection != null)
        {
            Console.WriteLine("An exception of type " + ex.GetType() +
                " was encountered while attempting to roll back the transaction.");
        }
    }

    Console.WriteLine("An exception of type " + e.GetType() +
        " was encountered while inserting the data.");
    Console.WriteLine("Neither record was written to database.");
}
finally
{
    myConnection.Close();
}
}

```

24.2.4. Connector/NET Reference

This section of the manual contains a complete reference to the Connector/NET ADO.NET component, automatically generated from the embedded documentation.

24.2.4.1. `MySql.Data.MySqlClient`

[Namespace hierarchy](#)

Classes

Class	Description
MySqlCommand	
MySqlCommandBuilder	
MySQLConnection	
MySQLDataAdapter	
MySQLDataReader	Provides a means of reading a forward-only stream of rows from a MySQL database. This class cannot be inherited.
MySQLError	Collection of error codes that can be returned by the server
MySQLException	The exception that is thrown when MySQL returns an error. This class cannot be inherited.
MySQLHelper	Helper class that makes it easier to work with the provider.
MySQLInfoMessageEventArgs	Provides data for the InfoMessage event. This class cannot be inherited.
MySQLParameter	Represents a parameter to a MySqlCommand , and optionally, its mapping to DataSet columns. This class cannot be inherited.
MySQLParameterCollection	Represents a collection of parameters relevant to a MySqlCommand as well as their respective mappings to columns in a DataSet. This class cannot be inherited.
MySQLRowUpdatedEventArgs	Provides data for the RowUpdated event. This class cannot be inherited.
MySQLRowUpdatingEventArgs	Provides data for the RowUpdating event. This class cannot be inherited.

MySQLTransaction	
----------------------------------	--

Delegates

Delegate	Description
MySQLInfoMessageEventHandler	Represents the method that will handle the InfoMessage event of a MySQLConnection .
MySQLRowUpdatedEventHandler	Represents the method that will handle the RowUpdatedevent of a MySQLDataAdapter .
MySQLRowUpdatingEventHandler	Represents the method that will handle the RowUpdatingevent of a MySQLDataAdapter .

Enumerations

Enumeration	Description
MySQLDbType	Specifies MySQL specific data type of a field, property, for use in a MySQLParameter .
MySQLErrorCode

[MySQLCommand overview](#)

Public Instance Constructors

MySQLCommand	Overloaded. Initializes a new instance of the MySqlCommand class.
------------------------------	---

Public Instance Properties

CommandText	
CommandTimeout	
CommandType	
Connection	
Container(inherited from Component)	Gets the IContainerthat contains the Component.
IsPrepared	
Parameters	
Site(inherited from Component)	Gets or sets the ISiteof the Component.
Transaction	
UpdatedRowSource	

Public Instance Methods

Cancel	Attempts to cancel the execution of a MySqlCommand. This operation is not supported.
CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
CreateParameter	Creates a new instance of a MySqlParameter object.
Dispose(inherited from Component)	Releases all resources used by the Component.
Equals(inherited from Object)	Determines whether the specified Objectis equal to the current Object.
ExecuteNonQuery	
ExecuteReader	Overloaded.
ExecuteScalar	
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCodeis suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Typeof the current instance.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
Prepare	
ToString(inherited from Component)	Returns a Stringcontaining the name of the Component, if any. This method should not be overridden.

Public Instance Events

Disposed(inherited from Component)	Adds an event handler to listen to the Disposedevent on the component.
------------------------------------	--

[MySQLConnection](#) overview

Public Instance Constructors

MySQLConnection	Overloaded. Initializes a new instance of the MySqlConnection class.
---------------------------------	--

Public Instance Properties

ConnectionString	
ConnectionTimeout	
Container(inherited from Component)	Gets the IContainerthat contains the Component.
Database	
DataSource	Gets the name of the MySQL server to which to connect.
ServerThread	Returns the id of the server thread this connection is executing on
ServerVersion	
Site(inherited from Component)	Gets or sets the ISiteof the Component.
State	
UseCompression	Indicates if this connection should use compression when communicating with the server.

Public Instance Methods

BeginTransaction	Overloaded.
ChangeDatabase	
Close	
CreateCommand	
CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Dispose(inherited from Component)	Releases all resources used by the Component.
Equals(inherited from Object)	Determines whether the specified Objectis equal to the current Object.

GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Type of the current instance.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
Open	
Ping	Ping
ToString(inherited from Component)	Returns a String containing the name of the Component, if any. This method should not be overridden.

Public Instance Events

Disposed(inherited from Component)	Adds an event handler to listen to the Disposed event on the component.
InfoMessage	
StateChange

```
NotOverridable Public Property ConnectionString As String _  
- Implements IDbConnection.ConnectionString
```

Syntax: C#

```
public string ConnectionString {get; set;}
```

Implements

IDbConnection.ConnectionString

See Also

[MySqlConnection Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.1.3.1.1.3. **ConnectionTimeout Property****Syntax: Visual Basic**

```
NotOverridable Public ReadOnly Property ConnectionTimeout As Integer _  
- Implements IDbConnection.ConnectionTimeout
```

Syntax: C#

```
public int ConnectionTimeout {get;}
```

Implements

IDbConnection.ConnectionTimeout

See Also

[MySqlConnection Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.1.3.1.1.4. **Database Property****Syntax: Visual Basic**

```
NotOverridable Public ReadOnly Property Database As String _  
- Implements IDbConnection.Database
```

Syntax: C#

```
public string Database {get;}
```

Implements

IDbConnection.Database

See Also

[MySqlConnection Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.1.3.1.1.5. DataSource Property

Gets the name of the MySQL server to which to connect.

Syntax: Visual Basic

```
Public ReadOnly Property DataSource As String
```

Syntax: C#

```
public string DataSource {get;}
```

See Also

[MySqlConnection Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.1.3.1.1.6. ServerThread Property

Returns the id of the server thread this connection is executing on

Syntax: Visual Basic

```
Public ReadOnly Property ServerThread As Integer
```

Syntax: C#

```
public int ServerThread {get;}
```

See Also

[MySqlConnection Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.1.3.1.1.7. ServerVersion Property

Syntax: Visual Basic

```
Public ReadOnly Property ServerVersion As String
```

Syntax: C#

```
public string ServerVersion {get;}
```

See Also

[MySqlConnection Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.1.3.1.1.8. State Property

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property State As ConnectionState _  
- Implements IDbConnection.State
```

Syntax: C#

```
public System.Data.ConnectionState State {get;}
```

Implements

IDbConnection.State

See Also

[MySqlConnection Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.1.3.1.1.9. UseCompression Property

Indicates if this connection should use compression when communicating with the server.

Syntax: Visual Basic

```
Public ReadOnly Property UseCompression As Boolean
```

Syntax: C#

```
public bool UseCompression {get;}
```

24.2.4.1.2.1.1.3.1.1.10.1. MySqlConnection.BeginTransaction Method

Syntax: Visual Basic

```
Overloads Public Function BeginTransaction() As MySQLTransaction
```

Syntax: C#

```
public MySQLTransaction BeginTransaction();
```

See Also

[MySQLConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLConnection.BeginTransaction Overload List](#)

24.2.4.1.2.1.1.3.1.1.10.1.1. MySQLTransaction Class

For a list of all members of this type, see [MySQLTransaction Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySQLTransaction_
    Implements IDbTransaction, IDisposable
```

Syntax: C#

```
public sealed class MySQLTransaction : IDbTransaction, IDisposable
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

See Also

[MySQLTransaction Members](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.1.3.1.1.10.1.1.1.1. [MySQLTransaction](#) Members

[MySQLTransaction overview](#)

Public Instance Properties

Connection	Gets the MySQLConnection object associated with the transaction, or a null reference (Nothing in Visual Basic) if the transaction is no longer valid.
IsolationLevel	Specifies the IsolationLevel for this transaction.

Public Instance Methods

Commit	
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
Rollback	
ToString(inherited from Object)	Returns a String that represents the current Object.

[MySQLTransaction Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.1.3.1.1.10.1.1.1.1.1.1.1. Connection Property

Gets the [MySQLConnection](#) object associated with the transaction, or a null reference (Nothing in Visual Basic) if the transaction is no longer valid.

Syntax: Visual Basic

```
Public ReadOnly Property Connection As MySqlConnection
```

Syntax: C#

```
public MySqlConnection Connection {get;}
```

Property Value

The [MySQLConnection](#) object associated with this transaction.

Remarks

A single application may have multiple database connections, each with zero or more transactions. This property enables you to determine the connection object associated with a particular transaction created by [BeginTransaction](#) .

See Also

[MySQLTransaction Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.1.3.1.1.10.1.1.1.1.1.2. IsolationLevel Property

Specifies the IsolationLevel for this transaction.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property IsolationLevel As IsolationLevel _
  Implements IDbTransaction.IsolationLevel
```

Syntax: C#

```
public System.Data.IsolationLevel IsolationLevel {get;}
```

Property Value

The IsolationLevel for this transaction. The default is ReadCommitted.

Implements

IDbTransaction.IsolationLevel

Remarks

Parallel transactions are not supported. Therefore, the IsolationLevel applies to the entire transaction.

```
NotOverridable Public Sub ChangeDatabase( _  
    ByVal databaseName As String _  
) _  
- Implements IDbConnection.ChangeDatabase
```

Syntax: C#

```
public void ChangeDatabase(  
    string databaseName  
);
```

Implements

IDbConnection.ChangeDatabase

See Also

[MySQLConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.1.3.1.1.12. [MySQLConnection.Close](#) Method**Syntax: Visual Basic**

```
NotOverridable Public Sub Close() _  
- Implements IDbConnection.Close
```

Syntax: C#

```
public void Close();
```

Implements

IDbConnection.Close

See Also

[MySQLConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.1.3.1.1.13. [MySQLConnection.CreateCommand](#) Method**Syntax: Visual Basic**

Public Event InfoMessage As MySqlInfoMessageEventHandler
```

Syntax: C#

```
public event MySqlInfoMessageEventHandler InfoMessage;
```

See Also

[MySQLConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.1.3.1.1.16.1. [MySQLInfoMessageEventHandler](#) Delegate

Represents the method that will handle the [InfoMessage](#) event of a [MySQLConnection](#) .

Syntax: Visual Basic

```
Public Delegate Sub MySqlInfoMessageEventHandler( _
    ByVal sender As Object, _
    ByVal args As MySqlInfoMessageEventArgs _
)
```

Syntax: C#

```
public delegate void MySqlInfoMessageEventHandler(
    object sender,
    MySqlInfoMessageEventArgs args
);
```

Requirements

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

See Also

[MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.1.3.1.1.16.1.1. [MySQLInfoMessageEventArgs](#) Class

Provides data for the InfoMessage event. This class cannot be inherited.

For a list of all members of this type, see [MySQLInfoMessageEventArgs Members](#) .

Syntax: Visual Basic

```
Public Class MySQLInfoMessageEventArgs_
    Inherits EventArgs
```

Syntax: C#

```
public class MySQLInfoMessageEventArgs : EventArgs
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

24.2.4.1.2.1.7.1. [MySqlParameterCollection](#) Class

Represents a collection of parameters relevant to a [MySqlCommand](#) as well as their respective mappings to columns in a DataSet. This class cannot be inherited.

For a list of all members of this type, see [MySqlParameterCollection Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySqlConnection_
    Inherits MarshalByRefObject_
    Implements IDataParameterCollection, IList, ICollection, IEnumerable
```

Syntax: C#

```
public sealed class MySqlConnection : MarshalByRefObject, IDataParameterCollection, IList, ICollection, IEnumerable
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

See Also

[MySQLParameterCollection Members](#) , [MySQL.Data.MySqlClient Namespace](#)24.2.4.1.2.1.7.1.1. [MySQLParameterCollection](#) Members[MySQLParameterCollection](#) overview**Public Instance Constructors**

MySQLParameterCollection Constructor	Initializes a new instance of the MySQLParameterCollection class.
--	---

Public Instance Properties

Count	Gets the number of MySQLParameter objects in the collection.
Item	Overloaded. Gets the MySQLParameter with a specified attribute. In C#, this property is the indexer for the MySQLParameterCollection class.

Public Instance Methods

Add	Overloaded. Adds the specified MySQLParameter object to the MySQLParameterCollection .
Clear	Removes all items from the collection.
Contains	Overloaded. Gets a value indicating whether a MySQLParameter exists in the collection.
CopyTo	Copies MySQLParameter objects from the MySQLParameterCollection to the specified array.
CreateObjRef (inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Equals (inherited from Object)	Determines whether the specified Object is equal to the current Object .
GetHashCode (inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService (inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType (inherited from Object)	Gets the Type of the current instance.
IndexOf	Overloaded. Gets the location of a MySQLParameter in the collection.
InitializeLifetimeService (inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
Insert	Inserts a MySQLParameter into the collection at the specified index.
Remove	Removes the specified MySQLParameter from the collection.
RemoveAt	Overloaded. Removes the specified MySQLParameter from the collection.
ToString (inherited from Object)	Returns a String that represents the current Object .

See Also[MySQLParameterCollection](#) Class , [MySQL.Data.MySqlClient Namespace](#)24.2.4.1.2.1.7.1.1.1. [MySQLParameterCollection](#) Constructor

Initializes a new instance of the [MySQLParameterCollection](#) class.

Syntax: Visual Basic

```
Public Sub New()
```

Syntax: C#

```
public MySqlParameterCollection();
```

See Also

[MySqlParameterCollection Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.2. Count Property

Gets the number of [MySqlParameter](#) objects in the collection.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property Count As Integer _
    Implements ICollection.Count
```

Syntax: C#

```
public int Count {get;}
```

Implements

[ICollection.Count](#)

[MySqlParameterCollection Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3. Item Property

Gets the [MySqlParameter](#) with a specified attribute. In C#, this property is the indexer for the [MySqlParameterCollection](#) class.

Overload List

Gets the [MySqlParameter](#) at the specified index.

- `public MySqlParameter this[int] {get; set;}`

Gets the [MySqlParameter](#) with the specified name.

- `public MySqlParameter this[string] {get; set;}`

See Also

[MySqlParameterCollection Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1. [MySqlParameter](#) Class

Represents a parameter to a [MySqlCommand](#) , and optionally, its mapping to [DataSetColumns](#). This class cannot be inherited.

For a list of all members of this type, see [MySqlParameter Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySqlParameter_
    Inherits MarshalByRefObject_
    Implements IDataParameter, IDbDataParameter, ICloneable
```

Syntax: C#

```
public sealed class MySqlParameter : MarshalByRefObject, IDataParameter, IDbDataParameter, ICloneable
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaran-

ted to be thread-safe.

Requirements

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

See Also

[MySqlParameter Members](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1. [MySqlParameter](#) Members

[MySqlParameter overview](#)

Public Instance Constructors

MySqlParameter	Overloaded. Initializes a new instance of the MySqlParameter class.
--------------------------------	---

Public Instance Properties

DbType	Gets or sets the DbType of the parameter.
Direction	Gets or sets a value indicating whether the parameter is input-only, output-only, bidirectional, or a stored procedure return value parameter. As of MySQL version 4.1 and earlier, input-only is the only valid choice.
IsNullable	Gets or sets a value indicating whether the parameter accepts null values.
IsUnsigned	
MySqlDbType	Gets or sets the MySqlDbType of the parameter.
ParameterName	Gets or sets the name of the MySqlParameter .
Precision	Gets or sets the maximum number of digits used to represent the Value property.
Scale	Gets or sets the number of decimal places to which Value is resolved.
Size	Gets or sets the maximum size, in bytes, of the data within the column.
SourceColumn	Gets or sets the name of the source column that is mapped to the DataSet and used for loading or returning the Value .
SourceVersion	Gets or sets the DataRowVersion to use when loading Value .
Value	Gets or sets the value of the parameter.

Public Instance Methods

CreateObjRef (inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Equals (inherited from Object)	Determines whether the specified Object is equal to the current Object .
GetHashCode (inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService (inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType (inherited from Object)	Gets the Type of the current instance.
InitializeLifetimeService (inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
ToString	Overridden. Gets a string containing the ParameterName .

24.2.4.1.2.1.7.1.1.3.1.1.1. [MySQLParameter](#) Constructor

Initializes a new instance of the [MySQLParameter](#) class.

Overload List

Initializes a new instance of the [MySQLParameter](#) class.

- [public MySQLParameter\(\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name and the data type.

- [public MySQLParameter\(string,MySQLDbType\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the [MySQLDbType](#) , and the size.

- [public MySQLParameter\(string,MySQLDbType,int\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the type of the parameter, the size of the parameter, a [ParameterDirection](#), the precision of the parameter, the scale of the parameter, the source column, a [DataRowVersion](#) to use, and the value of the parameter.

- [public MySQLParameter\(string,MySQLDbType,int,ParameterDirection,bool,byte,byte,string,DataRowVersion,object\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the [MySQLDbType](#) , the size, and the source column name.

- [public MySQLParameter\(string,MySQLDbType,int,string\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name and a value of the new [MySQLParameter](#).

- [public MySQLParameter\(string,object\);](#)

24.2.4.1.2.1.7.1.1.3.1.1.1.1. [MySQLParameter](#) Constructor ()

Initializes a new instance of the [MySQLParameter](#) class.

Syntax: Visual Basic

```
Overloads Public Sub New()
```

Syntax: C#

```
public MySQLParameter();
```

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameter Constructor Overload List](#)

24.2.4.1.2.1.7.1.1.3.1.1.1.2. [MySQLParameter](#) Constructor

Initializes a new instance of the [MySQLParameter](#) class with the parameter name and the data type.

Syntax: Visual Basic

```
Overloads Public Sub New( _
    ByVal parameterName As String, _
    ByVal dbType As MySqlDbType _
)
```

Syntax: C#

```
public MySQLParameter(
    stringparameterName,
    MySqlDbTypedbType
);
```

Parameters

- `parameterName`: The name of the parameter to map.
- `dbType`: One of the [MySQLDbType](#) values.

24.2.4.1.2.1.7.1.1.3.1.1.2.1. [MySQLDbType](#) Enumeration

Specifies MySQL specific data type of a field, property, for use in a [MySQLParameter](#) .

Syntax: Visual Basic

```
Public Enum MySqlDbType
```

Syntax: C#

```
public enum MySqlDbType
```

Members

Member Name	Description
Newdate	Obsolete. Use Datetime or Date type.
Timestamp	A timestamp. The range is '1970-01-01 00:00:01' to sometime in the year 2038.
Time	The range is '-838:59:59' to '838:59:59'
Date	Date The supported range is '1000-01-01' to '9999-12-31'
Datetime	The supported range is '1000-01-01 00:00:00' to '9999-12-31 23:59:59'
Year	A year in 2- or 4-digit format (default is 4-digit). The allowable values are 1901 to 2155, 0000 in the 4-digit year format, and 1970-2069 if you use the 2-digit format (70-69).
TinyBlob	A BLOB column with a maximum length of 255 (2 ⁸ - 1) characters
Blob	A BLOB column with a maximum length of 65535 (2 ¹⁶ - 1) characters
MediumBlob	A BLOB column with a maximum length of 16777215 (2 ²⁴ - 1) characters
LongBlob	A BLOB column with a maximum length of 4294967295 or 4G (2 ³² - 1) characters
Int16	A 16-bit signed integer. The signed range is -32768 to 32767. The unsigned range is 0 to 65535

Int24	Specifies a 24 (3 byte) signed or unsigned value
Int32	A 32-bit signed integer
Int64	A 64-bit signed integer
Byte	The signed range is -128 to 127. The unsigned range is 0 to 255.
Float	A small (single-precision) floating-point number. Allowable values are -3.402823466E+38 to -1.175494351E-38, 0, and 1.175494351E-38 to 3.402823466E+38.
Double	A normal-size (double-precision) floating-point number. Allowable values are -1.7976931348623157E+308 to -2.2250738585072014E-308, 0, and 2.2250738585072014E-308 to 1.7976931348623157E+308.
UByte	An 8-bit unsigned value
UInt16	A 16-bit unsigned value
UInt24	A 24-bit unsigned value
UInt32	A 32-bit unsigned value
UInt64	A 64-bit unsigned value
Decimal	A fixed precision and scale numeric value between -10 ³⁸ -1 and 10 ³⁸ -1
NewDecimal	New Decimal
Set	A set. A string object that can have zero or more values, each of which must be chosen from the list of values 'value1', 'value2', ... A SET can have a maximum of 64 members.
String	Obsolete Use VarChar type
VarChar	A variable-length string containing 0 to 255 characters
VarString	A variable-length string containing 0 to 65535 characters
Enum	An enumeration. A string object that can have only one value, chosen from the list of values 'value1', 'value2', ..., NULL or the special "" error value. An ENUM can have a maximum of 65535 distinct values.
Geometry	
Bit	Bit-field data type
TinyText	A nonbinary string column supporting a maximum length of 255 (2 ⁸ - 1) characters
Text	A nonbinary string column supporting a maximum length of 65535 (2 ¹⁶ - 1) characters
MediumText	A nonbinary string column supporting a maximum length of 16777215 (2 ²⁴ - 1) characters
LongText	A nonbinary string column supporting a maximum length of 4294967295 (2 ³² - 1) characters

Requirements

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

See Also

[MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.3. [MySQLParameter](#) Constructor (String, MySQLDbType, Int32)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the [MySQLDbType](#), and the size.

Syntax: Visual Basic

```
Overloads Public Sub New( _
    ByVal parameterName As String, _
    ByVal dbType As MySqlDbType, _
    ByVal size As Integer _
)
```

Syntax: C#

```
public MySqlParameter(
    stringparameterName,
    MySqlDbTypedbType,
    intsize
);
```

Parameters

- `parameterName`: The name of the parameter to map.
- `dbType`: One of the `MySqlDbType` values.
- `size`: The length of the parameter.

See Also

[MySqlParameter Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlParameter Constructor Overload List](#)

24.2.4.1.2.1.7.1.1.3.1.1.4. `MySqlParameter` Constructor

Initializes a new instance of the `MySqlParameter` class with the parameter name, the type of the parameter, the size of the parameter, a `ParameterDirection`, the precision of the parameter, the scale of the parameter, the source column, a `DataRowVersion` to use, and the value of the parameter.

Syntax: Visual Basic

```
Overloads Public Sub New( _
    ByVal parameterName As String, _
    ByVal dbType As MySqlDbType, _
    ByVal size As Integer, _
    ByVal direction As ParameterDirection, _
    ByVal isNullable As Boolean, _
    ByVal precision As Byte, _
    ByVal scale As Byte, _
    ByVal sourceColumn As String, _
    ByVal sourceVersion As DataRowVersion, _
    ByVal value As Object _
)
```

Syntax: C#

```
public MySqlParameter(
    stringparameterName,
    MySqlDbTypedbType,
    intsize,
    ParameterDirectiondirection,
    boolisNullable,
    byteprecision,
    bytescale,
    stringsourceColumn,
    DataRowVersionsourceVersion,
    objectvalue
);
```

Parameters

- `parameterName`: The name of the parameter to map.
- `dbType`: One of the `MySqlDbType` values.
- `size`: The length of the parameter.
- `direction`: One of the `ParameterDirection` values.
- `isNullable`: true if the value of the field can be null, otherwise false.

- **precision**: The total number of digits to the left and right of the decimal point to which **Value** is resolved.
- **scale**: The total number of decimal places to which **Value** is resolved.
- **sourceColumn**: The name of the source column.
- **sourceVersion**: One of the DataRowVersion values.
- **value**: An Object that is the value of the **MySQLParameter**.

Exceptions

Exception Type	Condition
ArgumentException

[MySQLParameter Class](#), [MySQL.Data.MySqlClient Namespace](#), [MySQLParameter Constructor Overload List](#)

24.2.4.1.2.1.7.1.1.3.1.1.4.1. Value Property

Gets or sets the value of the parameter.

Syntax: Visual Basic

```
NotOverridable Public Property Value As Object _
    Implements IDataParameter.Value
```

Syntax: C#

```
public object Value {get; set;}
```

Implements

IDataParameter.Value

See Also

[MySQLParameter Class](#), [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.5. MySQLParameter Constructor

Initializes a new instance of the **MySQLParameter** class with the parameter name, the **MySQLDbType**, the size, and the source column name.

Syntax: Visual Basic

```
Overloads Public Sub New( _
    ByVal parameterName As String, _
    ByVal dbType As MySQLDbType, _
    ByVal size As Integer, _
    ByVal sourceColumn As String _
)
```

Syntax: C#

```
public MySQLParameter(
    string parameterName,
    MySQLDbType dbType,
    int size,
    string sourceColumn
);
```

Parameters

- **parameterName**: The name of the parameter to map.
- **dbType**: One of the **MySQLDbType** values.

- `size`: The length of the parameter.
- `sourceColumn`: The name of the source column.

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameter Constructor Overload List](#)

24.2.4.1.2.1.7.1.1.3.1.1.1.6. `MySQLParameter` Constructor

Initializes a new instance of the `MySQLParameter` class with the parameter name and a value of the new `MySQLParameter`.

Syntax: Visual Basic

```
Overloads Public Sub New( _
    ByVal parameterName As String, _
    ByVal value As Object _
)
```

Syntax: C#

```
public MySQLParameter(
    stringparameterName,
    objectvalue
);
```

Parameters

- `parameterName`: The name of the parameter to map.
- `value`: An Objectthat is the value of the `MySQLParameter` .

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameter Constructor Overload List](#)

24.2.4.1.2.1.7.1.1.3.1.1.2. DbType Property

Gets or sets the DbTypeof the parameter.

Syntax: Visual Basic

```
NotOverridable Public Property DbType As DbType _
    Implements IDataParameter.DbType
```

Syntax: C#

```
public System.Data.DbType DbType {get; set;}
```

Implements

`IDataParameter.DbType`

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.3. Direction Property

Gets or sets a value indicating whether the parameter is input-only, output-only, bidirectional, or a stored procedure return value parameter. As of MySQL version 4.1 and earlier, input-only is the only valid choice.

Syntax: Visual Basic

```
NotOverridable Public Property Direction As ParameterDirection _
    Implements IDataParameter.Direction
```

Syntax: C#

```
public System.Data.ParameterDirection Direction {get; set;}
```

Implements

IDataParameter.Direction

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.4. IsNullable Property

Gets or sets a value indicating whether the parameter accepts null values.

Syntax: Visual Basic

```
NotOverridable Public Property IsNullable As Boolean _
    Implements IDataParameter.IsNullable
```

Syntax: C#

```
public bool IsNullable {get; set;}
```

Implements

IDataParameter.IsNullable

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.5. IsUnsigned Property

Syntax: Visual Basic

```
Public Property IsUnsigned As Boolean
```

Syntax: C#

```
public bool IsUnsigned {get; set;}
```

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.6. [MySQLDbType](#) Property

Gets or sets the MySQLDbType of the parameter.

Syntax: Visual Basic

```
Public Property MySQLDbType As MySQLDbType
```

Syntax: C#

```
public MySQLDbType MySQLDbType {get; set;}
```

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.7. ParameterName Property

Gets or sets the name of the MySQLParameter.

Syntax: Visual Basic

```
NotOverridable Public Property ParameterName As String _
    Implements IDataParameter.ParameterName
```

Syntax: C#

```
public string ParameterName {get; set;}
```

Implements

IDataParameter.ParameterName

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.8. Precision Property

Gets or sets the maximum number of digits used to represent the [Value](#) property.

Syntax: Visual Basic

```
NotOverridable Public Property Precision As Byte _
    Implements IDbDataParameter.Precision
```

Syntax: C#

```
public byte Precision {get; set;}
```

Implements

IDbDataParameter.Precision

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.9. Scale Property

Gets or sets the number of decimal places to which [Value](#) is resolved.

Syntax: Visual Basic

```
NotOverridable Public Property Scale As Byte _
    Implements IDbDataParameter.Scale
```

Syntax: C#

```
public byte Scale {get; set;}
```

Implements

IDbDataParameter.Scale

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.10. Size Property

Gets or sets the maximum size, in bytes, of the data within the column.

Syntax: Visual Basic

```
NotOverridable Public Property Size As Integer _
    Implements IDbDataParameter.Size
```

Syntax: C#

```
public int Size {get; set;}
```

Implements

IDbDataParameter.Size

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.11. SourceColumn Property

Gets or sets the name of the source column that is mapped to the DataSet and used for loading or returning the [Value](#) .

Syntax: Visual Basic

```
NotOverridable Public Property SourceColumn As String _
    Implements IDataParameter.SourceColumn
```

Syntax: C#

```
public string SourceColumn {get; set;}
```

Implements

IDataParameter.SourceColumn

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.12. SourceVersion Property

Gets or sets the DataRowVersion to use when loading [Value](#) .

Syntax: Visual Basic

```
NotOverridable Public Property SourceVersion As DataRowVersion _
    Implements IDataParameter.SourceVersion
```

Syntax: C#

```
public System.Data.DataRowVersion SourceVersion {get; set;}
```

Implements

IDataParameter.SourceVersion

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.1.1.13. MySQLParameter.ToString Method

Overridden. Gets a string containing the [ParameterName](#) .

Syntax: Visual Basic

```
Overrides Public Function ToString() As String
```

Syntax: C#

```
public override string ToString();
```

Return Value

See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.3.2. Item Property (Int32)

Gets the [MySQLParameter](#) at the specified index.

Syntax: Visual Basic

```
Overloads Public Default Property Item( _  
    ByVal index As Integer _  
) As MySQLParameter
```

Syntax: C#

```
public MySQLParameter this[  
    int index  
] {get; set;}
```

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Item Overload List](#)

24.2.4.1.2.1.7.1.1.3.3. Item Property (String)

Gets the [MySQLParameter](#) with the specified name.

Syntax: Visual Basic

```
Overloads Public Default Property Item( _  
    ByVal name As String _  
) As MySQLParameter
```

Syntax: C#

```
public MySQLParameter this[  
    string name  
] {get; set;}
```

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Item Overload List](#)

24.2.4.1.2.1.7.1.1.4. Add Method

Adds the specified [MySQLParameter](#) object to the [MySQLParameterCollection](#) .

Overload List

Adds the specified [MySQLParameter](#) object to the [MySQLParameterCollection](#) .

- [public MySQLParameter Add\(MySQLParameter\);](#)

Adds the specified [MySQLParameter](#) object to the [MySQLParameterCollection](#) .

- [public int Add\(object\);](#)

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) given the parameter name and the data type.

- [public MySQLParameter Add\(string,MySQLDbType\);](#)

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) with the parameter name, the data type, and the column length.

- [public MySQLParameter Add\(string,MySQLDbType,int\);](#)

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) with the parameter name, the data type, the column length, and the source column name.

- `public MySQLParameter Add(string,MySQLDbType,int,string);`

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) given the specified parameter name and value.

- `public MySQLParameter Add(string,object);`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.4.1. [MySQLParameterCollection.Add](#) Method

Adds the specified [MySQLParameter](#) object to the [MySQLParameterCollection](#) .

Syntax: Visual Basic

```
Overloads Public Function Add( _  
    ByVal value As MySQLParameter _  
) As MySQLParameter
```

Syntax: C#

```
public MySQLParameter Add(  
MySQLParameter value  
);
```

Parameters

- `value`: The [MySQLParameter](#) to add to the collection.

Return Value

The newly added [MySQLParameter](#) object.

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Add Overload List](#)

24.2.4.1.2.1.7.1.1.4.2. [MySQLParameterCollection.Add](#) Method

Adds the specified [MySQLParameter](#) object to the [MySQLParameterCollection](#) .

Syntax: Visual Basic

```
NotOverridable Overloads Public Function Add( _  
    ByVal value As Object _  
) As Integer _  
- Implements IList.Add
```

Syntax: C#

```
public int Add(  
object value  
);
```

Parameters

- `value`: The [MySQLParameter](#) to add to the collection.

Return Value

The index of the new [MySQLParameter](#) object.

Implements

[IList.Add](#)

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Add Overload List](#)

24.2.4.1.2.1.7.1.1.4.3. [MySQLParameterCollection.Add](#) Method

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) given the parameter name and the data type.

Syntax: Visual Basic

```
Overloads Public Function Add( _  
    ByVal parameterName As String, _  
    ByVal dbType As MySqlDbType _  
) As MySQLParameter
```

Syntax: C#

```
public MySQLParameter Add(  
    stringparameterName,  
    MySqlDbTypedbType  
);
```

Parameters

- [parameterName](#): The name of the parameter.
- [dbType](#): One of the [MySQLDbType](#) values.

Return Value

The newly added [MySQLParameter](#) object.

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Add Overload List](#)

24.2.4.1.2.1.7.1.1.4.4. [MySQLParameterCollection.Add](#) Method

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) with the parameter name, the data type, and the column length.

Syntax: Visual Basic

```
Overloads Public Function Add( _  
    ByVal parameterName As String, _  
    ByVal dbType As MySqlDbType, _  
    ByVal size As Integer _  
) As MySQLParameter
```

Syntax: C#

```
public MySQLParameter Add(  
    stringparameterName,  
    MySqlDbTypedbType,  
    intsize  
);
```

Parameters

- [parameterName](#): The name of the parameter.
- [dbType](#): One of the [MySQLDbType](#) values.
- [size](#): The length of the column.

Return Value

The newly added [MySQLParameter](#) object.

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Add Overload List](#)

24.2.4.1.2.1.7.1.1.4.5. MySQLParameterCollection.Add Method

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) with the parameter name, the data type, the column length, and the source column name.

Syntax: Visual Basic

```
Overloads Public Function Add( _  
    ByVal parameterName As String, _  
    ByVal dbType As MySqlDbType, _  
    ByVal size As Integer, _  
    ByVal sourceColumn As String _  
) As MySQLParameter
```

Syntax: C#

```
public MySQLParameter Add(  
    stringparameterName,  
    MySqlDbTypedbType,  
    intsize,  
    stringsourceColumn  
);
```

Parameters

- [parameterName](#): The name of the parameter.
- [dbType](#): One of the [MySQLDbType](#) values.
- [size](#): The length of the column.
- [sourceColumn](#): The name of the source column.

Return Value

The newly added [MySQLParameter](#) object.

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Add Overload List](#)

24.2.4.1.2.1.7.1.1.4.6. MySQLParameterCollection.Add Method

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) given the specified parameter name and value.

Syntax: Visual Basic

```
Overloads Public Function Add( _  
    ByVal parameterName As String, _  
    ByVal value As Object _  
) As MySQLParameter
```

Syntax: C#

```
public MySQLParameter Add(  
    stringparameterName,  
    objectvalue  
);
```

Parameters

- [parameterName](#): The name of the parameter.

- `value`: The [Value](#) of the [MySQLParameter](#) to add to the collection.

Return Value

The newly added [MySQLParameter](#) object.

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Add Overload List](#)

24.2.4.1.2.1.7.1.1.5. [MySQLParameterCollection.Clear](#) Method

Removes all items from the collection.

Syntax: Visual Basic

```
NotOverridable Public Sub Clear() _
    Implements IList.Clear
```

Syntax: C#

```
public void Clear();
```

Implements

IList.Clear

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.6. Contains Method

Gets a value indicating whether a [MySQLParameter](#) exists in the collection.

Overload List

Gets a value indicating whether a [MySQLParameter](#) exists in the collection.

- `public bool Contains(object);`

Gets a value indicating whether a [MySQLParameter](#) with the specified parameter name exists in the collection.

- `public bool Contains(string);`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.6.1. [MySQLParameterCollection.Contains](#) Method

Gets a value indicating whether a [MySQLParameter](#) exists in the collection.

Syntax: Visual Basic

```
NotOverridable Overloads Public Function Contains( _
    ByVal value As Object _
) As Boolean _
    Implements IList.Contains
```

Syntax: C#

```
public bool Contains(
    objectvalue
);
```

Parameters

- `value`: The value of the [MySQLParameter](#) object to find.

Return Value

true if the collection contains the [MySQLParameter](#) object; otherwise, false.

Implements

`ICollection.Contains`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Contains Overload List](#)

24.2.4.1.2.1.7.1.1.6.2. MySQLParameterCollection.Contains Method

Gets a value indicating whether a [MySQLParameter](#) with the specified parameter name exists in the collection.

Syntax: Visual Basic

```
NotOverridable Overloads Public Function Contains( _
    ByVal name As String _
) As Boolean _
- Implements IDataParameterCollection.Contains
```

Syntax: C#

```
public bool Contains(
    string name
);
```

Parameters

- `name`: The name of the [MySQLParameter](#) object to find.

Return Value

true if the collection contains the parameter; otherwise, false.

Implements

`IDataParameterCollection.Contains`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Contains Overload List](#)

24.2.4.1.2.1.7.1.1.7. MySQLParameterCollection.CopyTo Method

Copies [MySQLParameter](#) objects from the [MySQLParameterCollection](#) to the specified array.

Syntax: Visual Basic

```
NotOverridable Public Sub CopyTo( _
    ByVal array As Array, _
    ByVal index As Integer _
) _
- Implements ICollection.CopyTo
```

Syntax: C#

```
public void CopyTo(
    Array array,
    int index
);
```

Parameters

- `array`:
- `index`:

Implements

`ICollection.CopyTo`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.8. IndexOf Method

Gets the location of a [MySQLParameter](#) in the collection.

Overload List

Gets the location of a [MySQLParameter](#) in the collection.

- `public int IndexOf(object);`

Gets the location of the [MySQLParameter](#) in the collection with a specific parameter name.

- `public int IndexOf(string);`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.8.1. MySQLParameterCollection.IndexOf Method

Gets the location of a [MySQLParameter](#) in the collection.

Syntax: Visual Basic

```
NotOverridable Overloads Public Function IndexOf( _  
    ByVal value As Object _  
) As Integer _  
- Implements IList.IndexOf
```

Syntax: C#

```
public int IndexOf(  
    object value  
);
```

Parameters

- `value`: The [MySQLParameter](#) object to locate.

Return Value

The zero-based location of the [MySQLParameter](#) in the collection.

Implements

`IList.IndexOf`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.IndexOf Overload List](#)

24.2.4.1.2.1.7.1.1.8.2. [MySQLParameterCollection.IndexOf](#) Method

Gets the location of the [MySQLParameter](#) in the collection with a specific parameter name.

Syntax: Visual Basic

```
NotOverridable Overloads Public Function IndexOf( _  
    ByVal parameterName As String _  
) As Integer _  
- Implements IDataParameterCollection.IndexOf
```

Syntax: C#

```
public int IndexOf(  
    stringparameterName  
);
```

Parameters

- `parameterName`: The name of the [MySQLParameter](#) object to retrieve.

Return Value

The zero-based location of the [MySQLParameter](#) in the collection.

Implements

[IDataParameterCollection.IndexOf](#)

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.IndexOf Overload List](#)

24.2.4.1.2.1.7.1.1.9. [MySQLParameterCollection.Insert](#) Method

Inserts a [MySQLParameter](#) into the collection at the specified index.

Syntax: Visual Basic

```
NotOverridable Public Sub Insert( _  
    ByVal index As Integer, _  
    ByVal value As Object _  
) _  
- Implements IList.Insert
```

Syntax: C#

```
public void Insert(  
    intindex,  
    objectvalue  
);
```

Parameters

- `index`:
- `value`:

Implements

[IList.Insert](#)

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.10. [MySQLParameterCollection.Remove](#) Method

Removes the specified [MySQLParameter](#) from the collection.

Syntax: Visual Basic

```
NotOverridable Public Sub Remove( _  
    ByVal value As Object _  
) _  
    Implements IList.Remove
```

Syntax: C#

```
public void Remove(  
    object value  
);
```

Parameters

- `value`:

Implements

[IList.Remove](#)

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.11. RemoveAt Method

Removes the specified [MySQLParameter](#) from the collection.

Overload List

Removes the specified [MySQLParameter](#) from the collection using a specific index.

- `public void RemoveAt(int);`

Removes the specified [MySQLParameter](#) from the collection using the parameter name.

- `public void RemoveAt(string);`

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.7.1.1.11.1. [MySQLParameterCollection.RemoveAt](#) Method

Removes the specified [MySQLParameter](#) from the collection using a specific index.

Syntax: Visual Basic

```
NotOverridable Overloads Public Sub RemoveAt( _  
    ByVal index As Integer _  
) _  
    Implements IList.RemoveAt
```

Syntax: C#

```
public void RemoveAt(  
    int index  
);
```

Parameters

- [index](#): The zero-based index of the parameter.

Implements

IList.RemoveAt

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.RemoveAt Overload List](#)

24.2.4.1.2.1.7.1.11.2. [MySQLParameterCollection.RemoveAt](#) Method

Removes the specified [MySQLParameter](#) from the collection using the parameter name.

Syntax: Visual Basic

```
NotOverridable Overloads Public Sub RemoveAt( _
    ByVal name As String _
) _
    Implements IDataParameterCollection.RemoveAt
```

Syntax: C#

```
public void RemoveAt(
    string name
);
```

Parameters

- [name](#): The name of the [MySQLParameter](#) object to retrieve.

Implements

IDataParameterCollection.RemoveAt

See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.RemoveAt Overload List](#)

24.2.4.1.2.1.8. Transaction Property

Syntax: Visual Basic

```
Public Property Transaction As MySQLTransaction
```

Syntax: C#

```
public MySQLTransaction Transaction {get; set;}
```

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.9. UpdatedRowSource Property

Syntax: Visual Basic

```
NotOverridable Public Property UpdatedRowSource As UpdateRowSource _
    Implements IDbCommand.UpdatedRowSource
```

Syntax: C#

```
public System.Data.UpdateRowSource UpdatedRowSource {get; set;}
```

Implements

IDbCommand.UpdatedRowSource

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.10. [MySQLCommand.Cancel](#) Method

Attempts to cancel the execution of a MySQLCommand. This operation is not supported.

Syntax: Visual Basic

```
NotOverridable Public Sub Cancel() _
    Implements IDbCommand.Cancel
```

Syntax: C#

```
public void Cancel();
```

Implements

IDbCommand.Cancel

Remarks

Canceling an executing command is currently not supported on any version of MySQL.

Exceptions

Exception Type	Condition
NotSupportedException	This operation is not supported.

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.11. [MySQLCommand.CreateParameter](#) Method

Creates a new instance of a [MySQLParameter](#) object.

Syntax: Visual Basic

```
Public Function CreateParameter() As MySQLParameter
```

Syntax: C#

```
public MySQLParameter CreateParameter();
```

Return Value

A [MySQLParameter](#) object.

Remarks

This method is a strongly-typed version of CreateParameter.

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.12. [MySQLCommand.ExecuteNonQuery](#) Method

Syntax: Visual Basic

```
NotOverridable Public Function ExecuteNonQuery() As Integer _
    Implements IDbCommand.ExecuteNonQuery
```

Syntax: C#

```
public int ExecuteNonQuery();
```

Implements

IDbCommand.ExecuteNonQuery

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13. ExecuteReader Method

Overload List

- [public MySQLDataReader ExecuteReader\(\);](#)
- [public MySQLDataReader ExecuteReader\(CommandBehavior\);](#)

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1. [MySQLCommand.ExecuteReader](#) Method**Syntax: Visual Basic**

```
Overloads Public Function ExecuteReader() As MySQLDataReader
```

Syntax: C#

```
public MySQLDataReader ExecuteReader();
```

See Also

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLCommand.ExecuteReader Overload List](#)

24.2.4.1.2.1.13.1.1. [MySQLDataReader](#) Class

Provides a means of reading a forward-only stream of rows from a MySQL database. This class cannot be inherited.

For a list of all members of this type, see [MySQLDataReader Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySQLDataReader_
    Inherits MarshalByRefObject_
    Implements IEnumerable, IDataReader, IDisposable, IDataRecord
```

Syntax: C#

```
public sealed class MySQLDataReader : MarshalByRefObject, IEnumerable, IDataReader, IDisposable, IDataRecord
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

See Also

[MySQLDataReader Members](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1. [MySQLDataReader](#) Members[MySQLDataReader](#) overview**Public Instance Properties**

Depth	Gets a value indicating the depth of nesting for the current row. This method is not supported currently and always returns 0.
FieldCount	Gets the number of columns in the current row.
HasRows	Gets a value indicating whether the MySQLDataReader contains one or more rows.
IsClosed	Gets a value indicating whether the data reader is closed.
Item	Overloaded. Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the MySQLDataReader class.
RecordsAffected	Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.

Public Instance Methods

Close	Closes the MySQLDataReader object.
CreateObjRef (inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Equals (inherited from Object)	Determines whether the specified Object is equal to the current Object .
GetBoolean	Gets the value of the specified column as a Boolean.
GetByte	Gets the value of the specified column as a byte.
GetBytes	Reads a stream of bytes from the specified column offset into the buffer an array starting at the given buffer offset.
GetChar	Gets the value of the specified column as a single character.
GetChars	Reads a stream of characters from the specified column offset into the buffer as an array starting at the given buffer offset.
GetDataTypeName	Gets the name of the source data type.
GetDateTime	
GetDecimal	
GetDouble	
GetFieldType	Gets the Type that is the data type of the object.
GetFloat	
GetGuid	
GetHashCode (inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetInt16	
GetInt32	
GetInt64	
GetLifetimeService (inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetMySQLDateTime	
GetName	Gets the name of the specified column.
GetOrdinal	Gets the column ordinal, given the name of the column.
GetSchemaTable	Returns a DataTable that describes the column metadata of the MySQLDataReader .
GetString	
GetTimeSpan	

GetType(inherited from Object)	Gets the Type of the current instance.
GetUInt16	
GetUInt32	
GetUInt64	
GetValue	Gets the value of the specified column in its native format.
GetValues	Gets all attribute columns in the collection for the current row.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
IsDBNull	Gets a value indicating whether the column contains non-existent or missing values.
NextResult	Advances the data reader to the next result, when reading the results of batch SQL statements.
Read	Advances the MySQLDataReader to the next record.
ToString(inherited from Object)	Returns a String that represents the current Object.

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.1. Depth Property

Gets a value indicating the depth of nesting for the current row. This method is not supported currently and always returns 0.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property Depth As Integer _
    Implements IDataReader.Depth
```

Syntax: C#

```
public int Depth {get;}
```

Implements

IDataReader.Depth

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.2. FieldCount Property

Gets the number of columns in the current row.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property FieldCount As Integer _
    Implements IDataRecord.FieldCount
```

Syntax: C#

```
public int FieldCount {get;}
```

Implements

IDataRecord.FieldCount

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.3. HasRows Property

Gets a value indicating whether the `MySqlDataReader` contains one or more rows.

Syntax: Visual Basic

```
Public ReadOnly Property HasRows As Boolean
```

Syntax: C#

```
public bool HasRows {get;}
```

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.4. IsClosed Property

Gets a value indicating whether the data reader is closed.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property IsClosed As Boolean _  
- Implements IDataReader.IsClosed
```

Syntax: C#

```
public bool IsClosed {get;}
```

Implements

`IDataReader.IsClosed`

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.5. Item Property

Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the `MySqlDataReader` class.

Overload List

Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the `MySqlDataReader` class.

- `public object this[int] {get;}`

Gets the value of a column in its native format. In C#, this property is the indexer for the `MySqlDataReader` class.

- `public object this[string] {get;}`

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.5.1. Item Property (Int32)

Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the `MySqlDataReader` class.

Syntax: Visual Basic

```
NotOverridable Overloads Public Default ReadOnly Property Item( _  
    ByVal i As Integer _  
) _  
- Implements IDataRecord.Item As Object _  
- Implements IDataRecord.Item
```

Syntax: C#

```
public object this[
    int i
] {get;}
```

Implements

IDataRecord.Item

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLDataReader.Item Overload List](#)

24.2.4.1.2.1.13.1.1.1.5.2. Item Property (String)

Gets the value of a column in its native format. In C#, this property is the indexer for the MySQLDataReader class.

Syntax: Visual Basic

```
NotOverridable Overloads Public Default ReadOnly Property Item( _
    ByVal name As String _
) _
- Implements IDataRecord.Item As Object _
- Implements IDataRecord.Item
```

Syntax: C#

```
public object this[
    string name
] {get;}
```

Implements

IDataRecord.Item

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLDataReader.Item Overload List](#)

24.2.4.1.2.1.13.1.1.1.6. RecordsAffected Property

Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.

Syntax: Visual Basic

```
NotOverridable Public ReadOnly Property RecordsAffected As Integer _
- Implements IDataReader.RecordsAffected
```

Syntax: C#

```
public int RecordsAffected {get;}
```

Implements

IDataReader.RecordsAffected

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.7. MySQLDataReader.Close Method

Closes the MySQLDataReader object.

Syntax: Visual Basic

```
NotOverridable Public Sub Close() _
- Implements IDataReader.Close
```

Syntax: C#

```
public void Close();
```

Implements

IDataReader.Close

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.8. [MySQLDataReader.GetBoolean](#) Method

Gets the value of the specified column as a Boolean.

Syntax: Visual Basic

```
NotOverridable Public Function GetBoolean( _  
    ByVal i As Integer _  
) As Boolean _  
- Implements IDataRecord.GetBoolean
```

Syntax: C#

```
public bool GetBoolean(  
    inti  
);
```

Parameters

- `i`:

Return Value**Implements**

IDataRecord.GetBoolean

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.9. [MySQLDataReader.GetByte](#) Method

Gets the value of the specified column as a byte.

Syntax: Visual Basic

```
NotOverridable Public Function GetByte( _  
    ByVal i As Integer _  
) As Byte _  
- Implements IDataRecord.GetByte
```

Syntax: C#

```
public byte GetByte(  
    inti  
);
```

Parameters

- `i`:

Return Value**Implements**

IDataRecord.GetByte

See Also

[MySQLDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.10. [MySQLDataReader.GetBytes](#) Method

Reads a stream of bytes from the specified column offset into the buffer an array starting at the given buffer offset.

Syntax: Visual Basic

```
NotOverridable Public Function GetBytes( _
    ByVal i As Integer, _
    ByVal dataIndex As Long, _
    ByVal buffer As Byte(), _
    ByVal bufferSize As Integer, _
    ByVal length As Integer _
) As Long _
    Implements IDataRecord.GetBytes
```

Syntax: C#

```
public long GetBytes(
    int i,
    long dataIndex,
    byte[] buffer,
    int bufferSize,
    int length
);
```

Parameters

- **i**: The zero-based column ordinal.
- **dataIndex**: The index within the field from which to begin the read operation.
- **buffer**: The buffer into which to read the stream of bytes.
- **bufferIndex**: The index for buffer to begin the read operation.
- **length**: The maximum length to copy into the buffer.

Return Value

The actual number of bytes read.

Implements

IDataRecord.GetBytes

See Also

[MySQLDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.11. [MySQLDataReader.GetChar](#) Method

Gets the value of the specified column as a single character.

Syntax: Visual Basic

```
NotOverridable Public Function GetChar( _
    ByVal i As Integer _
) As Char _
    Implements IDataRecord.GetChar
```

Syntax: C#

```
public char GetChar(
    int i
);
```

Parameters

- `i`:

Return Value**Implements**

IDataRecord.GetChar

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.12. [MySqlDataReader.GetChars](#) Method

Reads a stream of characters from the specified column offset into the buffer as an array starting at the given buffer offset.

Syntax: Visual Basic

```
NotOverridable Public Function GetChars( _
    ByVal i As Integer, _
    ByVal fieldOffset As Long, _
    ByVal buffer As Char(), _
    ByVal bufferoffset As Integer, _
    ByVal length As Integer _
) As Long _
- Implements IDataRecord.GetChars
```

Syntax: C#

```
public long GetChars(
    inti,
    longfieldOffset,
    char[]buffer,
    intbufferoffset,
    intlength
);
```

Parameters

- `i`:
- `fieldOffset`:
- `buffer`:
- `bufferoffset`:
- `length`:

Return Value**Implements**

IDataRecord.GetChars

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.13. [MySqlDataReader.GetDataTypeName](#) Method

Gets the name of the source data type.

Syntax: Visual Basic

```
NotOverridable Public Function GetDataTypeName( _
    ByVal i As Integer _
) As String _
-
```

Implements `IDataRecord.GetDataTypeName`

Syntax: C#

```
public string GetDataTypeName(  
    int i  
);
```

Parameters

- `i`:

Return Value**Implements**

`IDataRecord.GetDataTypeName`

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.14. `MySQLDataReader.GetDateTime` Method

Syntax: Visual Basic

```
NotOverridable Public Function GetDateTime( _  
    ByVal index As Integer _  
) As Date _  
— Implements IDataRecord.GetDateTime
```

Syntax: C#

```
public DateTime GetDateTime(  
    int index  
);
```

Implements

`IDataRecord.GetDateTime`

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.15. `MySQLDataReader.GetDecimal` Method

Syntax: Visual Basic

```
NotOverridable Public Function GetDecimal( _  
    ByVal index As Integer _  
) As Decimal _  
— Implements IDataRecord.GetDecimal
```

Syntax: C#

```
public decimal GetDecimal(  
    int index  
);
```

Implements

`IDataRecord.GetDecimal`

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.16. `MySQLDataReader.GetDouble` Method

Syntax: Visual Basic

```
NotOverridable Public Function GetDouble( _  
    ByVal index As Integer _  
) As Double _  
- Implements IDataRecord.GetDouble
```

Syntax: C#

```
public double GetDouble(  
    int index  
);
```

Implements

IDataRecord.GetDouble

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.17. [MySqlDataReader.GetFieldType](#) Method

Gets the Type that is the data type of the object.

Syntax: Visual Basic

```
NotOverridable Public Function GetFieldType( _  
    ByVal i As Integer _  
) As Type _  
- Implements IDataRecord.GetFieldType
```

Syntax: C#

```
public Type GetFieldType(  
    int i  
);
```

Parameters

- **i**:

Return Value**Implements**

IDataRecord.GetFieldType

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.18. [MySqlDataReader.GetFloat](#) Method**Syntax: Visual Basic**

```
NotOverridable Public Function GetFloat( _  
    ByVal index As Integer _  
) As Single _  
- Implements IDataRecord.GetFloat
```

Syntax: C#

```
public float GetFloat(  
    int index  
);
```

Implements

IDataRecord.GetFloat

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.19. [MySQLDataReader.GetGuid](#) Method

Syntax: Visual Basic

```
NotOverridable Public Function GetGuid( _  
    ByVal index As Integer _  
) As Guid _  
- Implements IDataRecord.GetGuid
```

Syntax: C#

```
public Guid GetGuid(  
    int index  
);
```

Implements

IDataRecord.GetGuid

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.20. [MySQLDataReader.GetInt16](#) Method

Syntax: Visual Basic

```
NotOverridable Public Function GetInt16( _  
    ByVal index As Integer _  
) As Short _  
- Implements IDataRecord.GetInt16
```

Syntax: C#

```
public short GetInt16(  
    int index  
);
```

Implements

IDataRecord.GetInt16

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.21. [MySQLDataReader.GetInt32](#) Method

Syntax: Visual Basic

```
NotOverridable Public Function GetInt32( _  
    ByVal index As Integer _  
) As Integer _  
- Implements IDataRecord.GetInt32
```

Syntax: C#

```
public int GetInt32(  
    int index  
);
```

Implements

IDataRecord.GetInt32

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.22. [MySqlDataReader.GetInt64](#) Method**Syntax: Visual Basic**

```
NotOverridable Public Function GetInt64( _  
    ByVal index As Integer _  
) As Long _  
- Implements IDataRecord.GetInt64
```

Syntax: C#

```
public long GetInt64(  
    int index  
);
```

Implements

IDataRecord.GetInt64

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.23. [MySqlDataReader.GetMySqlDateTime](#) Method**Syntax: Visual Basic**

```
Public Function GetMySqlDateTime( _  
    ByVal index As Integer _  
) As MySqlDateTime
```

Syntax: C#

```
public MySqlDateTime GetMySqlDateTime(  
    int index  
);
```

See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.24. [MySqlDataReader.GetName](#) Method

Gets the name of the specified column.

Syntax: Visual Basic

```
NotOverridable Public Function GetName( _  
    ByVal i As Integer _  
) As String _  
- Implements IDataRecord.GetName
```

Syntax: C#

```
public string GetName(  
    int i  
);
```

Parameters

- *i*:

Return Value**Implements**

IDataRecord.GetName

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.25. [MySQLDataReader.GetOrdinal](#) Method

Gets the column ordinal, given the name of the column.

Syntax: Visual Basic

```
NotOverridable Public Function GetOrdinal( _  
    ByVal name As String _  
) As Integer _  
- Implements IDataRecord.GetOrdinal
```

Syntax: C#

```
public int GetOrdinal(  
    stringname  
);
```

Parameters

- `name`:

Return Value**Implements**

IDataRecord.GetOrdinal

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.26. [MySQLDataReader.GetSchemaTable](#) Method

Returns a DataTable that describes the column metadata of the MySQLDataReader.

Syntax: Visual Basic

```
NotOverridable Public Function GetSchemaTable() As DataTable _  
- Implements IDataReader.GetSchemaTable
```

Syntax: C#

```
public DataTable GetSchemaTable();
```

Return Value**Implements**

IDataReader.GetSchemaTable

See Also

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.2.1.13.1.1.1.27. [MySQLDataReader.GetString](#) Method

Syntax: Visual Basic

```
NotOverridable Public Function GetString( _  
    ByVal index As Integer _  
) As String _  
- Implements IDataRecord.GetString
```

Syntax: C#

```
public string GetString(  
    int index  
);
```

Implements

IDataRecord.GetString

```

Syntax: C#

```
public sealed class MySqlCommandBuilder : Component
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySQL.Data.MySqlCommand](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

See Also

[MySQLCommandBuilder Members](#) , [MySQL.Data.MySqlCommand Namespace](#)

24.2.4.1.3.1. MySqlCommandBuilder Members

[MySQLCommandBuilder overview](#)

Public Static (Shared) Methods

DeriveParameters	Overloaded. Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySQL.
----------------------------------	--

Public Instance Constructors

MySQLCommandBuilder	Overloaded. Initializes a new instance of the MySqlCommandBuilder class.
-------------------------------------	--

Public Instance Properties

Container(inherited from Component)	Gets the IContainer that contains the Component.
DataAdapter	
QuotePrefix	
QuoteSuffix	
Site(inherited from Component)	Gets or sets the ISite of the Component.

Public Instance Methods

CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
---	---

Dispose(inherited from Component)	Releases all resources used by the Component.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetDeleteCommand	
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetInsertCommand	
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Type of the current instance.
GetUpdateCommand	
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
RefreshSchema	
ToString(inherited from Component)	Returns a String containing the name of the Component, if any. This method should not be overridden.

Public Instance Events

Disposed(inherited from Component)	Adds an event handler to listen to the Disposed event on the component.
------------------------------------	---

[MySQLCommandBuilder Class](#) , [MySQL.Data.MySqlCommand Namespace](#)

24.2.4.1.3.1.1. DeriveParameters Method

Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySQL.

Overload List

Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySQL.

- [public static void DeriveParameters\(MySqlCommand\);](#)
- [public static void DeriveParameters\(MySqlCommand,bool\);](#)

See Also

[MySQLCommandBuilder Class](#) , [MySQL.Data.MySqlCommand Namespace](#)

24.2.4.1.3.1.1.1. MySqlCommandBuilder.DeriveParameters Method

Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySQL.

Syntax: Visual Basic

```
Overloads Public Shared Sub DeriveParameters( _
    ByVal command As MySqlCommand _
)
```

Syntax: C#

```
public static void DeriveParameters(
```

```
MySQLCommandcommand
);
```

Parameters

- **command**: The MySqlCommand referencing the stored procedure from which the parameter information is to be derived. The derived parameters are added to the Parameters collection of the MySqlCommand.

Exceptions

Exception Type	Condition
InvalidOperationException	The command text is not a valid stored procedure name.

[MySqlDataAdapter overview](#)

Public Instance Constructors

MySqlDataAdapter	Overloaded. Initializes a new instance of the MySqlDataAdapter class.
----------------------------------	---

Public Instance Properties

AcceptChangesDuringFill(inherited from DataAdapter)	Gets or sets a value indicating whether AcceptChanges is called on a DataRow after it is added to the DataTable during any of the Fill operations.
AcceptChangesDuringUpdate(inherited from DataAdapter)	Gets or sets whether AcceptChanges is called during a Update .
Container(inherited from Component)	Gets the IContainer that contains the Component .

ContinueUpdateOnError(inherited from DataAdapter)	Gets or sets a value that specifies whether to generate an exception when an error is encountered during a row update.
DeleteCommand	Overloaded.
FillLoadOption(inherited from DataAdapter)	Gets or sets the LoadOption that determines how the adapter fills the DataTable from the DbDataReader.
InsertCommand	Overloaded.
MissingMappingAction(inherited from DataAdapter)	Determines the action to take when incoming data does not have a matching table or column.
MissingSchemaAction(inherited from DataAdapter)	Determines the action to take when existing DataSet schema does not match incoming data.
ReturnProviderSpecificTypes(inherited from DataAdapter)	Gets or sets whether the Fill method should return provider-specific values or common CLS-compliant values.
SelectCommand	Overloaded.
Site(inherited from Component)	Gets or sets the ISite of the Component.
TableMappings(inherited from DataAdapter)	Gets a collection that provides the master mapping between a source table and a DataTable.
UpdateBatchSize(inherited from DbDataAdapter)	Gets or sets a value that enables or disables batch processing support, and specifies the number of commands that can be executed in a batch.
UpdateCommand	Overloaded.

Public Instance Methods

CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Dispose(inherited from Component)	Releases all resources used by the Component.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
Fill(inherited from DbDataAdapter)	Overloaded. Adds or refreshes rows in the DataSet to match those in the data source using the DataSet name, and creates a DataTable named "Table."
FillSchema(inherited from DbDataAdapter)	Overloaded. Configures the schema of the specified DataTable based on the specified SchemaType.
GetFillParameters(inherited from DbDataAdapter)	Gets the parameters set by the user when executing an SQL SELECT statement.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Type of the current instance.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
ResetFillLoadOption(inherited from DataAdapter)	Resets FillLoadOption to its default state and causes Fill to honor AcceptChangesDuringFill.
ShouldSerializeAcceptChangesDuringFill(inherited from DataAdapter)	Determines whether the AcceptChangesDuringFill property should be persisted.
ShouldSerializeFillLoadOption(inherited from DataAdapter)	Determines whether the FillLoadOption property should be persisted.
ToString(inherited from Component)	Returns a String containing the name of the Component, if any. This method should not be overridden.
Update(inherited from DbDataAdapter)	Overloaded. Calls the respective INSERT, UPDATE, or DELETE statements for each inserted, updated, or deleted row in the specified DataSet.

Public Instance Events

Disposed(inherited from Component)	Adds an event handler to listen to the Disposedevent on the component.
FillError(inherited from DataAdapter)	Returned when an error occurs during a fill operation.
RowUpdated	Occurs during Update after a command is executed against the data source. The attempt to update is made, so the event fires.
RowUpdating	Occurs during Update before a command is executed against the data source. The attempt to update is made, so the event fires.

Protected Internal Instance Properties

FillCommandBehavior(inherited from DbDataAdapter)	Gets or sets the behavior of the command used to fill the data adapter.

24.2.4.1.3.1.2.2.1.1.6. [MySqlDataAdapter.RowUpdated](#) Event

Occurs during Update after a command is executed against the data source. The attempt to update is made, so the event fires.

Syntax: Visual Basic

```
Public Event RowUpdated As MySqlRowUpdatedEventHandler
```

Syntax: C#

```
public event MySqlRowUpdatedEventHandler RowUpdated;
```

Event Data

The event handler receives an argument of type [MySqlRowUpdatedEventArgs](#) containing data related to this event. The following [MySqlRowUpdatedEventArgs](#) properties provide information specific to this event.

Property	Description
Command	Gets or sets the MySqlCommand executed when Update is called.
Errors	Gets any errors generated by the .NET Framework data provider when the Command was executed.
RecordsAffected	Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.
Row	Gets the DataRow sent through an Update.
RowCount	Gets the number of rows processed in a batch of updated records.
StatementType	Gets the type of SQL statement executed.
Status	Gets the UpdateStatus of the Command property.
TableMapping	Gets the DataTableMapping sent through an Update.

[MySQLRowUpdatedEventArgs overview](#)

Public Instance Constructors

MySQLRowUpdatedEventArgs Constructor	Initializes a new instance of the MySQLRowUpdatedEventArgs class.
--	---

Public Instance Properties

Command	Overloaded. Gets or sets the MySqlCommand executed when Update is called.
Errors(inherited from RowUpdatedEventArgs)	Gets any errors generated by the .NET Framework data provider when the Command was executed.
RecordsAffected(inherited from RowUpdatedEventArgs)	Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.
Row(inherited from RowUpdatedEventArgs)	Gets the DataRow sent through an Update.
RowCount(inherited from RowUpdatedEventArgs)	Gets the number of rows processed in a batch of updated records.
StatementType(inherited from RowUpdatedEventArgs)	Gets the type of SQL statement executed.
Status(inherited from RowUpdatedEventArgs)	Gets the UpdateStatus of the Command property.
TableMapping(inherited from RowUpdatedEventArgs)	Gets the DataTableMapping sent through an Update.

Public Instance Methods

CopyToRows(inherited from RowUpdatedEventArgs)	Overloaded. Copies references to the modified rows into the provided array.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
ToString(inherited from Object)	Returns a String that represents the current Object.

[MySQLRowUpdatedEventArgs Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.3.1.2.2.1.1.6.1.1.1.1. [MySQLRowUpdatedEventArgs](#) Constructor

Initializes a new instance of the MySQLRowUpdatedEventArgs class.

Syntax: Visual Basic

```
Public Sub New( _
    ByVal row As DataRow, _
    ByVal command As IDbCommand, _
    ByVal statementType As StatementType, _
    ByVal tableMapping As DataTableMapping _
)
```

Syntax: C#

```
public MySQLRowUpdatedEventArgs(
    DataRow row,
    IDbCommand command,
    StatementType statementType,
    DataTableMapping tableMapping
);
```

Parameters

- [row](#): The DataRow sent through an Update.
- [command](#): The IDbCommand executed when Update is called.
- [statementType](#): One of the StatementType values that specifies the type of query executed.
- [tableMapping](#): The DataTableMapping sent through an Update.

24.2.4.1.3.1.2.2.1.1.7. [MySqlDataAdapter.RowUpdating](#) Event

Occurs during Update before a command is executed against the data source. The attempt to update is made, so the event fires.

Syntax: Visual Basic

```
Public Event RowUpdating As MySqlRowUpdatingEventHandler
```

Syntax: C#

```
public event MySqlRowUpdatingEventHandler RowUpdating;
```

Event Data

The event handler receives an argument of type [MySqlRowUpdatingEventArgs](#) containing data related to this event. The following [MySqlRowUpdatingEventArgs](#) properties provide information specific to this event.

Property	Description
Command	Gets or sets the MySqlCommand to execute when performing the Update.
Errors	Gets any errors generated by the .NET Framework data provider when the Command executes.
Row	Gets the DataRow that will be sent to the server as part of an insert, update, or delete operation.
StatementType	Gets the type of SQL statement to execute.
Status	Gets or sets the UpdateStatus of the Command property.
TableMapping	Gets the DataTableMapping to send through the Update.

Command	Overloaded. Gets or sets the MySqlCommand to execute when performing the Update.
Errors(inherited from RowUpdatingEventArgs)	Gets any errors generated by the .NET Framework data provider when the Command executes.
Row(inherited from RowUpdatingEventArgs)	Gets the DataRow that will be sent to the server as part of an insert, update, or delete operation.
StatementType(inherited from RowUpdatingEventArgs)	Gets the type of SQL statement to execute.
Status(inherited from RowUpdatingEventArgs)	Gets or sets the UpdateStatus of the Command property.
TableMapping(inherited from RowUpdatingEventArgs)	Gets the DataTableMapping to send through the Update.

Public Instance Methods

Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
ToString(inherited from Object)	Returns a String that represents the current Object.

24.2.4.1.3.1.2.2.1.1.7.1.1.1.1. MySQLRowUpdatingEventArgs Constructor

Initializes a new instance of the MySQLRowUpdatingEventArgs class.

Syntax: Visual Basic

```
Public Sub New( _
    ByVal row As DataRow, _
    ByVal command As IDbCommand, _
    ByVal statementType As StatementType, _
    ByVal tableMapping As DataTableMapping _
)
```

Syntax: C#

```
public MySQLRowUpdatingEventArgs(
    DataRow row,
    IDbCommand command,
    StatementType statementType,
    DataTableMapping tableMapping
);
```

Parameters

- **row**: The DataRow to update.
- **command**: The IDbCommand to execute during update.
- **statementType**: One of the StatementType values that specifies the type of query executed.
- **tableMapping**: The DataTableMapping sent through an update.

24.2.4.1.4. [MySQLException](#) Class

The exception that is thrown when MySQL returns an error. This class cannot be inherited.

For a list of all members of this type, see [MySQLException Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySqlConnection_
    Inherits SystemException
```

Syntax: C#

```
public sealed class MySqlConnection : SystemException
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

See Also

[MySqlConnection Members](#) , [MySql.Data.MySqlClient Namespace](#)

[MySqlConnection overview](#)

Public Instance Properties

Data(inherited from Exception)	Gets a collection of key/value pairs that provide additional, user-defined information about the exception.
HelpLink(inherited from Exception)	Gets or sets a link to the help file associated with this exception.
InnerException(inherited from Exception)	Gets the Exception instance that caused the current exception.
Message(inherited from Exception)	Gets a message that describes the current exception.
Number	Gets a number that identifies the type of error.
Source(inherited from Exception)	Gets or sets the name of the application or the object that causes the error.
StackTrace(inherited from Exception)	Gets a string representation of the frames on the call stack at the time the current exception was thrown.
TargetSite(inherited from Exception)	Gets the method that throws the current exception.

Public Instance Methods

Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetBaseException(inherited from Exception)	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetObjectData(inherited from Exception)	When overridden in a derived class, sets the SerializationInfo with information about the exception.
GetType(inherited from Exception)	Gets the runtime type of the current instance.
ToString(inherited from Exception)	Creates and returns a string representation of the current exception.

24.2.4.1.4.1.1. Number Property

Gets a number that identifies the type of error.

Syntax: Visual Basic

```
Public ReadOnly Property Number As Integer
```

Syntax: C#

```
public int Number {get;}
```

See Also

[MySQLException Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.5. **MySQLHelper Class**

Helper class that makes it easier to work with the provider.

For a list of all members of this type, see [MySQLHelper Members](#) .

Syntax: Visual Basic

```
NotInheritable Public Class MySQLHelper
```

Syntax: C#

```
public sealed class MySQLHelper
```

Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

Requirements

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

See Also

[MySQLHelper Members](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.5.1. **MySQLHelper Members**

[MySQLHelper overview](#)

Public Static (Shared) Methods

ExecuteDataRow	Executes a single SQL statement and returns the first row of the resultset. A new MySqlConnection object is created, opened, and closed during this method.
ExecuteDataset	Overloaded. Executes a single SQL statement and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.
ExecuteNonQuery	Overloaded. Executes a single command against a MySQL database. The MySQLConnection is assumed to be open when the method is called and remains open after the method completes.
ExecuteReader	Overloaded. Executes a single command against a MySQL database.
ExecuteScalar	Overloaded. Execute a single command against a MySQL database.
UpdateDataSet	Updates the given table with data from the given DataSet

Public Instance Methods

Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
ToString(inherited from Object)	Returns a String that represents the current Object.

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.5.1.1. [MySQLHelper.ExecuteDataRow](#) Method

Executes a single SQL statement and returns the first row of the resultset. A new [MySQLConnection](#) object is created, opened, and closed during this method.

Syntax: Visual Basic

```
Public Shared Function ExecuteDataRow( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ParamArray parms As MySqlParameter() _
) As DataRow
```

Syntax: C#

```
public static DataRow ExecuteDataRow(
    string connectionString,
    string commandText,
    params MySqlParameter[] parms
);
```

Parameters

- `connectionString`: Settings to be used for the connection
- `commandText`: Command to execute
- `parms`: Parameters to use for the command

Return Value

[DataRow](#) containing the first row of the resultset

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.5.1.2. [ExecuteDataset](#) Method

Executes a single SQL statement and returns the resultset in a [DataSet](#). The state of the [MySQLConnection](#) object remains unchanged after execution of this method.

Overload List

Executes a single SQL statement and returns the resultset in a [DataSet](#). The state of the [MySQLConnection](#) object remains unchanged after execution of this method.

- `public static DataSet ExecuteDataset(MySqlConnection, string);`

Executes a single SQL statement and returns the resultset in a [DataSet](#). The state of the [MySQLConnection](#) object remains unchanged after execution of this method.

- `public static DataSet ExecuteDataset(MySqlConnection, string, params MySqlParameter[]);`

Executes a single SQL statement and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.

- `public static DataSet ExecuteDataset(string,string);`

Executes a single SQL statement and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.

- `public static DataSet ExecuteDataset(string,string,params MySqlParameter[]);`

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.5.1.2.1. [MySqlHelper.ExecuteDataset](#) Method

Executes a single SQL statement and returns the resultset in a DataSet. The state of the [MySqlConnection](#) object remains unchanged after execution of this method.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _
    ByVal connection As MySqlConnection, _
    ByVal commandText As String _
) As DataSet
```

Syntax: C#

```
public static DataSet ExecuteDataset(
    MySqlConnectionconnection,
    stringcommandText
);
```

Parameters

- `connection`: [MySqlConnection](#) object to use
- `commandText`: Command to execute

Return Value

DataSetcontaining the resultset

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteDataset Overload List](#)

24.2.4.1.5.1.2.2. [MySqlHelper.ExecuteDataset](#) Method

Executes a single SQL statement and returns the resultset in a DataSet. The state of the [MySqlConnection](#) object remains unchanged after execution of this method.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _
    ByVal connection As MySqlConnection, _
    ByVal commandText As String, _
    ParamArray commandParameters As MySqlParameter() _
) As DataSet
```

Syntax: C#

```
public static DataSet ExecuteDataset(
    MySqlConnectionconnection,
    stringcommandText,
    params MySqlParameter[]commandParameters
);
```

Parameters

- `connection`: [MySQLConnection](#) object to use
- `commandText`: Command to execute
- `commandParameters`: Parameters to use for the command

Return Value

DataSet containing the resultset

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteDataset Overload List](#)

24.2.4.1.5.1.2.3. MySQLHelper.ExecuteDataset Method

Executes a single SQL statement and returns the resultset in a DataSet. A new MySQLConnection object is created, opened, and closed during this method.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _
    ByVal connectionString As String, _
    ByVal commandText As String _
) As DataSet
```

Syntax: C#

```
public static DataSet ExecuteDataset(
    string connectionString,
    string commandText
);
```

Parameters

- `connectionString`: Settings to be used for the connection
- `commandText`: Command to execute

Return Value

DataSet containing the resultset

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteDataset Overload List](#)

24.2.4.1.5.1.2.4. MySQLHelper.ExecuteDataset Method

Executes a single SQL statement and returns the resultset in a DataSet. A new MySQLConnection object is created, opened, and closed during this method.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ParamArray commandParameters As MySqlParameter() _
) As DataSet
```

Syntax: C#

```
public static DataSet ExecuteDataset(
    string connectionString,
    string commandText,
    params MySqlParameter[] commandParameters
);
```

Parameters

- `connectionString`: Settings to be used for the connection
- `commandText`: Command to execute
- `commandParameters`: Parameters to use for the command

Return Value

DataSet containing the resultset

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteDataset Overload List](#)

24.2.4.1.5.1.3. ExecuteNonQuery Method

Executes a single command against a MySQL database. The [MySQLConnection](#) is assumed to be open when the method is called and remains open after the method completes.

Overload List

Executes a single command against a MySQL database. The [MySQLConnection](#) is assumed to be open when the method is called and remains open after the method completes.

- `public static int ExecuteNonQuery(MySqlConnection, string, params MySqlParameter[]);`

Executes a single command against a MySQL database. A new [MySQLConnection](#) is created using the [ConnectionString](#) given.

- `public static int ExecuteNonQuery(string, string, params MySqlParameter[]);`

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.5.1.3.1. MySQLHelper.ExecuteNonQuery Method

Executes a single command against a MySQL database. The [MySQLConnection](#) is assumed to be open when the method is called and remains open after the method completes.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteNonQuery( _
    ByVal connection As MySqlConnection, _
    ByVal commandText As String, _
    ParamArray commandParameters As MySqlParameter() _
) As Integer
```

Syntax: C#

```
public static int ExecuteNonQuery(
    MySqlConnection connection,
    string commandText,
    params MySqlParameter[] commandParameters
);
```

Parameters

- `connection`: [MySQLConnection](#) object to use
- `commandText`: SQL statement to be executed
- `commandParameters`: Array of [MySqlParameter](#) objects to use with the command.

Return Value**See Also**

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteNonQuery Overload List](#)

24.2.4.1.5.1.3.2. [MySQLHelper.ExecuteNonQuery](#) Method

Executes a single command against a MySQL database. A new [MySQLConnection](#) is created using the [ConnectionString](#) given.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteNonQuery( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ParamArray parms As MySqlParameter() _
) As Integer
```

Syntax: C#

```
public static int ExecuteNonQuery(
    string connectionString,
    string commandText,
    params MySqlParameter[] parms
);
```

Parameters

- `connectionString`: [ConnectionString](#) to use
- `commandText`: SQL statement to be executed
- `parms`: Array of [MySqlParameter](#) objects to use with the command.

Return Value**See Also**

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteNonQuery Overload List](#)

24.2.4.1.5.1.4. [ExecuteReader](#) Method

Executes a single command against a MySQL database.

Overload List

Executes a single command against a MySQL database.

- `public static MySqlDataReader ExecuteReader(string,string);`

Executes a single command against a MySQL database.

- `public static MySqlDataReader ExecuteReader(string,string,params MySqlParameter[]);`

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#)

24.2.4.1.5.1.4.1. [MySQLHelper.ExecuteReader](#) Method

Executes a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteReader( _
    ByVal connectionString As String, _
    ByVal commandText As String _
) As MySqlDataReader
```

Syntax: C#

```
public static MySqlDataReader ExecuteReader(
    string connectionString,
    string commandText
);
```

Parameters

- `connectionString`: Settings to use for this command
- `commandText`: Command text to use

Return Value

[MySqlDataReader](#) object ready to read the results of the command

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteReader Overload List](#)

24.2.4.1.5.1.4.2. [MySqlHelper.ExecuteReader](#) Method

Executes a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteReader( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ParamArray commandParameters As MySqlParameter() _
) As MySqlDataReader
```

Syntax: C#

```
public static MySqlDataReader ExecuteReader(
    string connectionString,
    string commandText,
    params MySqlParameter[] commandParameters
);
```

Parameters

- `connectionString`: Settings to use for this command
- `commandText`: Command text to use
- `commandParameters`: Array of [MySqlParameter](#) objects to use with the command

Return Value

[MySqlDataReader](#) object ready to read the results of the command

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteReader Overload List](#)

24.2.4.1.5.1.5. [ExecuteScalar](#) Method

Execute a single command against a MySQL database.

Overload List

Execute a single command against a MySQL database.

- `public static object ExecuteScalar(MySqlConnection,string);`

Execute a single command against a MySQL database.

- `public static object ExecuteScalar(MySqlConnection,string,params MySqlParameter[]);`

Execute a single command against a MySQL database.

- `public static object ExecuteScalar(string,string);`

Execute a single command against a MySQL database.

- `public static object ExecuteScalar(string,string,params MySqlParameter[]);`

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#)

24.2.4.1.5.1.5.1. [MySqlHelper.ExecuteScalar](#) Method

Execute a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _  
    ByVal connection As MySqlConnection, _  
    ByVal commandText As String _  
) As Object
```

Syntax: C#

```
public static object ExecuteScalar(  
    MySqlConnectionconnection,  
    stringcommandText  
);
```

Parameters

- `connection`: [MySqlConnection](#) object to use
- `commandText`: Command text to use for the command

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteScalar Overload List](#)

24.2.4.1.5.1.5.2. [MySqlHelper.ExecuteScalar](#) Method

Execute a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _  
    ByVal connection As MySqlConnection, _  
    ByVal commandText As String, _  
    ParamArray commandParameters As MySqlParameter() _  
) As Object
```

Syntax: C#

```
public static object ExecuteScalar(  
    MySqlConnectionconnection,  
    stringcommandText,  
    params MySqlParameter[]commandParameters  
);
```

Parameters

- `connection`: [MySQLConnection](#) object to use
- `commandText`: Command text to use for the command
- `commandParameters`: Parameters to use for the command

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteScalar Overload List](#)

24.2.4.1.5.1.5.3. [MySQLHelper.ExecuteScalar](#) Method

Execute a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _
    ByVal connectionString As String, _
    ByVal commandText As String _
) As Object
```

Syntax: C#

```
public static object ExecuteScalar(
    string connectionString,
    string commandText
);
```

Parameters

- `connectionString`: Settings to use for the update
- `commandText`: Command text to use for the update

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

See Also

24.2.4.1.5.1.5.4. [MySQLHelper.ExecuteScalar](#) Method

Execute a single command against a MySQL database.

Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ParamArray commandParameters As MySqlParameter() _
) As Object
```

Syntax: C#

```
public static object ExecuteScalar(
    string connectionString,
    string commandText,
    params MySqlParameter[] commandParameters
);
```

Parameters

- `connectionString`: Settings to use for the command

- `commandText`: Command text to use for the command
- `commandParameters`: Parameters to use for the command

Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

24.2.4.1.5.1.6. `MySQLHelper.UpdateDataSet` Method

Updates the given table with data from the given DataSet

Syntax: Visual Basic

```
Public Shared Sub UpdateDataSet( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ByVal ds As DataSet, _
    ByVal tablename As String _
)
```

Syntax: C#

```
public static void UpdateDataSet(
    stringconnectionString,
    stringcommandText,
    DataSetds,
    stringtablename
);
```

Parameters

- `connectionString`: Settings to use for the update
- `commandText`: Command text to use for the update
- `ds`: DataSetcontaining the new data to use in the update
- `tablename`: Tablename in the data set to update

Public Instance Constructors

MySQLConversionException Constructor	Ctor
--	------

Public Instance Properties

Data(inherited from Exception)	Gets a collection of key/value pairs that provide additional, user-defined information about the exception.
HelpLink(inherited from Exception)	Gets or sets a link to the help file associated with this exception.
InnerException(inherited from Exception)	Gets the Exceptioninstance that caused the current exception.
Message(inherited from Exception)	Gets a message that describes the current exception.
Source(inherited from Exception)	Gets or sets the name of the application or the object that causes the error.
StackTrace(inherited from Exception)	Gets a string representation of the frames on the call stack at the time the current exception was thrown.
TargetSite(inherited from Exception)	Gets the method that throws the current exception.

Public Instance Methods

Equals(inherited from Object)	Determines whether the specified Objectis equal to the current Object.
GetBaseException(inherited from Exception)	When overridden in a derived class, returns the Exceptionthat is the root cause of one or more subsequent exceptions.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCodeis suitable for use in hashing algorithms and data structures like a hash table.
GetObjectData(inherited from Exception)	When overridden in a derived class, sets the SerializationIn-fo with information about the exception.
GetType(inherited from Exception)	Gets the runtime type of the current instance.
ToString(inherited from Exception)	Creates and returns a string representation of the current excep-tion.

Protected Instance Properties

HResult(inherited from Exception)	Gets or sets HRESULT, a coded numerical value that is as-signed to a specific exception.
-----------------------------------	--

Protected Instance Methods

Finalize(inherited from Object)	Allows an Objectto attempt to free resources and perform other cleanup operations before the Objectis reclaimed by garbage collection.
MemberwiseClone(inherited from Object)	Creates a shallow copy of the current Object.

Public Static (Shared) Type Conversions

Explicit MySQLDateTime to DateTime Conversion	
---	--

Public Instance Properties

Day	Returns the day portion of this datetime
Hour	Returns the hour portion of this datetime
IsNull (inherited from MySQLValue)	
IsValidDateTime	Indicates if this object contains a value that can be represented as a DateTime
Minute	Returns the minute portion of this datetime
Month	Returns the month portion of this datetime
Second	Returns the second portion of this datetime
ValueAsObject (inherited from MySQLValue)	Returns the value of this field as an object
Year	Returns the year portion of this datetime

Public Instance Methods

Equals (inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetDateTime	Returns this value as a DateTime

GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
ToString	Returns a MySQL specific string representation of this value

Protected Instance Fields

classType (inherited from MySqlValue)	The system type represented by this value
dbType (inherited from MySqlValue)	The generic dbtype of this value
isNull (inherited from MySqlValue)	Is this value null
mysqlDbType (inherited from MySqlValue)	The specific MySQL db type
mysqlTypeName (inherited from MySqlValue)	The MySQL specific typename of this value
objectValue (inherited from MySqlValue)	

Protected Instance Methods

Finalize(inherited from Object)	Allows an Object to attempt to free resources and perform other cleanup operations before the Object is reclaimed by garbage collection.
MemberwiseClone(inherited from Object)	Creates a shallow copy of the current Object.

24.2.5. Connector/NET Notes and Tips

In this section we will cover some of the more common use cases for Connector/NET, including BLOB handling, date handling, and using Connector/NET with common tools such as Crystal Reports.

24.2.5.1. Connecting to MySQL Using Connector/NET

24.2.5.1.1. Introduction

All interaction between a .NET application and the MySQL server is routed through a [MySqlConnection](#) object. Before your application can interact with the server, a [MySqlConnection](#) object must be instantiated, configured, and opened.

Even when using the [MySqlHelper](#) class, a [MySqlConnection](#) object is created by the helper class.

In this section, we will describe how to connect to MySQL using the [MySqlConnection](#) object.

24.2.5.1.2. Creating a Connection String

The [MySqlConnection](#) object is configured using a connection string. A connection string contains several key/value pairs, separated by semicolons. Each key/value pair is joined with an equals sign.

The following is a sample connection string:

```
Server=127.0.0.1;Uid=root;Pwd=12345;Database=test;
```

In this example, the [MySqlConnection](#) object is configured to connect to a MySQL server at `127.0.0.1`, with a username of `root` and a password of `12345`. The default database for all statements will be the `test` database.

The following options are typically used (a full list of options is available in the API documentation for [Section 24.2.3.3.3](#), “[ConnectionString](#)”):

- **Server**: The name or network address of the instance of MySQL to which to connect. The default is `localhost`. Aliases include `host`, `Data Source`, `DataSource`, `Address`, `Addr` and `Network Address`.
- **Uid**: The MySQL user account to use when connecting. Aliases include `User Id`, `Username` and `User name`.
- **Pwd**: The password for the MySQL account being used. Alias `Password` can also be used.

- **Database:** The default database that all statements are applied to. Default is `mysql`. Alias `Initial Catalog` can also be used.
- **Port:** The port MySQL is using to listen for connections. Default is `3306`. Specify `-1` for this value to use a named-pipe connection.

24.2.5.1.3. Opening a Connection

Once you have created a connection string it can be used to open a connection to the MySQL server.

The following code is used to create a `MySqlConnection` object, assign the connection string, and open the connection.

Visual Basic Example

```
Dim conn As New MySql.Data.MySqlClient.MySqlConnection
Dim myConnectionString as String

myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    conn.ConnectionString = myConnectionString
    conn.Open()
Catch ex As MySql.Data.MySqlClient.MySqlException
    MessageBox.Show(ex.Message)
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection();
    conn.ConnectionString = myConnectionString;
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message);
}
```

You can also pass the connection string to the constructor of the `MySqlConnection` class:

Visual Basic Example

```
Dim myConnectionString as String

myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    Dim conn As New MySql.Data.MySqlClient.MySqlConnection(myConnectionString)
    conn.Open()
Catch ex As MySql.Data.MySqlClient.MySqlException
    MessageBox.Show(ex.Message)
End Try
```

C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection(myConnectionString);
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
}
```

```

    MessageBox.Show(ex.Message);
}

```

Once the connection is open it can be used by the other Connector/.NET classes to communicate with the MySQL server.

24.2.5.1.4. Handling Connection Errors

Because connecting to an external server is unpredictable, it is important to add error handling to your .NET application. When there is an error connecting, the `MySqlConnection` class will return a `MySqlException` object. This object has two properties that are of interest when handling errors:

- **Message:** A message that describes the current exception.
- **Number:** The MySQL error number.

When handling errors, you can your application's response based on the error number. The two most common error numbers when connecting are as follows:

- **0:** Cannot connect to server.
- **1045:** Invalid username and/or password.

The following code shows how to adapt the application's response based on the actual error:

Visual Basic Example

```

Dim myConnectionString as String

myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    Dim conn As New MySql.Data.MySqlClient.MySqlConnection(myConnectionString)
    conn.Open()
Catch ex As MySql.Data.MySqlClient.MySqlException
    Select Case ex.Number
        Case 0
            MessageBox.Show("Cannot connect to server. Contact administrator")
        Case 1045
            MessageBox.Show("Invalid username/password, please try again")
    End Select
End Try

```

C# Example

```

MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection(myConnectionString);
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    switch (ex.Number)
    {
        case 0:
            MessageBox.Show("Cannot connect to server. Contact administrator");
        case 1045:
            MessageBox.Show("Invalid username/password, please try again");
    }
}

```

Important

Note that if you are using multilanguage databases you must specify the character set in the connection string. If you do not specify the character set, the connection defaults to the `latin1` charset. You can specify the character set as part of the connection string, for example:

```

MySQLConnection myConnection = new MySQLConnection("server=127.0.0.1;uid=root;" +
"pwd=12345;database=test;Charset=latin1;");

```

24.2.5.2. Using the Connector/NET with Prepared Statements

24.2.5.2.1. Introduction

As of MySQL 4.1, it is possible to use prepared statements with Connector/NET. Use of prepared statements can provide significant performance improvements on queries that are executed more than once.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

24.2.5.2.2. Preparing Statements in Connector/NET

To prepare a statement, create a command object and set the `.CommandText` property to your query.

After entering your statement, call the `.Prepare` method of the `MySQLCommand` object. After the statement is prepared, add parameters for each of the dynamic elements in the query.

After you enter your query and enter parameters, execute the statement using the `.ExecuteNonQuery()`, `.ExecuteScalar()`, or `.ExecuteReader` methods.

For subsequent executions, you need only modify the values of the parameters and call the execute method again, there is no need to set the `.CommandText` property or redefine the parameters.

Visual Basic Example

```

Dim conn As New MySQLConnection
Dim cmd As New MySQLCommand

conn.ConnectionString = strConnection

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "INSERT INTO myTable VALUES(NULL, @number, @text)"
    cmd.Prepare()

    cmd.Parameters.Add("@number", 1)
    cmd.Parameters.Add("@text", "One")

    For i = 1 To 1000
        cmd.Parameters["@number"].Value = i
        cmd.Parameters["@text"].Value = "A string value"

        cmd.ExecuteNonQuery()
    Next
Catch ex As MySQLException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon)
End Try

```

C# Example

```

MySQL.Data.MySQLClient.MySqlConnection conn;
MySQL.Data.MySQLClient.MySqlCommand cmd;

conn = new MySQL.Data.MySQLClient.MySqlConnection();
cmd = new MySQL.Data.MySQLClient.MySqlCommand();

conn.ConnectionString = strConnection;

try
{
    conn.Open();
    cmd.Connection = conn;

    cmd.CommandText = "INSERT INTO myTable VALUES(NULL, @number, @text)";
    cmd.Prepare();

    cmd.Parameters.Add("@number", 1);
    cmd.Parameters.Add("@text", "One");

    for (int i=1; i <= 1000; i++)
    {

```

```

        cmd.Parameters["@number"].Value = i;
        cmd.Parameters["@text"].Value = "A string value";

        cmd.ExecuteNonQuery();
    }
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

24.2.5.3. Accessing Stored Procedures with Connector/NET

24.2.5.3.1. Introduction

With the release of MySQL version 5 the MySQL server now supports stored procedures with the SQL 2003 stored procedure syntax.

A stored procedure is a set of SQL statements that can be stored in the server. Once this has been done, clients don't need to keep reissuing the individual statements but can refer to the stored procedure instead.

Stored procedures can be particularly useful in situations such as the following:

- When multiple client applications are written in different languages or work on different platforms, but need to perform the same database operations.
- When security is paramount. Banks, for example, use stored procedures for all common operations. This provides a consistent and secure environment, and procedures can ensure that each operation is properly logged. In such a setup, applications and users would not get any access to the database tables directly, but can only execute specific stored procedures.

Connector/NET supports the calling of stored procedures through the `MySqlCommand` object. Data can be passed in and out of a MySQL stored procedure through use of the `MySqlCommand.Parameters` collection.

Note

When you call a stored procedure, the command object makes an additional `SELECT` call to determine the parameters of the stored procedure. You must ensure that the user calling the procedure has the `SELECT` privilege on the `mysql.proc` table to enable them to verify the parameters. Failure to do this will result in an error when calling the procedure.

This section will not provide in-depth information on creating Stored Procedures. For such information, please refer to <http://dev.mysql.com/doc/mysql/en/stored-routines.html>.

A sample application demonstrating how to use stored procedures with Connector/NET can be found in the `Samples` directory of your Connector/NET installation.

24.2.5.3.2. Creating Stored Procedures from Connector/NET

Stored procedures in MySQL can be created using a variety of tools. First, stored procedures can be created using the `mysql` command-line client. Second, stored procedures can be created using the `MySQL Query Browser` GUI client. Finally, stored procedures can be created using the `.ExecuteNonQuery` method of the `MySqlCommand` object:

Visual Basic Example

```

Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "CREATE PROCEDURE add_emp(" _
        & "IN fname VARCHAR(20), IN lname VARCHAR(20), IN bday DATETIME, OUT empno INT) " _
        & "BEGIN INSERT INTO emp(first_name, last_name, birthdate) " _
        & "VALUES(fname, lname, DATE(bday)); SET empno = LAST_INSERT_ID(); END"

    cmd.ExecuteNonQuery()
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn.Open();
    cmd.Connection = conn;

    cmd.CommandText = "CREATE PROCEDURE add_emp(" +
        "IN fname VARCHAR(20), IN lname VARCHAR(20), IN bday DATETIME, OUT empno INT) " +
        "BEGIN INSERT INTO emp(first_name, last_name, birthdate) " +
        "VALUES(fname, lname, DATE(bday)); SET empno = LAST_INSERT_ID(); END";

    cmd.ExecuteNonQuery();
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

It should be noted that, unlike the command-line and GUI clients, you are not required to specify a special delimiter when creating stored procedures in Connector/NET.

24.2.5.3.3. Calling a Stored Procedure from Connector/NET

To call a stored procedure using Connector/NET, create a `MySqlCommand` object and pass the stored procedure name as the `.CommandText` property. Set the `.CommandType` property to `CommandType.StoredProcedure`.

After the stored procedure is named, create one `MySqlCommand` parameter for every parameter in the stored procedure. `IN` parameters are defined with the parameter name and the object containing the value, `OUT` parameters are defined with the parameter name and the datatype that is expected to be returned. All parameters need the parameter direction defined.

After defining parameters, call the stored procedure by using the `MySqlCommand.ExecuteNonQuery()` method:

Visual Basic Example

```

Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "add_emp"
    cmd.CommandType = CommandType.StoredProcedure

    cmd.Parameters.Add("@lname", 'Jones')
    cmd.Parameters["@lname"].Direction = ParameterDirection.Input

    cmd.Parameters.Add("@fname", 'Tom')
    cmd.Parameters["@fname"].Direction = ParameterDirection.Input

    cmd.Parameters.Add("@bday", #12/13/1977 2:17:36 PM#)
    cmd.Parameters["@bday"].Direction = ParameterDirection.Input

    cmd.Parameters.Add("@empno", MySqlDbType.Int32)
    cmd.Parameters["@empno"].Direction = ParameterDirection.Output

    cmd.ExecuteNonQuery()

    MessageBox.Show(cmd.Parameters["@empno"].Value)
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;

```

```

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn.Open();
    cmd.Connection = conn;

    cmd.CommandText = "add_emp";
    cmd.CommandType = CommandType.StoredProcedure;

    cmd.Parameters.Add("@lname", "Jones");
    cmd.Parameters["@lname"].Direction = ParameterDirection.Input;

    cmd.Parameters.Add("@fname", "Tom");
    cmd.Parameters["@fname"].Direction = ParameterDirection.Input;

    cmd.Parameters.Add("@bday", DateTime.Parse("12/13/1977 2:17:36 PM"));
    cmd.Parameters["@bday"].Direction = ParameterDirection.Input;

    cmd.Parameters.Add("@empno", MySqlDbType.Int32);
    cmd.Parameters["@empno"].Direction = ParameterDirection.Output;

    cmd.ExecuteNonQuery();

    MessageBox.Show(cmd.Parameters["@empno"].Value);
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

Once the stored procedure is called, the values of output parameters can be retrieved by using the `.Value` property of the `MySqlConnection.Parameters` collection.

24.2.5.4. Handling BLOB Data With Connector/NET

24.2.5.4.1. Introduction

One common use for MySQL is the storage of binary data in **BLOB** columns. MySQL supports four different BLOB datatypes: **TINYBLOB**, **BLOB**, **MEDIUMBLOB**, and **LONGBLOB**.

Data stored in a BLOB column can be accessed using Connector/NET and manipulated using client-side code. There are no special requirements for using Connector/NET with BLOB data.

Simple code examples will be presented within this section, and a full sample application can be found in the `Samples` directory of the Connector/NET installation.

24.2.5.4.2. Preparing the MySQL Server

The first step in using MySQL with BLOB data is to configure the server. Let's start by creating a table to be accessed. In my file tables, I usually have four columns: an **AUTO_INCREMENT** column of appropriate size (**UNSIGNED SMALLINT**) to serve as a primary key to identify the file, a **VARCHAR** column that stores the filename, an **UNSIGNED MEDIUMINT** column that stores the size of the file, and a **MEDIUMBLOB** column that stores the file itself. For this example, I will use the following table definition:

```

CREATE TABLE file(
file_id SMALLINT UNSIGNED AUTO_INCREMENT NOT NULL PRIMARY KEY,
file_name VARCHAR(64) NOT NULL,
file_size MEDIUMINT UNSIGNED NOT NULL,
file MEDIUMBLOB NOT NULL);

```

After creating a table, you may need to modify the `max_allowed_packet` system variable. This variable determines how large of a packet (i.e. a single row) can be sent to the MySQL server. By default, the server will only accept a maximum size of 1 meg from our client application. If you do not intend to exceed 1 meg, this should be fine. If you do intend to exceed 1 meg in your file transfers, this number has to be increased.

The `max_allowed_packet` option can be modified using MySQL Administrator's Startup Variables screen. Adjust the Maximum allowed option in the Memory section of the Networking tab to an appropriate setting. After adjusting the value, click the **APPLY CHANGES** button and restart the server using the `Service Control` screen of MySQL Administrator. You can also adjust this value directly in the `my.cnf` file (add a line that reads `max_allowed_packet=xxM`), or use the `SET max_allowed_packet=xxM`; syntax from within MySQL.

Try to be conservative when setting `max_allowed_packet`, as transfers of BLOB data can take some time to complete. Try to set a value that will be adequate for your intended use and increase the value if necessary.

24.2.5.4.3. Writing a File to the Database

To write a file to a database we need to convert the file to a byte array, then use the byte array as a parameter to an `INSERT` query.

The following code opens a file using a `FileStream` object, reads it into a byte array, and inserts it into the `file` table:

Visual Basic Example

```
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

Dim SQL As String

Dim FileSize As UInt32
Dim rawData() As Byte
Dim fs As FileStream

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    fs = New FileStream("c:\image.png", FileMode.Open, FileAccess.Read)
    FileSize = fs.Length

    rawData = New Byte(FileSize) {}
    fs.Read(rawData, 0, FileSize)
    fs.Close()

    conn.Open()

    SQL = "INSERT INTO file VALUES(NULL, @FileName, @FileSize, @File)"

    cmd.Connection = conn
    cmd.CommandText = SQL
    cmd.Parameters.Add("@FileName", strFileName)
    cmd.Parameters.Add("@FileSize", FileSize)
    cmd.Parameters.Add("@File", rawData)

    cmd.ExecuteNonQuery()

    MessageBox.Show("File Inserted into database successfully!", _
        "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk)

    conn.Close()
Catch ex As Exception
    MessageBox.Show("There was an error: " & ex.Message, "Error", _
        MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```
MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();

string SQL;
UInt32 FileSize;
byte[] rawData;
FileStream fs;

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    fs = new FileStream(@"c:\image.png", FileMode.Open, FileAccess.Read);
    FileSize = fs.Length;

    rawData = new byte[FileSize];
    fs.Read(rawData, 0, FileSize);
    fs.Close();

    conn.Open();

    SQL = "INSERT INTO file VALUES(NULL, @FileName, @FileSize, @File)";

    cmd.Connection = conn;
    cmd.CommandText = SQL;
    cmd.Parameters.Add("@FileName", strFileName);
    cmd.Parameters.Add("@FileSize", FileSize);
    cmd.Parameters.Add("@File", rawData);

    cmd.ExecuteNonQuery();

    MessageBox.Show("File Inserted into database successfully!",
        "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk);
}
```

```

    conn.Close();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

The `Read` method of the `FileStream` object is used to load the file into a byte array which is sized according to the `Length` property of the `FileStream` object.

After assigning the byte array as a parameter of the `MySqlCommand` object, the `ExecuteNonQuery` method is called and the BLOB is inserted into the `file` table.

24.2.5.4.4. Reading a BLOB from the Database to a File on Disk

Once a file is loaded into the `file` table, we can use the `MySqlDataReader` class to retrieve it.

The following code retrieves a row from the `file` table, then loads the data into a `FileStream` object to be written to disk:

Visual Basic Example

```

Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myData As MySqlDataReader
Dim SQL As String
Dim rawData() As Byte
Dim FileSize As UInt32
Dim fs As FileStream

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

SQL = "SELECT file_name, file_size, file FROM file"

Try
    conn.Open()

    cmd.Connection = conn
    cmd.CommandText = SQL

    myData = cmd.ExecuteReader

    If Not myData.HasRows Then Throw New Exception("There are no BLOBs to save")

    myData.Read()

    FileSize = myData.GetUInt32(myData.GetOrdinal("file_size"))
    rawData = New Byte(FileSize) {}

    myData.GetBytes(myData.GetOrdinal("file"), 0, rawData, 0, FileSize)

    fs = New FileStream("C:\newfile.png", FileMode.OpenOrCreate, FileAccess.Write)
    fs.Write(rawData, 0, FileSize)
    fs.Close()

    MessageBox.Show("File successfully written to disk!", "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk)

    myData.Close()
    conn.Close()
Catch ex As Exception
    MessageBox.Show("There was an error: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataReader myData;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();

string SQL;
UInt32 FileSize;
byte[] rawData;
FileStream fs;

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

SQL = "SELECT file_name, file_size, file FROM file";

try

```

```

{
    conn.Open();

    cmd.Connection = conn;
    cmd.CommandText = SQL;

    myData = cmd.ExecuteReader();

    if (! myData.HasRows)
        throw new Exception("There are no BLOBs to save");

    myData.Read();

    FileSize = myData.GetUInt32(myData.GetOrdinal("file_size"));
    rawData = new byte[FileSize];

    myData.GetBytes(myData.GetOrdinal("file"), 0, rawData, 0, FileSize);

    fs = new FileStream(@"C:\newfile.png", FileMode.OpenOrCreate, FileAccess.Write);
    fs.Write(rawData, 0, FileSize);
    fs.Close();

    MessageBox.Show("File successfully written to disk!",
        "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk);

    myData.Close();
    conn.Close();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

After connecting, the contents of the `file` table are loaded into a `MySqlDataReader` object. The `GetBytes` method of the `MySqlDataReader` is used to load the BLOB into a byte array, which is then written to disk using a `FileStream` object.

The `GetOrdinal` method of the `MySqlDataReader` can be used to determine the integer index of a named column. Use of the `GetOrdinal` method prevents errors if the column order of the `SELECT` query is changed.

24.2.5.5. Using Connector/NET with Crystal Reports

24.2.5.5.1. Introduction

Crystal Reports is a common tool used by Windows application developers to perform reporting and document generation. In this section we will show how to use Crystal Reports XI with MySQL and Connector/NET.

24.2.5.5.2. Creating a Data Source

When creating a report in Crystal Reports there are two options for accessing the MySQL data while designing your report.

The first option is to use Connector/ODBC as an ADO data source when designing your report. You will be able to browse your database and choose tables and fields using drag and drop to build your report. The disadvantage of this approach is that additional work must be performed within your application to produce a data set that matches the one expected by your report.

The second option is to create a data set in VB.NET and save it as XML. This XML file can then be used to design a report. This works quite well when displaying the report in your application, but is less versatile at design time because you must choose all relevant columns when creating the data set. If you forget a column you must re-create the data set before the column can be added to the report.

The following code can be used to create a data set from a query and write it to disk:

Visual Basic Example

```

Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=world"

Try
    conn.Open()
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " _
        & "country.name, country.population, country.continent " _
        & "FROM country, city ORDER BY country.continent, country.name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

```

```

myData.WriteXml("C:\dataset.xml", XmlWriteMode.WriteSchema)
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

DataSet myData = new DataSet();
MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;
MySQL.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();
myAdapter = new MySQL.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " +
        "country.name, country.population, country.continent " +
        "FROM country, city ORDER BY country.continent, country.name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);

    myData.WriteXml(@"C:\dataset.xml", XmlWriteMode.WriteSchema);
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

The resulting XML file can be used as an ADO.NET XML datasource when designing your report.

If you choose to design your reports using Connector/ODBC, it can be downloaded from dev.mysql.com.

24.2.5.5.3. Creating the Report

For most purposes the Standard Report wizard should help with the initial creation of a report. To start the wizard, open Crystal Reports and choose the New > Standard Report option from the File menu.

The wizard will first prompt you for a data source. If you are using Connector/ODBC as your data source, use the OLEDB provider for ODBC option from the OLE DB (ADO) tree instead of the ODBC (RDO) tree when choosing a data source. If using a saved data set, choose the ADO.NET (XML) option and browse to your saved data set.

The remainder of the report creation process is done automatically by the wizard.

After the report is created, choose the Report Options... entry of the File menu. Un-check the Save Data With Report option. This prevents saved data from interfering with the loading of data within our application.

24.2.5.5.4. Displaying the Report

To display a report we first populate a data set with the data needed for the report, then load the report and bind it to the data set. Finally we pass the report to the crViewer control for display to the user.

The following references are needed in a project that displays a report:

- CrystalDecisions.CrystalReports.Engine
- CrystalDecisions.ReportSource
- CrystalDecisions.Shared
- CrystalDecisions.Windows.Forms

The following code assumes that you created your report using a data set saved using the code shown in [Section 24.2.5.5.2, "Creating a Data Source"](#), and have a crViewer control on your form named `myViewer`.

Visual Basic Example

```

Imports CrystalDecisions.CrystalReports.Engine
Imports System.Data
Imports MySql.Data.MySqlClient

Dim myReport As New ReportDocument
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = _
    "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    conn.Open()

    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " _
        & "country.name, country.population, country.continent " _
        & "FROM country, city ORDER BY country.continent, country.name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myReport.Load(".\world_report.rpt")
    myReport.SetDataSource(myData)
    myViewer.ReportSource = myReport
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

C# Example

```

using CrystalDecisions.CrystalReports.Engine;
using System.Data;
using MySql.Data.MySqlClient;

ReportDocument myReport = new ReportDocument();
DataSet myData = new DataSet();
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
myAdapter = new MySql.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " +
        "country.name, country.population, country.continent " +
        "FROM country, city ORDER BY country.continent, country.name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);

    myReport.Load(@".\world_report.rpt");
    myReport.SetDataSource(myData);
    myViewer.ReportSource = myReport;
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

A new data set is generated using the same query used to generate the previously saved data set. Once the data set is filled, a `ReportDocument` is used to load the report file and bind it to the data set. The `ReportDocument` is then passed as the `ReportSource` of the `crViewer`.

This same approach is taken when a report is created from a single table using Connector/ODBC. The data set replaces the table used in the report and the report is displayed properly.

When a report is created from multiple tables using Connector/ODBC, a data set with multiple tables must be created in our application. This allows each table in the report data source to be replaced with a report in the data set.

We populate a data set with multiple tables by providing multiple `SELECT` statements in our `MySqlCommand` object. These `SELECT` statements are based on the SQL query shown in Crystal Reports in the Database menu's Show SQL Query option. Assume the following query:

```
SELECT `country`.`Name`, `country`.`Continent`, `country`.`Population`, `city`.`Name`, `city`.`Population`
```

```
FROM `world`.`country` `country` LEFT OUTER JOIN `world`.`city` `city` ON `country`.`Code`=`city`.`CountryCode`
ORDER BY `country`.`Continent`, `country`.`Name`, `city`.`Name`
```

This query is converted to two [SELECT](#) queries and displayed with the following code:

Visual Basic Example

```
Imports CrystalDecisions.CrystalReports.Engine
Imports System.Data
Imports MySql.Data.MySqlClient

Dim myReport As New ReportDocument
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=world"

Try
    conn.Open()
    cmd.CommandText = "SELECT name, population, countrycode FROM city ORDER BY countrycode, name; " _
        & "SELECT name, population, code, continent FROM country ORDER BY continent, name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myReport.Load(".\world_report.rpt")
    myReport.Database.Tables(0).SetDataSource(myData.Tables(0))
    myReport.Database.Tables(1).SetDataSource(myData.Tables(1))
    myViewer.ReportSource = myReport
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

C# Example

```
using CrystalDecisions.CrystalReports.Engine;
using System.Data;
using MySql.Data.MySqlClient;

ReportDocument myReport = new ReportDocument();
DataSet myData = new DataSet();
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
myAdapter = new MySql.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT name, population, countrycode FROM city ORDER " +
        "BY countrycode, name; SELECT name, population, code, continent FROM " +
        "country ORDER BY continent, name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);

    myReport.Load(@".\world_report.rpt");
    myReport.Database.Tables(0).SetDataSource(myData.Tables(0));
    myReport.Database.Tables(1).SetDataSource(myData.Tables(1));
    myViewer.ReportSource = myReport;
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}
```

It is important to order the [SELECT](#) queries in alphabetical order, as this is the order the report will expect its source tables to be in. One `SetDataSource` statement is needed for each table in the report.

This approach can cause performance problems because Crystal Reports must bind the tables together on the client-side, which will be slower than using a pre-saved data set.

24.2.5.6. Handling Date and Time Information in Connector/NET

24.2.5.6.1. Introduction

MySQL and the .NET languages handle date and time information differently, with MySQL allowing dates that cannot be represented by a .NET data type, such as '0000-00-00 00:00:00'. These differences can cause problems if not properly handled.

In this section we will demonstrate how to properly handle date and time information when using Connector/NET.

24.2.5.6.2. Problems when Using Invalid Dates

The differences in date handling can cause problems for developers who use invalid dates. Invalid MySQL dates cannot be loaded into native .NET `DateTime` objects, including `NULL` dates.

Because of this issue, .NET `DataSet` objects cannot be populated by the `Fill` method of the `MySqlDataAdapter` class as invalid dates will cause a `System.ArgumentOutOfRangeException` exception to occur.

24.2.5.6.3. Restricting Invalid Dates

The best solution to the date problem is to restrict users from entering invalid dates. This can be done on either the client or the server side.

Restricting invalid dates on the client side is as simple as always using the .NET `DateTime` class to handle dates. The `DateTime` class will only allow valid dates, ensuring that the values in your database are also valid. The disadvantage of this is that it is not useful in a mixed environment where .NET and non .NET code are used to manipulate the database, as each application must perform its own date validation.

Users of MySQL 5.0.2 and higher can use the new `traditional` SQL mode to restrict invalid date values. For information on using the `traditional` SQL mode, see [Section 5.1.7, "SQL Modes"](#).

24.2.5.6.4. Handling Invalid Dates

Although it is strongly recommended that you avoid the use of invalid dates within your .NET application, it is possible to use invalid dates by means of the `MySqlDateTime` datatype.

The `MySqlDateTime` datatype supports the same date values that are supported by the MySQL server. The default behavior of Connector/NET is to return a .NET `DateTime` object for valid date values, and return an error for invalid dates. This default can be modified to cause Connector/NET to return `MySqlDateTime` objects for invalid dates.

To instruct Connector/NET to return a `MySqlDateTime` object for invalid dates, add the following line to your connection string:

```
Allow Zero Datetime=True
```

Please note that the use of the `MySqlDateTime` class can still be problematic. The following are some known issues:

1. Data binding for invalid dates can still cause errors (zero dates like 0000-00-00 do not seem to have this problem).
2. The `ToString` method return a date formatted in the standard MySQL format (for example, 2005-02-23 08:50:25). This differs from the `ToString` behavior of the .NET `DateTime` class.
3. The `MySqlDateTime` class supports `NULL` dates, while the .NET `DateTime` class does not. This can cause errors when trying to convert a `MySqlDateTime` to a `DateTime` if you do not check for `NULL` first.

Because of the known issues, the best recommendation is still to use only valid dates in your application.

24.2.5.6.5. Handling NULL Dates

The .NET `DateTime` datatype cannot handle `NULL` values. As such, when assigning values from a query to a `DateTime` variable, you must first check whether the value is in fact `NULL`.

When using a `MySqlDataReader`, use the `IsDBNull` method to check whether a value is `NULL` before making the assignment:

Visual Basic Example

```
If Not myReader.IsDBNull(myReader.GetOrdinal("mytime")) Then
    myTime = myReader.GetDateTime(myReader.GetOrdinal("mytime"))
Else
    myTime = DateTime.MinValue
End If
```

C# Example

```
if (! myReader.IsDBNull(myReader.GetOrdinal("mytime")))
    myTime = myReader.GetDateTime(myReader.GetOrdinal("mytime"));
else
    myTime = DateTime.MinValue;
```

`NULL` values will work in a data set and can be bound to form controls without special handling.

24.2.5.7. Frequently Asked Questions

The following details a number of frequently asked questions about Connector/NET.

Questions

- [25.2.5.7.1](#): How do I obtain the value of an auto-incremented column?

Questions and Answers

25.2.5.7.1: How do I obtain the value of an auto-incremented column?

When using the `commandBuilder` you should make sure that you set the `ReturnGeneratedIdentifiers` property to `true`.

Then, you can use an active view on a table to access the updated ID. For example:

```
conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
da = new MySql.Data.MySqlClient.MySqlDataAdapter();
cmdBuilder = new MySql.Data.MySqlClient.MySqlCommandBuilder();
SystemDataDataSet = new System.Data.DataSet();
SystemDataDataView = new System.Data.DataView();

...

cmd.Connection = conn;
cmd.CommandText = "SELECT * FROM contacts";
da.SelectCommand = cmd;
da.Fill(SystemDataDataSet, "contacts");
cmdBuilder.DataAdapter = da;
cmdBuilder.ReturnGeneratedIdentifiers = true;
cmdBuilder.DataAdapter.SelectCommand.CommandText = "SELECT * FROM contacts";
cmdBuilder.RefreshSchema();

SystemDataDataView = SystemDataDataSet.Tables["contacts"].DefaultView;

SystemDataDataRow = SystemDataDataView.Table.NewRow();
SystemDataDataRow["status"] = 1;

SystemDataDataView.Table.Rows.Add(SystemDataDataRow);
da.Update(SystemDataDataSet, "contacts");
System.Console.WriteLine("ID after update: " + SystemDataDataRow["id"]);
```

The `SystemDataDataRow` object in this instance provides the interface to the updated auto-increment value in the `id` column.

24.2.6. Connector/NET Support

The developers of Connector/NET greatly value the input of our users in the software development process. If you find Connector/NET lacking some feature important to you, or if you discover a bug and need to file a bug report, please use the instructions in [Section 1.7, "How to Report Bugs or Problems"](#).

24.2.6.1. Connector/NET Community Support

- Community support for Connector/NET can be found through the forums at <http://forums.mysql.com>.
- Community support for Connector/NET can also be found through the mailing lists at <http://lists.mysql.com>.
- Paid support is available from MySQL AB. Additional information is available at <http://www.mysql.com/support/>.

24.2.6.2. How to report Connector/NET Problems or Bugs

If you encounter difficulties or problems with Connector/NET, contact the Connector/NET community [Section 24.2.6.1](#),

“Connector/NET Community Support”.

You should first try to execute the same SQL statements and commands from the `mysql` client program or from `admindemo`. This helps you determine whether the error is in Connector/NET or MySQL.

If reporting a problem, you should ideally include the following information with the email:

- Operating system and version
- Connector/NET version
- MySQL server version
- Copies of error messages or other unexpected output
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

If you believe the problem to be a bug, then you must report the bug through <http://bugs.mysql.com/>.

24.2.6.3. Connector/NET Change History

The Connector/NET Change History (Changelog) is located with the main Changelog for MySQL. See [Section E.4, “MySQL Connector/NET Change History”](#).

24.3. MySQL Visual Studio Plugin

The MySQL Visual Studio Plugin is a DDEX provider; a plug-in for Visual Studio 2005 that allows developers to maintain database structures, and supports built-in data-driven application development tools.

The current version of the MySQL Visual Studio Plugin includes only database maintenance tools. Data-driven application development tools are not supported.

The MySQL DDEX Provider operates as a standard extension to the Visual Studio Data Designer functionality available through the Server Explorer menu of Visual Studio 2005, and enables developers to create database objects and data within a MySQL database.

The MySQL Visual Studio Plugin is designed to work with MySQL version 5.0, but is also compatible with MySQL 4.1.1 and provides limited compatibility with MySQL 5.1.

24.3.1. Installing the MySQL Visual Studio Plugin

The MySQL Visual Studio Plugin requires one of Visual Studio 2005 Standard, Professional or Team Developer Edition to be installed. Other editions of Visual Studio 2005 are not supported.

Note

Starting with Connector/NET 5.1.2, the Visual Studio Plugin is included in the installation. If you have installed Connector/NET 5.1.2, then you do not need to separately install the Visual Studio Plugin.

Here is the list of components that should already be installed before starting the installation of the MySQL Visual Studio Plugin:

- Visual Studio 2005 Standard, Professional or Team Developer Edition.
- MySQL Server 4.1.1 or later (either installed on the same machine, or a separate server).
- MySQL Connector/NET 5.0.

Note

When installing Connector/NET you must ensure that the connector is installed into the Global Assembly Cache (GAC). The Connector/NET installer handles this for you automatically, but in a custom installation the option may have been disabled.

The user used to connect to the MySQL server must have the following privileges to use the functionality provided by the MySQL Visual Studio Plugin:

- The `SELECT` privilege for the `INFORMATION_SCHEMA` database.
- The `EXECUTE` privilege for the `SHOW CREATE TABLE` statement.
- The `SELECT` privilege for the `mysql.proc` table (required for operations with stored procedures and functions).
- The `SELECT` privilege for the `mysql.func` table (required for operations with User Defined Functions (UDF)).
- The `EXECUTE` privilege for the `SHOW ENGINE STATUS` statement (required for retrieving extended error information).
- Appropriate privileges for performed operations (e.g. the `SELECT` privilege is required to browse data from a table etc.).

The MySQL Visual Studio Plugin is delivered as a MSI package that can be used to install, uninstall or reinstall the Provider. If you are not using Windows XP or Windows Server 2003 you upgrade the Windows Installer system to the latest version (see <http://support.microsoft.com/default.aspx?scid=kb;EN-US;292539> for details).

The MSI-package is named `MySQL.VisualStudio.msi`. To install the MySQL Visual Studio Plugin, right click on the MSI file and select `INSTALL`. The installation process is as follow:

1. The standard Welcome dialog is opened. Click Next to continue installation.
2. The License agreement (GNU GPL) window is opened. Accept the agreement and click NEXT to continue.
3. The destination folder choice dialog is opened. Here you can point out the folder where the MySQL Visual Studio Plugin will be installed. The default destination folder is `%ProgramFilesDir%\MySQL\MySQL DDEX Data Provider`, where `%ProgramFilesDir%` is the Program Files folder of the installation machine. After choosing the destination folder, click NEXT to continue.
4. The installer will ask to confirm that installation. Click Install to start installation process.
5. The installation will now take place. At the end of this step the Visual Studio command table is rebuilt (this process may take several minutes).
6. Once installation is complete, click FINISH to end the installation process.

To uninstall the MySQL Visual Studio Plugin, you can use either Add/Remove Programs component of the Control Panel or the same MSI-package. Choose the `REMOVE` option, and the Provider will be uninstalled automatically.

To repair the Provider, right click the MSI-package and choose the `REPAIR` option. The MySQL Visual Studio Plugin will be repaired automatically.

The installation package includes the following files:

- `MySQL.VisualStudio.dll` — the MySQL DDEX Provider assembly.
- `MySQL.Data.dll` — the assembly containing the MySQL Connector .NET which is used by the Provider.
- `MySql.VisualStudio.dll.config` — the configuration file for the MySQL Visual Studio Plugin. This file contains default values for the provider GUI layout.

Note

Do not remove this file before the first use of the Provider.

- `Register.reg` — the file with registry entries that can be used to register the MySQL DDEX Provider in the case of the manual installation.
- `Install.js` — the script used to register the Connector .NET as an ADO.NET data provider in the machine.config file.
- `Release notes.doc` — the document with release notes.

To install the Provider manually, copy all files of the installation package in a desired folder, then set the full path to the Provider assembly as a value of the CodeBase entry. For example:

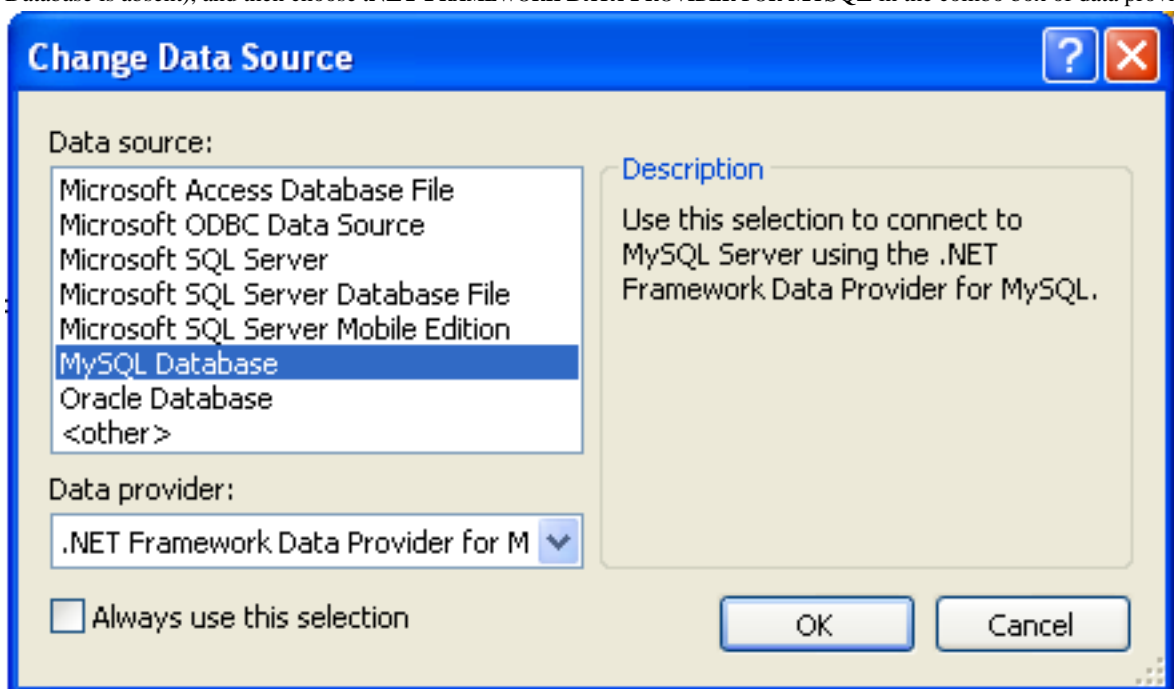

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\VisualStudio\8.0\Packages\{79A115C9-B133-4891-9E7B-242509DAD272}]@="MySql.Data.
"InprocServer32"="C:\WINNT\system32\mscoree.dll"
"Class"="MySql.Data.VisualStudio.MySqlDataProviderPackage"
"CodeBase"="C:\MySqlDdexProvider\MySql.VisualStudio.dll"
```

Then import information from the Register.reg file to the registry by clicking of the file. At the confirmation dialog choose Yes. Next you must run the command `devenv.exe /setup` within a Command Prompt to rebuild the Visual Studio command table.

24.3.2. Creating a connection to the MySQL server

Once the MySQL Visual Studio Plugin is installed, you can use it to create, modify and delete connections to MySQL databases. To create a connection with a MySQL database, perform the following steps:

1. Start Visual Studio 2005 and open Server Explorer window by choosing the **SERVER EXPLORER** option from the **VIEW** menu.
2. Right click on the **DATA CONNECTIONS** node and choose the **ADD CONNECTION** button.
3. The Add Connection dialog is opened. Press the **CHANGE** button to choose MySQL Database as a data source.
4. Change Data Source dialog is opened. Choose MySQL Database in the list of data sources (or the **other** option, if MySQL Database is absent), and then choose **.NET FRAMEWORK DATA PROVIDER FOR MYSQL** in the combo box of data providers.

Press OK to confirm your choice.

5. Enter the connection settings: the server host name (for example, localhost if the MySQL server is installed on the local machine), the user name, the password, and the default database schema. Note that you must specify the default schema name to open the connection.

6. You can also set the port to connect with the MySQL server by pressing the **ADVANCED** button. To test a connection with the MySQL server, set the server host name, the user name, and the password, and press the **TEST CONNECTION** button. If the test fails, check the connection values that you have supplied are correct and that the corresponding user and privileges have been configured on the MySQL server.
7. After you set all settings and test the connection, press **OK**. The newly created connection is displayed in Server Explorer. Now you can work with the MySQL server through standard Server Explorer interface.

After a connection is successfully established, all the connection settings are saved. When you next open Visual Studio, the connection to the MySQL server will appear within Server Explorer so that you can re-establish a connection to the MySQL server.

To modify and delete a connection, use the **SERVER EXPLORER** context menu for the corresponding node. You can modify any of the settings just by overwriting the existing values with new ones. Note that a connection should be modified or deleted only if no active editor for its objects is opened. Otherwise your data could be lost.

24.3.3. Using the MySQL Visual Studio Plugin

To work with a MySQL server using the MySQL Visual Studio Plugin, open the Visual Studio 2005, open the **SERVER EXPLORER**, and select the required connection. The working area of the MySQL Visual Studio Plugin consists of three parts.

- Database objects (tables, views, stored routines, triggers, and user defined functions) are displayed in the Server Explorer tree. Here you can choose an object and edit its properties and definition.
- Properties of a selected database object are displayed in the **PROPERTIES** panel. Certain properties can be edited directly within this window.
- The editor panel provides direct access to the SQL statement and definition of specific objects. For example, the SQL statements within a stored procedure definition are shown and edited within this panel.

24.3.3.1. Editing Tables

The Table Editor can be accessed through a mouse action on table-type node of Server Explorer. To create a new table, right click on the **TABLES** node (under the connection node) and choose the **CREATE TABLE** command from a context menu. To modify an existing table, double click on a node of the table you wish to modify, or right click on this node and choose the **ALTER TABLE** command from a context menu. Either of the commands opens the Table Editor.

The MySQL Visual Studio Plugin Table Editor is implemented in a similar fashion to the standard Query Browser Table Editor, but with minor differences.

The Table Editor consists of the following parts:

- Columns Editor — for column creation, modification and deletion.
- Indexes tab — for table/column index management.
- Foreign Keys tab — for configuration of foreign keys.
- Column Details tab — used to set advanced column options.
- Properties window — used to set table properties.

To save changes you have made in the Table Editor, use either Save or Save All buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. Before changes are saved, a confirmation dialog will be displayed to confirm that you want to update the corresponding object within the MySQL database.

24.3.3.1.1. Column Editor

You can use the Column Editor to set or change the name, data type, default value and other properties of a table column. To set the properties of an individual column, select the column using the mouse. Alternatively, you can move through the grid using **Tab** and **Shift+Tab** keys.

- To set or change the name, data type, default value and comment of a column, select the appropriate cell and edit the desired value.
- To set or unset flag-type column properties (i.e., primary key, **NOT NULL**, auto-incremented, flags), check or uncheck the corresponding checkboxes. Note that the available column flags will depend on the columns data type.
- To reorder columns, index columns or foreign key columns in the Column Editor, select the whole column you wish to reorder by clicking on the selector column at the left of the column grid. Then move the column by using **Ctrl+Up** (to move the

column up) and **Ctrl+Down** (to move the column down) keys.

- To delete a column, select it by clicking on the selector column at the left of the column grid, then press the **Delete** button on a keyboard.

24.3.3.1.2. Indexes tab

Index management is performed via the Indexes tab.

- To add an index, press the + button and set the properties in the **INDEX SETTINGS** groupbox at the right. You can set the index name, index kind, index type and a set of index columns.
- To remove an index, select the index from the list and press the - button.
- To change index settings, select the index from the list; detailed information about the index is displayed in the **INDEX SETTINGS** panel.

You cannot change a table column to an index column using drag and drop. Instead, you can add new index columns to a table and set their table columns by using the embedded editor within the Indexes tab

24.3.3.1.3. Foreign Keys tab

Foreign Key management is performed via the Foreign Keys tab.

- To add a foreign key, press the + button and set properties in the **FOREIGN KEYS SETTINGS** panel. You can set the foreign key name, referenced table name, foreign key columns and actions on update and delete.
- To remove a foreign key, select the foreign key and press the - button.
- To change foreign key settings, select the foreign key and use the **FOREIGN KEYS SETTINGS** panel to edit the properties.
- When a foreign key is changed, the MySQL Visual Studio Plugin generates two queries: the first query drops the changed keys and the second one recreates the new values. The reason for such a behavior is to avoid the [Bug#8377](#) and [Bug#8919](#).

Note

If changed values are for some reason inconsistent and cause the second query to fail, all affected foreign keys will be dropped. If this is the case, the MySQL Visual Studio Plugin will mark them as new in the Table Editor, and you will have to recreate them later. But if you close the Table Editor without saving, these foreign keys will be lost.

24.3.3.1.4. Column Details tab

The Column Details tab can be used to set column options. Besides the main column properties that are presented in the Column Editor, in the Column Details tab you can set two additional properties options: the character set and the collation sequence.

24.3.3.1.5. Table Properties window

There is no separate tab for table options and advanced options. All table options can be browsed and changed using the **PROPERTIES** window of Visual Studio 2005.

The following table properties can be set:

- **AUTO INCREMENT**
- **AVERAGE ROW LENGTH**
- **CHARACTER SET**
- **CHECKSUM FOR ROWS**
- **COLLATION**
- **COMMENT**
- **CONNECTION**

- **DATA DIRECTORY**
- **DELAY KEY UPDATES**
- **ENGINE**
- **INDEX DIRECTORY**
- **INSERT METHOD**
- **MAXIMUM ROWS**
- **MINIMUM ROWS**
- **NAME**
- **PACK KEYS**
- **PASSWORD**
- **ROW FORMAT**
- **UNION**

Some of these properties can have arbitrary text values, others accept values from a predefined set.

The properties **SCHEMA** and **SERVER** are read only.

24.3.3.2. Editing Table Data

The Table Data Editor, allows a user to browse, create and edit data of tables. The Table Data Editor is implemented as a simple data grid with auto generated columns.

To access the Table Data Editor, right click on a node representing the table or view in Server Explorer. From the nodes context menu, choose the **BROWSE** or **EDIT DATA** command. For tables and updatable views, this command opens the Table Data Editor in edit mode. For non-updatable views, this command opens the Table Data Editor in read-only mode.

When in the edit mode, you can modify table data by modifying the displayed table contents directly. To add a row, set desired values in the last row of the grid. To modify values, set new values in appropriate cells. To delete a row, select it by clicking on the selector column at the left of the grid, then press the **DELETE** button.

To save changes you have made in the Table Data Editor, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

24.3.3.3. Editing Views

To create a new view, right click the Views node under the connection node in Server Explorer. From the nodes context menu, choose the **CREATE VIEW** command. This command opens the SQL Editor.

To modify an existing view, double click on a node of the view you wish to modify, or right click on this node and choose the **ALTER VIEW** command from a context menu. Either of the commands opens the SQL Editor.

To create or alter the view definition using SQL Editor, type the appropriate SQL statement in the SQL Editor.

Note

You should enter only the defining statement itself, without the **CREATE VIEW AS** preface.

All other view properties can be set in the **PROPERTIES** window. These properties are:

- **ALGORITHM**
- **CHECK OPTION**
- **DEFINER**
- **NAME**
- **SECURITY TYPE**

Some of these properties can have arbitrary text values, others accept values from a predefined set.

The properties **IS UPDATABLE**, **SCHEMA** and **SERVER** are readonly.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

24.3.3.4. Editing Stored Procedures and Functions

To create a new stored procedure, right click the Stored Procedures node under the connection node in Server Explorer. From the nodes context menu, choose the **CREATE ROUTINE** command. This command opens the SQL Editor.

To create a new stored function, right click the **FUNCTIONS** node under the connection node in Server Explorer. From the node's context menu, choose the **CREATE ROUTINE** command.

To modify an existing stored routine (procedure or function), double click on a node of the routine you wish to modify, or right click on this node and choose the **ALTER ROUTINE** command from a context menu. Either of the commands opens the SQL Editor.

To create or alter the routine definition using SQL Editor, type this definition in the SQL Editor using standard SQL.

All other routine properties can be set in the **PROPERTIES** window. These properties are:

- Comment
- Data Access
- Definer
- Is Deterministic
- Security Type

Some of these properties can have arbitrary text values, others accept values only from a predefined set.

Also you can set all the options directly in the SQL Editor, using the standard **CREATE PROCEDURE** or **CREATE FUNCTION** statement. However, it is recommended to use the **PROPERTIES** window instead.

Note

You should never add the **CREATE** preface to the routine definition.

The properties **NAME**, **SCHEMA** and **SERVER** in the **PROPERTIES** window are read-only. Set or change the procedure name in the SQL editor.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database..

24.3.3.5. Editing Triggers

To create a new trigger, right click on a node of a table for which you wish to add a trigger. From the node's context menu, choose the **CREATE TRIGGER** command. This command opens the SQL Editor.

To modify an existing trigger, double click on a node of the trigger you wish to modify, or right click on this node and choose the **ALTER TRIGGER** command from a context menu. Either of the commands opens the SQL Editor.

To create or alter the trigger definition using SQL Editor, type the trigger statement in the SQL Editor using standard SQL.

Note

You should enter only the trigger statement, that is the part of the **CREATE TRIGGER** query that is placed after the **FOR EACH ROW** clause.

All other trigger properties are set in the **PROPERTIES** window. These properties are:

- **DEFINER**
- **EVENT MANIPULATION**

- **NAME**
- **TIMING**

Some of these properties can have arbitrary text values, others accept values only from a predefined set.

The properties **EVENT TABLE**, **SCHEMA** and **SERVER** in the **PROPERTIES** window are read-only.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

24.3.3.6. Editing User Defined Functions (UDF)

To create a new User Defined Function (UDF), right click the UDFs node under the connection node in Server Explorer. From the node's context menu, choose the **CREATE UDF** command. This command opens the UDF Editor.

To modify an existing UDF, double click on a node of the UDF you wish to modify, or right click on this node and choose the **Alter UDF** command from a context menu. Either of the commands opens the UDF Editor.

The UDF editor allows you to set the following properties through the properties panel:

- **NAME**
- **SO-NAME (DLL NAME)**
- **RETURN TYPE**
- **IS AGGREGATE**

The property **Server** in the **PROPERTIES** window is read-only.

To save changes you have made, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

24.3.3.7. Dropping database objects

Tables, views, stored routines, triggers, and UDFs can be dropped with the appropriate **DROP** command from its context menu: **DROP TABLE**, **DROP VIEW**, **DROP ROUTINE**, **DROP TRIGGER**, **DROP UDF**.

You will be asked to confirm the execution of the corresponding drop query in a confirmation dialog.

Dropping of multiple objects is not supported.

24.3.3.8. Cloning database objects

Tables, views, stored procedures and functions can be cloned with the appropriate **CLONE** command from its context menu: **CLONE TABLE**, **CLONE VIEW**, **CLONE ROUTINE**. The clone commands open the corresponding editor for a new object: the **TABLE EDITOR** for cloning a table and the SQL Editor for cloning a view or a routine.

To save the cloned object, use either **SAVE** or **SAVE ALL** buttons of the Visual Studio main toolbar, or just press **Ctrl+S**. A confirmation dialog will confirm whether you want the changes saved to the database.

24.3.4. Visual Studio Plugin Support

If you have a comment, or if you discover a bug, please, use our MySQL bug tracking system (<http://bugs.mysql.com>) to report problem or add your suggestion.

24.3.4.1. Visual Studio Plugin FAQ

Questions

- **25.3.4.1.1:** When creating a connection, typing the connection details causes the connection window to immediately close.

Questions and Answers

25.3.4.1.1: When creating a connection, typing the connection details causes the connection window to immediately close.

There are known issues with versions of Connector/NET earlier than 5.0.2. Connector/NET 1.0.x is known not to work. If you have any of these versions installed, or have previously upgraded from an earlier version, uninstall Connector/NET completely and then install Connector/NET 5.0.2.

24.4. MySQL Connector/J

MySQL provides connectivity for client applications developed in the Java programming language via a JDBC driver, which is called MySQL Connector/J.

MySQL Connector/J is a JDBC Type 4 driver. Different versions are available that are compatible with the JDBC 3.0 and JDBC 4.0 specifications. The Type 4 designation means that the driver is pure-Java implementation of the MySQL protocol and does not rely on the MySQL client libraries.

Although JDBC is useful by itself, we would hope that if you are not familiar with JDBC that after reading the first few sections of this manual, that you would avoid using naked JDBC for all but the most trivial problems and consider using one of the popular persistence frameworks such as [Hibernate](#), [Spring's JDBC templates](#) or [Ibatis SQL Maps](#) to do the majority of repetitive work and heavier lifting that is sometimes required with JDBC.

This section is not designed to be a complete JDBC tutorial. If you need more information about using JDBC you might be interested in the following online tutorials that are more in-depth than the information presented here:

- [JDBC Basics](#) — A tutorial from Sun covering beginner topics in JDBC
- [JDBC Short Course](#) — A more in-depth tutorial from Sun and JGuru

Key topics:

- For help with connection strings, connection options setting up your connection through JDBC, see [Section 24.4.4.1, “Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J”](#).
- For tips on using Connector/J and JDBC with generic J2EE toolkits, see [Section 24.4.5.2, “Using Connector/J with J2EE and Other Java Frameworks”](#).
- Developers using the Tomcat server platform, see [Section 24.4.5.2.2, “Using Connector/J with Tomcat”](#).
- Developers using JBoss, see [Section 24.4.5.2.3, “Using Connector/J with JBoss”](#).
- Developers using Spring, see [Section 24.4.5.2.4, “Using Connector/J with Spring”](#).

MySQL Enterprise

MySQL Enterprise subscribers will find more information about using JDBC with MySQL in the Knowledge Base articles about [JDBC](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

24.4.1. Connector/J Versions

There are currently four versions of MySQL Connector/J available:

- Connector/J 5.1 is the Type 4 pure Java JDBC driver, which conforms to the JDBC 3.0 and JDBC 4.0 specifications. It provides compatibility with all the functionality of MySQL, including 4.1, 5.0, 5.1 and the 6.0 alpha release featuring the new Falcon storage engine. Connector/J 5.1 provides ease of development features, including auto-registration with the Driver Manager, standardized validity checks, categorized SQLExceptions, support for the JDBC-4.0 XML processing, per connection client information, [NCHAR](#), [NVARCHAR](#) and [NCLOB](#) types. This release also includes all bug fixes up to and including Connector/J 5.0.6.
- Connector/J 5.0 provides support for all the functionality offered by Connector/J 3.1 and includes distributed transaction (XA) support.
- Connector/J 3.1 was designed for connectivity to MySQL 4.1 and MySQL 5.0 servers and provides support for all the functionality in MySQL 5.0 except distributed transaction (XA) support.
- Connector/J 3.0 provides core functionality and was designed with connectivity to MySQL 3.x or MySQL 4.1 servers, although

it will provide basic compatibility with later versions of MySQL. Connector/J 3.0 does not support server-side prepared statements, and does not support any of the features in versions of MySQL later than 4.1.

The following table summarizes the Connector/J versions available:

Connector/J version	Driver Type	JDBC version	MySQL Server version	Status
5.1	4	3.0, 4.0	4.1, 5.0, 5.1, 6.0	Recommended version
5.0	4	3.0	4.1, 5.0	Released version
3.1	4	3.0	4.1, 5.0	Obsolete
3.0	4	3.0	3.x, 4.1	Obsolete

The current recommended version for Connector/J is 5.1. This guide covers all four connector versions, with specific notes given where a setting applies to a specific option.

24.4.1.1. Java Versions Supported

The following table summarizes Connector/J Java dependencies:

Connector/J version	Java RTE required	JDK required (to build source code)
5.1	1.3.x, 1.4.x, 1.5.x, 1.6.x	1.6.x and 1.5.x (or older)
5.0	1.3.x, 1.4.x, 1.5.x, 1.6.x	1.4.2, 1.5.x, 1.6.x
3.1	1.2.x, 1.3.x, 1.4.x, 1.5.x, 1.6.x	1.4.2, 1.5.x, 1.6.x
3.0	1.2.x, 1.3.x, 1.4.x, 1.5.x, 1.6.x	1.4.2, 1.5.x, 1.6.x

MySQL Connector/J does not support JDK-1.1.x or JDK-1.0.x.

Because of the implementation of `java.sql.Savepoint`, Connector/J 3.1.0 and newer will not run on a Java runtime older than 1.4 unless the class verifier is turned off (by setting the `-Xverify:none` option to the Java runtime). This is because the class verifier will try to load the class definition for `java.sql.Savepoint` even though it is not accessed by the driver unless you actually use savepoint functionality.

Caching functionality provided by Connector/J 3.1.0 or newer is also not available on JVMs older than 1.4.x, as it relies on `java.util.LinkedHashMap` which was first available in JDK-1.4.0.

If you are building Connector/J from source code using the source distribution (see [Section 24.4.2.4, “Installing from the Development Source Tree”](#)) then you must use JDK 1.4.2 or newer to compile the Connector package. For Connector/J 5.1 you must have both JDK-1.6.x. and JDK-1.5.x installed in order to be able to build the source code.

24.4.2. Connector/J Installation

You can install the Connector/J package using either the binary or source distribution. The binary distribution provides the easiest method for installation; the source distribution enables you to customize your installation further. With either solution, you must manually add the Connector/J location to your Java `CLASSPATH`.

If you are upgrading from a previous version, read the upgrade information before continuing. See [Section 24.4.2.3, “Upgrading from an Older Version”](#).

24.4.2.1. Installing Connector/J from a Binary Distribution

The easiest method of installation is to use the binary distribution of the Connector/J package. The binary distribution is available either as a Tar/Gzip or Zip file which you must extract to a suitable location and then optionally make the information about the package available by changing your `CLASSPATH` (see [Section 24.4.2.2, “Installing the Driver and Configuring the CLASSPATH”](#)).

MySQL Connector/J is distributed as a .zip or .tar.gz archive containing the sources, the class files, and the JAR archive named `mysql-connector-java-[version]-bin.jar`, and starting with Connector/J 3.1.8 a debug build of the driver in a file named `mysql-connector-java-[version]-bin-g.jar`.

Starting with Connector/J 3.1.9, the `.class` files that constitute the JAR files are only included as part of the driver JAR file.

You should not use the debug build of the driver unless instructed to do so when reporting a problem or a bug to MySQL AB, as it

is not designed to be run in production environments, and will have adverse performance impact when used. The debug binary also depends on the Aspect/J runtime library, which is located in the `src/lib/aspectjrt.jar` file that comes with the Connector/J distribution.

You will need to use the appropriate graphical or command-line utility to extract the distribution (for example, WinZip for the .zip archive, and `tar` for the .tar.gz archive). Because there are potentially long filenames in the distribution, we use the GNU tar archive format. You will need to use GNU tar (or an application that understands the GNU tar archive format) to unpack the .tar.gz variant of the distribution.

24.4.2.2. Installing the Driver and Configuring the CLASSPATH

Once you have extracted the distribution archive, you can install the driver by placing `mysql-connector-java-[version]-bin.jar` in your classpath, either by adding the full path to it to your `CLASSPATH` environment variable, or by directly specifying it with the command line switch `-cp` when starting your JVM.

If you are going to use the driver with the JDBC DriverManager, you would use `com.mysql.jdbc.Driver` as the class that implements `java.sql.Driver`.

You can set the `CLASSPATH` environment variable under UNIX, Linux or Mac OS X either locally for a user within their `.profile`, `.login` or other login file. You can also set it globally by editing the global `/etc/profile` file.

For example, under a C shell (csh, tcsh) you would add the Connector/J driver to your `CLASSPATH` using the following:

```
shell> setenv CLASSPATH /path/mysql-connector-java-[ver]-bin.jar:$CLASSPATH
```

Or with a Bourne-compatible shell (sh, ksh, bash):

```
shell> export set CLASSPATH=/path/mysql-connector-java-[ver]-bin.jar:$CLASSPATH
```

Within Windows 2000, Windows XP, Windows Server 2003 and Windows Vista, you must set the environment variable through the System Control Panel.

If you want to use MySQL Connector/J with an application server such as GlassFish, Tomcat or JBoss, you will have to read your vendor's documentation for more information on how to configure third-party class libraries, as most application servers ignore the `CLASSPATH` environment variable. For configuration examples for some J2EE application servers, see [Section 24.4.5.2, "Using Connector/J with J2EE and Other Java Frameworks"](#). However, the authoritative source for JDBC connection pool configuration information for your particular application server is the documentation for that application server.

If you are developing servlets or JSPs, and your application server is J2EE-compliant, you can put the driver's .jar file in the `WEB-INF/lib` subdirectory of your webapp, as this is a standard location for third party class libraries in J2EE web applications.

You can also use the `MysqlDataSource` or `MysqlConnectionPoolDataSource` classes in the `com.mysql.jdbc.jdbc2.optional` package, if your J2EE application server supports or requires them. Starting with Connector/J 5.0.0, the `javax.sql.XADataSource` interface is implemented via the `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` class, which supports XA distributed transactions when used in combination with MySQL server version 5.0.

The various `MysqlDataSource` classes support the following parameters (through standard set mutators):

- user
- password
- serverName (see the previous section about fail-over hosts)
- databaseName
- port

24.4.2.3. Upgrading from an Older Version

MySQL AB tries to keep the upgrade process as easy as possible, however as is the case with any software, sometimes changes need to be made in new versions to support new features, improve existing functionality, or comply with new standards.

This section has information about what users who are upgrading from one version of Connector/J to another (or to a new version of the MySQL server, with respect to JDBC functionality) should be aware of.

24.4.2.3.1. Upgrading from MySQL Connector/J 3.0 to 3.1

Connector/J 3.1 is designed to be backward-compatible with Connector/J 3.0 as much as possible. Major changes are isolated to new functionality exposed in MySQL-4.1 and newer, which includes Unicode character sets, server-side prepared statements, SQL-State codes returned in error messages by the server and various performance enhancements that can be enabled or disabled via configuration properties.

- **Unicode Character Sets** — See the next section, as well as [Section 9.1, “Character Set Support”](#), for information on this new feature of MySQL. If you have something misconfigured, it will usually show up as an error with a message similar to `Illegal mix of collations`.
- **Server-side Prepared Statements** — Connector/J 3.1 will automatically detect and use server-side prepared statements when they are available (MySQL server version 4.1.0 and newer).

Starting with version 3.1.7, the driver scans SQL you are preparing via all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this feature by passing `emulateUnsupportedPstmts=false` in your JDBC URL.

If your application encounters issues with server-side prepared statements, you can revert to the older client-side emulated prepared statement code that is still presently used for MySQL servers older than 4.1.0 with the connection property `useServerPrepStmts=false`

- **Datetimes** with all-zero components (`0000-00-00 ...`) — These values can not be represented reliably in Java. Connector/J 3.0.x always converted them to NULL when being read from a `ResultSet`.

Connector/J 3.1 throws an exception by default when these values are encountered as this is the most correct behavior according to the JDBC and SQL standards. This behavior can be modified using the `zeroDateTimeBehavior` configuration property. The allowable values are:

- `exception` (the default), which throws an `SQLException` with an `SQLState` of `S1009`.
- `convertToNull`, which returns `NULL` instead of the date.
- `round`, which rounds the date to the nearest closest value which is `0001-01-01`.

Starting with Connector/J 3.1.7, `ResultSet.getString()` can be decoupled from this behavior via `noDatetimeStringSync=true` (the default value is `false`) so that you can retrieve the unaltered all-zero value as a `String`. It should be noted that this also precludes using any time zone conversions, therefore the driver will not allow you to enable `noDatetimeStringSync` and `useTimezone` at the same time.

- **New SQLState Codes** — Connector/J 3.1 uses SQL:1999 `SQLState` codes returned by the MySQL server (if supported), which are different from the legacy X/Open state codes that Connector/J 3.0 uses. If connected to a MySQL server older than MySQL-4.1.0 (the oldest version to return `SQLStates` as part of the error code), the driver will use a built-in mapping. You can revert to the old mapping by using the configuration property `useSqlStateCodes=false`.
- **`ResultSet.getString()`** — Calling `ResultSet.getString()` on a BLOB column will now return the address of the `byte[]` array that represents it, instead of a `String` representation of the BLOB. BLOBs have no character set, so they can't be converted to `java.lang.Strings` without data loss or corruption.

To store strings in MySQL with LOB behavior, use one of the `TEXT` types, which the driver will treat as a `java.sql.Clob`.

- **Debug builds** — Starting with Connector/J 3.1.8 a debug build of the driver in a file named `mysql-connector-java-[version]-bin-g.jar` is shipped alongside the normal binary jar file that is named `mysql-connector-java-[version]-bin.jar`.

Starting with Connector/J 3.1.9, we don't ship the `.class` files unbundled, they are only available in the JAR archives that ship with the driver.

You should not use the debug build of the driver unless instructed to do so when reporting a problem or bug to MySQL AB, as it is not designed to be run in production environments, and will have adverse performance impact when used. The debug binary also depends on the Aspect/J runtime library, which is located in the `src/lib/aspectjrt.jar` file that comes with the Connector/J distribution.

24.4.2.3.2. Upgrading to MySQL Connector/J 5.1.x

- In Connector/J 5.0.x and earlier, the alias for a table in a `SELECT` statement is returned when accessing the result set metadata

using `ResultSetMetaData.getColumnname()`. This behavior however is not JDBC compliant, and in Connector/J 5.1 this behavior was changed so that the original table name, rather than the alias, is returned.

The JDBC-compliant behavior is designed to let API users reconstruct the DML statement based on the metadata within `ResultSet` and `ResultSetMetaData`.

You can get the alias for a column in a result set by calling `ResultSetMetaData.getColumnLabel()`. If you want to use the old non-compliant behavior with `ResultSetMetaData.getColumnname()`, use the `useOldAliasMetadataBehavior` option and set the value to `true`.

In Connector/J 5.0.x the default value of `useOldAliasMetadataBehavior` was true, but in Connector/J 5.1 this was changed to a default value of false.

24.4.2.3.3. JDBC-Specific Issues When Upgrading to MySQL Server 4.1 or Newer

- *Using the UTF-8 Character Encoding* - Prior to MySQL server version 4.1, the UTF-8 character encoding was not supported by the server, however the JDBC driver could use it, allowing storage of multiple character sets in latin1 tables on the server.

Starting with MySQL-4.1, this functionality is deprecated. If you have applications that rely on this functionality, and can not upgrade them to use the official Unicode character support in MySQL server version 4.1 or newer, you should add the following property to your connection URL:

```
useOldUTF8Behavior=true
```

- *Server-side Prepared Statements* - Connector/J 3.1 will automatically detect and use server-side prepared statements when they are available (MySQL server version 4.1.0 and newer). If your application encounters issues with server-side prepared statements, you can revert to the older client-side emulated prepared statement code that is still presently used for MySQL servers older than 4.1.0 with the following connection property:

```
useServerPrepStmts=false
```

24.4.2.4. Installing from the Development Source Tree

Caution

You should read this section only if you are interested in helping us test our new code. If you just want to get MySQL Connector/J up and running on your system, you should use a standard binary release distribution.

To install MySQL Connector/J from the development source tree, make sure that you have the following prerequisites:

- Subversion, to check out the sources from our repository (available from <http://subversion.tigris.org/>).
- Apache Ant version 1.7 or newer (available from <http://ant.apache.org/>).
- JDK 1.4.2 or later. Although MySQL Connector/J can be used with older JDKs, to compile it from source you must have at least JDK 1.4.2. If you are building Connector/J 5.1 you will need JDK 1.6.x and an older JDK such as JDK 1.5.x. You will then need to point your JAVA_HOME environment variable at the older installation.

The Subversion source code repository for MySQL Connector/J is located at <http://svn.mysql.com/svnpublic/connector-j>. In general, you should not check out the entire repository because it contains every branch and tag for MySQL Connector/J and is quite large.

To check out and compile a specific branch of MySQL Connector/J, follow these steps:

1. Check out the latest code from the branch that you want with the following command (replacing `[major]` and `[minor]` with appropriate version numbers):

```
shell> svn co »
http://svn.mysql.com/svnpublic/connector-j/branches/branch_[major]_[minor] connector-j
```

This creates a `connector-j` subdirectory in the current directory that contains the latest sources for the requested branch.

2. If you are building Connector/J 5.1 make sure that you have both JDK 1.6.x installed and an older JDK such as JDK 1.5.x. This is because Connector/J supports both JDBC 3.0 (which was prior to JDK 1.6.x) and JDBC 4.0. Set your JAVA_HOME environment variable to the path of the older JDK installation.

3. Change location to the `connector-j` directory to make it your current working directory:

```
shell> cd connector-j
```

4. If you are building Connector/J 5.1 you need to edit the `build.xml` to reflect the location of your JDK 1.6.x installation. The lines that you need to change are:

```
<property name="com.mysql.jdbc.java6.javac" value="C:\jvms\jdk1.6.0\bin\javac.exe" />
<property name="com.mysql.jdbc.java6.rtar" value="C:\jvms\jdk1.6.0\jre\lib\rt.jar" />
```

Alternatively, you can set the value of these property names through the Ant `-D` option.

5. Issue the following command to compile the driver and create a `.jar` file suitable for installation:

```
shell> ant dist
```

This creates a `build` directory in the current directory, where all build output will go. A directory is created in the `build` directory that includes the version number of the sources you are building from. This directory contains the sources, compiled `.class` files, and a `.jar` file suitable for deployment. For other possible targets, including ones that will create a fully packaged distribution, issue the following command:

```
shell> ant -projecthelp
```

6. A newly created `.jar` file containing the JDBC driver will be placed in the directory `build/mysql-connector-java-[version]`.

Install the newly created JDBC driver as you would a binary `.jar` file that you download from MySQL by following the instructions in [Section 24.4.2.2, "Installing the Driver and Configuring the CLASSPATH"](#).

A package containing both the binary and source code for Connector/J 5.1 can also be found at the following location: [Connector/J 5.1 Download](#)

24.4.3. Connector/J Examples

Examples of using Connector/J are located throughout this document, this section provides a summary and links to these examples.

- [Example 24.1, "Obtaining a connection from the DriverManager"](#)
- [Example 24.2, "Using java.sql.Statement to execute a SELECT query"](#)
- [Example 24.3, "Stored Procedures"](#)
- [Example 24.4, "Using Connection.prepareStatement\(\)"](#)
- [Example 24.5, "Registering output parameters"](#)
- [Example 24.6, "Setting CallableStatement input parameters"](#)
- [Example 24.7, "Retrieving results and output parameter values"](#)
- [Example 24.8, "Retrieving AUTO_INCREMENT column values using Statement.getGeneratedKeys\(\)"](#)
- [Example 24.9, "Retrieving AUTO_INCREMENT column values using SELECT LAST_INSERT_ID\(\)"](#)
- [Example 24.10, "Retrieving AUTO_INCREMENT column values in Updatable ResultSets"](#)
- [Example 24.11, "Using a connection pool with a J2EE application server"](#)
- [Example 24.12, "Example of transaction with retry logic"](#)

24.4.4. Connector/J (JDBC) Reference

This section of the manual contains reference material for MySQL Connector/J, some of which is automatically generated during the Connector/J build process.

24.4.4.1. Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J

The name of the class that implements `java.sql.Driver` in MySQL Connector/J is `com.mysql.jdbc.Driver`. The `org.gjt.mm.mysql.Driver` class name is also usable to remain backward-compatible with MM.MySQL. You should use this class name when registering the driver, or when otherwise configuring software to use MySQL Connector/J.

The JDBC URL format for MySQL Connector/J is as follows, with items in square brackets ([,]) being optional:

```
jdbc:mysql://[host][, failoverhost...][:port]/[database] »
[?propertyName1]=propertyValue1[&propertyName2]=propertyValue2]...
```

If the hostname is not specified, it defaults to 127.0.0.1. If the port is not specified, it defaults to 3306, the default port number for MySQL servers.

```
jdbc:mysql://[host:port],[host:port].../[database] »
[?propertyName1]=propertyValue1[&propertyName2]=propertyValue2]...
```

If the database is not specified, the connection will be made with no default database. In this case, you will need to either call the `setCatalog()` method on the `Connection` instance or fully-specify table names using the database name (i.e. `SELECT dbname.tablename.colname FROM dbname.tablename...`) in your SQL. Not specifying the database to use upon connection is generally only useful when building tools that work with multiple databases, such as GUI database managers.

MySQL Connector/J has fail-over support. This allows the driver to fail-over to any number of slave hosts and still perform read-only queries. Fail-over only happens when the connection is in an `autoCommit(true)` state, because fail-over can not happen reliably when a transaction is in progress. Most application servers and connection pools set `autoCommit` to `true` at the end of every transaction/connection use.

The fail-over functionality has the following behavior:

- If the URL property `autoReconnect` is false: Failover only happens at connection initialization, and failback occurs when the driver determines that the first host has become available again.
- If the URL property `autoReconnect` is true: Failover happens when the driver determines that the connection has failed (before every query), and falls back to the first host when it determines that the host has become available again (after `queriesBeforeRetryMaster` queries have been issued).

In either case, whenever you are connected to a "failed-over" server, the connection will be set to read-only state, so queries that would modify data will have exceptions thrown (the query will **never** be processed by the MySQL server).

Configuration properties define how Connector/J will make a connection to a MySQL server. Unless otherwise noted, properties can be set for a `DataSource` object or for a `Connection` object.

Configuration Properties can be set in one of the following ways:

- Using the `set*()` methods on MySQL implementations of `java.sql.DataSource` (which is the preferred method when using implementations of `java.sql.DataSource`):
 - `com.mysql.jdbc.jdbc2.optional.MysqlDataSource`
 - `com.mysql.jdbc.jdbc2.optional.MysqlConnectionPoolDataSource`
- As a key/value pair in the `java.util.Properties` instance passed to `DriverManager.getConnection()` or `Driver.connect()`
- As a JDBC URL parameter in the URL given to `java.sql.DriverManager.getConnection()`, `java.sql.Driver.connect()` or the MySQL implementations of the `javax.sql.DataSource` `setURL()` method.

Note

If the mechanism you use to configure a JDBC URL is XML-based, you will need to use the XML character literal `&`; to separate configuration parameters, as the ampersand is a reserved character for XML.

The properties are listed in the following tables.

Connection/Authentication.

Property Name	Definition	Default Value	Since Version
user	The user to connect as		all versions
password	The password to use when connecting		all versions
socketFactory	The name of the class that the driver should use for creating socket connections to the server. This class must implement the interface 'com.mysql.jdbc.SocketFactory' and have public no-args constructor.	com.mysql.jdbc.StandardSocketFactory	3.0.3
connectTimeout	Timeout for socket connect (in milliseconds), with 0 being no timeout. Only works on JDK-1.4 or newer. Defaults to '0'.	0	3.0.1
socketTimeout	Timeout on network socket operations (0, the default means no timeout).	0	3.0.1
connectionLifecycleInterceptors	A comma-delimited list of classes that implement "com.mysql.jdbc.ConnectionLifecycleInterceptor" that should notified of connection lifecycle events (creation, destruction, commit, rollback, setCatalog and setAutoCommit) and potentially alter the execution of these commands. ConnectionLifecycleInterceptors are "stackable", more than one interceptor may be specified via the configuration property as a comma-delimited list, with the interceptors executed in order from left to right.		5.1.4
useConfigs	Load the comma-delimited list of configuration properties before parsing the URL or applying user-specified properties. These configurations are explained in the 'Configurations' of the documentation.		3.1.5
interactiveClient	Set the CLIENT_INTERACTIVE flag, which tells MySQL to timeout connections based on INTERACTIVE_TIMEOUT instead of WAIT_TIMEOUT	false	3.1.0
localSocketAddress	Hostname or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.		5.0.5
mysqlIOFactory	The name of the class which implements "com.mysql.jdbc.MySQLIO" for communicating with mysqld. (default is "com.mysql.jdbc.MySQLIOprotocol")	com.mysql.jdbc.MySQLIOprotocol	6.0.0
propertiesTransform	An implementation of com.mysql.jdbc.ConnectionPropertiesTransform that the driver will use to modify URL properties passed to the driver before attempting a connection		3.1.4
useCompression	Use zlib compression when communicating with the server (true/false)? Defaults to 'false'.	false	3.0.17

Networking.

Property Name	Definition	Default Value	Since Version
tcpKeepAlive	If connecting using TCP/IP, should the driver set SO_KEEPALIVE?	true	5.0.7
tcpNoDelay	If connecting using TCP/IP, should the driver set SO_TCP_NODELAY (disabling the Nagle Algorithm)?	true	5.0.7
tcpRcvBuf	If connecting using TCP/IP, should the driver set SO_RCV_BUF to the given value? The default value of '0', means use the platform default value for this property)	0	5.0.7
tcpSndBuf	If connecting using TCP/IP, should the driver set SO_SND_BUF to the given value? The default value of '0', means use the platform default value for this property)	0	5.0.7
tcpTrafficClass	If connecting using TCP/IP, should the driver set traffic class or type-of-service fields ?See the documentation for	0	5.0.7

	java.net.Socket.setTrafficClass() for more information.		
--	---	--	--

High Availability and Clustering.

Property Name	Definition	Default Value	Since Version
autoReconnect	Should the driver try to re-establish stale and/or dead connections? If enabled the driver will throw an exception for a queries issued on a stale or dead connection, which belong to the current transaction, but will attempt reconnect before the next query issued on the connection in a new transaction. The use of this feature is not recommended, because it has side effects related to session state and data consistency when applications don't handle SQLExceptions properly, and is only designed to be used when you are unable to configure your application to handle SQLExceptions resulting from dead and stale connections properly. Alternatively, investigate setting the MySQL server variable "wait_timeout" to some high value rather than the default of 8 hours.	false	1.1
autoReconnectForPools	Use a reconnection strategy appropriate for connection pools (defaults to 'false')	false	3.1.3
failOverReadOnly	When failing over in autoReconnect mode, should the connection be set to 'read-only'?	true	3.0.12
maxReconnects	Maximum number of reconnects to attempt if autoReconnect is true, default is '3'.	3	1.1
reconnectAtTxEnd	If autoReconnect is set to true, should the driver attempt reconnects at the end of every transaction?	false	3.0.10
initialTimeout	If autoReconnect is enabled, the initial time to wait between reconnect attempts (in seconds, defaults to '2').	2	1.1
roundRobinLoadBalance	When autoReconnect is enabled, and failoverReadOnly is false, should we pick hosts to connect to on a round-robin basis?	false	3.1.2
queriesBeforeRetryMaster	Number of queries to issue before falling back to master when failed over (when using multi-host failover). Whichever condition is met first, 'queriesBeforeRetryMaster' or 'secondsBeforeRetryMaster' will cause an attempt to be made to reconnect to the master. Defaults to 50.	50	3.0.2
secondsBeforeRetryMaster	How long should the driver wait, when failed over, before attempting	30	3.0.2
selfDestructOnPingMaxOperations	=If set to a non-zero value, the driver will report close the connection and report failure when Connection.ping() or Connection.isValid(int) is called if the connection's count of commands sent to the server exceeds this value.	0	5.1.6
selfDestructOnPingSecondsLifetime	If set to a non-zero value, the driver will report close the connection and report failure when Connection.ping() or Connection.isValid(int) is called if the connection's lifetime exceeds this value.	0	5.1.6
resourceId	A globally unique name that identifies the resource that this datasource or connection is connected to, used for XAResource.isSameRM() when the driver can't determine this value based on hostnames used in the URL		5.0.1

Security.

Property Name	Definition	Default Value	Since Version
allowMultiQueries	Allow the use of ';' to delimit multiple queries during one statement (true/false), defaults to 'false'	false	3.1.1
useSSL	Use SSL when communicating with the server (true/false), defaults to 'false'	false	3.0.2
requireSSL	Require SSL connection if useSSL=true? (defaults to 'false').	false	3.1.0

verifyServerCertificate	If "useSSL" is set to "true", should the driver verify the server's certificate? When using this feature, the keystore parameters should be specified by the "clientCertificateKeyStore*" properties, rather than system properties.	true	5.1.6
clientCertificateKeyStoreUrl	URL to the client certificate KeyStore (if not specified, use defaults)		5.1.0
clientCertificateKeyStoreType	KeyStore type for client certificates (NULL or empty means use default, standard keystore types supported by the JVM are "JKS" and "PKCS12", your environment may have more available depending on what security products are installed and available to the JVM.		5.1.0
clientCertificateKeyStorePassword	Password for the client certificates KeyStore		5.1.0
trustCertificateKeyStoreUrl	URL to the trusted root certificate KeyStore (if not specified, use defaults)		5.1.0
trustCertificateKeyStoreType	KeyStore type for trusted root certificates (NULL or empty means use default, standard keystore types supported by the JVM are "JKS" and "PKCS12", your environment may have more available depending on what security products are installed and available to the JVM.		5.1.0
trustCertificateKeyStorePassword	Password for the trusted root certificates KeyStore		5.1.0
allowLoadLocalInfile	Should the driver allow use of 'LOAD DATA LOCAL INFILE...' (defaults to 'true').	true	3.0.3
allowUrlInLocalInfile	Should the driver allow URLs in 'LOAD DATA LOCAL INFILE' statements?	false	3.1.4
paranoid	Take measures to prevent exposure sensitive information in error messages and clear data structures holding sensitive data when possible? (defaults to 'false')	false	3.0.1

Performance Extensions.

Property Name	Definition	Default Value	Since Version
callableStmtCacheSize	If 'cacheCallableStmts' is enabled, how many callable statements should be cached?	100	3.1.2
metadataCacheSize	The number of queries to cache ResultSetMetadata for if cacheResultSetMetaData is set to 'true' (default 50)	50	3.1.1
prepStmtCacheSize	If prepared statement caching is enabled, how many prepared statements should be cached?	25	3.0.10
prepStmtCacheSqlLimit	If prepared statement caching is enabled, what's the largest SQL the driver will cache the parsing for?	256	3.0.10
alwaysSendSetIsolation	Should the driver always communicate with the database when Connection.setTransactionIsolation() is called? If set to false, the driver will only communicate with the database when the requested transaction isolation is different than the whichever is newer, the last value that was set via Connection.setTransactionIsolation(), or the value that was read from the server when the connection was established.	true	3.1.7
maintainTimeStats	Should the driver maintain various internal timers to enable idle time calculations as well as more verbose error messages when the connection to the server fails? Setting this property to false removes at least two calls to System.getCurrentTimeMillis() per query.	true	3.1.9
useCursorFetch	If connected to MySQL > 5.0.2, and setFetchSize() > 0 on a statement, should that statement use cursor-based fetching to retrieve rows?	false	5.0.0
blobSendChunkSize	Chunk to use when sending BLOB/CLOBs via ServerPreparedStatements	1048576	3.1.9
cacheCallableStmts	Should the driver cache the parsing stage of CallableStatements	false	3.1.2
cachePrepStmts	Should the driver cache the parsing stage of PreparedStatements of client-side prepared statements, the "check" for suitability of	false	3.0.10

	server-side prepared and server-side prepared statements themselves?		
cacheResultSetMetadata	Should the driver cache ResultSetMetaData for Statements and PreparedStatements? (Req. JDK-1.4+, true/false, default 'false')	false	3.1.1
cacheServerConfiguration	Should the driver cache the results of 'SHOW VARIABLES' and 'SHOW COLLATION' on a per-URL basis?	false	3.1.5
defaultFetchSize	The driver will call setFetchSize(n) with this value on all newly-created Statements	0	3.1.9
dontTrackOpenResources	The JDBC specification requires the driver to automatically track and close resources, however if your application doesn't do a good job of explicitly calling close() on statements or result sets, this can cause memory leakage. Setting this property to true relaxes this constraint, and can be more memory efficient for some applications.	false	3.1.7
dynamicCalendars	Should the driver retrieve the default calendar when required, or cache it per connection/session?	false	3.1.5
elideSetAutoCommits	If using MySQL-4.1 or newer, should the driver only issue 'set autocommit=n' queries when the server's state doesn't match the requested state by Connection.setAutoCommit(boolean)?	false	3.1.3
enableQueryTimeouts	When enabled, query timeouts set via Statement.setQueryTimeout() use a shared java.util.Timer instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the TimerTask for the given timeout which won't be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality.	true	5.0.6
holdResultsOpenOverStatementClose	Should the driver close result sets on Statement.close() as required by the JDBC specification?	false	3.1.7
largeRowSizeThreshold	What size result set row should the JDBC driver consider "large", and thus use a more memory-efficient way of representing the row internally?	2048	5.1.1
loadBalanceStrategy	If using a load-balanced connection to connect to SQL nodes in a MySQL Cluster/NDB configuration (by using the URL prefix "jdbc:mysql:loadbalance://"), which load balancing algorithm should the driver use: (1) "random" - the driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload. (2) "bestResponseTime" - the driver will route the request to the host that had the best response time for the previous transaction.	random	5.0.6
locatorFetchBufferSize	If 'emulateLocators' is configured to 'true', what size buffer should be used when fetching BLOB data for getBinaryInputStream?	1048576	3.2.1
rewriteBatchedStatements	Should the driver use multiqueries (irregardless of the setting of "allowMultiQueries") as well as rewriting of prepared statements for INSERT into multi-value inserts when executeBatch() is called? Notice that this has the potential for SQL injection if using plain java.sql.Statements and your code doesn't sanitize input correctly. Notice that for prepared statements, server-side prepared statements can not currently take advantage of this rewrite option, and that if you don't specify stream lengths when using PreparedStatement.set*Stream(), the driver won't be able to determine the optimum number of parameters per batch and you might receive an error from the driver that the resultant packet is too large. Statement.getGeneratedKeys() for these rewritten statements only works when the entire batch includes INSERT statements.	false	3.1.13
useDirectRowUnpack	Use newer result set row unpacking code that skips a copy from network buffers to a MySQL packet instance and instead reads directly into the result set row data buffers.	true	5.1.1

useDynamicCharsetInfo	Should the driver use a per-connection cache of character set information queried from the server when necessary, or use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver?	true	5.0.6
useFastDateParsing	Use internal String->Date/Time/Timestamp conversion routines to avoid excessive object creation?	true	5.0.5
useFastIntParsing	Use internal String->Integer conversion routines to avoid excessive object creation?	true	3.1.4
useJvmCharsetConverters	Always use the character encoding routines built into the JVM, rather than using lookup tables for single-byte character sets?	false	5.0.1
useLocalSessionState	Should the driver refer to the internal values of autocommit and transaction isolation that are set by Connection.setAutoCommit() and Connection.setTransactionIsolation() and transaction state as maintained by the protocol, rather than querying the database or blindly sending commands to the database for commit() or rollback() method calls?	false	3.1.7
useReadAheadInput	Use newer, optimized non-blocking, buffered input stream when reading from the server?	true	3.1.5

Debugging/Profiling.

Property Name	Definition	Default Value	Since Version
logger	The name of a class that implements "com.mysql.jdbc.log.Log" that will be used to log messages to. (default is "com.mysql.jdbc.log.StandardLogger", which logs to STDERR)	com.mysql.jdbc.log.StandardLogger	3.1.1
gatherPerfMetrics	Should the driver gather performance metrics, and report them via the configured logger every 'reportMetricsIntervalMillis' milliseconds?	false	3.1.2
profileSQL	Trace queries and their execution/fetch times to the configured logger (true/false) defaults to 'false'	false	3.1.0
profileSql	Deprecated, use 'profileSQL' instead. Trace queries and their execution/fetch times on STDERR (true/false) defaults to 'false'		2.0.14
reportMetricsIntervalMillis	If 'gatherPerfMetrics' is enabled, how often should they be logged (in ms)?	30000	3.1.2
maxQuerySizeToLog	Controls the maximum length/size of a query that will get logged when profiling or tracing	2048	3.1.3
packetDebugBufferSize	The maximum number of packets to retain when 'enablePacket-Debug' is true	20	3.1.3
slowQueryThresholdMillis	If 'logSlowQueries' is enabled, how long should a query (in ms) before it is logged as 'slow'?	2000	3.1.2
slowQueryThresholdNanos	If 'useNanosForElapsedTime' is set to true, and this property is set to a non-zero value, the driver will use this threshold (in nanosecond units) to determine if a query was slow.	0	5.0.7
useUsageAdvisor	Should the driver issue 'usage' warnings advising proper and efficient usage of JDBC and MySQL Connector/J to the log (true/false, defaults to 'false')?	false	3.1.1
autoGenerateTestcaseScript	Should the driver dump the SQL it is executing, including server-side prepared statements to STDERR?	false	3.1.9
autoSlowLog	Instead of using slowQueryThreshold* to determine if a query is slow enough to be logged, maintain statistics that allow the driver to determine queries that are outside the 99th percentile?	true	5.1.4
clientInfoProvider	The name of a class that implements the com.mysql.jdbc.JDBC4ClientInfoProvider interface in order to support JDBC-4.0's Connection.getClientInfo() methods	com.mysql.jdbc.JDBC4ClientInfoProvider	5.1.0

		vider	
dumpMetadataOnColumnNotFound	Should the driver dump the field-level metadata of a result set into the exception message when <code>ResultSet.findColumn()</code> fails?	false	3.1.13
dumpQueriesOnException	Should the driver dump the contents of the query sent to the server in the message for <code>SQLExceptions</code> ?	false	3.1.3
enablePacketDebug	When enabled, a ring-buffer of 'packetDebugBufferSize' packets will be kept, and dumped when exceptions are thrown in key areas in the driver's code	false	3.1.3
explainSlowQueries	If 'logSlowQueries' is enabled, should the driver automatically issue an 'EXPLAIN' on the server and send the results to the configured log at a WARN level?	false	3.1.2
includeInnoDBStatusInDeadlockExceptions	Include the output of "SHOW ENGINE INNODB STATUS" in exception messages when deadlock exceptions are detected?	false	5.0.7
logSlowQueries	Should queries that take longer than 'slowQueryThresholdMillis' be logged?	false	3.1.2
logXACommands	Should the driver log XA commands sent by <code>MySQLXAConnection</code> to the server, at the DEBUG level of logging?	false	5.0.5
profilerEventHandler	Name of a class that implements the interface <code>com.mysql.jdbc.profiler.ProfilerEventHandler</code> that will be used to handle profiling/tracing events.	<code>com.mysql.jdbc.profiler.LoggingProfilerEventHandler</code>	5.1.6
resultSetSizeThreshold	If the usage advisor is enabled, how many rows should a result set contain before the driver warns that it is suspiciously large?	100	5.0.5
traceProtocol	Should trace-level network protocol be logged?	false	3.1.2
useNanosForElapsedTime	For profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (JDK >= 1.5)?	false	5.0.7

Miscellaneous.

Property Name	Definition	Default Value	Since Version
useUnicode	Should the driver use Unicode character encodings when handling strings? Should only be used when the driver can't determine the character set mapping, or you are trying to 'force' the driver to use a character set that MySQL either doesn't natively support (such as UTF-8), true/false, defaults to 'true'	true	1.1g
characterEncoding	If 'useUnicode' is set to true, what character encoding should the driver use when dealing with strings? (defaults is to 'autodetect')		1.1g
characterSetResults	Character set to tell the server to return results as.		3.0.13
connectionCollation	If set, tells the server to use this collation via 'set collation_connection'		3.0.13
useBlobToStoreUTF8OutsideBMP	Tells the driver to treat [MEDIUM/LONG]BLOB columns as [LONG]VARCHAR columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server can't handle natively.	false	5.1.3
utf8OutsideBmpExcludedColumnNamePattern	When "useBlobToStoreUTF8OutsideBMP" is set to "true", column names matching the given regex will still be treated as BLOBs unless they match the regex specified for "utf8OutsideBmpIncludedColumnNamePattern". The regex must follow the patterns used for the <code>java.util.regex</code> package.		5.1.3
utf8OutsideBmpIncludedColumnNamePattern	Used to specify exclusion rules to "utf8OutsideBmpExcludedColumnNamePattern". The regex must follow the patterns used for the <code>java.util.regex</code> package.		5.1.3
sessionVariables	A comma-separated list of name/value pairs to be sent as SET SESSION ... to the server when the driver connects.		3.1.8

allowNaNAndInf	Should the driver allow NaN or +/- INF values in PreparedStatement.setDouble()?	false	3.1.5
autoClosePstmtStreams	Should the driver automatically call .close() on streams/readers passed as arguments via set*() methods?	false	3.1.12
autoDeserialize	Should the driver automatically detect and de-serialize objects stored in BLOB fields?	false	3.1.5
blobsAreStrings	Should the driver always treat BLOBs as Strings - specifically to work around dubious metadata returned by the server for GROUP BY clauses?	false	5.0.8
capitalizeTypeNames	Capitalize type names in DatabaseMetaData? (usually only useful when using WebObjects, true/false, defaults to 'false')	true	2.0.7
clobCharacterEncoding	The character encoding to use for sending and retrieving TEXT, MEDIUMTEXT and LONGTEXT values instead of the configured connection characterEncoding		5.0.0
clobberStreamingResults	This will cause a 'streaming' ResultSet to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server.	false	3.0.9
continueBatchOnError	Should the driver continue processing batch commands if one statement fails. The JDBC spec allows either way (defaults to 'true').	true	3.0.3
createDatabaseIfNotExist	Creates the database given in the URL if it doesn't yet exist. Assumes the configured user has permissions to create databases.	false	3.1.9
emptyStringsConvertToZero	Should the driver allow conversions from empty string fields to numeric values of '0'?	true	3.1.8
emulateLocators	Should the driver emulate java.sql.Blobs with locators? With this feature enabled, the driver will delay loading the actual Blob data until the one of the retrieval methods (getInputStream(), getBytes(), and so forth) on the blob data stream has been accessed. For this to work, you must use a column alias with the value of the column to the actual name of the Blob. The feature also has the following restrictions: The SELECT that created the result set must reference only one table, the table must have a primary key; the SELECT must alias the original blob column name, specified as a string, to an alternate name; the SELECT must cover all columns that make up the primary key.	false	3.1.0
emulateUnsupportedPstmts	Should the driver detect prepared statements that are not supported by the server, and replace them with client-side emulated versions?	true	3.1.7
functionsNeverReturnBlobs	Should the driver always treat data from functions returning BLOBs as Strings - specifically to work around dubious metadata returned by the server for GROUP BY clauses?	false	5.0.8
generateSimpleParameterMetadata	Should the driver generate simplified parameter metadata for PreparedStatements when no metadata is available either because the server couldn't support preparing the statement, or server-side prepared statements are disabled?	false	5.0.5
ignoreNonTxTables	Ignore non-transactional table warning for rollback? (defaults to 'false').	false	3.0.9
jdbcCompliantTruncation	Should the driver throw java.sql.DataTruncation exceptions when data is truncated as is required by the JDBC specification when connected to a server that supports warnings (MySQL 4.1.0 and newer)? This property has no effect if the server sql-mode includes STRICT_TRANS_TABLES.	true	3.1.2
maxRows	The maximum number of rows to return (0, the default means return all rows).	-1	all versions
netTimeoutForStreamingResults	What value should the driver automatically set the server setting 'net_write_timeout' to when the streaming result sets feature is in use? (value has unit of seconds, the value '0' means the driver will not try and adjust this value)	600	5.1.0
noAccessToProcedureBodies	When determining procedure parameter types for CallableState-	false	5.0.3

	ments, and the connected user can't access procedure bodies through "SHOW CREATE PROCEDURE" or select on mysql.proc should the driver instead create basic metadata (all parameters reported as IN VARCHARs, but allowing registerOutParameter() to be called on them anyway) instead of throwing an exception?		
noDatetimeStringSync	Don't ensure that ResultSet.getDatetimeType().toString().equals(ResultSet.getString())	false	3.1.7
noTimezoneConversionForTimeType	Don't convert TIME values using the server timezone if 'useTimezone'='true'	false	5.0.0
nullCatalogMeansCurrent	When DatabaseMetadataMethods ask for a 'catalog' parameter, does the value null mean use the current catalog? (this is not JDBC-compliant, but follows legacy behavior from earlier versions of the driver)	true	3.1.8
nullNamePatternMatchesAll	Should DatabaseMetaMethods that accept *pattern parameters treat null the same as '%' (this is not JDBC-compliant, however older versions of the driver accepted this departure from the specification)	true	3.1.8
overrideSupportsIntegrityEnhancementFacility	Should the driver return "true" for DatabaseMetaMethods.supportsIntegrityEnhancementFacility() even if the database doesn't support it to workaround applications that require this method to return "true" to signal support of foreign keys, even though the SQL specification states that this facility contains much more than just foreign key support (one such application being OpenOffice)?	false	3.1.12
padCharsWithSpace	If a result set column has the CHAR type and the value does not fill the amount of characters specified in the DDL for the column, should the driver pad the remaining characters with space (for ANSI compliance)?	false	5.0.6
pedantic	Follow the JDBC spec to the letter.	false	3.0.0
pinGlobalTxToPhysicalConnection	When using XAConnections, should the driver ensure that operations on a given XID are always routed to the same physical connection? This allows the XAConnection to support "XA START ... JOIN" after "XA END" has been called	false	5.0.1
populateInsertRowWithDefaultValues	When using ResultSets that are CONCUR_UPDATABLE, should the driver pre-populate the "insert" row with default values from the DDL for the table used in the query so those values are immediately available for ResultSet accessors? This functionality requires a call to the database for metadata each time a result set of this type is created. If disabled (the default), the default values will be populated by the an internal call to refreshRow() which pulls back default values and/or values changed by triggers.	false	5.0.5
processEscapeCodesForPrepStmts	Should the driver process escape codes in queries that are prepared?	true	3.1.12
relaxAutoCommit	If the version of MySQL the driver connects to does not support transactions, still allow calls to commit(), rollback() and setAutoCommit() (true/false, defaults to 'false')?	false	2.0.13
retainStatementAfterResultSetClose	Should the driver retain the Statement reference in a ResultSet after ResultSet.close() has been called. This is not JDBC-compliant after JDBC-4.0.	false	3.1.11
rollbackOnPooledClose	Should the driver issue a rollback() when the logical connection in a pool is closed?	true	3.0.15
runningCTS13	Enables workarounds for bugs in Sun's JDBC compliance test-suite version 1.3	false	3.1.7
serverTimezone	Override detection/mapping of timezone. Used when timezone from server doesn't map to Java timezone		3.0.2
statementInterceptors	A comma-delimited list of classes that implement "com.mysql.jdbc.StatementInterceptor" that should be placed "in between" query execution to influence the results. StatementInterceptors are "chainable", the results returned by the "current" interceptor will be passed on to the next in in the chain,		5.1.1

	from left-to-right order, as specified in this property.		
strictFloatingPoint	Used only in older versions of compliance test	false	3.0.0
strictUpdates	Should the driver do strict checking (all primary keys selected) of updatable result sets (true, false, defaults to 'true')?	true	3.0.4
tinyIntIsBit	Should the driver treat the datatype TINYINT(1) as the BIT type (because the server silently converts BIT -> TINYINT(1) when creating tables)?	true	3.0.16
transformedBitsIsBoolean	If the driver converts TINYINT(1) to a different type, should it use BOOLEAN instead of BIT for future compatibility with MySQL-5.0, as MySQL-5.0 has a BIT type?	false	3.1.9
treatUtilDateAsTimestamp	Should the driver treat java.util.Date as a TIMESTAMP for the purposes of PreparedStatement.setObject()?	true	5.0.5
ultraDevHack	Create PreparedStatements for prepareCall() when required, because UltraDev is broken and issues a prepareCall() for <code>_all_</code> statements? (true/false, defaults to 'false')	false	2.0.3
useGmtMillisForDatetimes	Convert between session timezone and GMT before creating Date and Timestamp instances (value of "false" is legacy behavior, "true" leads to more JDBC-compliant behavior.	false	3.1.12
useHostsInPrivileges	Add '@hostname' to users in Database-MetaData.getColumn/TablePrivileges() (true/false), defaults to 'true'.	true	3.0.2
useInformationSchema	When connected to MySQL-5.0.7 or newer, should the driver use the INFORMATION_SCHEMA to derive information used by DatabaseMetaData?	false	5.0.0
useJDBCCompliantTimezoneShift	Should the driver use JDBC-compliant rules when converting TIME/TIMESTAMP/DATETIME values' timezone information for those JDBC arguments which take a java.util.Calendar argument? (Notice that this option is exclusive of the "use-Timezone=true" configuration option.)	false	5.0.0
useLegacyDatetimeCode	Use code for DATE/TIME/DATETIME/TIMESTAMP handling in result sets and statements that consistently handles timezone conversions from client to server and back again, or use the legacy code for these datatypes that has been in the driver for backwards-compatibility?	true	5.1.6
useOldAliasMetadataBehavior	Should the driver use the legacy behavior for "AS" clauses on columns and tables, and only return aliases (if any) for ResultSetMetaData.getColumnname() or ResultSetMetaData.getTable_name() rather than the original column/table name? In 5.0.x, the default value was true.	false	5.0.4
useOldUTF8Behavior	Use the UTF-8 behavior the driver did when communicating with 4.0 and older servers	false	3.1.6
useOnlyServerErrorMessages	Don't prepend 'standard' SQLState error messages to error messages returned by the server.	true	3.0.15
useSSPSCompatibleTimezoneShift	If migrating from an environment that was using server-side prepared statements, and the configuration property "useJDBCCompliantTimeZoneShift" set to "true", use compatible behavior when not using server-side prepared statements when sending TIMESTAMP values to the MySQL server.	false	5.0.5
useServerPrepStmts	Use server-side prepared statements if the server supports them?	false	3.1.0
useSqlStateCodes	Use SQL Standard state codes instead of 'legacy' X/Open/SQL state codes (true/false), default is 'true'	true	3.1.3
useStreamLengthsInPrepStmts	Honor stream length parameter in PreparedStatement/ResultSet.setXXXStream() method calls (true/false, defaults to 'true')?	true	3.0.2
useTimezone	Convert time/date types between client and server timezones (true/false, defaults to 'false')?	false	3.0.2
useUnbufferedInput	Don't use BufferedInputStream for reading data from the server	true	3.0.11
yearIsDateType	Should the JDBC driver treat the MySQL type "YEAR" as a java.sql.Date, or as a SHORT?	true	3.1.9
zeroDateTimeBehavior	What should happen when the driver encounters DATETIME values that are composed entirely of zeroes (used by MySQL to	exception	3.1.4

	represent invalid dates)? Valid values are "exception", "round" and "convertToNull".		
--	--	--	--

Connector/J also supports access to MySQL via named pipes on Windows NT/2000/XP using the `NamedPipeSocketFactory` as a plugin-socket factory via the `socketFactory` property. If you don't use a `namedPipePath` property, the default of `\\.\pipe\MySQL` will be used. If you use the `NamedPipeSocketFactory`, the hostname and port number values in the JDBC url will be ignored. You can enable this feature using:

```
socketFactory=com.mysql.jdbc.NamedPipeSocketFactory
```

Named pipes only work when connecting to a MySQL server on the same physical machine as the one the JDBC driver is being used on. In simple performance tests, it appears that named pipe access is between 30%-50% faster than the standard TCP/IP access. However, this varies per system, and named pipes are slower than TCP/IP in many Windows configurations.

You can create your own socket factories by following the example code in `com.mysql.jdbc.NamedPipeSocketFactory`, or `com.mysql.jdbc.StandardSocketFactory`.

24.4.4.2. JDBC API Implementation Notes

MySQL Connector/J passes all of the tests in the publicly-available version of Sun's JDBC compliance test suite. However, in many places the JDBC specification is vague about how certain functionality should be implemented, or the specification allows leeway in implementation.

This section gives details on a interface-by-interface level about how certain implementation decisions may affect how you use MySQL Connector/J.

- **Blob**

Starting with Connector/J version 3.1.0, you can emulate Blobs with locators by adding the property `'emulateLocators=true'` to your JDBC URL. Using this method, the driver will delay loading the actual Blob data until you retrieve the other data and then use retrieval methods (`getInputStream()`, `getBytes()`, and so forth) on the blob data stream.

For this to work, you must use a column alias with the value of the column to the actual name of the Blob, for example:

```
SELECT id, 'data' as blob_data from blobtable
```

For this to work, you must also follow these rules:

- The `SELECT` must also reference only one table, the table must have a primary key.
- The `SELECT` must alias the original blob column name, specified as a string, to an alternate name.
- The `SELECT` must cover all columns that make up the primary key.

The Blob implementation does not allow in-place modification (they are copies, as reported by the `DatabaseMetaData.locatorsUpdateCopies()` method). Because of this, you should use the corresponding `PreparedStatement.setBlob()` or `ResultSet.updateBlob()` (in the case of updatable result sets) methods to save changes back to the database.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about type conversion in the Knowledge Base article, [Type Conversions Supported by MySQL Connector/J](http://www.mysql.com/products/enterprise/advisors.html). To subscribe to MySQL Enterprise see <http://www.mysql.com/products/enterprise/advisors.html>.

- **CallableStatement**

Starting with Connector/J 3.1.1, stored procedures are supported when connecting to MySQL version 5.0 or newer via the `CallableStatement` interface. Currently, the `getParameterMetaData()` method of `CallableStatement` is not supported.

- **Clob**

The Clob implementation does not allow in-place modification (they are copies, as reported by the `DatabaseMetaData.locatorsUpdateCopies()` method). Because of this, you should use the `PreparedStatement.setClob()` method to save changes back to the database. The JDBC API does not have a `ResultSet.updateClob()` method.

- **Connection**

Unlike older versions of MM.MySQL the `isClosed()` method does not ping the server to determine if it is alive. In accordance with the JDBC specification, it only returns true if `closed()` has been called on the connection. If you need to determine if the connection is still valid, you should issue a simple query, such as `SELECT 1`. The driver will throw an exception if the connection is no longer valid.

- **DatabaseMetaData**

Foreign Key information (`getImportedKeys()/getExportedKeys()` and `getCrossReference()`) is only available from InnoDB tables. However, the driver uses `SHOW CREATE TABLE` to retrieve this information, so when other storage engines support foreign keys, the driver will transparently support them as well.

- **PreparedStatement**

PreparedStatements are implemented by the driver, as MySQL does not have a prepared statement feature. Because of this, the driver does not implement `getParameterMetaData()` or `getMetaData()` as it would require the driver to have a complete SQL parser in the client.

Starting with version 3.1.0 MySQL Connector/J, server-side prepared statements and binary-encoded result sets are used when the server supports them.

Take care when using a server-side prepared statement with **large** parameters that are set via `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()`, `setBlob()`, or `setClob()`. If you want to re-execute the statement with any large parameter changed to a non-large parameter, it is necessary to call `clearParameters()` and set all parameters again. The reason for this is as follows:

- During both server-side prepared statements and client-side emulation, large data is exchanged only when `PreparedStatement.execute()` is called.
- Once that has been done, the stream used to read the data on the client side is closed (as per the JDBC spec), and can't be read from again.
- If a parameter changes from large to non-large, the driver must reset the server-side state of the prepared statement to allow the parameter that is being changed to take the place of the prior large value. This removes all of the large data that has already been sent to the server, thus requiring the data to be re-sent, via the `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()`, `setBlob()` or `setClob()` methods.

Consequently, if you want to change the type of a parameter to a non-large one, you must call `clearParameters()` and set all parameters of the prepared statement again before it can be re-executed.

- **ResultSet**

By default, ResultSets are completely retrieved and stored in memory. In most cases this is the most efficient way to operate, and due to the design of the MySQL network protocol is easier to implement. If you are working with ResultSets that have a large number of rows or large values, and can not allocate heap space in your JVM for the memory required, you can tell the driver to stream the results back one row at a time.

To enable this functionality, you need to create a Statement instance in the following manner:

```
stmt = conn.createStatement( java.sql.ResultSet.TYPE_FORWARD_ONLY,
                             java.sql.ResultSet.CONCUR_READ_ONLY );
stmt.setFetchSize( Integer.MIN_VALUE );
```

The combination of a forward-only, read-only result set, with a fetch size of `Integer.MIN_VALUE` serves as a signal to the driver to stream result sets row-by-row. After this any result sets created with the statement will be retrieved row-by-row.

There are some caveats with this approach. You will have to read all of the rows in the result set (or close it) before you can issue any other queries on the connection, or an exception will be thrown.

The earliest the locks these statements hold can be released (whether they be `MyISAM` table-level locks or row-level locks in some other storage engine such as `InnoDB`) is when the statement completes.

If the statement is within scope of a transaction, then locks are released when the transaction completes (which implies that the statement needs to complete first). As with most other databases, statements are not complete until all the results pending on the statement are read or the active result set for the statement is closed.

Therefore, if using streaming results, you should process them as quickly as possible if you want to maintain concurrent access to the tables referenced by the statement producing the result set.

- **ResultSetMetaData**

The `isAutoIncrement()` method only works when using MySQL servers 4.0 and newer.

- **Statement**

When using versions of the JDBC driver earlier than 3.2.1, and connected to server versions earlier than 5.0.3, the `setFetchSize()` method has no effect, other than to toggle result set streaming as described above.

Connector/J 5.0.0 and later include support for both `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL 5.0.0 or newer server, and require a separate connection to issue the `KILL QUERY` statement. In the case of `setQueryTimeout()`, the implementation creates an additional thread to handle the timeout functionality.

Note

Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeException` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead.

MySQL does not support SQL cursors, and the JDBC driver doesn't emulate them, so "setCursorName()" has no effect.

Connector/J 5.1.3 and later include two additional methods:

- `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.

- `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.

This method returns `NULL` if no such stream has been set via `setLocalInfileInputStream()`.

24.4.4.3. Java, JDBC and MySQL Types

MySQL Connector/J is flexible in the way it handles conversions between MySQL data types and Java data types.

In general, any MySQL data type can be converted to a `java.lang.String`, and any numerical type can be converted to any of the Java numerical types, although round-off, overflow, or loss of precision may occur.

Starting with Connector/J 3.1.0, the JDBC driver will issue warnings or throw `DataTruncation` exceptions as is required by the JDBC specification unless the connection was configured not to do so by using the property `jdbcCompliantTruncation` and setting it to `false`.

The conversions that are always guaranteed to work are listed in the following table:

Connection Properties - Miscellaneous.

These MySQL Data Types	Can always be converted to these Java types
<code>CHAR</code> , <code>VARCHAR</code> , <code>BLOB</code> , <code>TEXT</code> , <code>ENUM</code> , and <code>SET</code>	<code>java.lang.String</code> , <code>java.io.InputStream</code> , <code>java.io.Reader</code> , <code>java.sql.Blob</code> , <code>java.sql.Clob</code>
<code>FLOAT</code> , <code>REAL</code> , <code>DOUBLE PRECISION</code> , <code>NUMERIC</code> , <code>DECIMAL</code> , <code>TINYINT</code> , <code>SMALLINT</code> , <code>MEDIUMINT</code> , <code>INTEGER</code> , <code>BIGINT</code>	<code>java.lang.String</code> , <code>java.lang.Short</code> , <code>java.lang.Integer</code> , <code>java.lang.Long</code> , <code>java.lang.Double</code> , <code>java.math.BigDecimal</code>
<code>DATE</code> , <code>TIME</code> , <code>DATETIME</code> , <code>TIMESTAMP</code>	<code>java.lang.String</code> , <code>java.sql.Date</code> , <code>java.sql.Timestamp</code>

Note

Round-off, overflow or loss of precision may occur if you choose a Java numeric data type that has less precision or capacity than the MySQL data type you are converting to/from.

The `ResultSet.getObject()` method uses the type conversions between MySQL and Java types, following the JDBC specification where appropriate. The value returned by `ResultSetMetaData.getColumnClassName()` is also shown below. For more information on the `java.sql.Types` classes see [Java 2 Platform Types](#).

MySQL Types to Java Types for `ResultSet.getObject()`.

MySQL Type Name	Return value of <code>getColumnClassName</code>	Returned as Java Class
BIT(1) (new in MySQL-5.0)	BIT	<code>java.lang.Boolean</code>
BIT(> 1) (new in MySQL-5.0)	BIT	<code>byte[]</code>
TINYINT	TINYINT	<code>java.lang.Boolean</code> if the configuration property <code>tinyIntIsBit</code> is set to <code>true</code> (the default) and the storage size is 1, or <code>java.lang.Integer</code> if not.
BOOL, BOOLEAN	TINYINT	See TINYINT, above as these are aliases for TINYINT(1), currently.
SMALLINT[(M)] [UNSIGNED]	SMALLINT [UNSIGNED]	<code>java.lang.Integer</code> (regardless if UNSIGNED or not)
MEDIUMINT[(M)] [UNSIGNED]	MEDIUMINT [UNSIGNED]	<code>java.lang.Integer</code> , if UNSIGNED <code>java.lang.Long</code> (C/J 3.1 and earlier), or <code>java.lang.Integer</code> for C/J 5.0 and later
INT,INTEGER[(M)] [UNSIGNED]	INTEGER [UNSIGNED]	<code>java.lang.Integer</code> , if UNSIGNED <code>java.lang.Long</code>
BIGINT[(M)] [UNSIGNED]	BIGINT [UNSIGNED]	<code>java.lang.Long</code> , if UNSIGNED <code>java.math.BigInteger</code>
FLOAT[(M,D)]	FLOAT	<code>java.lang.Float</code>
DOUBLE[(M,B)]	DOUBLE	<code>java.lang.Double</code>
DECIMAL[(M[,D])]	DECIMAL	<code>java.math.BigDecimal</code>
DATE	DATE	<code>java.sql.Date</code>
DATETIME	DATETIME	<code>java.sql.Timestamp</code>
TIMESTAMP[(M)]	TIMESTAMP	<code>java.sql.Timestamp</code>
TIME	TIME	<code>java.sql.Time</code>
YEAR[(2 4)]	YEAR	If <code>yearIsDateType</code> configuration property is set to false, then the returned object type is <code>java.sql.Short</code> . If set to true (the default) then an object of type <code>java.sql.Date</code> (with the date set to January 1st, at midnight).
CHAR(M)	CHAR	<code>java.lang.String</code> (unless the character set for the column is BINARY, then <code>byte[]</code> is returned).
VARCHAR(M) [BINARY]	VARCHAR	<code>java.lang.String</code> (unless the character set for the column is BINARY, then <code>byte[]</code> is returned).
BINARY(M)	BINARY	<code>byte[]</code>
VARBINARY(M)	VARBINARY	<code>byte[]</code>
TINYBLOB	TINYBLOB	<code>byte[]</code>
TINYTEXT	VARCHAR	<code>java.lang.String</code>
BLOB	BLOB	<code>byte[]</code>
TEXT	VARCHAR	<code>java.lang.String</code>
MEDIUMBLOB	MEDIUMBLOB	<code>byte[]</code>
MEDIUMTEXT	VARCHAR	<code>java.lang.String</code>
LOBLOB	LOBLOB	<code>byte[]</code>
LONGTEXT	VARCHAR	<code>java.lang.String</code>
ENUM('value1','value2',...)	CHAR	<code>java.lang.String</code>
SET('value1','value2',...)	CHAR	<code>java.lang.String</code>

24.4.4.4. Using Character Sets and Unicode

All strings sent from the JDBC driver to the server are converted automatically from native Java Unicode form to the client charac-

ter encoding, including all queries sent via `Statement.execute()`, `Statement.executeUpdate()`, `Statement.executeQuery()` as well as all `PreparedStatement` and `CallableStatement` parameters with the exclusion of parameters set using `setBytes()`, `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()` and `setBlob()`.

Prior to MySQL Server 4.1, Connector/J supported a single character encoding per connection, which could either be automatically detected from the server configuration, or could be configured by the user through the `useUnicode` and `characterEncoding` properties.

Starting with MySQL Server 4.1, Connector/J supports a single character encoding between client and server, and any number of character encodings for data returned by the server to the client in `ResultSets`.

The character encoding between client and server is automatically detected upon connection. The encoding used by the driver is specified on the server via the `character_set` system variable for server versions older than 4.1.0 and `character_set_server` for server versions 4.1.0 and newer. For more information, see [Section 9.1.3.1, “Server Character Set and Collation”](#).

To override the automatically-detected encoding on the client side, use the `characterEncoding` property in the URL used to connect to the server.

When specifying character encodings on the client side, Java-style names should be used. The following table lists Java-style names for MySQL character sets:

MySQL to Java Encoding Name Translations.

MySQL Character Set Name	Java-Style Character Encoding Name
ascii	US-ASCII
big5	Big5
gbk	GBK
sjis	SJIS (or Cp932 or MS932 for MySQL Server < 4.1.11)
cp932	Cp932 or MS932 (MySQL Server > 4.1.11)
gb2312	EUC_CN
ujis	EUC_JP
euckr	EUC_KR
latin1	ISO8859_1
latin2	ISO8859_2
greek	ISO8859_7
hebrew	ISO8859_8
cp866	Cp866
tis620	TIS620
cp1250	Cp1250
cp1251	Cp1251
cp1257	Cp1257
macroman	MacRoman
macce	MacCentralEurope
utf8	UTF-8
ucs2	UnicodeBig

Warning

Do not issue the query 'set names' with Connector/J, as the driver will not detect that the character set has changed, and will continue to use the character set detected during the initial connection setup.

To allow multiple character sets to be sent from the client, the UTF-8 encoding should be used, either by configuring `utf8` as the default server character set, or by configuring the JDBC driver to use UTF-8 through the `characterEncoding` property.

24.4.4.5. Connecting Securely Using SSL

SSL in MySQL Connector/J encrypts all data (other than the initial handshake) between the JDBC driver and the server. The per-

formance penalty for enabling SSL is an increase in query processing time between 35% and 50%, depending on the size of the query, and the amount of data it returns.

For SSL Support to work, you must have the following:

- A JDK that includes JSSE (Java Secure Sockets Extension), like JDK-1.4.1 or newer. SSL does not currently work with a JDK that you can add JSSE to, like JDK-1.2.x or JDK-1.3.x due to the following JSSE bug: <http://developer.java.sun.com/developer/bugParade/bugs/4273544.html>
- A MySQL server that supports SSL and has been compiled and configured to do so, which is MySQL-4.0.4 or later, see [Section 5.5.7, “Using SSL for Secure Connections”](#), for more information.
- A client certificate (covered later in this section)

The system works through two Java truststore files, one file contains the certificate information for the server (`truststore` in the examples below). The other file contains the certificate for the client (`keystore` in the examples below). All Java truststore files are password protected by supplying a suitable password to the `keytool` when you create the files. You need the file names and associated passwords to create an SSL connection.

You will first need to import the MySQL server CA Certificate into a Java truststore. A sample MySQL server CA Certificate is located in the `SSL` subdirectory of the MySQL source distribution. This is what SSL will use to determine if you are communicating with a secure MySQL server. Alternatively, use the CA Certificate that you have generated or been provided with by your SSL provider.

To use Java's `keytool` to create a truststore in the current directory, and import the server's CA certificate (`cacert.pem`), you can do the following (assuming that `keytool` is in your path. The `keytool` should be located in the `bin` subdirectory of your JDK or JRE):

```
shell> keytool -import -alias mysqlServerCACert \
               -file cacert.pem -keystore truststore
```

You will need to enter the password when prompted for the keystore file. Interaction with `keytool` will look like this:

```
Enter keystore password: *****
Owner: EMAILADDRESS=walrus@example.com, CN=Walrus,
      O=MySQL AB, L=Orenburg, ST=Some-State, C=RU
Issuer: EMAILADDRESS=walrus@example.com, CN=Walrus,
        O=MySQL AB, L=Orenburg, ST=Some-State, C=RU
Serial number: 0
Valid from:
  Fri Aug 02 16:55:53 CDT 2002 until: Sat Aug 02 16:55:53 CDT 2003
Certificate fingerprints:
  MD5: 61:91:A0:F2:03:07:61:7A:81:38:66:DA:19:C4:8D:AB
  SHA1: 25:77:41:05:D5:AD:99:8C:14:8C:CA:68:9C:2F:B8:89:C3:34:4D:6C
Trust this certificate? [no]: yes
Certificate was added to keystore
```

You then have two options, you can either import the client certificate that matches the CA certificate you just imported, or you can create a new client certificate.

To import an existing certificate, the certificate should be in DER format. You can use `openssl` to convert an existing certificate into the new format. For example:

```
shell> openssl x509 -outform DER -in client-cert.pem -out client.cert
```

You now need to import the converted certificate into your keystore using `keytool`:

```
shell> keytool -import -file client.cert -keystore keystore -alias mysqlClientCertificate
```

To generate your own client certificate, use `keytool` to create a suitable certificate and add it to the `keystore` file:

```
shell> keytool -genkey -keyalg rsa \
               -alias mysqlClientCertificate -keystore keystore
```

Keytool will prompt you for the following information, and create a keystore named `keystore` in the current directory.

You should respond with information that is appropriate for your situation:

```
Enter keystore password: *****
What is your first and last name?
[Unknown]: Matthews
```

```

What is the name of your organizational unit?
[Unknown]: Software Development
What is the name of your organization?
[Unknown]: MySQL AB
What is the name of your City or Locality?
[Unknown]: Flossmoor
What is the name of your State or Province?
[Unknown]: IL
What is the two-letter country code for this unit?
[Unknown]: US
Is <CN=Matthews, OU=Software Development, O=MySQL AB,
L=Flossmoor, ST=IL, C=US> correct?
[no]: y

Enter key password for <mysqlClientCertificate>
(RETURN if same as keystore password):

```

Finally, to get JSSE to use the keystore and truststore that you have generated, you need to set the following system properties when you start your JVM, replacing `path_to_keystore_file` with the full path to the keystore file you created, `path_to_truststore_file` with the path to the truststore file you created, and using the appropriate password values for each property. You can do this either on the command line:

```

-Djavax.net.ssl.keystore=path_to_keystore_file
-Djavax.net.ssl.keystorePassword=password
-Djavax.net.ssl.trustStore=path_to_truststore_file
-Djavax.net.ssl.trustStorePassword=password

```

Or you can set the values directly within the application:

```

System.setProperty("javax.net.ssl.keystore", "path_to_keystore_file");
System.setProperty("javax.net.ssl.keystorePassword", "password");
System.setProperty("javax.net.ssl.trustStore", "path_to_truststore_file");
System.setProperty("javax.net.ssl.trustStorePassword", "password");

```

You will also need to set `useSSL` to `true` in your connection parameters for MySQL Connector/J, either by adding `useSSL=true` to your URL, or by setting the property `useSSL` to `true` in the `java.util.Properties` instance you pass to `DriverManager.getConnection()`.

You can test that SSL is working by turning on JSSE debugging (as detailed below), and look for the following key events:

```

JSSE provides debugging (to STDOUT) when you set the following system property: `-Djavax.net.debug=all`. This will tell you what keystores and truststores are being used, as well as what is going on during the SSL handshake and certificate exchange. It will be helpful when trying to determine what is not working when trying to get an SSL connection to happen.

24.4.4.6. Using Master/Slave Replication with ReplicationConnection

Starting with Connector/J 3.1.7, we've made available a variant of the driver that will automatically send queries to a read/write

master, or a failover or round-robin loadbalanced set of slaves based on the state of `Connection.getReadOnly()`.

An application signals that it wants a transaction to be read-only by calling `Connection.setReadOnly(true)`, this replication-aware connection will use one of the slave connections, which are load-balanced per-vm using a round-robin scheme (a given connection is sticky to a slave unless that slave is removed from service). If you have a write transaction, or if you have a read that is time-sensitive (remember, replication in MySQL is asynchronous), set the connection to be not read-only, by calling `Connection.setReadOnly(false)` and the driver will ensure that further calls are sent to the master MySQL server. The driver takes care of propagating the current state of autocommit, isolation level, and catalog between all of the connections that it uses to accomplish this load balancing functionality.

To enable this functionality, use the "`com.mysql.jdbc.ReplicationDriver`" class when configuring your application server's connection pool or when creating an instance of a JDBC driver for your standalone application. Because it accepts the same URL format as the standard MySQL JDBC driver, `ReplicationDriver` does not currently work with `java.sql.DriverManager`-based connection creation unless it is the only MySQL JDBC driver registered with the `DriverManager`.

Here is a short, simple example of how `ReplicationDriver` might be used in a standalone application.

```
import java.sql.Connection;
import java.sql.ResultSet;
import java.util.Properties;

import com.mysql.jdbc.ReplicationDriver;

public class ReplicationDriverDemo {

    public static void main(String[] args) throws Exception {
        ReplicationDriver driver = new ReplicationDriver();

        Properties props = new Properties();

        // We want this for failover on the slaves
        props.put("autoReconnect", "true");

        // We want to load balance between the slaves
        props.put("roundRobinLoadBalance", "true");

        props.put("user", "foo");
        props.put("password", "bar");

        //
        // Looks like a normal MySQL JDBC url, with a
        // comma-separated list of hosts, the first
        // being the 'master', the rest being any number
        // of slaves that the driver will load balance against
        //
        Connection conn =
            driver.connect("jdbc:mysql://master,slave1,slave2,slave3/test",
                props);

        //
        // Perform read/write work on the master
        // by setting the read-only flag to "false"
        //
        conn.setReadOnly(false);
        conn.setAutoCommit(false);
        conn.createStatement().executeUpdate("UPDATE some_table ...");
        conn.commit();

        //
        // Now, do a query from a slave, the driver automatically picks one
        // from the list
        //
        conn.setReadOnly(true);

        ResultSet rs =
            conn.createStatement().executeQuery("SELECT a,b FROM alt_table");

        .....
    }
}
```

You may also want to investigate the Load Balancing JDBC Pool (lbpool) tool, which provides a wrapper around the standard JDBC driver and allows you to use DB connection pools that includes checks for system failures and uneven load distribution. For more information, see [Load Balancing JDBC Pool \(lbpool\)](#).

24.4.4.7. Mapping MySQL Error Numbers to SQLStates

The table below provides a mapping of the MySQL Error Numbers to [SQL States](#)

Table 24.2. Mapping of MySQL Error Numbers to SQLStates

MySQL Error Number	MySQL Error Name	Legacy (X/Open) SQLState	SQL Standard SQLState

24.4.5. Connector/J Notes and Tips

24.4.5.1. Basic JDBC Concepts

This section provides some general JDBC background.

24.4.5.1.1. Connecting to MySQL Using the `DriverManager` Interface

When you are using JDBC outside of an application server, the `DriverManager` class manages the establishment of Connections.

The `DriverManager` needs to be told which JDBC drivers it should try to make Connections with. The easiest way to do this is to use `Class.forName()` on the class that implements the `java.sql.Driver` interface. With MySQL Connector/J, the name of this class is `com.mysql.jdbc.Driver`. With this method, you could use an external configuration file to supply the driver class name and driver parameters to use when connecting to a database.

The following section of Java code shows how you might register MySQL Connector/J from the `main()` method of your application:

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

// Notice, do not import com.mysql.jdbc.*
// or you will have problems!

public class LoadDriver {
    public static void main(String[] args) {
        try {
            // The newInstance() call is a work around for some
            // broken Java implementations

            Class.forName("com.mysql.jdbc.Driver").newInstance();
        } catch (Exception ex) {
            // handle the error
        }
    }
}
```

After the driver has been registered with the `DriverManager`, you can obtain a `Connection` instance that is connected to a particular database by calling `DriverManager.getConnection()`:

Example 24.1. Obtaining a connection from the `DriverManager`

This example shows how you can obtain a `Connection` instance from the `DriverManager`. There are a few different signatures for the `getConnection()` method. You should see the API documentation that comes with your JDK for more specific information on how to use them.

```
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

Connection conn = null;
...
try {
    conn =
        DriverManager.getConnection("jdbc:mysql://localhost/test? " +
                                   "user=monty&password=greatsqlldb");
}
```

```

// Do something with the Connection
...
} catch (SQLException ex) {
    // handle any errors
    System.out.println("SQLException: " + ex.getMessage());
    System.out.println("SQLState: " + ex.getSQLState());
    System.out.println("VendorError: " + ex.getErrorCode());
}

```

Once a `Connection` is established, it can be used to create `Statement` and `PreparedStatement` objects, as well as retrieve metadata about the database. This is explained in the following sections.

24.4.5.1.2. Using Statements to Execute SQL

`Statement` objects allow you to execute basic SQL queries and retrieve the results through the `ResultSet` class which is described later.

To create a `Statement` instance, you call the `createStatement()` method on the `Connection` object you have retrieved via one of the `DriverManager.getConnection()` or `DataSource.getConnection()` methods described earlier.

Once you have a `Statement` instance, you can execute a `SELECT` query by calling the `executeQuery(String)` method with the SQL you want to use.

To update data in the database, use the `executeUpdate(String SQL)` method. This method returns the number of rows affected by the update statement.

If you don't know ahead of time whether the SQL statement will be a `SELECT` or an `UPDATE/INSERT`, then you can use the `execute(String SQL)` method. This method will return true if the SQL query was a `SELECT`, or false if it was an `UPDATE`, `INSERT`, or `DELETE` statement. If the statement was a `SELECT` query, you can retrieve the results by calling the `getResultSet()` method. If the statement was an `UPDATE`, `INSERT`, or `DELETE` statement, you can retrieve the affected rows count by calling `getUpdateCount()` on the `Statement` instance.

Example 24.2. Using `java.sql.Statement` to execute a `SELECT` query

```

import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;
import java.sql.Statement;
import java.sql.ResultSet;

// assume that conn is an already created JDBC connection (see previous examples)

Statement stmt = null;
ResultSet rs = null;

try {
    stmt = conn.createStatement();
    rs = stmt.executeQuery("SELECT foo FROM bar");

    // or alternatively, if you don't know ahead of time that
    // the query will be a SELECT...

    if (stmt.execute("SELECT foo FROM bar")) {
        rs = stmt.getResultSet();
    }

    // Now do something with the ResultSet ....
}
catch (SQLException ex){
    // handle any errors
    System.out.println("SQLException: " + ex.getMessage());
    System.out.println("SQLState: " + ex.getSQLState());
    System.out.println("VendorError: " + ex.getErrorCode());
}
finally {
    // it is a good idea to release
    // resources in a finally{} block
    // in reverse-order of their creation
    // if they are no-longer needed

    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException sqlEx) { } // ignore
    }

    rs = null;
}

if (stmt != null) {
    try {
        stmt.close();
    }
}

```

```

    } catch (SQLException sqlEx) { } // ignore
    stmt = null;
}
}

```

24.4.5.1.3. Using `CallableStatement` to Execute Stored Procedures

Starting with MySQL server version 5.0 when used with Connector/J 3.1.1 or newer, the `java.sql.CallableStatement` interface is fully implemented with the exception of the `getParameterMetaData()` method.

For more information on MySQL stored procedures, please refer to <http://dev.mysql.com/doc/mysql/en/stored-routines.html>.

Connector/J exposes stored procedure functionality through JDBC's `CallableStatement` interface.

Note

Current versions of MySQL server do not return enough information for the JDBC driver to provide result set metadata for callable statements. This means that when using `CallableStatement`, `ResultSetMetaData` may return `NULL`.

The following example shows a stored procedure that returns the value of `inOutParam` incremented by 1, and the string passed in via `inputParam` as a `ResultSet`:

Example 24.3. Stored Procedures

```

CREATE PROCEDURE demoSp(IN inputParam VARCHAR(255), \
                       INOUT inOutParam INT)
BEGIN
  DECLARE z INT;
  SET z = inOutParam + 1;
  SET inOutParam = z;

  SELECT inputParam;

  SELECT CONCAT('zyxw', inputParam);
END

```

To use the `demoSp` procedure with Connector/J, follow these steps:

1. Prepare the callable statement by using `Connection.prepareCall()`.

Notice that you have to use JDBC escape syntax, and that the parentheses surrounding the parameter placeholders are not optional:

Example 24.4. Using `Connection.prepareCall()`

```

import java.sql.CallableStatement;
...

//
// Prepare a call to the stored procedure 'demoSp'
// with two parameters
//
// Notice the use of JDBC-escape syntax ({call ...})
//
CallableStatement cStmt = conn.prepareCall("{call demoSp(?, ?)}");

cStmt.setString(1, "abcdefg");

```

Note

`Connection.prepareCall()` is an expensive method, due to the metadata retrieval that the driver performs to support output parameters. For performance reasons, you should try to minimize unnecessary calls to `Connection.prepareCall()` by reusing `CallableStatement` instances in your code.

2. Register the output parameters (if any exist)

To retrieve the values of output parameters (parameters specified as `OUT` or `INOUT` when you created the stored procedure), JDBC requires that they be specified before statement execution using the various `registerOutputParameter()` methods in the `CallableStatement` interface:

Example 24.5. Registering output parameters

```
import java.sql.Types;
...
// Connector/J supports both named and indexed
// output parameters. You can register output
// parameters using either method, as well
// as retrieve output parameters using either
// method, regardless of what method was
// used to register them.
//
// The following examples show how to use
// the various methods of registering
// output parameters (you should of course
// use only one registration per parameter).
//
//
// Registers the second parameter as output, and
// uses the type 'INTEGER' for values returned from
// getObject()
//
cStmt.registerOutParameter(2, Types.INTEGER);
//
// Registers the named parameter 'inOutParam', and
// uses the type 'INTEGER' for values returned from
// getObject()
//
cStmt.registerOutParameter("inOutParam", Types.INTEGER);
...
```

3. Set the input parameters (if any exist)

Input and in/out parameters are set as for `PreparedStatement` objects. However, `CallableStatement` also supports setting parameters by name:

Example 24.6. Setting `CallableStatement` input parameters

```
...
//
// Set a parameter by index
//
cStmt.setString(1, "abcdefg");
//
// Alternatively, set a parameter using
// the parameter name
//
cStmt.setString("inputParameter", "abcdefg");
//
// Set the 'in/out' parameter using an index
//
cStmt.setInt(2, 1);
//
// Alternatively, set the 'in/out' parameter
// by name
//
cStmt.setInt("inOutParam", 1);
...
```

4. Execute the `CallableStatement`, and retrieve any result sets or output parameters.

Although `CallableStatement` supports calling any of the `Statement` execute methods (`executeUpdate()`, `ex-`

`executeQuery()` or `execute()`, the most flexible method to call is `execute()`, as you do not need to know ahead of time if the stored procedure returns result sets:

Example 24.7. Retrieving results and output parameter values

```
...
boolean hadResults = cStmt.execute();

//
// Process all returned result sets
//
while (hadResults) {
    ResultSet rs = cStmt.getResultSet();

    // process result set
    ...

    hadResults = cStmt.getMoreResults();
}

//
// Retrieve output parameters
//
// Connector/J supports both index-based and
// name-based retrieval
//
int outputValue = cStmt.getInt(2); // index-based
outputValue = cStmt.getInt("inOutParam"); // name-based
...

```

24.4.5.1.4. Retrieving `AUTO_INCREMENT` Column Values

Before version 3.0 of the JDBC API, there was no standard way of retrieving key values from databases that supported auto increment or identity columns. With older JDBC drivers for MySQL, you could always use a MySQL-specific method on the `Statement` interface, or issue the query `SELECT LAST_INSERT_ID()` after issuing an `INSERT` to a table that had an `AUTO_INCREMENT` key. Using the MySQL-specific method call isn't portable, and issuing a `SELECT` to get the `AUTO_INCREMENT` key's value requires another round-trip to the database, which isn't as efficient as possible. The following code snippets demonstrate the three different ways to retrieve `AUTO_INCREMENT` values. First, we demonstrate the use of the new JDBC-3.0 method `getGeneratedKeys()` which is now the preferred method to use if you need to retrieve `AUTO_INCREMENT` keys and have access to JDBC-3.0. The second example shows how you can retrieve the same value using a standard `SELECT LAST_INSERT_ID()` query. The final example shows how updatable result sets can retrieve the `AUTO_INCREMENT` value when using the `insertRow()` method.

Example 24.8. Retrieving `AUTO_INCREMENT` column values using `Statement.getGeneratedKeys()`

```
Statement stmt = null;
ResultSet rs = null;

try {

    //
    // Create a Statement instance that we can use for
    // 'normal' result sets assuming you have a
    // Connection 'conn' to a MySQL database already
    // available

    stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
                               java.sql.ResultSet.CONCUR_UPDATABLE);

    //
    // Issue the DDL queries for the table for this example
    //

    stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
    stmt.executeUpdate(
        "CREATE TABLE autoIncTutorial ( "
        + "priKey INT NOT NULL AUTO_INCREMENT, "
        + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

    //
    // Insert one row that will generate an AUTO INCREMENT
    // key in the 'priKey' field
    //

    stmt.executeUpdate(

```

```

        "INSERT INTO autoIncTutorial (dataField) "
        + "values ('Can I Get the Auto Increment Field?')",
        Statement.RETURN_GENERATED_KEYS);

//
// Example of using Statement.getGeneratedKeys()
// to retrieve the value of an auto-increment
// value
//

int autoIncKeyFromApi = -1;

rs = stmt.getGeneratedKeys();

if (rs.next()) {
    autoIncKeyFromApi = rs.getInt(1);
} else {
    // throw an exception from here
}

rs.close();

rs = null;

System.out.println("Key returned from getGeneratedKeys():"
    + autoIncKeyFromApi);
} finally {

    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException ex) {
            // ignore
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}
}

```

Example 24.9. Retrieving `AUTO_INCREMENT` column values using `SELECT LAST_INSERT_ID()`

```

Statement stmt = null;
ResultSet rs = null;

try {

    //
    // Create a Statement instance that we can use for
    // 'normal' result sets.

    stmt = conn.createStatement();

    //
    // Issue the DDL queries for the table for this example
    //

    stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
    stmt.executeUpdate(
        "CREATE TABLE autoIncTutorial ( "
        + "priKey INT NOT NULL AUTO_INCREMENT, "
        + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

    //
    // Insert one row that will generate an AUTO INCREMENT
    // key in the 'priKey' field
    //

    stmt.executeUpdate(
        "INSERT INTO autoIncTutorial (dataField) "
        + "values ('Can I Get the Auto Increment Field?')");

    //
    // Use the MySQL LAST_INSERT_ID()
    // function to do the same thing as getGeneratedKeys()
    //

    int autoIncKeyFromFunc = -1;
    rs = stmt.executeQuery("SELECT LAST_INSERT_ID()");

    if (rs.next()) {
        autoIncKeyFromFunc = rs.getInt(1);
    } else {
        // throw an exception from here
    }
}
}

```

```

rs.close();

System.out.println("Key returned from " +
    "'SELECT LAST_INSERT_ID()': " +
    autoIncKeyFromFunc);
} finally {
    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException ex) {
            // ignore
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}
}

```

Example 24.10. Retrieving `AUTO_INCREMENT` column values in `Updatable ResultSets`

```

Statement stmt = null;
ResultSet rs = null;

try {
    //
    // Create a Statement instance that we can use for
    // 'normal' result sets as well as an 'updatable'
    // one, assuming you have a Connection 'conn' to
    // a MySQL database already available
    //
    stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
        java.sql.ResultSet.CONCUR_UPDATABLE);

    //
    // Issue the DDL queries for the table for this example
    //
    stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
    stmt.executeUpdate(
        "CREATE TABLE autoIncTutorial ("
        + "priKey INT NOT NULL AUTO_INCREMENT, "
        + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

    //
    // Example of retrieving an AUTO INCREMENT key
    // from an updatable result set
    //
    rs = stmt.executeQuery("SELECT priKey, dataField "
        + "FROM autoIncTutorial");

    rs.moveToInsertRow();

    rs.updateString("dataField", "AUTO INCREMENT here?");
    rs.insertRow();

    //
    // the driver adds rows at the end
    //
    rs.last();

    //
    // We should now be on the row we just inserted
    //
    int autoIncKeyFromRS = rs.getInt("priKey");

    rs.close();

    rs = null;

    System.out.println("Key returned for inserted row: "
        + autoIncKeyFromRS);
} finally {
    if (rs != null) {
        try {
            rs.close();

```

```

    } catch (SQLException ex) {
        // ignore
    }
}

if (stmt != null) {
    try {
        stmt.close();
    } catch (SQLException ex) {
        // ignore
    }
}
}

```

When you run the preceding example code, you should get the following output: Key returned from `getGeneratedKeys()`: 1 Key returned from `SELECT LAST_INSERT_ID()`: 1 Key returned for inserted row: 2 You should be aware, that at times, it can be tricky to use the `SELECT LAST_INSERT_ID()` query, as that function's value is scoped to a connection. So, if some other query happens on the same connection, the value will be overwritten. On the other hand, the `getGeneratedKeys()` method is scoped by the `Statement` instance, so it can be used even if other queries happen on the same connection, but not on the same `Statement` instance.

24.4.5.2. Using Connector/J with J2EE and Other Java Frameworks

This section describes how to use Connector/J in several contexts.

24.4.5.2.1. General J2EE Concepts

This section provides general background on J2EE concepts that pertain to use of Connector/J.

24.4.5.2.1.1. Understanding Connection Pooling

Connection pooling is a technique of creating and managing a pool of connections that are ready for use by any thread that needs them.

This technique of pooling connections is based on the fact that most applications only need a thread to have access to a JDBC connection when they are actively processing a transaction, which usually take only milliseconds to complete. When not processing a transaction, the connection would otherwise sit idle. Instead, connection pooling allows the idle connection to be used by some other thread to do useful work.

In practice, when a thread needs to do work against a MySQL or other database with JDBC, it requests a connection from the pool. When the thread is finished using the connection, it returns it to the pool, so that it may be used by any other threads that want to use it.

When the connection is loaned out from the pool, it is used exclusively by the thread that requested it. From a programming point of view, it is the same as if your thread called `DriverManager.getConnection()` every time it needed a JDBC connection, however with connection pooling, your thread may end up using either a new, or already-existing connection.

Connection pooling can greatly increase the performance of your Java application, while reducing overall resource usage. The main benefits to connection pooling are:

- Reduced connection creation time

Although this is not usually an issue with the quick connection setup that MySQL offers compared to other databases, creating new JDBC connections still incurs networking and JDBC driver overhead that will be avoided if connections are recycled.

- Simplified programming model

When using connection pooling, each individual thread can act as though it has created its own JDBC connection, allowing you to use straight-forward JDBC programming techniques.

- Controlled resource usage

If you don't use connection pooling, and instead create a new connection every time a thread needs one, your application's resource usage can be quite wasteful and lead to unpredictable behavior under load.

Remember that each connection to MySQL has overhead (memory, CPU, context switches, and so forth) on both the client and server side. Every connection limits how many resources there are available to your application as well as the MySQL server. Many of these resources will be used whether or not the connection is actually doing any useful work!

Connection pools can be tuned to maximize performance, while keeping resource utilization below the point where your application will start to fail rather than just run slower.

Luckily, Sun has standardized the concept of connection pooling in JDBC through the JDBC-2.0 Optional interfaces, and all major application servers have implementations of these APIs that work fine with MySQL Connector/J.

Generally, you configure a connection pool in your application server configuration files, and access it via the Java Naming and Directory Interface (JNDI). The following code shows how you might use a connection pool from an application deployed in a J2EE application server:

Example 24.11. Using a connection pool with a J2EE application server

```
import java.sql.Connection;
import java.sql.SQLException;
import java.sql.Statement;

import javax.naming.InitialContext;
import javax.sql.DataSource;

public class MyServletJspOrEjb {

    public void doSomething() throws Exception {
        /*
         * Create a JNDI Initial context to be able to
         * lookup the DataSource
         *
         * In production-level code, this should be cached as
         * an instance or static variable, as it can
         * be quite expensive to create a JNDI context.
         *
         * Note: This code only works when you are using servlets
         * or EJBs in a J2EE application server. If you are
         * using connection pooling in standalone Java code, you
         * will have to create/configure datasources using whatever
         * mechanisms your particular connection pooling library
         * provides.
         */

        InitialContext ctx = new InitialContext();

        /*
         * Lookup the DataSource, which will be backed by a pool
         * that the application server provides. DataSource instances
         * are also a good candidate for caching as an instance
         * variable, as JNDI lookups can be expensive as well.
         */

        DataSource ds =
            (DataSource)ctx.lookup("java:comp/env/jdbc/MySQLDB");

        /*
         * The following code is what would actually be in your
         * Servlet, JSP or EJB 'service' method...where you need
         * to work with a JDBC connection.
         */

        Connection conn = null;
        Statement stmt = null;

        try {
            conn = ds.getConnection();

            /*
             * Now, use normal JDBC programming to work with
             * MySQL, making sure to close each resource when you're
             * finished with it, which allows the connection pool
             * resources to be recovered as quickly as possible
             */

            stmt = conn.createStatement();
            stmt.execute("SOME SQL QUERY");

            stmt.close();
            stmt = null;

            conn.close();
            conn = null;
        } finally {
            /*
             * close any jdbc instances here that weren't
             * explicitly closed during normal code path, so
             * that we don't 'leak' resources...
             */

            if (stmt != null) {
                try {
                    stmt.close();
                } catch (SQLException sqlex) {
                    // ignore -- as we can't do anything about it here
                }
            }
        }
    }
}
```

```

    }
    stmt = null;
}
if (conn != null) {
    try {
        conn.close();
    } catch (SQLException sqlex) {
        // ignore -- as we can't do anything about it here
    }
    conn = null;
}
}
}
}
}
}

```

As shown in the example above, after obtaining the JNDI InitialContext, and looking up the DataSource, the rest of the code should look familiar to anyone who has done JDBC programming in the past.

The most important thing to remember when using connection pooling is to make sure that no matter what happens in your code (exceptions, flow-of-control, and so forth), connections, and anything created by them (such as statements or result sets) are closed, so that they may be re-used, otherwise they will be stranded, which in the best case means that the MySQL server resources they represent (such as buffers, locks, or sockets) may be tied up for some time, or worst case, may be tied up forever.

What's the Best Size for my Connection Pool?

As with all other configuration rules-of-thumb, the answer is: it depends. Although the optimal size depends on anticipated load and average database transaction time, the optimum connection pool size is smaller than you might expect. If you take Sun's Java Petstore blueprint application for example, a connection pool of 15-20 connections can serve a relatively moderate load (600 concurrent users) using MySQL and Tomcat with response times that are acceptable.

To correctly size a connection pool for your application, you should create load test scripts with tools such as Apache JMeter or The Grinder, and load test your application.

An easy way to determine a starting point is to configure your connection pool's maximum number of connections to be unbounded, run a load test, and measure the largest amount of concurrently used connections. You can then work backward from there to determine what values of minimum and maximum pooled connections give the best performance for your particular application.

24.4.5.2.2. Using Connector/J with Tomcat

The following instructions are based on the instructions for Tomcat-5.x, available at <http://tomcat.apache.org/tomcat-5.5-doc/jndi-datasource-examples-howto.html> which is current at the time this document was written.

First, install the .jar file that comes with Connector/J in `$/CATALINA_HOME/common/lib` so that it is available to all applications installed in the container.

Next, Configure the JNDI DataSource by adding a declaration resource to `$/CATALINA_HOME/conf/server.xml` in the context that defines your web application:

```

<Context ...>
...
<Resource name="jdbc/MySQLDB"
    auth="Container"
    type="javax.sql.DataSource"/>

<!-- The name you used above, must match _exactly_ here!
    The connection pool will be bound into JNDI with the name
    "java:/comp/env/jdbc/MySQLDB"
-->

<ResourceParams name="jdbc/MySQLDB">
    <parameter>
        <name>factory</name>
        <value>org.apache.commons.dbcp.BasicDataSourceFactory</value>
    </parameter>

    <!-- Don't set this any higher than max_connections on your
        MySQL server, usually this should be a 10 or a few 10's
        of connections, not hundreds or thousands -->

    <parameter>
        <name>maxActive</name>
        <value>10</value>
    </parameter>

    <!-- You don't want to many idle connections hanging around
        if you can avoid it, only enough to soak up a spike in

```

```

    the load -->

    <parameter>
      <name>maxIdle</name>
      <value>5</value>
    </parameter>

    <!-- Don't use autoReconnect=true, it's going away eventually
    and it's a crutch for older connection pools that couldn't
    test connections. You need to decide whether your application
    is supposed to deal with SQLExceptions (hint, it should), and
    how much of a performance penalty you're willing to pay
    to ensure 'freshness' of the connection -->

    <parameter>
      <name>validationQuery</name>
      <value>SELECT 1</value>
    </parameter>

    <!-- The most conservative approach is to test connections
    before they're given to your application. For most applications
    this is okay, the query used above is very small and takes
    no real server resources to process, other than the time used
    to traverse the network.

    If you have a high-load application you'll need to rely on
    something else. -->

    <parameter>
      <name>testOnBorrow</name>
      <value>true</value>
    </parameter>

    <!-- Otherwise, or in addition to testOnBorrow, you can test
    while connections are sitting idle -->

    <parameter>
      <name>testWhileIdle</name>
      <value>true</value>
    </parameter>

    <!-- You have to set this value, otherwise even though
    you've asked connections to be tested while idle,
    the idle evictor thread will never run -->

    <parameter>
      <name>timeBetweenEvictionRunsMillis</name>
      <value>10000</value>
    </parameter>

    <!-- Don't allow connections to hang out idle too long,
    never longer than what wait_timeout is set to on the
    server...A few minutes or even fraction of a minute
    is sometimes okay here, it depends on your application
    and how much spikey load it will see -->

    <parameter>
      <name>minEvictableIdleTimeMillis</name>
      <value>60000</value>
    </parameter>

    <!-- Username and password used when connecting to MySQL -->

    <parameter>
      <name>username</name>
      <value>someuser</value>
    </parameter>

    <parameter>
      <name>password</name>
      <value>somepass</value>
    </parameter>

    <!-- Class name for the Connector/J driver -->

    <parameter>
      <name>driverClassName</name>
      <value>com.mysql.jdbc.Driver</value>
    </parameter>

    <!-- The JDBC connection url for connecting to MySQL, notice
    that if you want to pass any other MySQL-specific parameters
    you should pass them here in the URL, setting them using the
    parameter tags above will have no effect, you will also
    need to use &amp; to separate parameter values as the
    ampersand is a reserved character in XML -->

    <parameter>
      <name>url</name>
      <value>jdbc:mysql://localhost:3306/test</value>
    </parameter>

  </ResourceParams>
</Context>

```

In general, you should follow the installation instructions that come with your version of Tomcat, as the way you configure data-sources in Tomcat changes from time-to-time, and unfortunately if you use the wrong syntax in your XML file, you will most likely end up with an exception similar to the following:

```
Error: java.sql.SQLException: Cannot load JDBC driver class 'null ' SQL
state: null
```

24.4.5.2.3. Using Connector/J with JBoss

These instructions cover JBoss-4.x. To make the JDBC driver classes available to the application server, copy the .jar file that comes with Connector/J to the `lib` directory for your server configuration (which is usually called `default`). Then, in the same configuration directory, in the subdirectory named `deploy`, create a datasource configuration file that ends with `-ds.xml`, which tells JBoss to deploy this file as a JDBC Datasource. The file should have the following contents:

```
<datasources>
  <local-tx-datasource>
    <!-- This connection pool will be bound into JNDI with the name
         "java/MySQLDB" -->

    <jndi-name>MySQLDB</jndi-name>
    <connection-url>jdbc:mysql://localhost:3306/dbname</connection-url>
    <driver-class>com.mysql.jdbc.Driver</driver-class>
    <user-name>user</user-name>
    <password>pass</password>

    <min-pool-size>5</min-pool-size>

    <!-- Don't set this any higher than max_connections on your
         MySQL server, usually this should be a 10 or a few 10's
         of connections, not hundreds or thousands -->

    <max-pool-size>20</max-pool-size>

    <!-- Don't allow connections to hang out idle too long,
         never longer than what wait_timeout is set to on the
         server...A few minutes is usually okay here,
         it depends on your application
         and how much spikey load it will see -->

    <idle-timeout-minutes>5</idle-timeout-minutes>

    <!-- If you're using Connector/J 3.1.8 or newer, you can use
         our implementation of these to increase the robustness
         of the connection pool. -->

    <exception-sorter-class-name>
    com.mysql.jdbc.integration.jboss.ExtendedMysqlExceptionSorter
    </exception-sorter-class-name>
    <valid-connection-checker-class-name>
    com.mysql.jdbc.integration.jboss.MysqlValidConnectionChecker
    </valid-connection-checker-class-name>

  </local-tx-datasource>
</datasources>
```

24.4.5.2.4. Using Connector/J with Spring

The Spring Framework is a Java-based application framework designed for assisting in application design by providing a way to configure components. The technique used by Spring is a well known design pattern called Dependency Injection (see [Inversion of Control Containers and the Dependency Injection pattern](#)). This article will focus on Java-oriented access to MySQL databases with Spring 2.0. For those wondering, there is a .NET port of Spring appropriately named Spring.NET.

Spring is not only a system for configuring components, but also includes support for aspect oriented programming (AOP). This is one of the main benefits and the foundation for Spring's resource and transaction management. Spring also provides utilities for integrating resource management with JDBC and Hibernate.

For the examples in this section the MySQL world sample database will be used. The first task is to set up a MySQL data source through Spring. Components within Spring use the "bean" terminology. For example, to configure a connection to a MySQL server supporting the world sample database you might use:

```
<util:map id="dbProps">
  <entry key="db.driver" value="com.mysql.jdbc.Driver"/>
  <entry key="db.jdbcurl" value="jdbc:mysql://localhost/world"/>
  <entry key="db.username" value="myuser"/>
  <entry key="db.password" value="mypass"/>
</util:map>
```

In the above example we are assigning values to properties that will be used in the configuration. For the datasource configuration:

```
<bean id="dataSource"
```

```

class="org.springframework.jdbc.datasource.DriverManagerDataSource">
<property name="driverClassName" value="${db.driver}"/>
<property name="url" value="${db.jdbcurl}"/>
<property name="username" value="${db.username}"/>
<property name="password" value="${db.password}"/>
</bean>

```

The placeholders are used to provide values for properties of this bean. This means that you can specify all the properties of the configuration in one place instead of entering the values for each property on each bean. We do, however, need one more bean to pull this all together. The last bean is responsible for actually replacing the placeholders with the property values.

```

<bean
class="org.springframework.beans.factory.config.PropertyPlaceholderConfigurer">
<property name="properties" ref="dbProps"/>
</bean>

```

Now that we have our MySQL data source configured and ready to go, we write some Java code to access it. The example below will retrieve three random cities and their corresponding country using the data source we configured with Spring.

```

// Create a new application context. this processes the Spring config
ApplicationContext ctx =
    new ClassPathXmlApplicationContext("exlappContext.xml");
// Retrieve the data source from the application context
DataSource ds = (DataSource) ctx.getBean("dataSource");
// Open a database connection using Spring's DataSourceUtils
Connection c = DataSourceUtils.getConnection(ds);
try {
    // retrieve a list of three random cities
    PreparedStatement ps = c.prepareStatement(
        "select City.Name as 'City', Country.Name as 'Country' " +
        "from City inner join Country on City.CountryCode = Country.Code " +
        "order by rand() limit 3");
    ResultSet rs = ps.executeQuery();
    while(rs.next()) {
        String city = rs.getString("City");
        String country = rs.getString("Country");
        System.out.printf("The city %s is in %s\n", city, country);
    }
} catch (SQLException ex) {
    // something has failed and we print a stack trace to analyse the error
    ex.printStackTrace();
    // ignore failure closing connection
    try { c.close(); } catch (SQLException e) { }
} finally {
    // properly release our connection
    DataSourceUtils.releaseConnection(c, ds);
}

```

This is very similar to normal JDBC access to MySQL with the main difference being that we are using `DataSourceUtils` instead of the `DriverManager` to create the connection.

While it may seem like a small difference, the implications are somewhat far reaching. Spring manages this resource in a way similar to a container managed data source in a J2EE application server. When a connection is opened, it can be subsequently accessed in other parts of the code if it is synchronized with a transaction. This makes it possible to treat different parts of your application as transactional instead of passing around a database connection.

24.4.5.2.4.1. Using `JdbcTemplate`

Spring makes extensive use of the Template method design pattern (see [Template Method Pattern](#)). Our immediate focus will be on the `JdbcTemplate` and related classes, specifically `NamedParameterJdbcTemplate`. The template classes handle obtaining and releasing a connection for data access when one is needed.

The next example shows how to use `NamedParameterJdbcTemplate` inside of a DAO (Data Access Object) class to retrieve a random city given a country code.

```

public class Ex2JdbcDao {
    /**
     * Data source reference which will be provided by Spring.
     */
    private DataSource dataSource;

    /**
     * Our query to find a random city given a country code. Notice
     * the ":country" parameter towards the end. This is called a
     * named parameter.
     */
    private String queryString = "select Name from City " +
        "where CountryCode = :country order by rand() limit 1";

    /**
     * Retrieve a random city using Spring JDBC access classes.
     */
}

```

```

public String getRandomCityByCountryCode(String cntryCode) {
    // A template that allows using queries with named parameters
    NamedParameterJdbcTemplate template =
        new NamedParameterJdbcTemplate(dataSource);
    // A java.util.Map is used to provide values for the parameters
    Map params = new HashMap();
    params.put("country", cntryCode);
    // We query for an Object and specify what class we are expecting
    return (String)template.queryForObject(queryString, params, String.class);
}

/**
 * A JavaBean setter-style method to allow Spring to inject the data source.
 * @param dataSource
 */
public void setDataSource(DataSource dataSource) {
    this.dataSource = dataSource;
}
}

```

The focus in the above code is on the `getRandomCityByCountryCode()` method. We pass a country code and use the `NamedParameterJdbcTemplate` to query for a city. The country code is placed in a Map with the key "country", which is the parameter is named in the SQL query.

To access this code, you need to configure it with Spring by providing a reference to the data source.

```

<bean id="dao" class="code.Ex2JdbcDao">
  <property name="dataSource" ref="dataSource"/>
</bean>

```

At this point, we can just grab a reference to the DAO from Spring and call `getRandomCityByCountryCode()`.

```

// Create the application context
ApplicationContext ctx =
    new ClassPathXmlApplicationContext("ex2appContext.xml");
// Obtain a reference to our DAO
Ex2JdbcDao dao = (Ex2JdbcDao) ctx.getBean("dao");

String countryCode = "USA";

// Find a few random cities in the US
for(int i = 0; i < 4; ++i)
    System.out.printf("A random city in %s is %s\n", countryCode,
        dao.getRandomCityByCountryCode(countryCode));

```

This example shows how to use Spring's JDBC classes to completely abstract away the use of traditional JDBC classes including `Connection` and `PreparedStatement`.

24.4.5.2.4.2. Transactional JDBC Access

You might be wondering how we can add transactions into our code if we don't deal directly with the JDBC classes. Spring provides a transaction management package that not only replaces JDBC transaction management, but also allows declarative transaction management (configuration instead of code).

In order to use transactional database access, we will need to change the storage engine of the tables in the world database. The downloaded script explicitly creates MyISAM tables which do not support transactional semantics. The InnoDB storage engine does support transactions and this is what we will be using. We can change the storage engine with the following statements.

```

ALTER TABLE City ENGINE=InnoDB;
ALTER TABLE Country ENGINE=InnoDB;
ALTER TABLE CountryLanguage ENGINE=InnoDB;

```

A good programming practice emphasized by Spring is separating interfaces and implementations. What this means is that we can create a Java interface and only use the operations on this interface without any internal knowledge of what the actual implementation is. We will let Spring manage the implementation and with this it will manage the transactions for our implementation.

First you create a simple interface:

```

public interface Ex3Dao {
    Integer createCity(String name, String countryCode,
        String district, Integer population);
}

```

This interface contains one method that will create a new city record in the database and return the id of the new record. Next you need to create an implementation of this interface.

```

public class Ex3DaoImpl implements Ex3Dao {
    protected DataSource dataSource;
}

```

```

protected SqlUpdate updateQuery;
protected SqlFunction idQuery;

public Integer createCity(String name, String countryCode,
    String district, Integer population) {
    updateQuery.update(new Object[] { name, countryCode,
        district, population });
    return getLastId();
}

protected Integer getLastId() {
    return idQuery.run();
}
}

```

You can see that we only operate on abstract query objects here and don't deal directly with the JDBC API. Also, this is the complete implementation. All of our transaction management will be dealt with in the configuration. To get the configuration started, we need to create the DAO.

```

<bean id="dao" class="code.Ex3DaoImpl">
  <property name="dataSource" ref="dataSource"/>
  <property name="updateQuery">...</property>
  <property name="idQuery">...</property>
</bean>

```

Now you need to set up the transaction configuration. The first thing you must do is create transaction manager to manage the data source and a specification of what transaction properties are required for for the `dao` methods.

```

<bean id="transactionManager"
  class="org.springframework.jdbc.datasource.DataSourceTransactionManager">
  <property name="dataSource" ref="dataSource"/>
</bean>

<tx:advice id="txAdvice" transaction-manager="transactionManager">
  <tx:attributes>
    <tx:method name="*" />
  </tx:attributes>
</tx:advice>

```

The preceding code creates a transaction manager that handles transactions for the data source provided to it. The `txAdvice` uses this transaction manager and the attributes specify to create a transaction for all methods. Finally you need to apply this advice with an AOP pointcut.

```

<aop:config>
  <aop:pointcut id="daoMethods"
    expression="execution(* code.Ex3Dao.*(..))"/>
  <aop:advisor advice-ref="txAdvice" pointcut-ref="daoMethods"/>
</aop:config>

```

This basically says that all methods called on the `Ex3Dao` interface will be wrapped in a transaction. To make use of this, you only have to retrieve the `dao` from the application context and call a method on the `dao` instance.

```

Ex3Dao dao = (Ex3Dao) ctx.getBean("dao");
Integer id = dao.createCity(name, countryCode, district, pop);

```

We can verify from this that there is no transaction management happening in our Java code and it's all configured with Spring. This is a very powerful notion and regarded as one of the most beneficial features of Spring.

24.4.5.2.4.3. Connection Pooling

In many situations, such as web applications, there will be a large number of small database transactions. When this is the case, it usually makes sense to create a pool of database connections available for web requests as needed. Although MySQL does not spawn an extra process when a connection is made, there is still a small amount of overhead to create and set up the connection. Pooling of connections also alleviates problems such as collecting large amounts of sockets in the `TIME_WAIT` state.

Setting up pooling of MySQL connections with Spring is as simple as changing the data source configuration in the application context. There are a number of configurations that we can use. The first example is based on the [Jakarta Commons DBCP library](#). The example below replaces the source configuration that was based on `DriverManagerDataSource` with DBCP's `BasicDataSource`.

```

<bean id="dataSource" destroy-method="close"
  class="org.apache.commons.dbcp.BasicDataSource">
  <property name="driverClassName" value="${db.driver}"/>
  <property name="url" value="${db.jdbcurl}"/>
  <property name="username" value="${db.username}"/>
  <property name="password" value="${db.password}"/>
  <property name="initialSize" value="3"/>
</bean>

```

The configuration of the two solutions is very similar. The difference is that DBCP will pool connections to the database instead of creating a new connection every time one is requested. We have also set a parameter here called `initialSize`. This tells DBCP that we want three connections in the pool when it is created.

Another way to configure connection pooling is to configure a data source in our J2EE application server. Using JBoss as an example, you can set up the MySQL connection pool by creating a file called `mysql-local-ds.xml` and placing it in the server/default/deploy directory in JBoss. Once we have this setup, we can use JNDI to look it up. With Spring, this lookup is very simple. The data source configuration looks like this.

```
<jee:jndi-lookup id="dataSource" jndi-name="java:MySQL_DS" />
```

24.4.5.2.5. Using Connector/J with GlassFish

24.4.5.3. Common Problems and Solutions

There are a few issues that seem to be commonly encountered often by users of MySQL Connector/J. This section deals with their symptoms, and their resolutions.

Questions

- [25.4.5.3.1](#): When I try to connect to the database with MySQL Connector/J, I get the following exception:

```
SQLException: Server configuration denies access to data source
SQLState: 08001
VendorError: 0
```

What's going on? I can connect just fine with the MySQL command-line client.

- [25.4.5.3.2](#): My application throws an SQLException 'No Suitable Driver'. Why is this happening?
- [25.4.5.3.3](#): I'm trying to use MySQL Connector/J in an applet or application and I get an exception similar to:

```
SQLException: Cannot connect to MySQL server on host:3306.
Is there a MySQL server running on the machine/port you
are trying to connect to?

(java.security.AccessControlException)
SQLState: 08S01
VendorError: 0
```

- [25.4.5.3.4](#): I have a servlet/application that works fine for a day, and then stops working overnight
- [25.4.5.3.5](#): I'm trying to use JDBC-2.0 updatable result sets, and I get an exception saying my result set is not updatable.
- [25.4.5.3.6](#): I cannot connect to the MySQL server using Connector/J, and I'm sure the connection parameters are correct.
- [25.4.5.3.7](#): I am trying to connect to my MySQL server within my application, but I get the following error and stack trace:

```
java.net.SocketException
MESSAGE: Software caused connection abort: recv failed

STACKTRACE:

java.net.SocketException: Software caused connection abort: recv failed
at java.net.SocketInputStream.socketRead0(Native Method)
at java.net.SocketInputStream.read(Unknown Source)
at com.mysql.jdbc.MysqlIO.readFully(MysqlIO.java:1392)
at com.mysql.jdbc.MysqlIO.readPacket(MysqlIO.java:1414)
at com.mysql.jdbc.MysqlIO.doHandshake(MysqlIO.java:625)
at com.mysql.jdbc.Connection.createNewIO(Connection.java:1926)
at com.mysql.jdbc.Connection.<init>(Connection.java:452)
at com.mysql.jdbc.NonRegisteringDriver.connect(NonRegisteringDriver.java:411)
```

- [25.4.5.3.8](#): My application is deployed through JBoss and I am using transactions to handle the statements on the MySQL database. Under heavy loads I am getting an error and stack trace, but these only occur after a fixed period of heavy activity.
- [25.4.5.3.9](#): When using `gcj` an `java.io.CharConversionException` is raised when working with certain character sequences.
- [25.4.5.3.10](#): Updating a table that contains a primary key that is either `FLOAT` or compound primary key that uses `FLOAT` fails to update the table and raises an exception.

Questions and Answers

25.4.5.3.1: When I try to connect to the database with MySQL Connector/J, I get the following exception:

```
SQLException: Server configuration denies access to data source
SQLState: 08001
VendorError: 0
```

What's going on? I can connect just fine with the MySQL command-line client.

MySQL Connector/J must use TCP/IP sockets to connect to MySQL, as Java does not support Unix Domain Sockets. Therefore, when MySQL Connector/J connects to MySQL, the security manager in MySQL server will use its grant tables to determine whether the connection should be allowed.

You must add the necessary security credentials to the MySQL server for this to happen, using the [GRANT](#) statement to your MySQL Server. See [Section 12.5.1.3, “GRANT Syntax”](#), for more information.

Note

Testing your connectivity with the `mysql` command-line client will not work unless you add the `--host` flag, and use something other than `localhost` for the host. The `mysql` command-line client will use Unix domain sockets if you use the special hostname `localhost`. If you are testing connectivity to `localhost`, use `127.0.0.1` as the hostname instead.

Warning

Changing privileges and permissions improperly in MySQL can potentially cause your server installation to not have optimal security properties.

25.4.5.3.2: My application throws an SQLException 'No Suitable Driver'. Why is this happening?

There are three possible causes for this error:

- The Connector/J driver is not in your `CLASSPATH`, see [Section 24.4.2, “Connector/J Installation”](#).
- The format of your connection URL is incorrect, or you are referencing the wrong JDBC driver.
- When using `DriverManager`, the `jdbc.drivers` system property has not been populated with the location of the Connector/J driver.

25.4.5.3.3: I'm trying to use MySQL Connector/J in an applet or application and I get an exception similar to:

```
SQLException: Cannot connect to MySQL server on host:3306.
Is there a MySQL server running on the machine/port you
are trying to connect to?

(java.security.AccessControlException)
SQLState: 08S01
VendorError: 0
```

Either you're running an Applet, your MySQL server has been installed with the `--skip-networking` option set, or your MySQL server has a firewall sitting in front of it.

Applets can only make network connections back to the machine that runs the web server that served the `.class` files for the applet. This means that MySQL must run on the same machine (or you must have some sort of port re-direction) for this to work. This also means that you will not be able to test applets from your local file system, you must always deploy them to a web server.

MySQL Connector/J can only communicate with MySQL using TCP/IP, as Java does not support Unix domain sockets. TCP/IP communication with MySQL might be affected if MySQL was started with the `--skip-networking` flag, or if it is firewalled.

If MySQL has been started with the `--skip-networking` option set (the Debian Linux package of MySQL server does this for example), you need to comment it out in the file `/etc/mysql/my.cnf` or `/etc/my.cnf`. Of course your `my.cnf` file might also exist in the `data` directory of your MySQL server, or anywhere else (depending on how MySQL was compiled for your system). Binaries created by MySQL AB always look in `/etc/my.cnf` and `[datadir]/my.cnf`. If your MySQL server has been firewalled, you will need to have the firewall configured to allow TCP/IP connections from the host where your Java code is running to the MySQL server on the port that MySQL is listening to (by default, 3306).

25.4.5.3.4: I have a servlet/application that works fine for a day, and then stops working overnight

MySQL closes connections after 8 hours of inactivity. You either need to use a connection pool that handles stale connections or use the `autoReconnect` parameter (see [Section 24.4.4.1, “Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J”](#)).

Also, you should be catching `SQLException`s in your application and dealing with them, rather than propagating them all the way until your application exits, this is just good programming practice. MySQL Connector/J will set the `SQLState` (see `java.sql.SQLException.getSQLState()` in your APIDocs) to "08S01" when it encounters network-connectivity issues during the processing of a query. Your application code should then attempt to re-connect to MySQL at this point.

The following (simplistic) example shows what code that can handle these exceptions might look like:

Example 24.12. Example of transaction with retry logic

```
public void doBusinessOp() throws SQLException {
    Connection conn = null;
    Statement stmt = null;
    ResultSet rs = null;

    //
    // How many times do you want to retry the transaction
    // (or at least _getting_ a connection)?
    //
    int retryCount = 5;

    boolean transactionCompleted = false;

    do {
        try {
            conn = getConnection(); // assume getting this from a
                                   // javax.sql.DataSource, or the
                                   // java.sql.DriverManager

            conn.setAutoCommit(false);

            //
            // Okay, at this point, the 'retry-ability' of the
            // transaction really depends on your application logic,
            // whether or not you're using autocommit (in this case
            // not), and whether you're using transactional storage
            // engines
            //
            // For this example, we'll assume that it's _not_ safe
            // to retry the entire transaction, so we set retry
            // count to 0 at this point
            //
            // If you were using exclusively transaction-safe tables,
            // or your application could recover from a connection going
            // bad in the middle of an operation, then you would not
            // touch 'retryCount' here, and just let the loop repeat
            // until retryCount == 0.
            //
            retryCount = 0;

            stmt = conn.createStatement();

            String query = "SELECT foo FROM bar ORDER BY baz";

            rs = stmt.executeQuery(query);

            while (rs.next()) {
            }

            rs.close();
            rs = null;

            stmt.close();
            stmt = null;

            conn.commit();
            conn.close();
            conn = null;

            transactionCompleted = true;
        } catch (SQLException sqlEx) {

            //
            // The two SQL states that are 'retry-able' are 08S01
            // for a communications error, and 40001 for deadlock.
            //
            // Only retry if the error was due to a stale connection,
            // communications problem or deadlock
            //
            String sqlState = sqlEx.getSQLState();

            if ("08S01".equals(sqlState) || "40001".equals(sqlState)) {
                retryCount--;
            } else {
                retryCount = 0;
            }
        } finally {
            if (rs != null) {
                try {
                    rs.close();
                }
            }
        }
    }
}
```

```

    } catch (SQLException sqlEx) {
        // You'd probably want to log this . . .
    }
}

if (stmt != null) {
    try {
        stmt.close();
    } catch (SQLException sqlEx) {
        // You'd probably want to log this as well . . .
    }
}

if (conn != null) {
    try {
        //
        // If we got here, and conn is not null, the
        // transaction should be rolled back, as not
        // all work has been done

        try {
            conn.rollback();
        } finally {
            conn.close();
        }
    } catch (SQLException sqlEx) {
        //
        // If we got an exception here, something
        // pretty serious is going on, so we better
        // pass it up the stack, rather than just
        // logging it. . .

        throw sqlEx;
    }
}

} while (!transactionCompleted && (retryCount > 0));
}

```

Note

Use of the `autoReconnect` option is not recommended because there is no safe method of reconnecting to the MySQL server without risking some corruption of the connection state or database state information. Instead, you should use a connection pool which will enable your application to connect to the MySQL server using an available connection from the pool. The `autoReconnect` facility is deprecated, and may be removed in a future release.

25.4.5.3.5: I'm trying to use JDBC-2.0 updatable result sets, and I get an exception saying my result set is not updatable.

Because MySQL does not have row identifiers, MySQL Connector/J can only update result sets that have come from queries on tables that have at least one primary key, the query must select every primary key and the query can only span one table (that is, no joins). This is outlined in the JDBC specification.

Note that this issue only occurs when using updatable result sets, and is caused because Connector/J is unable to guarantee that it can identify the correct rows within the result set to be updated without having a unique reference to each row. There is no requirement to have a unique field on a table if you are using `UPDATE` or `DELETE` statements on a table where you can individually specify the criteria to be matched using a `WHERE` clause.

25.4.5.3.6: I cannot connect to the MySQL server using Connector/J, and I'm sure the connection parameters are correct.

Make sure that the `skip-networking` option has not been enabled on your server. Connector/J must be able to communicate with your server over TCP/IP, named sockets are not supported. Also ensure that you are not filtering connections through a Firewall or other network security system. For more information, see [Section B.1.2.2, "Can't connect to \[local\] MySQL server"](#).

25.4.5.3.7: I am trying to connect to my MySQL server within my application, but I get the following error and stack trace:

```

java.net.SocketException
MESSAGE: Software caused connection abort: recv failed

STACKTRACE:

java.net.SocketException: Software caused connection abort: recv failed
at java.net.SocketInputStream.socketRead0(Native Method)
at java.net.SocketInputStream.read(Unknown Source)
at com.mysql.jdbc.MySqlIO.readFully(MySqlIO.java:1392)
at com.mysql.jdbc.MySqlIO.readPacket(MySqlIO.java:1414)
at com.mysql.jdbc.MySqlIO.doHandshake(MySqlIO.java:625)
at com.mysql.jdbc.Connection.createNewIO(Connection.java:1926)
at com.mysql.jdbc.Connection.<init>(Connection.java:452)
at com.mysql.jdbc.NonRegisteringDriver.connect(NonRegisteringDriver.java:411)

```

The error probably indicates that you are using an older version of the Connector/J JDBC driver (2.0.14 or 3.0.x) and you are trying

to connect to a MySQL server with version 4.1x or newer. The older drivers are not compatible with 4.1 or newer of MySQL as they do not support the newer authentication mechanisms.

It is likely that the older version of the Connector/J driver exists within your application directory or your `CLASSPATH` includes the older Connector/J package.

25.4.5.3.8: My application is deployed through JBoss and I am using transactions to handle the statements on the MySQL database. Under heavy loads I am getting a error and stack trace, but these only occur after a fixed period of heavy activity.

This is a JBoss, not Connector/J, issue and is connected to the use of transactions. Under heavy loads the time taken for transactions to complete can increase, and the error is caused because you have exceeded the predefined timeout.

You can increase the timeout value by setting the `TransactionTimeout` attribute to the `TransactionManagerService` within the `/conf/jboss-service.xml` file (pre-4.0.3) or `/deploy/jta-service.xml` for JBoss 4.0.3 or later. See `TransactionTimeout` within the JBoss wiki for more information.

25.4.5.3.9: When using gcj an java.io.CharConversionException is raised when working with certain character sequences.

This is a known issue with `gcj` which raises an exception when it reaches an unknown character or one it cannot convert. You should add `useJvmCharsetConverters=true` to your connection string to force character conversion outside of the `gcj` libraries, or try a different JDK.

25.4.5.3.10: Updating a table that contains a primary key that is either FLOAT or compound primary key that uses FLOAT fails to update the table and raises an exception.

Connector/J adds conditions to the `WHERE` clause during an `UPDATE` to check the old values of the primary key. If there is no match then Connector/J considers this a failure condition and raises an exception.

The problem is that rounding differences between supplied values and the values stored in the database may mean that the values never match, and hence the update fails. The issue will affect all queries, not just those from Connector/J.

To prevent this issue, use a primary key that does not use `FLOAT`. If you have to use a floating point column in your primary key use `DOUBLE` or `DECIMAL` types in place of `FLOAT`.

24.4.6. Connector/J Support

24.4.6.1. Connector/J Community Support

MySQL AB provides assistance to the user community by means of its mailing lists. For Connector/J related issues, you can get help from experienced users by using the MySQL and Java mailing list. Archives and subscription information is available online at <http://lists.mysql.com/java>.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See [Section 1.6.1, “MySQL Mailing Lists”](#).

Community support from experienced users is also available through the [JDBC Forum](#). You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See [Section 1.6.2, “MySQL Community Support at the MySQL Forums”](#).

24.4.6.2. How to Report Connector/J Bugs or Problems

The normal place to report bugs is <http://bugs.mysql.com/>, which is the address for our bugs database. This database is public, and can be browsed and searched by anyone. If you log in to the system, you will also be able to enter new reports.

If you have found a sensitive security bug in MySQL, you can send email to [<security@mysql.com>](mailto:security@mysql.com).

Writing a good bug report takes patience, but doing it right the first time saves time both for us and for yourself. A good bug report, containing a full test case for the bug, makes it very likely that we will fix the bug in the next release.

This section will help you write your report correctly so that you don't waste your time doing things that may not help us much or at all.

If you have a repeatable bug report, please report it to the bugs database at <http://bugs.mysql.com/>. Any bug that we are able to repeat has a high chance of being fixed in the next MySQL release.

To report other problems, you can use one of the MySQL mailing lists.

Remember that it is possible for us to respond to a message containing too much information, but not to one containing too little. People often omit facts because they think they know the cause of a problem and assume that some details don't matter.

A good principle is this: If you are in doubt about stating something, state it. It is faster and less troublesome to write a couple more lines in your report than to wait longer for the answer if we must ask you to provide information that was missing from the initial report.

The most common errors made in bug reports are (a) not including the version number of Connector/J or MySQL used, and (b) not fully describing the platform on which Connector/J is installed (including the JVM version, and the platform type and version number that MySQL itself is installed on).

This is highly relevant information, and in 99 cases out of 100, the bug report is useless without it. Very often we get questions like, “Why doesn't this work for me?” Then we find that the feature requested wasn't implemented in that MySQL version, or that a bug described in a report has already been fixed in newer MySQL versions.

Sometimes the error is platform-dependent; in such cases, it is next to impossible for us to fix anything without knowing the operating system and the version number of the platform.

If at all possible, you should create a repeatable, standalone testcase that doesn't involve any third-party classes.

To streamline this process, we ship a base class for testcases with Connector/J, named `'com.mysql.jdbc.util.BaseBugReport'`. To create a testcase for Connector/J using this class, create your own class that inherits from `com.mysql.jdbc.util.BaseBugReport` and override the methods `setUp()`, `tearDown()` and `runTest()`.

In the `setUp()` method, create code that creates your tables, and populates them with any data needed to demonstrate the bug.

In the `runTest()` method, create code that demonstrates the bug using the tables and data you created in the `setUp` method.

In the `tearDown()` method, drop any tables you created in the `setUp()` method.

In any of the above three methods, you should use one of the variants of the `getConnection()` method to create a JDBC connection to MySQL:

- `getConnection()` - Provides a connection to the JDBC URL specified in `getUrl()`. If a connection already exists, that connection is returned, otherwise a new connection is created.
- `getNewConnection()` - Use this if you need to get a new connection for your bug report (i.e. there's more than one connection involved).
- `getConnection(String url)` - Returns a connection using the given URL.
- `getConnection(String url, Properties props)` - Returns a connection using the given URL and properties.

If you need to use a JDBC URL that is different from `'jdbc:mysql:///test'`, override the method `getUrl()` as well.

Use the `assertTrue(boolean expression)` and `assertTrue(String failureMessage, boolean expression)` methods to create conditions that must be met in your testcase demonstrating the behavior you are expecting (vs. the behavior you are observing, which is why you are most likely filing a bug report).

Finally, create a `main()` method that creates a new instance of your testcase, and calls the `run` method:

```
public static void main(String[] args) throws Exception {
    new MyBugReport().run();
}
```

Once you have finished your testcase, and have verified that it demonstrates the bug you are reporting, upload it with your bug report to <http://bugs.mysql.com/>.

24.4.6.3. Connector/J Change History

The Connector/J Change History (Changelog) is located with the main Changelog for MySQL. See [Section E.6, “MySQL Connector/J Change History”](#).

24.5. MySQL Connector/MXJ

MySQL Connector/MXJ is a Java Utility package for deploying and managing a MySQL database. Deploying and using MySQL can be as easy as adding an additional parameter to the JDBC connection url, which will result in the database being started when the first connection is made. This makes it easy for Java developers to deploy applications which require a database by reducing installation barriers for their end-users.

MySQL Connector/MXJ makes the MySQL database appear to be a java-based component. It does this by determining what platform the system is running on, selecting the appropriate binary, and launching the executable. It will also optionally deploy an initial database, with any specified parameters.

Included are instructions for use with a JDBC driver and deploying as a JMX MBean to JBoss.

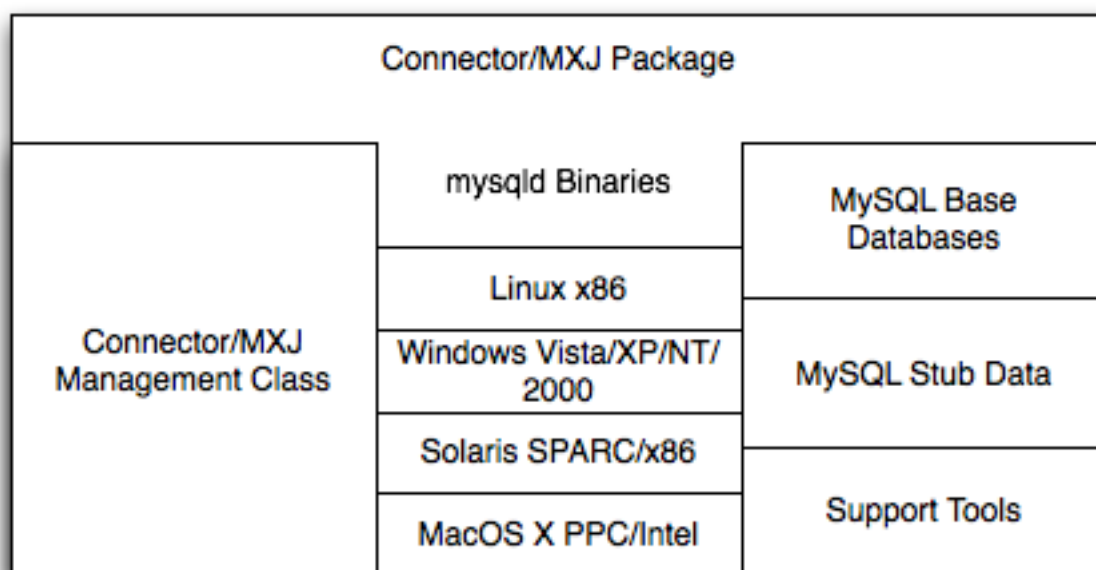

You can download sources and binaries from: <http://dev.mysql.com/downloads/connector/mxj/>

This is a beta release and feedback is welcome and encouraged.

Please send questions or comments to the [MySQL and Java mailing list](#).

24.5.1. Connector/MXJ Overview

Connector/MXJ consists of a Java class, a copy of the `mysqld` binary for a specific list of platforms, and associated files and support utilities. The Java class controls the initialization of an instance of the embedded `mysqld` binary, and the ongoing management of the `mysqld` process. The entire sequence and management can be controlled entirely from within Java using the Connector/MXJ Java classes. You can see an overview of the contents of the Connector/MXJ package in the figure below.

It is important to note that Connector/MXJ is not an embedded version of MySQL, or a version of MySQL written as part of a Java class. Connector/MXJ works through the use of an embedded, compiled binary of `mysqld` as would normally be used when deploying a standard MySQL installation.

It is the Connector/MXJ wrapper, support classes and tools, that enable Connector/MXJ to appear as a MySQL instance.

When Connector/MXJ is initialized, the corresponding `mysqld` binary for the current platform is extracted, along with a pre-configured data directory. Both are contained within the Connector/MXJ JAR file. The `mysqld` instance is then started, with any additional options as specified during the initialization, and the MySQL database becomes accessible.

Because Connector/MXJ works in combination with Connector/J, you can access and integrate with the MySQL instance through a JDBC connection. When you have finished with the server, the instance is terminated, and, by default, any data created during the session is retained within the temporary directory created when the instance was started.

Connector/MXJ and the embedded `mysqld` instance can be deployed in a number of environments where relying on an existing database, or installing a MySQL instance would be impossible, including CD-ROM embedded database applications and temporary database requirements within a Java-based application environment.

24.5.2. Connector/MXJ Versions

- Connector/MXJ 5.x, currently in beta status, includes `mysqld` version 5.x and includes binaries for Linux x86, Mac OS X PPC, Windows XP/NT/2000 x86 and Solaris SPARC. Connector/MXJ 5.x requires the Connector/J 5.x package.

The exact version of `mysqld` included depends on the version of Connector/MXJ

1. Connector/MXJ v5.0.3 included MySQL v5.0.22
 2. Connector/MXJ v5.0.4 includes MySQL v5.0.27 (Community) or MySQL v5.0.32 (Enterprise)
 3. Connector/MXJ v5.0.6 includes MySQL 5.0.37 (Community)
 4. Connector/MXJ v5.0.7 includes MySQL 5.0.41 (Community) or MySQL 5.0.42 (Enterprise)
 5. Connector/MXJ v5.0.8 includes MySQL 5.0.45 (Community) or MySQL 5.0.46 (Enterprise)
 6. Connector/MXJ v5.0.9 includes MySQL 5.0.51a (Community) or MySQL 5.0.54 (Enterprise)
- Connector/MXJ 1.x includes `mysqlld` version 4.1.13 and includes binaries for Linux x86, Windows XP/NT/2000 x86 and Solaris SPARC. Connector/MXJ 1.x requires the Connector/J 3.x package.

A summary of the different MySQL versions supplied with each Connector/MXJ release are shown in the table.

Connector/MXJ Version	MySQL Version(s)
5.0.8	5.0.45 (CS), 5.0.46 (ES)
5.0.7	5.0.41 (CS), 5.0.42 (ES)
5.0.6	5.0.37 (CS), 5.0.40 (ES)
5.0.5	5.0.37 (CS), 5.0.36 (ES)
5.0.4	5.0.27 (CS), 5.0.32 (ES)
5.0.3	5.0.22
5.0.2	5.0.19

This guide provides information on the Connector/MXJ 5.x release. For information on using the older releases, please see the documentation included with the appropriate distribution.

24.5.3. Connector/MXJ Installation

Connector/MXJ does not have a installation application or process, but there are some steps you can follow to make the installation and deployment of Connector/MXJ easier.

Before you start, there are some baseline requirements for

- Java Runtime Environment (v1.4.0 or newer) if you are only going to deploy the package.
- Java Development Kit (v1.4.0 or newer) if you want to build Connector/MXJ from source.
- Connector/J 5.0 or newer.

Depending on your target installation/deployment environment you may also require:

- JBoss - 4.0rc1 or newer
- Apache Tomcat - 5.0 or newer
- Sun's JMX reference implementation version 1.2.1 (from <http://java.sun.com/products/JavaManagement/>)

24.5.3.1. Supported Platforms

Connector/MXJ is compatible with any platform supporting Java and MySQL. By default, Connector/MXJ incorporates the `mysqlld` binary for a select number of platforms which differs by version. The following platforms have been tested and working as deployment platforms. Support for all the platforms listed below is not included by default.

- Linux (i386)
- FreeBSD (i386)

- Windows NT (x86), Windows 2000 (x86), Windows XP (x86), Windows Vista (x86)
- Solaris 8, SPARC 32-bit (compatible with Solaris 8, Solaris 9 and Solaris 10 on SPARC 32-bit and 64-bit platforms)
- Mac OS X (PowerPC and Intel)

The Connector/MXJ 5.0.8 release includes `mysqld` binaries for the following platforms by as standard:

- Linux (i386)
- Windows (x86), compatible with Windows NT, Windows 2000, Windows XP , Windows Vista
- Solaris 8, SPARC 32-bit (compatible with Solaris 8, Solaris 9 and Solaris 10 on SPARC 32-bit and 64-bit platforms)
- Mac OS X (PowerPC and Intel)

For more information on packaging your own Connector/MXJ with the platforms you require, see [Section 24.5.6.1, “Creating your own Connector/MXJ Package”](#)

24.5.3.2. Connector/MXJ Base Installation

Because there is no formal installation process, the method, installation directory, and access methods you use for Connector/MXJ are entirely up to your individual requirements.

To perform a basic installation, choose a target directory for the files included in the Connector/MXJ package. On Unix/Linux systems you may opt to use a directory such as `/usr/local/connector-mxj`; On Windows, you may want to install the files in the base directory, `C:\Connector-MXJ`, or within the `Program Files` directory.

To install the files, for a Connector/MXJ 5.0.4 installation:

1. Download the Connector/MXJ package, either in Tar/Gzip format (ideal for Unix/Linux systems) or Zip format (Windows).
2. Extract the files from the package. This will create a directory `mysql-connector-mxj-gpl-[ver]`. Copy and optionally rename this directory to your desired location.
3. For best results, you should update your global `CLASSPATH` variable with the location of the required `jar` files.

Within Unix/Linux you can do this globally by editing the global shell profile, or on a user by user basis by editing their individual shell profile.

On Windows 2000, Windows NT and Windows XP, you can edit the global `CLASSPATH` by editing the `Environment Variables` configured through the `System` control panel.

For Connector/MXJ 5.0.6 and later you need the following JAR files in your `CLASSPATH`:

1. `mysql-connector-mxj-gpl-[ver].jar` — contains the main Connector/MXJ classes.
2. `mysql-connector-mxj-gpl-[ver]-db-files.jar` — contains the embedded `mysqld` and database files.
3. `aspectjrt.jar` — the AspectJ runtime library, located in `lib/aspectjrt.jar` in the Connector/MXJ package.
4. `mysql-connector-java-[ver]-bin.jar` — Connector/J, see [Section 24.4, “MySQL Connector/J”](#).

For Connector/MXJ 5.0.4 and later you need the following JAR files in your `CLASSPATH`:

1. `connector-mxj.jar` — contains the main Connector/MXJ classes.
2. `connector-mxj-db-files.jar` — contains the embedded `mysqld` and database files.
3. `aspectjrt.jar` — the AspectJ runtime library, located in `lib/aspectjrt.jar` in the Connector/MXJ package.
4. `mysql-connector-mxj-gpl-[ver].jar` — Connector/J, see [Section 24.4, “MySQL Connector/J”](#).

For Connector/MXJ 5.0.3 and earlier, you need the following JAR files:

1. `connector-mxj.jar`
2. `aspectjrt.jar` — the AspectJ runtime library, located in `lib/aspectjrt.jar` in the Connector/MXJ package.
3. `mysql-connector-mxj-gpl-[ver].jar` — Connector/J, see [Section 24.4, “MySQL Connector/J”](#).

24.5.3.3. Connector/MXJ Quick Start Guide

Once you have extracted the Connector/MXJ and Connector/J components you can run one of the sample applications that initiates a MySQL instance. You can test the installation by running the `ConnectorMXJUrlTestExample`:

```
$ java ConnectorMXJUrlTestExample
jdbc:mysql:mxj://localhost:3336/our_test_app?server.baseDir>
  =/var/tmp/test-mxj&createDatabaseIfNotExist=true&server.initialize-user=true
[/var/tmp/test-mxj/bin/mysqld][--no-defaults][--port=3336][--socket=mysql.sock]>
  [--basedir=/var/tmp/test-mxj][--datadir=/var/tmp/test-mxj/data]>
  [--pid-file=/var/tmp/test-mxj/data/MysqldResource.pid]
[MysqldResource] launching mysqld (driver_launched_mysqld_1)
InnoDB: The first specified data file ./ibdata1 did not exist:
InnoDB: a new database to be created!
080220 9:40:20 InnoDB: Setting file ./ibdata1 size to 10 MB
InnoDB: Database physically writes the file full: wait...
080220 9:40:20 InnoDB: Log file ./ib_logfile0 did not exist: new to be created
InnoDB: Setting log file ./ib_logfile0 size to 5 MB
InnoDB: Database physically writes the file full: wait...
080220 9:40:20 InnoDB: Log file ./ib_logfile1 did not exist: new to be created
InnoDB: Setting log file ./ib_logfile1 size to 5 MB
InnoDB: Database physically writes the file full: wait...
InnoDB: Doublewrite buffer not found: creating new
InnoDB: Doublewrite buffer created
InnoDB: Creating foreign key constraint system tables
InnoDB: Foreign key constraint system tables created
080220 9:40:21 InnoDB: Started; log sequence number 0 0
080220 9:40:21 [Note] /var/tmp/test-mxj/bin/mysqld: ready for connections.
Version: '5.0.51a' socket: 'mysql.sock' port: 3336 MySQL Community Server (GPL)
[MysqldResource] mysqld running as process: 2238
-----
SELECT VERSION()
-----
5.0.51a
-----
[MysqldResource] stopping mysqld (process: 2238)
080220 9:40:27 [Note] /var/tmp/test-mxj/bin/mysqld: Normal shutdown

080220 9:40:27 InnoDB: Starting shutdown...
080220 9:40:29 InnoDB: Shutdown completed; log sequence number 0 43655
080220 9:40:29 [Note] /var/tmp/test-mxj/bin/mysqld: Shutdown complete

[MysqldResource] shutdown complete
```

The above output shows an instance of MySQL starting, the necessary files being created (log files, InnoDB data files) and the MySQL database entering the running state. The instance is then shutdown by Connector/MXJ before the example terminates.

24.5.3.4. Deploying Connector/MXJ using Driver Launch

Connector/MXJ and Connector/J work together to enable you to launch an instance of the `mysqld` server through the use of a keyword in the JDBC connection string. Deploying Connector/MXJ within a Java application can be automated through this method, making the deployment of Connector/MXJ a simple process:

1. Download and unzip Connector/MXJ, add `mysql-connector-mxj-gpl-[ver].jar` to the `CLASSPATH`.
If you are using Connector/MXJ v5.0.4 or later you will also need to add the `mysql-connector-mxj-gpl-[ver]-db-files.jar` file to your `CLASSPATH`.
2. To the JDBC connection string, embed the `mxj` keyword, for example: `jdbc:mysql:mxj://localhost:PORT/DB-NAME`.

For more details, see [Section 24.5.4, “Connector/MXJ Configuration”](#).

24.5.3.5. Deploying Connector/MXJ within JBoss

For deployment within a JBoss environment, you must configure the JBoss environment to use the Connector/MXJ component within the JDBC parameters:

1. Download Connector/MXJ and copy the `mysql-connector-mxj-gpl-[ver].jar` file to the `$_JBASS_HOME/server/default/lib` directory.

If you are using Connector/MXJ v5.0.4 or later you will also need to copy the `mysql-connector-mxj-gpl-[ver]-db-files.jar` file to `$_JBASS_HOME/server/default/lib`.
2. Download Connector/J and copy the `mysql-connector-java-5.1.5-bin.jar` file to the `$_JBASS_HOME/server/default/lib` directory.
3. Create an MBean service xml file in the `$_JBASS_HOME/server/default/deploy` directory with any attributes set, for instance the `datadir` and `autostart`.
4. Set the JDBC parameters of your web application to use:

```
String driver = "com.mysql.jdbc.Driver";
String url = "jdbc:mysql:///test?propertiesTransform="+
            "com.mysql.management.jmx.ConnectorMXJPropertiesTransform";
String user = "root";
String password = "";
Class.forName(driver);
Connection conn = DriverManager.getConnection(url, user, password);
```

You may wish to create a separate users and database table spaces for each application, rather than using "root and test".

We highly suggest having a routine backup procedure for backing up the database files in the `datadir`.

24.5.3.6. Verifying Installation using JUnit

The best way to ensure that your platform is supported is to run the JUnit tests. These will test the Connector/MXJ classes and the associated components.

24.5.3.6.1. JUnit Test Requirements

The first thing to do is make sure that the components will work on the platform. The `MysqldResource` class is really a wrapper for a native version of MySQL, so not all platforms are supported. At the time of this writing, Linux on the i386 architecture has been tested and seems to work quite well, as does OS X v10.3. There has been limited testing on Windows and Solaris.

Requirements:

1. JDK-1.4 or newer (or the JRE if you aren't going to be compiling the source or JSPs).
2. MySQL Connector/J version 5.0 or newer (from <http://dev.mysql.com/downloads/connector/j/>) installed and available via your CLASSPATH.
3. The `javax.management` classes for JMX version 1.2.1, these are present in the following application servers:
 - JBoss - 4.0rc1 or newer.
 - Apache Tomcat - 5.0 or newer.
 - Sun's JMX reference implementation version 1.2.1 (from <http://java.sun.com/products/JavaManagement/>).
4. JUnit 3.8.1 (from <http://www.junit.org/>).

If building from source, All of the requirements from above, plus:

1. Ant version 1.5 or newer (download from <http://ant.apache.org/>).

24.5.3.6.2. Running the JUnit Tests

1. The tests attempt to launch MySQL on the port 3336. If you have a MySQL running, it may conflict, but this isn't very likely because the default port for MySQL is 3306. However, You may set the "c-mxj_test_port" Java property to a port of your choosing. Alternatively, you may wish to start by shutting down any instances of MySQL you have running on the target machine.

The tests suppress output to the console by default. For verbose output, you may set the "c-mxj_test_silent" Java property to

"false".

2. To run the JUnit test suite, the `$CLASSPATH` must include the following:
 - JUnit
 - JMX
 - Connector/J
 - MySQL Connector/MXJ
3. If `connector-mxj.jar` is not present in your download, unzip MySQL Connector/MXJ source archive.

```
cd mysqljdjmx
ant dist
```

Then add `$TEMP/cmxj/stage/connector-mxj/connector-mxj.jar` to the `CLASSPATH`.

4. if you have `junit`, execute the unit tests. From the command line, type:

```
java com.mysql.management.AllTestsSuite
```

The output should look something like this:

```
.....
.....
.....
Time: 259.438
OK (101 tests)
```

Note that the tests are a bit slow near the end, so please be patient.

24.5.4. Connector/MXJ Configuration

24.5.4.1. Running as part of the JDBC Driver

A feature of the MySQL Connector/J JDBC driver is the ability to specify a connection to an embedded Connector/MXJ instance through the use of the `mxj` keyword in the JDBC connection string.

In the following example, we have a program which creates a connection, executes a query, and prints the result to the `System.out`. The MySQL database will be deployed and started as part of the connection process, and shutdown as part of the finally block.

You can find this file in the Connector/MXJ package as `src/ConnectorMXJUrlTestExample.java`.

```
import java.io.File;
import java.sql.Connection;
import java.sql.DriverManager;

import com.mysql.management.driverlaunched.ServerLauncherSocketFactory;
import com.mysql.management.util.QueryUtil;

public class ConnectorMXJUrlTestExample {
    public static String DRIVER = "com.mysql.jdbc.Driver";

    public static String JAVA_IO_TMPDIR = "java.io.tmpdir";

    public static void main(String[] args) throws Exception {
        File ourAppDir = new File(System.getProperty(JAVA_IO_TMPDIR));
        File databaseDir = new File(ourAppDir, "test-mxj");
        int port = Integer.parseInt(System.getProperty("c-mxj_test_port", "3336"));
        String dbName = "our_test_app";

        String url = "jdbc:mysql:mxj://localhost:" + port + "/" + dbName //
            + "?" + "server.basedir=" + databaseDir //
            + "&" + "createDatabaseIfNotExist=true" //
            + "&" + "server.initialize-user=true" //
            ;

        System.out.println(url);

        String userName = "alice";
        String password = "q93uti0opwhkd";
```

```

Class.forName(DRIVER);
Connection conn = null;
try {
    conn = DriverManager.getConnection(url, userName, password);
    String sql = "SELECT VERSION()";
    String queryForString = new QueryUtil(conn).queryForString(sql);

    System.out.println("-----");
    System.out.println(sql);
    System.out.println("-----");
    System.out.println(queryForString);
    System.out.println("-----");
    System.out.flush();
    Thread.sleep(100); // wait for System.out to finish flush
} finally {
    try {
        if (conn != null)
            conn.close();
    } catch (Exception e) {
        e.printStackTrace();
    }
}

ServerLauncherSocketFactory.shutdown(databaseDir, null);
}
}

```

To run the above program, be sure to have connector-mxj.jar and Connector/J in the CLASSPATH. Then type:

```
java ConnectorMXJTestExample
```

24.5.4.2. Running within a Java Object

If you have a java application and wish to “embed” a MySQL database, make use of the [com.mysql.management.MysqldResource](#) class directly. This class may be instantiated with the default (no argument) constructor, or by passing in a [java.io.File](#) object representing the directory you wish the server to be “unzipped” into. It may also be instantiated with printstreams for “stdout” and “stderr” for logging.

Once instantiated, a [java.util.Map](#), the object will be able to provide a [java.util.Map](#) of server options appropriate for the platform and version of MySQL which you will be using.

The [MysqldResource](#) enables you to “start” MySQL with a [java.util.Map](#) of server options which you provide, as well as “shutdown” the database. The following example shows a simplistic way to embed MySQL in an application using plain java objects.

You can find this file in the Connector/MXJ package as [src/ConnectorMXJObjectTestExample.java](#).

```

import java.io.File;
import java.sql.Connection;
import java.sql.DriverManager;
import java.util.HashMap;
import java.util.Map;

import com.mysql.management.MysqldResource;
import com.mysql.management.MysqldResourceI;
import com.mysql.management.util.QueryUtil;

public class ConnectorMXJObjectTestExample {
    public static final String DRIVER = "com.mysql.jdbc.Driver";

    public static final String JAVA_IO_TMPDIR = "java.io.tmpdir";

    public static void main(String[] args) throws Exception {
        File ourAppDir = new File(System.getProperty(JAVA_IO_TMPDIR));
        File databaseDir = new File(ourAppDir, "mysql-mxj");
        int port = Integer.parseInt(System.getProperty("c-mxj_test_port",
            "3336"));
        String userName = "alice";
        String password = "q93uti0opwhkd";

        MysqldResource mysqldResource = startDatabase(databaseDir, port,
            userName, password);

        Class.forName(DRIVER);
        Connection conn = null;
        try {
            String dbName = "our_test_app";
            String url = "jdbc:mysql://localhost:" + port + "/" + dbName //
                + "?" + "createDatabaseIfNotExist=true//";
            ;
            conn = DriverManager.getConnection(url, userName, password);
            String sql = "SELECT VERSION()";
            String queryForString = new QueryUtil(conn).queryForString(sql);

            System.out.println("-----");

```

```

        System.out.println(sql);
        System.out.println("-----");
        System.out.println(queryForString);
        System.out.println("-----");
        System.out.flush();
        Thread.sleep(100); // wait for System.out to finish flush
    } finally {
        try {
            if (conn != null) {
                conn.close();
            }
        } catch (Exception e) {
            e.printStackTrace();
        }
        try {
            mysqlResource.shutdown();
        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}

public static MysqlResource startDatabase(File databaseDir, int port,
    String userName, String password) {
    MysqlResource mysqlResource = new MysqlResource(databaseDir);

    Map database_options = new HashMap();
    database_options.put(MysqlResourceI.PORT, Integer.toString(port));
    database_options.put(MysqlResourceI.INITIALIZE_USER, "true");
    database_options.put(MysqlResourceI.INITIALIZE_USER_NAME, userName);
    database_options.put(MysqlResourceI.INITIALIZE_PASSWORD, password);

    mysqlResource.start("test-mysql-thread", database_options);

    if (!mysqlResource.isRunning()) {
        throw new RuntimeException("MySQL did not start.");
    }

    System.out.println("MySQL is running.");

    return mysqlResource;
}
}

```

24.5.4.3. Setting server options

Of course there are many options we may wish to set for a MySQL database. These options may be specified as part of the JDBC connection string simply by prefixing each server option with `server..` In the following example we set two driver parameters and two server parameters:

```

String url = "jdbc:mysql://" + hostColonPort + "/"
    + "?"
    + "cacheServerConfiguration=true"
    + "&"
    + "useLocalSessionState=true"
    + "&"
    + "server.basedir=/opt/myapp/db"
    + "&"
    + "server.datadir=/mnt/bigdisk/myapp/data";

```

Starting with Connector/MXJ 5.0.6 you can use the `initializer-user` property to a connection string. If set to true, the default anonymous and root users will be removed and the user/password combination from the connection URL will be used to create a new user. For example:

```

String url = "jdbc:mysql:mxj://localhost:" + port
    + "/alice_db"
    + "?server.datadir=" + dataDir.getPath()
    + "&server.initialize-user=true"
    + "&createDatabaseIfNotExist=true"
    ;

```

24.5.5. Connector/MXJ Reference

The following sections include detailed information on the different API interfaces to Connector/MXJ.

24.5.5.1. MysqlResource Constructors

The `MysqlResource` class supports three different constructor forms:

- `public MysqlResource(File baseDir, File dataDir, String mysqlVersionString, Print-`

```
Stream out, PrintStream err)
```

Enables you to set the base directory, data directory, select a server by its version string, standard out and standard error.

- `public MysqlDResource(File baseDir, File dataDir, String mysqlVersionString)`

Enables you to set the base directory, data directory and select a server by its version string. Output for standard out and standard err are directed to System.out and System.err.

- `public MysqlDResource(File baseDir, File dataDir)`

Enables you to set the base directory and data directory. The default MySQL version is selected, and output for standard out and standard err are directed to System.out and System.err.

- `public MysqlDResource(File baseDir);`

Allows the setting of the "basedir" to deploy the MySQL files to. Output for standard out and standard err are directed to System.out and System.err.

- `public MysqlDResource();`

The basedir is defaulted to a subdirectory of the java.io.tmpdir. Output for standard out and standard err are directed to System.out and System.err;

24.5.5.2. MysqlDResource Methods

MysqlDResource API includes the following methods:

- `void start(String threadName, Map mysqlDArgs);`

Deploys and starts MySQL. The "threadName" string is used to name the thread which actually performs the execution of the MySQL command line. The map is the set of arguments and their values to be passed to the command line.

- `void shutdown();`

Shuts down the MySQL instance managed by the MysqlDResource object.

- `Map getServerOptions();`

Returns a map of all the options and their current (or default, if not running) options available for the MySQL database.

- `boolean isRunning();`

Returns true if the MySQL database is running.

- `boolean isReadyForConnections();`

Returns true once the database reports that is ready for connections.

- `void setKillDelay(int millis);`

The default "Kill Delay" is 30 seconds. This represents the amount of time to wait between the initial request to shutdown and issuing a "force kill" if the database has not shutdown by itself.

- `void addCompletionListenser(Runnable listener);`

Allows for applications to be notified when the server process completes. Each "listener" will be fired off in its own thread.

- `String getVersion();`

Returns the version of MySQL.

- `void setVersion(int MajorVersion, int minorVersion, int patchLevel);`

The standard distribution comes with only one version of MySQL packaged. However, it is possible to package multiple versions, and specify which version to use.

24.5.6. Connector/MXJ Notes and Tips

This section contains notes and tips on using the Connector/MXJ component within your applications.

24.5.6.1. Creating your own Connector/MXJ Package

If you want to create a custom Connector/MXJ package that includes a specific `mysqld` version or platform then you must extract and rebuild the `mysql-connector-mxj.jar` (Connector/MXJ v5.0.3 or earlier) or `mysql-connector-mxj-gpl-[ver]-db-files.jar` (Connector/MXJ v5.0.4 or later) file.

First, you should create a new directory into which you can extract the current `connector-mxj.jar`:

```
shell> mkdir custom-mxj
shell> cd custom-mxj
shell> jar -xf connector-mxj.jar
shell> ls
5-0-22/
ConnectorMXJObjectTestExample.class
ConnectorMXJUrlTestExample.class
META-INF/
TestDb.class
com/
kill.exe
```

If you are using Connector/MXJ v5.0.4 or later, you should unpack the `connector-mxj-db-files.jar`:

```
shell> mkdir custom-mxj
shell> cd custom-mxj
shell> jar -xf connector-mxj-db-files.jar
shell> ls
5-0-51a/
META-INF/
connector-mxj.properties
```

The MySQL version directory, `5-0-22` or `5-0-51a` in the preceding examples, contains all of the files used to create an instance of MySQL when Connector/MXJ is executed. All of the files in this directory are required for each version of MySQL that you want to embed. Note as well the format of the version number, which uses hyphens instead of periods to separate the version number components.

Within the version specific directory are the platform specific directories, and archives of the `data` and `share` directory required by MySQL for the various platforms. For example, here is the listing for the default Connector/MXJ package:

```
shell>> ls
Linux-i386/
META-INF/
Mac_OS_X-ppc/
SunOS-sparc/
Win-x86/
com/
data_dir.jar
share_dir.jar
win_share_dir.jar
```

Platform specific directories are listed by their OS and platform - for example the `mysqld` for Mac OS X PowerPC is located within the `Mac_OS_X-ppc` directory. You can delete directories from this location that you do not require, and add new directories for additional platforms that you want to support.

To add a platform specific `mysqld`, create a new directory with the corresponding name for your operating system/platform. For example, you could add a directory for Mac OS X/Intel using the directory `Mac_OS_X-i386`.

On Unix systems, you can determine the platform using `uname`:

```
shell> uname -p
i386
```

In Connector/MXJ v5.0.9 and later, an additional `platform-map.properties` file is used to associate a specific platform and operating system combination with the directory in which the `mysqld` for that combination is located. The determined operating system and platform are on the left, and the directory name where the appropriate `mysqld` is located is on the right. You can see a sample of the file below:

```
Linux-i386=Linux-i386
Linux-x86=Linux-i386
Linux-i686=Linux-i386
Linux-x86_64=Linux-i386
Linux-ia64=Linux-i386

#Linux-ppc=Linux-ppc
#Linux-ppc64=Linux-ppc

Mac_OS_X-i386=Mac_OS_X-i386
Mac_OS_X-ppc=Mac_OS_X-ppc
```

```
Rhapsody-PowerPC=Mac_OS_X-ppc
#Mac_OS-PowerPC=
#macos-PowerPC=
#MacOS-PowerPC=

SunOS-sparc=SunOS-sparc
Solaris-sparc=SunOS-sparc
SunOS-x86=SunOS-x86
Solaris-x86=SunOS-x86

FreeBSD-x86=FreeBSD-x86

Windows_Vista-x86=Win-x86
Windows_2003-x86=Win-x86
Windows_XP-x86=Win-x86
Windows_2000-x86=Win-x86
Windows_NT-x86=Win-x86
Windows_NT_(unknown)-x86=Win-x86
```

Now you need to download or compile `mysqld` for the MySQL version and platform you want to include in your custom `connector-mxj.jar` package into the new directory.

Create a file called `version.txt` in the OS/platform directory you have just created that contains the version string/path of the `mysqld` binary. For example:

```
mysql-5.0.22-osx10.3-i386/bin/mysqld
```

You can now recreate the `connector-mxj.jar` file with the added `mysqld`:

```
shell> cd custom-mxj
shell> jar -cf ../connector-mxj.jar *
```

For Connector/MXJ v5.0.4 and later, you should repackage to the `connector-mxj-db-files.jar`:

```
shell> cd custom-mxj
shell> jar -cf ../mysql-connector-mxj-gpl-[ver]-db-files.jar *
```

You should test this package using the steps outlined in [Section 24.5.3.3, “Connector/MXJ Quick Start Guide”](#).

Note

Because the `mysql-connector-mxj-gpl-[ver]-db-files.jar` file is separate from the main Connector/MXJ classes you can distribute different `mysql-connector-mxj-gpl-[ver]-db-files.jar` files to different hosts or for different projects without having to create a completely new main `mysql-connector-mxj-gpl-[ver].jar` file for each one.

24.5.6.2. Deploying Connector/MXJ with a pre-configured database

To include a pre-configured/populated database within your Connector/MXJ JAR file you must create a custom `data_dir.jar` file, as included within the main `connector-mxj.jar` (Connector/MXJ 5.0.3 or earlier) or `mysql-connector-mxj-gpl-[ver]-db-files.jar` (Connector/MXJ 5.0.4 or later) file:

1. First extract the `connector-mxj.jar` or `mysql-connector-gpl-[ver]-db-files.jar` file, as outlined in the previous section (see [Section 24.5.6.1, “Creating your own Connector/MXJ Package”](#)).
2. First, create your database and populate the database with the information you require in an existing instance of MySQL - including Connector/MXJ instances. Data file formats are compatible across platforms.
3. Shutdown the instance of MySQL.
4. Create a JAR file of the data directory and databases that you want to include your Connector/MXJ package. You should include the `mysql` database, which includes user authentication information, in addition to the specific databases you want to include. For example, to create a JAR of the `mysql` and `mxjtest` databases:

```
shell> jar -cf ../data_dir.jar mysql mxjtest
```

5. For Connector/MXJ 5.0.3 or earlier, copy the `data_dir.jar` file into the extracted `connector-mxj.jar` directory, and then create an archive for `connector-mxj.jar`.

For Connector/MXJ 5.0.4 or later, copy the `data_dir.jar` file into the extracted `mysql-connector-mxj-gpl-[ver]-db-files.jar` directory, and then create an archive for `mysql-connector-mxj-db-gpl-[ver]--files.jar`.

Note that if you are create databases using the InnoDB engine, you must include the `ibdata.*` and `ib_logfile*` files within the `data_dir.jar` archive.

24.5.6.3. Running within a JMX Agent (custom)

As a JMX MBean, MySQL Connector/MXJ requires a JMX v1.2 compliant MBean container, such as JBoss version 4. The MBean will uses the standard JMX management APIs to present (and allow the setting of) parameters which are appropriate for that platform.

If you are not using the SUN Reference implementation of the JMX libraries, you should skip this section. Or, if you are deploying to JBoss, you also may wish to skip to the next section.

We want to see the `MysqldDynamicMBean` in action inside of a JMX agent. In the `com.mysql.management.jmx.sunri` package is a custom JMX agent with two MBeans:

1. the `MysqldDynamicMBean`, and
2. a `com.sun.jdmk.comm.HtmlAdaptorServer`, which provides a web interface for manipulating the beans inside of a JMX agent.

When this very simple agent is started, it will allow a MySQL database to be started and stopped with a web browser.

1. Complete the testing of the platform as above.
 - current JDK, JUnit, Connector/J, MySQL Connector/MXJ
 - this section *requires* the SUN reference implementation of JMX
 - `PATH`, `JAVA_HOME`, `ANT_HOME`, `CLASSPATH`
2. If not building from source, skip to next step

rebuild with the "sunri.present"

```
ant -Dsunri.present=true dist
re-run tests:
java junit.textui.TestRunner com.mysql.management.AllTestsSuite
```

3. launch the test agent from the command line:

```
java com.mysql.management.jmx.sunri.MysqldTestAgentSunHtmlAdaptor &
```

4. from a browser:

```
http://localhost:9092/
```

5. under `MysqldAgent`,

```
select "name=mysqlld"
```

6. Observe the MBean View
7. scroll to the bottom of the screen press the `STARTMYSQLD` button
8. click [Back to MBean View](#)
9. scroll to the bottom of the screen press `STOPMYSQLD` button
10. kill the java process running the Test Agent (jmx server)

24.5.6.4. Deployment in a standard JMX Agent environment (JBoss)

Once there is confidence that the MBean will function on the platform, deploying the MBean inside of a standard JMX Agent is the next step. Included are instructions for deploying to JBoss.

1. Ensure a current version of java development kit (v1.4.x), see above.
 - Ensure `JAVA_HOME` is set (JBoss requires `JAVA_HOME`)
 - Ensure `JAVA_HOME/bin` is in the `PATH` (You will NOT need to set your `CLASSPATH`, nor will you need any of the jars used in the previous tests).
2. Ensure a current version of JBoss (v4.0RC1 or better)

```
http://www.jboss.org/index.html
select "Downloads"
select "jboss-4.0.zip"
pick a mirror
unzip ~/dload/jboss-4.0.zip
create a JBOSS_HOME environment variable set to the unzipped directory
unix only:
cd $JBOSS_HOME/bin
chmod +x *.sh
```

3. Deploy (copy) the `connector-mxj.jar` to `$JBOSS_HOME/server/default/lib`.
4. Deploy (copy) `mysql-connector-java-3.1.4-beta-bin.jar` to `$JBOSS_HOME/server/default/lib`.
5. Create a `mxjtest.war` directory in `$JBOSS_HOME/server/default/deploy`.
6. Deploy (copy) `index.jsp` to `$JBOSS_HOME/server/default/deploy/mxjtest.war`.
7. Create a `mysqld-service.xml` file in `$JBOSS_HOME/server/default/deploy`.

```
<?xml version="1.0" encoding="UTF-8"?>
<server>
  <mbean code="com.mysql.management.jmx.jboss.JBossMysqldDynamicMBean"
    name="mysql:type=service,name=mysqld">
    <attribute name="datadir">/tmp/xxx_data_xxx</attribute>
    <attribute name="autostart">true</attribute>
  </mbean>
</server>
```

8. Start jboss:
 - on unix: `$JBOSS_HOME/bin/run.sh`
 - on windows: `%JBOSS_HOME%\bin\run.bat`

Be ready: JBoss sends a lot of output to the screen.
9. When JBoss seems to have stopped sending output to the screen, open a web browser to: `http://localhost:8080/jmx-console`
10. Scroll down to the bottom of the page in the `mysql` section, select the bulleted `mysqld` link.
11. Observe the JMX MBean View page. MySQL should already be running.
12. (If "autostart=true" was set, you may skip this step.) Scroll to the bottom of the screen. You may press the INVOKE button to stop (or start) MySQL observe `Operation completed successfully without a return value`. Click `Back to MBean View`
13. To confirm MySQL is running, open a web browser to `http://localhost:8080/mxjtest/` and you should see that

```
SELECT 1
```

returned with a result of

14. Guided by the `$JBOSS_HOME/server/default/deploy/mxjtest.war/index.jsp` you will be able to use MySQL in your Web Application. There is a `test` database and a `root` user (no password) ready to experiment with. Try creating a table, inserting some rows, and doing some selects.
15. Shut down MySQL. MySQL will be stopped automatically when JBoss is stopped, or: from the browser, scroll down to the bottom of the MBean View press the stop service INVOKE button to halt the service. Observe `Operation completed successfully without a return value`. Using `ps` or `task manager` see that MySQL is no longer running

As of 1.0.6-beta version is the ability to have the MBean start the MySQL database upon start up. Also, we've taken advantage of the JBoss life-cycle extension methods so that the database will gracefully shut down when JBoss is shutdown.

24.5.7. Connector/MXJ Support

There are a wide variety of options available for obtaining support for using Connector/MXJ. You should contact the Connector/MXJ community for help before reporting a potential bug or problem. See [Section 24.5.7.1, “Connector/MXJ Community Support”](#).

24.5.7.1. Connector/MXJ Community Support

MySQL AB provides assistance to the user community by means of a number of mailing lists and web based forums.

You can find help and support through the [MySQL and Java](#) mailing list.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See [Section 1.6.1, “MySQL Mailing Lists”](#).

Community support from experienced users is also available through the [MyODBC Forum](#). You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See [Section 1.6.2, “MySQL Community Support at the MySQL Forums”](#).

24.5.7.2. How to Report Connector/MXJ Problems

If you encounter difficulties or problems with Connector/MXJ, contact the Connector/MXJ community [Section 24.5.7.1, “Connector/MXJ Community Support”](#).

If reporting a problem, you should ideally include the following information with the email:

- Operating system and version
- Connector/MXJ version
- MySQL server version
- Copies of error messages or other unexpected output
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

If you believe the problem to be a bug, then you must report the bug through <http://bugs.mysql.com/>.

24.5.7.3. Connector/MXJ Change History

The Connector/MXJ Change History (Changelog) is located with the main Changelog for MySQL. See [Section E.7, “MySQL Connector/MXJ Change History”](#).

24.6. libmysqld, the Embedded MySQL Server Library

The embedded MySQL server library is NOT part of MySQL 5.0. It is part of previous editions and will be included in future versions, starting with MySQL 5.1. You can find appropriate documentation in the corresponding manuals for these versions. In this manual, only an overview of the embedded library is provided.

The embedded MySQL server library makes it possible to run a full-featured MySQL server inside a client application. The main benefits are increased speed and more simple management for embedded applications.

The embedded server library is based on the client/server version of MySQL, which is written in C/C++. Consequently, the embedded server also is written in C/C++. There is no embedded server available in other languages.

The API is identical for the embedded MySQL version and the client/server version. To change an old threaded application to use the embedded library, you normally only have to add calls to the following functions:

Function	When to Call
<code>mysql_library_init()</code>	Should be called before any other MySQL function is called, preferably early in the <code>main()</code> function.

<code>mysql_library_end()</code>	Should be called before your program exits.
<code>mysql_thread_init()</code>	Should be called in each thread you create that accesses MySQL.
<code>mysql_thread_end()</code>	Should be called before calling <code>pthread_exit()</code>

Then you must link your code with `libmysqld.a` instead of `libmysqlclient.a`. To ensure binary compatibility between your application and the server library, be sure to compile your application against headers for the same series of MySQL that was used to compile the server library. For example, if `libmysqld` was compiled against MySQL 4.1 headers, do not compile your application against MySQL 5.1 headers, or vice versa.

The `mysql_library_xxx()` functions are also included in `libmysqlclient.a` to allow you to change between the embedded and the client/server version by just linking your application with the right library. See [Section 24.7.3.40](#), “`mysql_library_init()`”.

One difference between the embedded server and the standalone server is that for the embedded server, authentication for connections is disabled by default. To use authentication for the embedded server, specify the `-with-embedded-privilege-control` option when you invoke `configure` to configure your MySQL distribution.

24.7. MySQL C API

The C API code is distributed with MySQL. It is included in the `mysqlclient` library and allows C programs to access a database.

Many of the clients in the MySQL source distribution are written in C. If you are looking for examples that demonstrate how to use the C API, take a look at these clients. You can find these in the `clients` directory in the MySQL source distribution.

Most of the other client APIs (all except Connector/J and Connector/NET) use the `mysqlclient` library to communicate with the MySQL server. This means that, for example, you can take advantage of many of the same environment variables that are used by other client programs, because they are referenced from the library. See [Chapter 4, MySQL Programs](#), for a list of these variables.

The client has a maximum communication buffer size. The size of the buffer that is allocated initially (16KB) is automatically increased up to the maximum size (the maximum is 16MB). Because buffer sizes are increased only as demand warrants, simply increasing the default maximum limit does not in itself cause more resources to be used. This size check is mostly a check for erroneous statements and communication packets.

The communication buffer must be large enough to contain a single SQL statement (for client-to-server traffic) and one row of returned data (for server-to-client traffic). Each thread's communication buffer is dynamically enlarged to handle any query or row up to the maximum limit. For example, if you have `BLOB` values that contain up to 16MB of data, you must have a communication buffer limit of at least 16MB (in both server and client). The client's default maximum is 16MB, but the default maximum in the server is 1MB. You can increase this by changing the value of the `max_allowed_packet` parameter when the server is started. See [Section 7.5.2](#), “[Tuning Server Parameters](#)”.

The MySQL server shrinks each communication buffer to `net_buffer_length` bytes after each query. For clients, the size of the buffer associated with a connection is not decreased until the connection is closed, at which time client memory is reclaimed.

For programming with threads, see [Section 24.7.16](#), “[How to Make a Threaded Client](#)”. For creating a standalone application which includes the “server” and “client” in the same program (and does not communicate with an external MySQL server), see [Section 24.6](#), “[libmysqld, the Embedded MySQL Server Library](#)”.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about using the C API in the Knowledge Base articles, [The C API](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

24.7.1. C API Data Types

This section describes C API data types other than those used for prepared statements. For information about the latter, see [Section 24.7.5](#), “[C API Prepared Statement Data types](#)”.

- `MYSQL`

This structure represents a handle to one database connection. It is used for almost all MySQL functions. You should not try to make a copy of a `MYSQL` structure. There is no guarantee that such a copy will be usable.

- `MYSQL_RES`

This structure represents the result of a query that returns rows (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`). The information returned from a query is called the *result set* in the remainder of this section.

- `MYSQL_ROW`

This is a type-safe representation of one row of data. It is currently implemented as an array of counted byte strings. (You cannot treat these as null-terminated strings if field values may contain binary data, because such values may contain null bytes internally.) Rows are obtained by calling `mysql_fetch_row()`.

- `MYSQL_FIELD`

This structure contains information about a field, such as the field's name, type, and size. Its members are described in more detail here. You may obtain the `MYSQL_FIELD` structures for each field by calling `mysql_fetch_field()` repeatedly. Field values are not part of this structure; they are contained in a `MYSQL_ROW` structure.

- `MYSQL_FIELD_OFFSET`

This is a type-safe representation of an offset into a MySQL field list. (Used by `mysql_field_seek()`.) Offsets are field numbers within a row, beginning at zero.

- `my_ulonglong`

The type used for the number of rows and for `mysql_affected_rows()`, `mysql_num_rows()`, and `mysql_insert_id()`. This type provides a range of 0 to 1.84e19.

On some systems, attempting to print a value of type `my_ulonglong` does not work. To print such a value, convert it to `unsigned long` and use a `%lu` print format. Example:

```
printf ("Number of rows: %lu\n",
        (unsigned long) mysql_num_rows(result));
```

- `my_bool`

A boolean type, for values that are true (non-zero) or false (zero).

The `MYSQL_FIELD` structure contains the members listed here:

- `char * name`

The name of the field, as a null-terminated string. If the field was given an alias with an `AS` clause, the value of `name` is the alias.

- `char * org_name`

The name of the field, as a null-terminated string. Aliases are ignored.

- `char * table`

The name of the table containing this field, if it isn't a calculated field. For calculated fields, the `table` value is an empty string. If the column is selected from a view, `table` names the view. If the table or view was given an alias with an `AS` clause, the value of `table` is the alias. For a `UNION`, the value is the empty string.

- `char * org_table`

The name of the table, as a null-terminated string. Aliases are ignored. If the column is selected from a view, `org_table` names the underlying table. For a `UNION`, the value is the empty string.

- `char * db`

The name of the database that the field comes from, as a null-terminated string. If the field is a calculated field, `db` is an empty string. For a `UNION`, the value is the empty string.

- `char * catalog`

The catalog name. This value is always `"def"`.

- `char * def`

The default value of this field, as a null-terminated string. This is set only if you use `mysql_list_fields()`.

- `unsigned long length`

The width of the field. This corresponds to the display length, in bytes.

- `unsigned long max_length`

The maximum width of the field for the result set (the length in bytes of the longest field value for the rows actually in the result set). If you use `mysql_store_result()` or `mysql_list_fields()`, this contains the maximum length for the field. If you use `mysql_use_result()`, the value of this variable is zero.

The value of `max_length` is the length of the string representation of the values in the result set. For example, if you retrieve a `FLOAT` column and the “widest” value is `-12.345`, `max_length` is 7 (the length of `'-12.345'`).

If you are using prepared statements, `max_length` is not set by default because for the binary protocol the lengths of the values depend on the types of the values in the result set. (See [Section 24.7.5, “C API Prepared Statement Data types”](#).) If you want the `max_length` values anyway, enable the `STMT_ATTR_UPDATE_MAX_LENGTH` option with `mysql_stmt_attr_set()` and the lengths will be set when you call `mysql_stmt_store_result()`. (See [Section 24.7.7.3, “mysql_stmt_attr_set\(\)”](#), and [Section 24.7.7.27, “mysql_stmt_store_result\(\)”](#).)

- `unsigned int name_length`

The length of `name`.

- `unsigned int org_name_length`

The length of `org_name`.

- `unsigned int table_length`

The length of `table`.

- `unsigned int org_table_length`

The length of `org_table`.

- `unsigned int db_length`

The length of `db`.

- `unsigned int catalog_length`

The length of `catalog`.

- `unsigned int def_length`

The length of `def`.

- `unsigned int flags`

Different bit-flags for the field. The `flags` value may have zero or more of the following bits set:

Flag Value	Flag Description
<code>NOT_NULL_FLAG</code>	Field can't be <code>NULL</code>
<code>PRI_KEY_FLAG</code>	Field is part of a primary key
<code>UNIQUE_KEY_FLAG</code>	Field is part of a unique key
<code>MULTIPLE_KEY_FLAG</code>	Field is part of a non-unique key
<code>UNSIGNED_FLAG</code>	Field has the <code>UNSIGNED</code> attribute
<code>ZEROFILL_FLAG</code>	Field has the <code>ZEROFILL</code> attribute
<code>BINARY_FLAG</code>	Field has the <code>BINARY</code> attribute
<code>AUTO_INCREMENT_FLAG</code>	Field has the <code>AUTO_INCREMENT</code> attribute
<code>ENUM_FLAG</code>	Field is an <code>ENUM</code> (deprecated)
<code>SET_FLAG</code>	Field is a <code>SET</code> (deprecated)
<code>BLOB_FLAG</code>	Field is a <code>BLOB</code> or <code>TEXT</code> (deprecated)
<code>TIMESTAMP_FLAG</code>	Field is a <code>TIMESTAMP</code> (deprecated)
<code>NUM_FLAG</code>	Field is numeric; see additional notes following table

<code>NO_DEFAULT_VALUE_FLAG</code>	Field has no default value; see additional notes following table
------------------------------------	--

Use of the `BLOB_FLAG`, `ENUM_FLAG`, `SET_FLAG`, and `TIMESTAMP_FLAG` flags is deprecated because they indicate the type of a field rather than an attribute of its type. It is preferable to test `field->type` against `MYSQL_TYPE_BLOB`, `MYSQL_TYPE_ENUM`, `MYSQL_TYPE_SET`, or `MYSQL_TYPE_TIMESTAMP` instead.

`NUM_FLAG` indicates that a column is numeric. This includes columns with a type of `MYSQL_TYPE_DECIMAL`, `MYSQL_TYPE_TINY`, `MYSQL_TYPE_SHORT`, `MYSQL_TYPE_LONG`, `MYSQL_TYPE_FLOAT`, `MYSQL_TYPE_DOUBLE`, `MYSQL_TYPE_NULL`, `MYSQL_TYPE_TIMESTAMP`, `MYSQL_TYPE_LONGLONG`, `MYSQL_TYPE_INT24`, and `MYSQL_TYPE_YEAR`.

`NO_DEFAULT_VALUE_FLAG` indicates that a column has no `DEFAULT` clause in its definition. This does not apply to `NULL` columns (because such columns have a default of `NULL`), or to `AUTO_INCREMENT` columns (which have an implied default value). `NO_DEFAULT_VALUE_FLAG` was added in MySQL 5.0.2.

The following example illustrates a typical use of the `flags` value:

```
if (field->flags & NOT_NULL_FLAG)
    printf("Field can't be null\n");
```

You may use the following convenience macros to determine the boolean status of the `flags` value:

Flag Status	Description
<code>IS_NOT_NULL(flags)</code>	True if this field is defined as <code>NOT NULL</code>
<code>IS_PRI_KEY(flags)</code>	True if this field is a primary key
<code>IS_BLOB(flags)</code>	True if this field is a <code>BLOB</code> or <code>TEXT</code> (deprecated; test <code>field->type</code> instead)

- `unsigned int decimals`

The number of decimals for numeric fields.

- `unsigned int charsetnr`

An ID number that indicates the character set/collation pair for the field.

To distinguish between binary and non-binary data for string data types, check whether the `charsetnr` value is 63. If so, the character set is `binary`, which indicates binary rather than non-binary data. This enables you to distinguish `BINARY` from `CHAR`, `VARBINARY` from `VARCHAR`, and the `BLOB` types from the `TEXT` types.

`charsetnr` values are the same as those displayed in the `Id` column of the `SHOW COLLATION` statement or the `ID` column of the `INFORMATION_SCHEMA.COLLATIONS` table. You can use those information sources to see which character set and collation specific `charsetnr` values indicate:

```
mysql> SHOW COLLATION WHERE Id = 63;
+-----+-----+-----+-----+-----+-----+
| Collation | Charset | Id | Default | Compiled | Sortlen |
+-----+-----+-----+-----+-----+-----+
| binary   | binary  | 63 | Yes     | Yes     | 1       |
+-----+-----+-----+-----+-----+-----+

mysql> SELECT COLLATION_NAME, CHARACTER_SET_NAME
-> FROM INFORMATION_SCHEMA.COLLATIONS WHERE ID = 33;
+-----+-----+
| COLLATION_NAME | CHARACTER_SET_NAME |
+-----+-----+
| utf8_general_ci | utf8                |
+-----+-----+
```

- `enum enum_field_types type`

The type of the field. The `type` value may be one of the `MYSQL_TYPE_` symbols shown in the following table.

Type Value	Type Description
<code>MYSQL_TYPE_TINY</code>	<code>TINYINT</code> field
<code>MYSQL_TYPE_SHORT</code>	<code>SMALLINT</code> field
<code>MYSQL_TYPE_LONG</code>	<code>INTEGER</code> field

<code>MYSQL_TYPE_INT24</code>	<code>MEDIUMINT</code> field
<code>MYSQL_TYPE_LONGLONG</code>	<code>BIGINT</code> field
<code>MYSQL_TYPE_DECIMAL</code>	<code>DECIMAL</code> or <code>NUMERIC</code> field
<code>MYSQL_TYPE_NEWDECIMAL</code>	Precision math <code>DECIMAL</code> or <code>NUMERIC</code> field (MySQL 5.0.3 and up)
<code>MYSQL_TYPE_FLOAT</code>	<code>FLOAT</code> field
<code>MYSQL_TYPE_DOUBLE</code>	<code>DOUBLE</code> or <code>REAL</code> field
<code>MYSQL_TYPE_BIT</code>	<code>BIT</code> field (MySQL 5.0.3 and up)
<code>MYSQL_TYPE_TIMESTAMP</code>	<code>TIMESTAMP</code> field
<code>MYSQL_TYPE_DATE</code>	<code>DATE</code> field
<code>MYSQL_TYPE_TIME</code>	<code>TIME</code> field
<code>MYSQL_TYPE_DATETIME</code>	<code>DATETIME</code> field
<code>MYSQL_TYPE_YEAR</code>	<code>YEAR</code> field
<code>MYSQL_TYPE_STRING</code>	<code>CHAR</code> or <code>BINARY</code> field
<code>MYSQL_TYPE_VAR_STRING</code>	<code>VARCHAR</code> or <code>VARBINARY</code> field
<code>MYSQL_TYPE_BLOB</code>	<code>BLOB</code> or <code>TEXT</code> field (use <code>max_length</code> to determine the maximum length)
<code>MYSQL_TYPE_SET</code>	<code>SET</code> field
<code>MYSQL_TYPE_ENUM</code>	<code>ENUM</code> field
<code>MYSQL_TYPE_GEOMETRY</code>	Spatial field
<code>MYSQL_TYPE_NULL</code>	<code>NULL</code> -type field

You can use the `IS_NUM()` macro to test whether a field has a numeric type. Pass the `type` value to `IS_NUM()` and it evaluates to `TRUE` if the field is numeric:

```
if (IS_NUM(field->type))
    printf("Field is numeric\n");
```

24.7.2. C API Function Overview

The functions available in the C API are summarized here and described in greater detail in a later section. See [Section 24.7.3, “C API Function Descriptions”](#).

Function	Description
<code>my_init()</code>	Initialize global variables, and thread handler in thread-safe programs
<code>mysql_affected_rows()</code>	Returns the number of rows changed/deleted/inserted by the last <code>UPDATE</code> , <code>DELETE</code> , or <code>INSERT</code> query
<code>mysql_autocommit()</code>	Toggles autocommit mode on/off
<code>mysql_change_user()</code>	Changes user and database on an open connection
<code>mysql_character_set_name()</code>	Return default character set name for current connection
<code>mysql_close()</code>	Closes a server connection
<code>mysql_commit()</code>	Commits the transaction
<code>mysql_connect()</code>	Connects to a MySQL server (this function is deprecated; use <code>mysql_real_connect()</code> instead)
<code>mysql_create_db()</code>	Creates a database (this function is deprecated; use the SQL statement <code>CREATE DATABASE</code> instead)
<code>mysql_data_seek()</code>	Seeks to an arbitrary row number in a query result set
<code>mysql_debug()</code>	Does a <code>DEBUG_PUSH</code> with the given string
<code>mysql_drop_db()</code>	Drops a database (this function is deprecated; use the SQL statement <code>DROP DATABASE</code> instead)
<code>mysql_dump_debug_info()</code>	Makes the server write debug information to the log
<code>mysql_eof()</code>	Determines whether the last row of a result set has been read (this function is deprecated; <code>mysql_errno()</code> or <code>mysql_error()</code> may be used instead)

<code>mysql_errno()</code>	Returns the error number for the most recently invoked MySQL function
<code>mysql_error()</code>	Returns the error message for the most recently invoked MySQL function
<code>mysql_escape_string()</code>	Escapes special characters in a string for use in an SQL statement
<code>mysql_fetch_field()</code>	Returns the type of the next table field
<code>mysql_fetch_field_direct()</code>	Returns the type of a table field, given a field number
<code>mysql_fetch_fields()</code>	Returns an array of all field structures
<code>mysql_fetch_lengths()</code>	Returns the lengths of all columns in the current row
<code>mysql_fetch_row()</code>	Fetches the next row from the result set
<code>mysql_field_count()</code>	Returns the number of result columns for the most recent statement
<code>mysql_field_seek()</code>	Puts the column cursor on a specified column
<code>mysql_field_tell()</code>	Returns the position of the field cursor used for the last <code>mysql_fetch_field()</code>
<code>mysql_free_result()</code>	Frees memory used by a result set
<code>mysql_get_character_set_info()</code>	Return information about default character set
<code>mysql_get_client_info()</code>	Returns client version information as a string
<code>mysql_get_client_version()</code>	Returns client version information as an integer
<code>mysql_get_host_info()</code>	Returns a string describing the connection
<code>mysql_get_proto_info()</code>	Returns the protocol version used by the connection
<code>mysql_get_server_info()</code>	Returns the server version number
<code>mysql_get_server_version()</code>	Returns version number of server as an integer
<code>mysql_get_ssl_cipher()</code>	Return current SSL cipher
<code>mysql_hex_string()</code>	Encode string in hexadecimal format
<code>mysql_info()</code>	Returns information about the most recently executed query
<code>mysql_init()</code>	Gets or initializes a <code>MYSQL</code> structure
<code>mysql_insert_id()</code>	Returns the ID generated for an <code>AUTO_INCREMENT</code> column by the previous query
<code>mysql_kill()</code>	Kills a given thread
<code>mysql_library_end()</code>	Finalize the MySQL C API library
<code>mysql_library_init()</code>	Initialize the MySQL C API library
<code>mysql_list_dbs()</code>	Returns database names matching a simple regular expression
<code>mysql_list_fields()</code>	Returns field names matching a simple regular expression
<code>mysql_list_processes()</code>	Returns a list of the current server threads
<code>mysql_list_tables()</code>	Returns table names matching a simple regular expression
<code>mysql_more_results()</code>	Checks whether any more results exist
<code>mysql_next_result()</code>	Returns/initiates the next result in multiple-statement executions
<code>mysql_num_fields()</code>	Returns the number of columns in a result set
<code>mysql_num_rows()</code>	Returns the number of rows in a result set
<code>mysql_options()</code>	Sets connect options for <code>mysql_real_connect()</code>
<code>mysql_ping()</code>	Checks whether the connection to the server is working, reconnecting as necessary
<code>mysql_query()</code>	Executes an SQL query specified as a null-terminated string
<code>mysql_real_connect()</code>	Connects to a MySQL server
<code>mysql_real_escape_string()</code>	Escapes special characters in a string for use in an SQL statement, taking into account the current character set of the connection
<code>mysql_real_query()</code>	Executes an SQL query specified as a counted string
<code>mysql_refresh()</code>	Flush or reset tables and caches
<code>mysql_reload()</code>	Tells the server to reload the grant tables
<code>mysql_rollback()</code>	Rolls back the transaction
<code>mysql_row_seek()</code>	Seeks to a row offset in a result set, using value returned from <code>mysql_row_tell()</code>
<code>mysql_row_tell()</code>	Returns the row cursor position
<code>mysql_select_db()</code>	Selects a database

<code>mysql_server_end()</code>	Finalize the MySQL C API library
<code>mysql_server_init()</code>	Initialize the MySQL C API library
<code>mysql_set_character_set()</code>	Set default character set for current connection
<code>mysql_set_local_infile_default()</code>	Set the <code>LOAD DATA LOCAL INFILE</code> handler callbacks to their default values
<code>mysql_set_local_infile_handler()</code>	Install application-specific <code>LOAD DATA LOCAL INFILE</code> handler callbacks
<code>mysql_set_server_option()</code>	Sets an option for the connection (like <code>multi-statements</code>)
<code>mysql_sqlstate()</code>	Returns the <code>SQLSTATE</code> error code for the last error
<code>mysql_shutdown()</code>	Shuts down the database server
<code>mysql_ssl_set()</code>	Prepare to establish SSL connection to server
<code>mysql_stat()</code>	Returns the server status as a string
<code>mysql_store_result()</code>	Retrieves a complete result set to the client
<code>mysql_thread_end()</code>	Finalize thread handler
<code>mysql_thread_id()</code>	Returns the current thread ID
<code>mysql_thread_init()</code>	Initialize thread handler
<code>mysql_thread_safe()</code>	Returns 1 if the clients are compiled as thread-safe
<code>mysql_use_result()</code>	Initiates a row-by-row result set retrieval
<code>mysql_warning_count()</code>	Returns the warning count for the previous SQL statement

Application programs should use this general outline for interacting with MySQL:

1. Initialize the MySQL library by calling `mysql_library_init()`. This function exists in both the `mysqlclient` C client library and the `mysqld` embedded server library, so it is used whether you build a regular client program by linking with the `-libmysqlclient` flag, or an embedded server application by linking with the `-libmysqld` flag.
2. Initialize a connection handler by calling `mysql_init()` and connect to the server by calling `mysql_real_connect()`.
3. Issue SQL statements and process their results. (The following discussion provides more information about how to do this.)
4. Close the connection to the MySQL server by calling `mysql_close()`.
5. End use of the MySQL library by calling `mysql_library_end()`.

The purpose of calling `mysql_library_init()` and `mysql_library_end()` is to provide proper initialization and finalization of the MySQL library. For applications that are linked with the client library, they provide improved memory management. If you don't call `mysql_library_end()`, a block of memory remains allocated. (This does not increase the amount of memory used by the application, but some memory leak detectors will complain about it.) For applications that are linked with the embedded server, these calls start and stop the server.

`mysql_library_init()` and `mysql_library_end()` are available as of MySQL 5.0.3. For older versions of MySQL, you can call `mysql_server_init()` and `mysql_server_end()` instead.

In a non-multi-threaded environment, the call to `mysql_library_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multi-threaded environment, and thus neither is `mysql_init()`, which calls `mysql_library_init()`. You must either call `mysql_library_init()` prior to spawning any threads, or else use a mutex to protect the call, whether you invoke `mysql_library_init()` or indirectly via `mysql_init()`. This should be done prior to any other client library call.

To connect to the server, call `mysql_init()` to initialize a connection handler, then call `mysql_real_connect()` with that handler (along with other information such as the hostname, username, and password). Upon connection, `mysql_real_connect()` sets the `reconnect` flag (part of the `MYSQL` structure) to a value of 1 in versions of the API older than 5.0.3, or 0 in newer versions. A value of 1 for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. As of MySQL 5.0.13, you can use the `MYSQL_OPT_RECONNECT` option to `mysql_options()` to control reconnection behavior. When you are done with the connection, call `mysql_close()` to terminate it.

While a connection is active, the client may send SQL statements to the server using `mysql_query()` or `mysql_real_query()`. The difference between the two is that `mysql_query()` expects the query to be specified as a null-terminated string whereas `mysql_real_query()` expects a counted string. If the string contains binary data (which may in-

clude null bytes), you must use `mysql_real_query()`.

For each non-`SELECT` query (for example, `INSERT`, `UPDATE`, `DELETE`), you can find out how many rows were changed (affected) by calling `mysql_affected_rows()`.

For `SELECT` queries, you retrieve the selected rows as a result set. (Note that some statements are `SELECT`-like in that they return rows. These include `SHOW`, `DESCRIBE`, and `EXPLAIN`. They should be treated the same way as `SELECT` statements.)

There are two ways for a client to process result sets. One way is to retrieve the entire result set all at once by calling `mysql_store_result()`. This function acquires from the server all the rows returned by the query and stores them in the client. The second way is for the client to initiate a row-by-row result set retrieval by calling `mysql_use_result()`. This function initializes the retrieval, but does not actually get any rows from the server.

In both cases, you access rows by calling `mysql_fetch_row()`. With `mysql_store_result()`, `mysql_fetch_row()` accesses rows that have previously been fetched from the server. With `mysql_use_result()`, `mysql_fetch_row()` actually retrieves the row from the server. Information about the size of the data in each row is available by calling `mysql_fetch_lengths()`.

After you are done with a result set, call `mysql_free_result()` to free the memory used for it.

The two retrieval mechanisms are complementary. Client programs should choose the approach that is most appropriate for their requirements. In practice, clients tend to use `mysql_store_result()` more commonly.

An advantage of `mysql_store_result()` is that because the rows have all been fetched to the client, you not only can access rows sequentially, you can move back and forth in the result set using `mysql_data_seek()` or `mysql_row_seek()` to change the current row position within the result set. You can also find out how many rows there are by calling `mysql_num_rows()`. On the other hand, the memory requirements for `mysql_store_result()` may be very high for large result sets and you are more likely to encounter out-of-memory conditions.

An advantage of `mysql_use_result()` is that the client requires less memory for the result set because it maintains only one row at a time (and because there is less allocation overhead, `mysql_use_result()` can be faster). Disadvantages are that you must process each row quickly to avoid tying up the server, you don't have random access to rows within the result set (you can only access rows sequentially), and you don't know how many rows are in the result set until you have retrieved them all. Furthermore, you **must** retrieve all the rows even if you determine in mid-retrieval that you've found the information you were looking for.

The API makes it possible for clients to respond appropriately to statements (retrieving rows only as necessary) without knowing whether the statement is a `SELECT`. You can do this by calling `mysql_store_result()` after each `mysql_query()` (or `mysql_real_query()`). If the result set call succeeds, the statement was a `SELECT` and you can read the rows. If the result set call fails, call `mysql_field_count()` to determine whether a result was actually to be expected. If `mysql_field_count()` returns zero, the statement returned no data (indicating that it was an `INSERT`, `UPDATE`, `DELETE`, and so forth), and was not expected to return rows. If `mysql_field_count()` is non-zero, the statement should have returned rows, but didn't. This indicates that the statement was a `SELECT` that failed. See the description for `mysql_field_count()` for an example of how this can be done.

Both `mysql_store_result()` and `mysql_use_result()` allow you to obtain information about the fields that make up the result set (the number of fields, their names and types, and so forth). You can access field information sequentially within the row by calling `mysql_fetch_field()` repeatedly, or by field number within the row by calling `mysql_fetch_field_direct()`. The current field cursor position may be changed by calling `mysql_field_seek()`. Setting the field cursor affects subsequent calls to `mysql_fetch_field()`. You can also get information for fields all at once by calling `mysql_fetch_fields()`.

For detecting and reporting errors, MySQL provides access to error information by means of the `mysql_errno()` and `mysql_error()` functions. These return the error code or error message for the most recently invoked function that can succeed or fail, allowing you to determine when an error occurred and what it was.

24.7.3. C API Function Descriptions

In the descriptions here, a parameter or return value of `NULL` means `NULL` in the sense of the C programming language, not a MySQL `NULL` value.

Functions that return a value generally return a pointer or an integer. Unless specified otherwise, functions returning a pointer return a non-`NULL` value to indicate success or a `NULL` value to indicate an error, and functions returning an integer return zero to indicate success or non-zero to indicate an error. Note that “non-zero” means just that. Unless the function description says otherwise, do not test against a value other than zero:

```
if (result)                /* correct */
    ... error ...

if (result < 0)            /* incorrect */
    ... error ...

if (result == -1)         /* incorrect */
    ... error ...
```

When a function returns an error, the **Errors** subsection of the function description lists the possible types of errors. You can find out which of these occurred by calling `mysql_errno()`. A string representation of the error may be obtained by calling `mysql_error()`.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about the C API functions in the Knowledge Base articles, [The C API](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

24.7.3.1. `mysql_affected_rows()`

```
my_ulonglong mysql_affected_rows(MYSQL *mysql)
```

Description

After executing a statement with `mysql_query()` or `mysql_real_query()`, returns the number of rows changed (for `UPDATE`), deleted (for `DELETE`), or inserted (for `INSERT`). For `SELECT` statements, `mysql_affected_rows()` works like `mysql_num_rows()`.

Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an `UPDATE` statement, no rows matched the `WHERE` clause in the query or that no query has yet been executed. -1 indicates that the query returned an error or that, for a `SELECT` query, `mysql_affected_rows()` was called prior to calling `mysql_store_result()`. Because `mysql_affected_rows()` returns an unsigned value, you can check for -1 by comparing the return value to `(my_ulonglong)-1` (or to `(my_ulonglong)~0`, which is equivalent).

Errors

None.

Example

```
char *stmt = "UPDATE products SET cost=cost*1.25 WHERE group=10";
mysql_query(&mysql,stmt);
printf("%ld products updated",
       (long) mysql_affected_rows(&mysql));
```

For `UPDATE` statements, if you specify the `CLIENT_FOUND_ROWS` flag when connecting to `mysqld`, `mysql_affected_rows()` returns the number of rows matched by the `WHERE` clause. Otherwise, the default behavior is to return the number of rows actually changed.

Note that when you use a `REPLACE` command, `mysql_affected_rows()` returns 2 if the new row replaced an old row, because in this case, one row was inserted after the duplicate was deleted.

If you use `INSERT ... ON DUPLICATE KEY UPDATE` to insert a row, `mysql_affected_rows()` returns 1 if the row is inserted as a new row and 2 if an existing row is updated.

`mysql_affected_rows()` returns 0 following a `CALL` statement for a stored procedure that contains a statement that modifies rows because in this case `mysql_insert_id()` applies to `CALL` and not the statement within the procedure. Within the procedure, you can use `ROW_COUNT()` at the SQL level to obtain the `AUTO_INCREMENT` value.

24.7.3.2. `mysql_autocommit()`

```
my_bool mysql_autocommit(MYSQL *mysql, my_bool mode)
```

Description

Sets autocommit mode on if `mode` is 1, off if `mode` is 0.

Return Values

Zero if successful. Non-zero if an error occurred.

Errors

None.

24.7.3.3. `mysql_change_user()`

```
my_bool mysql_change_user(MYSQL *mysql, const char *user, const char *password, const char *db)
```

Description

Changes the user and causes the database specified by `db` to become the default (current) database on the connection specified by `mysql`. In subsequent queries, this database is the default for table references that do not include an explicit database specifier.

`mysql_change_user()` fails if the connected user cannot be authenticated or doesn't have permission to use the database. In this case, the user and database are not changed.

The `db` parameter may be set to `NULL` if you don't want to have a default database.

This command resets the state as if one had done a new connect. (See [Section 24.7.13, "Controlling Automatic Reconnect Behavior"](#).) It always performs a `ROLLBACK` of any active transactions, closes and drops all temporary tables, and unlocks all locked tables. Session system variables are reset to the values of the corresponding global system variables. Prepared statements are released and `HANDLER` variables are closed. Locks acquired with `GET_LOCK()` are released. These effects occur even if the user didn't change.

Return Values

Zero for success. Non-zero if an error occurred.

Errors

The same that you can get from `mysql_real_connect()`.

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.
- `ER_UNKNOWN_COM_ERROR`
The MySQL server doesn't implement this command (probably an old server).
- `ER_ACCESS_DENIED_ERROR`
The user or password was wrong.
- `ER_BAD_DB_ERROR`
The database didn't exist.
- `ER_DBACCESS_DENIED_ERROR`
The user did not have access rights to the database.
- `ER_WRONG_DB_NAME`
The database name was too long.

Example

```
if (mysql_change_user(&mysql, "user", "password", "new_database"))
{
    fprintf(stderr, "Failed to change user. Error: %s\n",
            mysql_error(&mysql));
}
```

```
}
```

24.7.3.4. `mysql_character_set_name()`

```
const char *mysql_character_set_name(MYSQL *mysql)
```

Description

Returns the default character set name for the current connection.

Return Values

The default character set name

Errors

None.

24.7.3.5. `mysql_close()`

```
void mysql_close(MYSQL *mysql)
```

Description

Closes a previously opened connection. `mysql_close()` also deallocates the connection handle pointed to by `mysql` if the handle was allocated automatically by `mysql_init()` or `mysql_connect()`.

Return Values

None.

Errors

None.

24.7.3.6. `mysql_commit()`

```
my_bool mysql_commit(MYSQL *mysql)
```

Description

Commits the current transaction.

As of MySQL 5.0.3, the action of this function is subject to the value of the `completion_type` system variable. In particular, if the value of `completion_type` is 2, the server performs a release after terminating a transaction and closes the client connection. The client program should call `mysql_close()` to close the connection from the client side.

Return Values

Zero if successful. Non-zero if an error occurred.

Errors

None.

24.7.3.7. `mysql_connect()`

```
MYSQL *mysql_connect(MYSQL *mysql, const char *host, const char *user, const char *passwd)
```

Description

This function is deprecated. Use `mysql_real_connect()` instead.

`mysql_connect()` attempts to establish a connection to a MySQL database engine running on `host`. `mysql_connect()` must complete successfully before you can execute any of the other API functions, with the exception of `mysql_get_client_info()`.

The meanings of the parameters are the same as for the corresponding parameters for `mysql_real_connect()` with the difference that the connection parameter may be `NULL`. In this case, the C API allocates memory for the connection structure automatic-

ally and frees it when you call `mysql_close()`. The disadvantage of this approach is that you can't retrieve an error message if the connection fails. (To get error information from `mysql_errno()` or `mysql_error()`, you must provide a valid `MYSQL` pointer.)

Return Values

Same as for `mysql_real_connect()`.

Errors

Same as for `mysql_real_connect()`.

24.7.3.8. `mysql_create_db()`

```
int mysql_create_db(MYSQL *mysql, const char *db)
```

Description

Creates the database named by the `db` parameter.

This function is deprecated. It is preferable to use `mysql_query()` to issue an SQL `CREATE DATABASE` statement instead.

Return Values

Zero if the database was created successfully. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

Example

```
if(mysql_create_db(&mysql, "my_database"))
{
    fprintf(stderr, "Failed to create new database. Error: %s\n",
            mysql_error(&mysql));
}
```

24.7.3.9. `mysql_data_seek()`

```
void mysql_data_seek(MYSQL_RES *result, my_ulonglong offset)
```

Description

Seeks to an arbitrary row in a query result set. The `offset` value is a row number and should be in the range from 0 to `mysql_num_rows(result)-1`.

This function requires that the result set structure contains the entire result of the query, so `mysql_data_seek()` may be used only in conjunction with `mysql_store_result()`, not with `mysql_use_result()`.

Return Values

None.

Errors

None.

24.7.3.10. `mysql_debug()`

```
void mysql_debug(const char *debug)
```

Description

Does a `DEBUG_PUSH` with the given string. `mysql_debug()` uses the Fred Fish debug library. To use this function, you must compile the client library to support debugging. See [MySQL Internals: Porting](#).

Return Values

None.

Errors

None.

Example

The call shown here causes the client library to generate a trace file in `/tmp/client.trace` on the client machine:

```
mysql_debug("d:t:0,/tmp/client.trace");
```

24.7.3.11. `mysql_drop_db()`

```
int mysql_drop_db(MYSQL *mysql, const char *db)
```

Description

Drops the database named by the `db` parameter.

This function is deprecated. It is preferable to use `mysql_query()` to issue an `SQL DROP DATABASE` statement instead.

Return Values

Zero if the database was dropped successfully. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

Example

```
if(mysql_drop_db(&mysql, "my_database"))
    fprintf(stderr, "Failed to drop the database: Error: %s\n",
            mysql_error(&mysql));
```

24.7.3.12. `mysql_dump_debug_info()`

```
int mysql_dump_debug_info(MYSQL *mysql)
```

Description

Instructs the server to write some debug information to the log. For this to work, the connected user must have the `SUPER` privilege.

Return Values

Zero if the command was successful. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

24.7.3.13. `mysql_eof()`

```
my_bool mysql_eof(MYSQL_RES *result)
```

Description

This function is deprecated. `mysql_errno()` or `mysql_error()` may be used instead.

`mysql_eof()` determines whether the last row of a result set has been read.

If you acquire a result set from a successful call to `mysql_store_result()`, the client receives the entire set in one operation. In this case, a `NULL` return from `mysql_fetch_row()` always means the end of the result set has been reached and it is unnecessary to call `mysql_eof()`. When used with `mysql_store_result()`, `mysql_eof()` always returns true.

On the other hand, if you use `mysql_use_result()` to initiate a result set retrieval, the rows of the set are obtained from the server one by one as you call `mysql_fetch_row()` repeatedly. Because an error may occur on the connection during this process, a `NULL` return value from `mysql_fetch_row()` does not necessarily mean the end of the result set was reached normally. In this case, you can use `mysql_eof()` to determine what happened. `mysql_eof()` returns a non-zero value if the end of the result set was reached and zero if an error occurred.

Historically, `mysql_eof()` predates the standard MySQL error functions `mysql_errno()` and `mysql_error()`. Because those error functions provide the same information, their use is preferred over `mysql_eof()`, which is deprecated. (In fact, they provide more information, because `mysql_eof()` returns only a boolean value whereas the error functions indicate a reason for the error when one occurs.)

Return Values

Zero if no error occurred. Non-zero if the end of the result set has been reached.

Errors

None.

Example

The following example shows how you might use `mysql_eof()`:

```
mysql_query(&mysql,"SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
    // do something with data
}
if(!mysql_eof(result)) // mysql_fetch_row() failed due to an error
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```

However, you can achieve the same effect with the standard MySQL error functions:

```
mysql_query(&mysql, "SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
    // do something with data
}
if(mysql_errno(&mysql)) // mysql_fetch_row() failed due to an error
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```

24.7.3.14. `mysql_errno()`

```
unsigned int mysql_errno(MYSQL *mysql)
```

Description

For the connection specified by `mysql`, `mysql_errno()` returns the error code for the most recently invoked API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL `errmsg.h` header file. Server error message numbers are listed in `mysqld_error.h`. Errors also are listed at [Appendix B, Errors, Error Codes, and Common Problems](#).

Note that some functions like `mysql_fetch_row()` don't set `mysql_errno()` if they succeed.

A rule of thumb is that all functions that have to ask the server for information reset `mysql_errno()` if they succeed.

MySQL-specific error numbers returned by `mysql_errno()` differ from SQLSTATE values returned by `mysql_sqlstate()`. For example, the `mysql` client program displays errors using the following format, where `1146` is the `mysql_errno()` value and `'42S02'` is the corresponding `mysql_sqlstate()` value:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Return Values

An error code value for the last `mysql_xxx()` call, if it failed. zero means no error occurred.

Errors

None.

24.7.3.15. `mysql_error()`

```
const char *mysql_error(MYSQL *mysql)
```

Description

For the connection specified by `mysql`, `mysql_error()` returns a null-terminated string containing the error message for the most recently invoked API function that failed. If a function didn't fail, the return value of `mysql_error()` may be the previous error or an empty string to indicate no error.

A rule of thumb is that all functions that have to ask the server for information reset `mysql_error()` if they succeed.

For functions that reset `mysql_error()`, the following two tests are equivalent:

```
if(*mysql_error(&mysql))
{
    // an error occurred
}

if(mysql_error(&mysql)[0])
{
    // an error occurred
}
```

The language of the client error messages may be changed by recompiling the MySQL client library. Currently, you can choose error messages in several different languages. See [Section 9.3, "Setting the Error Message Language"](#).

Return Values

A null-terminated character string that describes the error. An empty string if no error occurred.

Errors

None.

24.7.3.16. `mysql_escape_string()`

You should use `mysql_real_escape_string()` instead!

This function is identical to `mysql_real_escape_string()` except that `mysql_real_escape_string()` takes a connection handler as its first argument and escapes the string according to the current character set. `mysql_escape_string()` does not take a connection argument and does not respect the current character set.

24.7.3.17. `mysql_fetch_field()`

```
MYSQL_FIELD *mysql_fetch_field(MYSQL_RES *result)
```

Description

Returns the definition of one column of a result set as a `MYSQL_FIELD` structure. Call this function repeatedly to retrieve information about all columns in the result set. `mysql_fetch_field()` returns `NULL` when no more fields are left.

`mysql_fetch_field()` is reset to return information about the first field each time you execute a new `SELECT` query. The field returned by `mysql_fetch_field()` is also affected by calls to `mysql_field_seek()`.

If you've called `mysql_query()` to perform a `SELECT` on a table but have not called `mysql_store_result()`, MySQL returns the default blob length (8KB) if you call `mysql_fetch_field()` to ask for the length of a `BLOB` field. (The 8KB size is chosen because MySQL doesn't know the maximum length for the `BLOB`. This should be made configurable sometime.) Once you've retrieved the result set, `field->max_length` contains the length of the largest value for this column in the specific query.

Return Values

The `MYSQL_FIELD` structure for the current column. `NULL` if no columns are left.

Errors

None.

Example

```
MYSQL_FIELD *field;

while((field = mysql_fetch_field(result)))
{
    printf("field name %s\n", field->name);
}
```

24.7.3.18. `mysql_fetch_field_direct()`

```
MYSQL_FIELD *mysql_fetch_field_direct(MYSQL_RES *result, unsigned int fieldnr)
```

Description

Given a field number `fieldnr` for a column within a result set, returns that column's field definition as a `MYSQL_FIELD` structure. You may use this function to retrieve the definition for an arbitrary column. The value of `fieldnr` should be in the range from 0 to `mysql_num_fields(result)-1`.

Return Values

The `MYSQL_FIELD` structure for the specified column.

Errors

None.

Example

```
unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *field;

num_fields = mysql_num_fields(result);
for(i = 0; i < num_fields; i++)
{
    field = mysql_fetch_field_direct(result, i);
    printf("Field %u is %s\n", i, field->name);
}
```

}

24.7.3.19. `mysql_fetch_fields()`

```
MYSQL_FIELD *mysql_fetch_fields(MYSQL_RES *result)
```

Description

Returns an array of all `MYSQL_FIELD` structures for a result set. Each structure provides the field definition for one column of the result set.

Return Values

An array of `MYSQL_FIELD` structures for all columns of a result set.

Errors

None.

Example

```
unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *fields;

num_fields = mysql_num_fields(result);
fields = mysql_fetch_fields(result);
for(i = 0; i < num_fields; i++)
{
    printf("Field %u is %s\n", i, fields[i].name);
}
```

24.7.3.20. `mysql_fetch_lengths()`

```
unsigned long *mysql_fetch_lengths(MYSQL_RES *result)
```

Description

Returns the lengths of the columns of the current row within a result set. If you plan to copy field values, this length information is also useful for optimization, because you can avoid calling `strlen()`. In addition, if the result set contains binary data, you **must** use this function to determine the size of the data, because `strlen()` returns incorrect results for any field containing null characters.

The length for empty columns and for columns containing `NULL` values is zero. To see how to distinguish these two cases, see the description for `mysql_fetch_row()`.

Return Values

An array of unsigned long integers representing the size of each column (not including any terminating null characters). `NULL` if an error occurred.

Errors

`mysql_fetch_lengths()` is valid only for the current row of the result set. It returns `NULL` if you call it before calling `mysql_fetch_row()` or after retrieving all rows in the result.

Example

```
MYSQL_ROW row;
unsigned long *lengths;
unsigned int num_fields;
unsigned int i;

row = mysql_fetch_row(result);
if (row)
{
    num_fields = mysql_num_fields(result);
    lengths = mysql_fetch_lengths(result);
    for(i = 0; i < num_fields; i++)
    {
        printf("Column %u is %lu bytes in length.\n",
            i, lengths[i]);
    }
}
```

24.7.3.21. `mysql_fetch_row()`

```
MYSQL_ROW mysql_fetch_row(MYSQL_RES *result)
```

Description

Retrieves the next row of a result set. When used after `mysql_store_result()`, `mysql_fetch_row()` returns `NULL` when there are no more rows to retrieve. When used after `mysql_use_result()`, `mysql_fetch_row()` returns `NULL` when there are no more rows to retrieve or if an error occurred.

The number of values in the row is given by `mysql_num_fields(result)`. If `row` holds the return value from a call to `mysql_fetch_row()`, pointers to the values are accessed as `row[0]` to `row[mysql_num_fields(result)-1]`. `NULL` values in the row are indicated by `NULL` pointers.

The lengths of the field values in the row may be obtained by calling `mysql_fetch_lengths()`. Empty fields and fields containing `NULL` both have length 0; you can distinguish these by checking the pointer for the field value. If the pointer is `NULL`, the field is `NULL`; otherwise, the field is empty.

Return Values

A `MYSQL_ROW` structure for the next row. `NULL` if there are no more rows to retrieve or if an error occurred.

Errors

Note that error is not reset between calls to `mysql_fetch_row()`

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

Example

```
MYSQL_ROW row;
unsigned int num_fields;
unsigned int i;

num_fields = mysql_num_fields(result);
while ((row = mysql_fetch_row(result)))
{
    unsigned long *lengths;
    lengths = mysql_fetch_lengths(result);
    for(i = 0; i < num_fields; i++)
    {
        printf("[%s] ", (int) lengths[i],
              row[i] ? row[i] : "NULL");
    }
    printf("\n");
}
```

24.7.3.22. `mysql_field_count()`

```
unsigned int mysql_field_count(MYSQL *mysql)
```

Description

Returns the number of columns for the most recent query on the connection.

The normal use of this function is when `mysql_store_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a non-empty result. This allows the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT`-like) statement. The example shown here illustrates how this may be done.

See [Section 24.7.14.1, “Why `mysql_store_result\(\)` Sometimes Returns `NULL` After `mysql_query\(\)` Returns Success”](#).

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

Example

```

MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql, query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{
    result = mysql_store_result(&mysql);
    if (result) // there are rows
    {
        num_fields = mysql_num_fields(result);
        // retrieve rows, then call mysql_free_result(result)
    }
    else // mysql_store_result() returned nothing; should it have?
    {
        if(mysql_field_count(&mysql) == 0)
        {
            // query does not return data
            // (it was not a SELECT)
            num_rows = mysql_affected_rows(&mysql);
        }
        else // mysql_store_result() should have returned data
        {
            fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
        }
    }
}

```

An alternative is to replace the `mysql_field_count(&mysql)` call with `mysql_errno(&mysql)`. In this case, you are checking directly for an error from `mysql_store_result()` rather than inferring from the value of `mysql_field_count()` whether the statement was a `SELECT`.

24.7.3.23. `mysql_field_seek()`

```
MYSQL_FIELD_OFFSET mysql_field_seek(MYSQL_RES *result, MYSQL_FIELD_OFFSET offset)
```

Description

Sets the field cursor to the given offset. The next call to `mysql_fetch_field()` retrieves the field definition of the column associated with that offset.

To seek to the beginning of a row, pass an `offset` value of zero.

Return Values

The previous value of the field cursor.

Errors

None.

24.7.3.24. `mysql_field_tell()`

```
MYSQL_FIELD_OFFSET mysql_field_tell(MYSQL_RES *result)
```

Description

Returns the position of the field cursor used for the last `mysql_fetch_field()`. This value can be used as an argument to `mysql_field_seek()`.

Return Values

The current offset of the field cursor.

Errors

None.

24.7.3.25. `mysql_free_result()`

```
void mysql_free_result(MYSQL_RES *result)
```

Description

Frees the memory allocated for a result set by `mysql_store_result()`, `mysql_use_result()`, `mysql_list_dbs()`, and so forth. When you are done with a result set, you must free the memory it uses by calling `mysql_free_result()`.

Do not attempt to access a result set after freeing it.

Return Values

None.

Errors

None.

24.7.3.26. `mysql_get_character_set_info()`

```
void mysql_get_character_set_info(MYSQL *mysql, MY_CHARSET_INFO *cs)
```

Description

This function provides information about the default client character set. The default character set may be changed with the `mysql_set_character_set()` function.

This function was added in MySQL 5.0.10.

Example

This example shows the fields that are available in the `MY_CHARSET_INFO` structure:

```
if (!mysql_set_character_set(&mysql, "utf8"))
{
    MY_CHARSET_INFO cs;
    mysql_get_character_set_info(&mysql, &cs);
    printf("character set information:\n");
    printf("character set+collation number: %d\n", cs.number);
    printf("character set name: %s\n", cs.name);
    printf("collation name: %s\n", cs.csname);
    printf("comment: %s\n", cs.comment);
    printf("directory: %s\n", cs.dir);
    printf("multi byte character min. length: %d\n", cs.mbminlen);
    printf("multi byte character max. length: %d\n", cs.mbmaxlen);
}
```

24.7.3.27. `mysql_get_client_info()`

```
const char *mysql_get_client_info(void)
```

Description

Returns a string that represents the client library version.

Return Values

A character string that represents the MySQL client library version.

Errors

None.

24.7.3.28. `mysql_get_client_version()`

```
unsigned long mysql_get_client_version(void)
```

Description

Returns an integer that represents the client library version. The value has the format `XYZZZ` where `X` is the major version, `YY` is the release level, and `ZZ` is the version number within the release level. For example, a value of `40102` represents a client library version of `4.1.2`.

Return Values

An integer that represents the MySQL client library version.

Errors

None.

24.7.3.29. `mysql_get_host_info()`

```
const char *mysql_get_host_info(MYSQL *mysql)
```

Description

Returns a string describing the type of connection in use, including the server hostname.

Return Values

A character string representing the server hostname and the connection type.

Errors

None.

24.7.3.30. `mysql_get_proto_info()`

```
unsigned int mysql_get_proto_info(MYSQL *mysql)
```

Description

Returns the protocol version used by current connection.

Return Values

An unsigned integer representing the protocol version used by the current connection.

Errors

None.

24.7.3.31. `mysql_get_server_info()`

```
const char *mysql_get_server_info(MYSQL *mysql)
```

Description

Returns a string that represents the server version number.

Return Values

A character string that represents the server version number.

Errors

None.

24.7.3.32. `mysql_get_server_version()`

```
unsigned long mysql_get_server_version(MYSQL *mysql)
```

Description

Returns the version number of the server as an integer.

Return Values

A number that represents the MySQL server version in this format:

```
major_version*10000 + minor_version *100 + sub_version
```

For example, 5.0.12 is returned as 50012.

This function is useful in client programs for quickly determining whether some version-specific server capability exists.

Errors

None.

24.7.3.33. `mysql_get_ssl_cipher()`

```
const char *mysql_get_ssl_cipher(MYSQL *mysql)
```

Description

`mysql_get_ssl_cipher()` returns the SSL cipher used for the given connection to the server. `mysql` is the connection handler returned from `mysql_init()`.

This function was added in MySQL 5.0.23.

Return Values

A string naming the SSL cipher used for the connection, or `NULL` if no cipher is being used.

24.7.3.34. `mysql_hex_string()`

```
unsigned long mysql_hex_string(char *to, const char *from, unsigned long length)
```

Description

This function is used to create a legal SQL string that you can use in an SQL statement. See [Section 8.1.1, “Strings”](#).

The string in `from` is encoded to hexadecimal format, with each character encoded as two hexadecimal digits. The result is placed in `to` and a terminating null byte is appended.

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. When `mysql_hex_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null character.

The return value can be placed into an SQL statement using either `0xvalue` or `X'value` format. However, the return value does not include the `0x` or `X'...`. The caller must supply whichever of those is desired.

Example

```
char query[1000],*end;

end = strmov(query,"INSERT INTO test_table values(");
end = strmov(end,"0x");
end += mysql_hex_string(end,"What's this",11);
end = strmov(end,"0x");
end += mysql_hex_string(end,"binary data: \0\r\n",16);
*end++ = ')';

if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
    fprintf(stderr, "Failed to insert row, Error: %s\n",
            mysql_error(&mysql));
}
```

The `strmov()` function used in the example is included in the `mysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

Return Values

The length of the value placed into `to`, not including the terminating null character.

Errors

None.

24.7.3.35. `mysql_info()`

```
const char *mysql_info(MYSQL *mysql)
```

Description

Retrieves a string providing information about the most recently executed statement, but only for the statements listed here. For

other statements, `mysql_info()` returns `NULL`. The format of the string varies depending on the type of statement, as described here. The numbers are illustrative only; the string contains values appropriate for the statement.

- `INSERT INTO ... SELECT ...`
String format: `Records: 100 Duplicates: 0 Warnings: 0`
- `INSERT INTO ... VALUES (...),(...),(...)...`
String format: `Records: 3 Duplicates: 0 Warnings: 0`
- `LOAD DATA INFILE ...`
String format: `Records: 1 Deleted: 0 Skipped: 0 Warnings: 0`
- `ALTER TABLE`
String format: `Records: 3 Duplicates: 0 Warnings: 0`
- `UPDATE`
String format: `Rows matched: 40 Changed: 40 Warnings: 0`

Note that `mysql_info()` returns a non-`NULL` value for `INSERT ... VALUES` only for the multiple-row form of the statement (that is, only if multiple value lists are specified).

Return Values

A character string representing additional information about the most recently executed statement. `NULL` if no information is available for the statement.

Errors

None.

24.7.3.36. `mysql_init()`

```
MYSQL *mysql_init(MYSQL *mysql)
```

Description

Allocates or initializes a `MYSQL` object suitable for `mysql_real_connect()`. If `mysql` is a `NULL` pointer, the function allocates, initializes, and returns a new object. Otherwise, the object is initialized and the address of the object is returned. If `mysql_init()` allocates a new object, it is freed when `mysql_close()` is called to close the connection.

Return Values

An initialized `MYSQL*` handle. `NULL` if there was insufficient memory to allocate a new object.

Errors

In case of insufficient memory, `NULL` is returned.

24.7.3.37. `mysql_insert_id()`

```
my_ulonglong mysql_insert_id(MYSQL *mysql)
```

Description

Returns the value generated for an `AUTO_INCREMENT` column by the previous `INSERT` or `UPDATE` statement. Use this function after you have performed an `INSERT` statement into a table that contains an `AUTO_INCREMENT` field, or have used `INSERT` or `UPDATE` to set a column value with `LAST_INSERT_ID(expr)`.

More precisely, `mysql_insert_id()` is updated under these conditions:

- `INSERT` statements that store a value into an `AUTO_INCREMENT` column. This is true whether the value is automatically generated by storing the special values `NULL` or `0` into the column, or is an explicit non-special value.

- In the case of a multiple-row `INSERT` statement, `mysql_insert_id()` returns the *first* automatically generated `AUTO_INCREMENT` value; if no such value is generated, it returns the *last* explicit value inserted into the `AUTO_INCREMENT` column.
If no rows are successfully inserted, `mysql_insert_id()` returns 0.
- Starting in MySQL 5.0.54, if an `INSERT ... SELECT` statement is executed, and no automatically generated value is successfully inserted, `mysql_insert_id()` returns the ID of the last inserted row.
- `INSERT` statements that generate an `AUTO_INCREMENT` value by inserting `LAST_INSERT_ID(expr)` into any column or by updating any column to `LAST_INSERT_ID(expr)`.
- If the previous statement returned an error, the value of `mysql_insert_id()` is undefined.

`mysql_insert_id()` returns 0 if the previous statement does not use an `AUTO_INCREMENT` value. If you need to save the value for later, be sure to call `mysql_insert_id()` immediately after the statement that generates the value.

The value of `mysql_insert_id()` is not affected by statements such as `SELECT` that return a result set.

The value of `mysql_insert_id()` is affected only by statements issued within the current client connection. It is not affected by statements issued by other clients.

The `LAST_INSERT_ID()` SQL function returns the most recently generated `AUTO_INCREMENT` value, and is not reset between statements because the value of that function is maintained in the server. Another difference from `mysql_insert_id()` is that `LAST_INSERT_ID()` is not updated if you set an `AUTO_INCREMENT` column to a specific non-special value. See [Section 11.10.3, “Information Functions”](#).

`mysql_insert_id()` returns 0 following a `CALL` statement for a stored procedure that generates an `AUTO_INCREMENT` value because in this case `mysql_insert_id()` applies to `CALL` and not the statement within the procedure. Within the procedure, you can use `LAST_INSERT_ID()` at the SQL level to obtain the `AUTO_INCREMENT` value.

The reason for the differences between `LAST_INSERT_ID()` and `mysql_insert_id()` is that `LAST_INSERT_ID()` is made easy to use in scripts while `mysql_insert_id()` tries to provide more exact information about what happens to the `AUTO_INCREMENT` column.

Return Values

Described in the preceding discussion.

Errors

None.

24.7.3.38. `mysql_kill()`

```
int mysql_kill(MYSQL *mysql, unsigned long pid)
```

Description

Asks the server to kill the thread specified by `pid`.

This function is deprecated. It is preferable to use `mysql_query()` to issue an `SQL KILL` statement instead.

Return Values

Zero for success. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

24.7.3.39. `mysql_library_end()`

```
void mysql_library_end(void)
```

Description

This function finalizes the MySQL library. You should call it when you are done using the library (for example, after disconnecting from the server). The action taken by the call depends on whether your application is linked to the MySQL client library or the MySQL embedded server library. For a client program linked against the `libmysqlclient` library by using the `-lmysqlclient` flag, `mysql_library_end()` performs some memory management to clean up. For an embedded server application linked against the `libmysqld` library by using the `-lmysqld` flag, `mysql_library_end()` shuts down the embedded server and then cleans up.

See [Section 24.7.2, “C API Function Overview”](#), and [Section 24.7.3.40, “mysql_library_init\(\)”](#), for usage information.

`mysql_library_end()` was added in MySQL 5.0.3. For older versions of MySQL, call `mysql_server_end()` instead.

24.7.3.40. `mysql_library_init()`

```
int mysql_library_init(int argc, char **argv, char **groups)
```

Description

This function should be called to initialize the MySQL library before you call any other MySQL function. If your application uses the embedded server, this call starts the server and initializes any subsystems (`mysys`, `InnoDB`, and so forth) that the server uses.

In a non-multi-threaded environment, the call to `mysql_library_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multi-threaded environment, and thus neither is `mysql_init()`, which calls `mysql_library_init()`. You must either call `mysql_library_init()` prior to spawning any threads, or else use a mutex to protect the call, whether you invoke `mysql_library_init()` or indirectly via `mysql_init()`. This should be done prior to any other client library call.

After your application is done using the MySQL library, call `mysql_library_end()` to clean up. See [Section 24.7.3.39, “mysql_library_end\(\)”](#).

The `argc` and `argv` arguments are analogous to the arguments to `main()`. The first element of `argv` is ignored (it typically contains the program name). For convenience, `argc` may be 0 (zero) if there are no command-line arguments for the server. `mysql_library_init()` makes a copy of the arguments so it is safe to destroy `argv` or `groups` after the call.

If you want to connect to an external server without starting the embedded server, you have to specify a negative value for `argc`.

The `groups` argument should be an array of strings that indicate the groups in option files from which options should be read. See [Section 4.2.3.2, “Using Option Files”](#). The final entry in the array should be `NULL`. For convenience, if the `groups` argument itself is `NULL`, the `[server]` and `[embedded]` groups are used by default.

See [Section 24.7.2, “C API Function Overview”](#), for additional usage information.

`mysql_library_init()` was added in MySQL 5.0.3. For older versions of MySQL, call `mysql_server_init()` instead.

Example

```
#include <mysql.h>
#include <stdlib.h>

static char *server_args[] = {
    "this_program", /* this string is not used */
    "--datadir=.",
    "--key_buffer_size=32M"
};
static char *server_groups[] = {
    "embedded",
    "server",
    "this_program_SERVER",
    (char *)NULL
};

int main(void) {
```

```

if (mysql_library_init(sizeof(server_args) / sizeof(char *),
                      server_args, server_groups)) {
    fprintf(stderr, "could not initialize MySQL library\n");
    exit(1);
}

/* Use any MySQL API functions here */

mysql_library_end();

return EXIT_SUCCESS;
}

```

Return Values

Zero if successful. Non-zero if an error occurred.

24.7.3.41. `mysql_list_dbs()`

```
MYSQL_RES *mysql_list_dbs(MYSQL *mysql, const char *wild)
```

Description

Returns a result set consisting of database names on the server that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters “%” or “_”, or may be a `NULL` pointer to match all databases. Calling `mysql_list_dbs()` is similar to executing the query `SHOW databases [LIKE wild]`.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

24.7.3.42. `mysql_list_fields()`

```
MYSQL_RES *mysql_list_fields(MYSQL *mysql, const char *table, const char *wild)
```

Description

Returns a result set consisting of field names in the given table that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters “%” or “_”, or may be a `NULL` pointer to match all fields. Calling `mysql_list_fields()` is similar to executing the query `SHOW COLUMNS FROM tbl_name [LIKE wild]`.

Note that it's recommended that you use `SHOW COLUMNS FROM tbl_name` instead of `mysql_list_fields()`.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

24.7.3.43. `mysql_list_processes()`

```
MYSQL_RES *mysql_list_processes(MYSQL *mysql)
```

Description

Returns a result set describing the current server threads. This is the same kind of information as that reported by `mysqladmin processlist` or a `SHOW PROCESSLIST` query.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

24.7.3.44. `mysql_list_tables()`

```
MYSQL_RES *mysql_list_tables(MYSQL *mysql, const char *wild)
```

Description

Returns a result set consisting of table names in the current database that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters “%” or “_”, or may be a `NULL` pointer to match all tables. Calling `mysql_list_tables()` is similar to executing the query `SHOW tables [LIKE wild]`.

You must free the result set with `mysql_free_result()`.

Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

24.7.3.45. `mysql_more_results()`

```
my_bool mysql_more_results(MYSQL *mysql)
```

Description

This function is used when you execute multiple statements specified as a single statement string, or when you execute `CALL` statements, which can return multiple result sets.

`mysql_more_results()` true if more results exist from the currently executed statement, in which case the application must call `mysql_next_result()` to fetch the results.

Return Values

`TRUE` (1) if more results exist. `FALSE` (0) if no more results exist.

In most cases, you can call `mysql_next_result()` instead to test whether more results exist and initiate retrieval if so.

See [Section 24.7.9, “C API Handling of Multiple Statement Execution”](#), and [Section 24.7.3.46, “mysql_next_result\(\)”](#).

Errors

None.

24.7.3.46. `mysql_next_result()`

```
int mysql_next_result(MYSQL *mysql)
```

Description

This function is used when you execute multiple statements specified as a single statement string, or when you execute `CALL` statements, which can return multiple result sets.

If more statement results exist, `mysql_next_result()` reads the next statement result and returns the status back to the application.

Before calling `mysql_next_result()`, you must call `mysql_free_result()` for the preceding statement if it is a query that returned a result set.

After calling `mysql_next_result()` the state of the connection is as if you had called `mysql_real_query()` or `mysql_query()` for the next statement. This means that you can call `mysql_store_result()`, `mysql_warning_count()`, `mysql_affected_rows()`, and so forth.

If `mysql_next_result()` returns an error, no other statements are executed and there are no more results to fetch.

If your program executes stored procedures with the `CALL SQL` statement, you *must* set the `CLIENT_MULTI_RESULTS` flag explicitly, or implicitly by setting `CLIENT_MULTI_STATEMENTS` when you call `mysql_real_connect()`. This is because each `CALL` returns a result to indicate the call status, in addition to any results sets that might be returned by statements executed within the procedure. In addition, because `CALL` can return multiple results, you should process those results using a loop that calls `mysql_next_result()` to determine whether there are more results.

For an example that shows how to use `mysql_next_result()`, see [Section 24.7.9, “C API Handling of Multiple Statement Execution”](#).

Return Values

Return Value	Description
0	Successful and there are more results
-1	Successful and there are no more results
>0	An error occurred

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)

Commands were executed in an improper order. For example if you didn't call `mysql_use_result()` for a previous result set.

- [CR_SERVER_GONE_ERROR](#)

The MySQL server has gone away.

- [CR_SERVER_LOST](#)

The connection to the server was lost during the query.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

24.7.3.47. `mysql_num_fields()`

```
unsigned int mysql_num_fields(MYSQL_RES *result)
```

To pass a `MYSQL*` argument instead, use `unsigned int mysql_field_count(MYSQL *mysql)`.

Description

Returns the number of columns in a result set.

Note that you can get the number of columns either from a pointer to a result set or to a connection handle. You would use the connection handle if `mysql_store_result()` or `mysql_use_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a non-empty result. This allows the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT`-like) statement. The example shown here illustrates how this may be done.

See [Section 24.7.14.1, “Why `mysql_store_result\(\)` Sometimes Returns `NULL` After `mysql_query\(\)` Returns Success”](#).

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

Example

```
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql, query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{
    result = mysql_store_result(&mysql);
    if (result) // there are rows
    {
        num_fields = mysql_num_fields(result);
        // retrieve rows, then call mysql_free_result(result)
    }
    else // mysql_store_result() returned nothing; should it have?
```

```

{
    if (mysql_errno(&mysql))
    {
        fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
    }
    else if (mysql_field_count(&mysql) == 0)
    {
        // query does not return data
        // (it was not a SELECT)
        num_rows = mysql_affected_rows(&mysql);
    }
}
}

```

An alternative (if you know that your query should have returned a result set) is to replace the `mysql_errno(&mysql)` call with a check whether `mysql_field_count(&mysql)` returns 0. This happens only if something went wrong.

24.7.3.48. `mysql_num_rows()`

```
my_ulonglong mysql_num_rows(MYSQL_RES *result)
```

Description

Returns the number of rows in the result set.

The use of `mysql_num_rows()` depends on whether you use `mysql_store_result()` or `mysql_use_result()` to return the result set. If you use `mysql_store_result()`, `mysql_num_rows()` may be called immediately. If you use `mysql_use_result()`, `mysql_num_rows()` does not return the correct value until all the rows in the result set have been retrieved.

`mysql_num_rows()` is intended for use with statements that return a result set, such as `SELECT`. For statements such as `INSERT`, `UPDATE`, or `DELETE`, the number of affected rows can be obtained with `mysql_affected_rows()`.

Return Values

The number of rows in the result set.

Errors

None.

24.7.3.49. `mysql_options()`

```
int mysql_options(MYSQL *mysql, enum mysql_option option, const char *arg)
```

Description

Can be used to set extra connect options and affect behavior for a connection. This function may be called multiple times to set several options.

`mysql_options()` should be called after `mysql_init()` and before `mysql_connect()` or `mysql_real_connect()`.

The `option` argument is the option that you want to set; the `arg` argument is the value for the option. If the option is an integer, `arg` should point to the value of the integer.

The following list describes the possible options, their effect, and how `arg` is used for each option. Several of the options apply only when the application is linked against the `libmysqld` embedded server library and are unused for applications linked against the `libmysql` client library. For option descriptions that indicate `arg` is unused, its value is irrelevant; it is conventional to pass 0.

- `MYSQL_INIT_COMMAND` (argument type: `char *`)
Statement to execute when connecting to the MySQL server. Automatically re-executed if reconnection occurs.
- `MYSQL_OPT_COMPRESS` (argument: not used)
Use the compressed client/server protocol.
- `MYSQL_OPT_CONNECT_TIMEOUT` (argument type: `unsigned int *`)
Connect timeout in seconds.
- `MYSQL_OPT_GUESS_CONNECTION` (argument: not used)

For an application linked against the `libmysqld` embedded server library, this allows the library to guess whether to use the embedded server or a remote server. “Guess” means that if the hostname is set and is not `localhost`, it uses a remote server. This behavior is the default. `MYSQL_OPT_USE_EMBEDDED_CONNECTION` and `MYSQL_OPT_USE_REMOTE_CONNECTION` can be used to override it. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_LOCAL_INFILE` (argument type: optional pointer to `unsigned int`)

If no pointer is given or if pointer points to an `unsigned int` that has a non-zero value, the `LOAD LOCAL INFILE` statement is enabled.
- `MYSQL_OPT_NAMED_PIPE` (argument: not used)

Use named pipes to connect to a MySQL server on Windows, if the server allows named-pipe connections.
- `MYSQL_OPT_PROTOCOL` (argument type: `unsigned int *`)

Type of protocol to use. Should be one of the enum values of `mysql_protocol_type` defined in `mysql.h`.
- `MYSQL_OPT_READ_TIMEOUT` (argument type: `unsigned int *`)

The timeout in seconds for attempts to read from the server. Each attempt uses this timeout value and there are retries if necessary, so the total effective timeout value is three times the option value. You can set the value so that a lost connection can be detected earlier than the TCP/IP `Close_Wait_Timeout` value of 10 minutes. This option works only for TCP/IP connections, and only for Windows prior to MySQL 5.0.25.
- `MYSQL_OPT_RECONNECT` (argument type: `my_bool *`)

Enable or disable automatic reconnection to the server if the connection is found to have been lost. Reconnect has been off by default since MySQL 5.0.3; this option is new in 5.0.13 and provides a way to set reconnection behavior explicitly.

Note: `mysql_real_connect()` incorrectly reset the `MYSQL_OPT_RECONNECT` option to its default value before MySQL 5.0.19. Therefore, prior to that version, if you want reconnect to be enabled for each connection, you must call `mysql_options()` with the `MYSQL_OPT_RECONNECT` option after each call to `mysql_real_connect()`. This is not necessary as of 5.0.19: Call `mysql_options()` only before `mysql_real_connect()` as usual.
- `MYSQL_OPT_SET_CLIENT_IP` (argument type: `char *`)

For an application linked against the `libmysqld` embedded server library (when `libmysqld` is compiled with authentication support), this means that the user is considered to have connected from the specified IP address (specified as a string) for authentication purposes. This option is ignored for applications linked against the `libmysqlclient` client library.
- `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` (argument type: `my_bool *`)

Enable or disable verification of the server's Common Name value in its certificate against the hostname used when connecting to the server. The connection is rejected if there is a mismatch. This feature can be used to prevent man-in-the-middle attacks. Verification is disabled by default. Added in MySQL 5.0.23.
- `MYSQL_OPT_USE_EMBEDDED_CONNECTION` (argument: not used)

For an application linked against the `libmysqld` embedded server library, this forces the use of the embedded server for the connection. This option is ignored for applications linked against the `libmysqlclient` client library.
- `MYSQL_OPT_USE_REMOTE_CONNECTION` (argument: not used)

For an application linked against the `libmysqld` embedded server library, this forces the use of a remote server for the connection. This option is ignored for applications linked against the `libmysqlclient` client library.
- `MYSQL_OPT_USE_RESULT` (argument: not used)

This option is unused.
- `MYSQL_OPT_WRITE_TIMEOUT` (argument type: `unsigned int *`)

The timeout in seconds for attempts to write to the server. Each attempt uses this timeout value and there are `net_retry_count` retries if necessary, so the total effective timeout value is `net_retry_count` times the option value. This option works only for TCP/IP connections, and only for Windows prior to MySQL 5.0.25.
- `MYSQL_READ_DEFAULT_FILE` (argument type: `char *`)

Read options from the named option file instead of from `my.cnf`.

- `MYSQL_READ_DEFAULT_GROUP` (argument type: `char *`)

Read options from the named group from `my.cnf` or the file specified with `MYSQL_READ_DEFAULT_FILE`.

- `MYSQL_REPORT_DATA_TRUNCATION` (argument type: `my_bool *`)

Enable or disable reporting of data truncation errors for prepared statements via the `error` member of `MYSQL_BIND` structures. (Default: enabled) Added in 5.0.3.

- `MYSQL_SECURE_AUTH` (argument type: `my_bool *`)

Whether to connect to a server that does not support the password hashing used in MySQL 4.1.1 and later.

- `MYSQL_SET_CHARSET_DIR` (argument type: `char *`)

The pathname to the directory that contains character set definition files.

- `MYSQL_SET_CHARSET_NAME` (argument type: `char *`)

The name of the character set to use as the default character set.

- `MYSQL_SHARED_MEMORY_BASE_NAME` (argument type: `char *`)

The name of the shared-memory object for communication to the server on Windows, if the server supports shared-memory connections. Should have the same value as the `--shared-memory-base-name` option used for the `mysqld` server you want to connect to.

The `client` group is always read if you use `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP`.

The specified group in the option file may contain the following options:

Option	Description
<code>character-sets-dir=path</code>	The directory where character sets are installed.
<code>compress</code>	Use the compressed client/server protocol.
<code>connect-timeout=seconds</code>	Connect timeout in seconds. On Linux this timeout is also used for waiting for the first answer from the server.
<code>database=db_name</code>	Connect to this database if no database was specified in the connect command.
<code>debug</code>	Debug options.
<code>default-character-set=charset_name</code>	The default character set to use.
<code>disable-local-infile</code>	Disable use of <code>LOAD DATA LOCAL</code> .
<code>host=host_name</code>	Default hostname.
<code>init-command=stmt</code>	Statement to execute when connecting to MySQL server. Automatically re-executed if reconnection occurs.
<code>interactive-timeout=seconds</code>	Same as specifying <code>CLIENT_INTERACTIVE</code> to <code>mysql_real_connect()</code> . See Section 24.7.3.52, “ <code>mysql_real_connect()</code> ”.
<code>local-infile[={0 1}]</code>	If no argument or non-zero argument, enable use of <code>LOAD DATA LOCAL</code> ; otherwise disable.
<code>max_allowed_packet=bytes</code>	Maximum size of packet that client can read from server.
<code>multi-queries, multi-results</code>	Allow multiple result sets from multiple-statement executions or stored procedures.
<code>multi-statements</code>	Allow the client to send multiple statements in a single string (separated by “;”).
<code>password=password</code>	Default password.
<code>pipe</code>	Use named pipes to connect to a MySQL server on Windows.
<code>port=port_num</code>	Default port number.
<code>protocol={TCP SOCKET PIPE MEMORY}</code>	The protocol to use when connecting to the server.
<code>return-found-rows</code>	Tell <code>mysql_info()</code> to return found rows instead of updated rows when using <code>UPDATE</code> .

<code>shared-memory-base-name=name</code>	Shared-memory name to use to connect to server.
<code>socket=path</code>	Default socket file.
<code>ssl-ca=file_name</code>	Certificate Authority file.
<code>ssl-capath=path</code>	Certificate Authority directory.
<code>ssl-cert=file_name</code>	Certificate file.
<code>ssl-cipher=cipher_list</code>	Allowable SSL ciphers.
<code>ssl-key=file_name</code>	Key file.
<code>timeout=seconds</code>	Like <code>connect-timeout</code> .
<code>user</code>	Default user.

`timeout` has been replaced by `connect-timeout`, but `timeout` is still supported in MySQL 5.0 for backward compatibility.

For more information about option files, see [Section 4.2.3.2, “Using Option Files”](#).

Return Values

Zero for success. Non-zero if you specify an unknown option.

Example

```
MYSQL mysql;
mysql_init(&mysql);
mysql_options(&mysql, MYSQL_OPT_COMPRESS, 0);
mysql_options(&mysql, MYSQL_READ_DEFAULT_GROUP, "odbc");
if (!mysql_real_connect(&mysql, "host", "user", "passwd", "database", 0, NULL, 0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}
```

This code requests that the client use the compressed client/server protocol and read the additional options from the `odbc` section in the `my.cnf` file.

24.7.3.50. `mysql_ping()`

```
int mysql_ping(MYSQL *mysql)
```

Description

Checks whether the connection to the server is working. If the connection has gone down, an attempt to reconnect is made unless auto-reconnect is disabled.

This function can be used by clients that remain idle for a long while, to check whether the server has closed the connection and reconnect if necessary.

Return Values

Zero if the connection to the server is alive. Non-zero if an error occurred. A non-zero return does not indicate whether the MySQL server itself is down; the connection might be broken for other reasons such as network problems.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

24.7.3.51. `mysql_query()`

```
int mysql_query(MYSQL *mysql, const char *stmt_str)
```

Description

Executes the SQL statement pointed to by the null-terminated string `stmt_str`. Normally, the string must consist of a single SQL statement and you should not add a terminating semicolon (“;”) or `\g` to the statement. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See [Section 24.7.9, “C API Handling of Multiple Statement Execution”](#).

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the “\0” character, which `mysql_query()` interprets as the end of the statement string.)

If you want to know whether the statement should return a result set, you can use `mysql_field_count()` to check for this. See [Section 24.7.3.22, “mysql_field_count\(\)”](#).

Return Values

Zero if the statement was successful. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

24.7.3.52. `mysql_real_connect()`

```
MYSQL *mysql_real_connect(MYSQL *mysql, const char *host, const char *user, const char *passwd, const char *db, unsigned int port, const char *unix_socket, unsigned long client_flag)
```

Description

`mysql_real_connect()` attempts to establish a connection to a MySQL database engine running on `host`. `mysql_real_connect()` must complete successfully before you can execute any other API functions that require a valid MySQL connection handle structure.

The parameters are specified as follows:

- The first parameter should be the address of an existing `MYSQL` structure. Before calling `mysql_real_connect()` you must call `mysql_init()` to initialize the `MYSQL` structure. You can change a lot of connect options with the `mysql_options()` call. See [Section 24.7.3.49, “mysql_options\(\)”](#).
- The value of `host` may be either a hostname or an IP address. If `host` is `NULL` or the string “localhost”, a connection to the local host is assumed. For Windows, the client connects using a shared-memory connection, if the server has shared-memory connections enabled. Otherwise, TCP/IP is used. For Unix, the client connects using a Unix socket file. For local connections, you can also influence the type of connection to use with the `MYSQL_OPT_PROTOCOL` or `MYSQL_OPT_NAMED_PIPE` options to `mysql_options()`. The type of connection must be supported by the server. For a `host` value of “.” on Windows, the client connects using a named pipe, if the server has named-pipe connections enabled. If named-pipe connections are not enabled, an error occurs.
- The `user` parameter contains the user’s MySQL login ID. If `user` is `NULL` or the empty string “”, the current user is assumed. Under Unix, this is the current login name. Under Windows ODBC, the current username must be specified explicitly. See the MyODBC section of [Chapter 24, Connectors and APIs](#).
- The `passwd` parameter contains the password for `user`. If `passwd` is `NULL`, only entries in the `user` table for the user that

have a blank (empty) password field are checked for a match. This allows the database administrator to set up the MySQL privilege system in such a way that users get different privileges depending on whether they have specified a password.

Note

Do not attempt to encrypt the password before calling `mysql_real_connect()`; password encryption is handled automatically by the client API.

- The `user` and `passwd` parameters use whatever character set has been configured for the `MYSQL` object. By default, this is `latin1`, but can be changed by calling `mysql_options(mysql, MYSQL_SET_CHARSET_NAME, "charset_name")` prior to connecting.
- `db` is the database name. If `db` is not `NULL`, the connection sets the default database to this value.
- If `port` is not 0, the value is used as the port number for the TCP/IP connection. Note that the `host` parameter determines the type of the connection.
- If `unix_socket` is not `NULL`, the string specifies the socket or named pipe that should be used. Note that the `host` parameter determines the type of the connection.
- The value of `client_flag` is usually 0, but can be set to a combination of the following flags to enable certain features:

Flag Name	Flag Description
<code>CLIENT_COMPRESS</code>	Use compression protocol.
<code>CLIENT_FOUND_ROWS</code>	Return the number of found (matched) rows, not the number of changed rows.
<code>CLIENT_IGNORE_SIGPIPE</code>	Prevents the client library from installing a <code>SIGPIPE</code> signal handler. This can be used to avoid conflicts with a handler that the application has already installed.
<code>CLIENT_IGNORE_SPACE</code>	Allow spaces after function names. Makes all functions names reserved words.
<code>CLIENT_INTERACTIVE</code>	Allow <code>interactive_timeout</code> seconds (instead of <code>wait_timeout</code> seconds) of inactivity before closing the connection. The client's session <code>wait_timeout</code> variable is set to the value of the session <code>interactive_timeout</code> variable.
<code>CLIENT_LOCAL_FILES</code>	Enable <code>LOAD DATA LOCAL</code> handling.
<code>CLIENT_MULTI_RESULTS</code>	Tell the server that the client can handle multiple result sets from multiple-statement executions or stored procedures. This is automatically set if <code>CLIENT_MULTI_STATEMENTS</code> is set. See the note following this table for more information about this flag.
<code>CLIENT_MULTI_STATEMENTS</code>	Tell the server that the client may send multiple statements in a single string (separated by “;”). If this flag is not set, multiple-statement execution is disabled. See the note following this table for more information about this flag.
<code>CLIENT_NO_SCHEMA</code>	Don't allow the <code>db_name.tbl_name.col_name</code> syntax. This is for ODBC. It causes the parser to generate an error if you use that syntax, which is useful for trapping bugs in some ODBC programs.
<code>CLIENT_ODBC</code>	Unused.
<code>CLIENT_SSL</code>	Use SSL (encrypted protocol). This option should not be set by application programs; it is set internally in the client library. Instead, use <code>mysql_ssl_set()</code> before calling <code>mysql_real_connect()</code> .

If your program uses the `CALL` SQL statement to execute stored procedures that produce result sets, you *must* set the `CLIENT_MULTI_RESULTS` flag, either explicitly, or implicitly by setting `CLIENT_MULTI_STATEMENTS` when you call `mysql_real_connect()`. This is because each such stored procedure produces multiple results: the result sets returned by statements executed within the procedure, as well as a result to indicate the call status.

If you enable `CLIENT_MULTI_STATEMENTS` or `CLIENT_MULTI_RESULTS`, you should process the result for every call to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 24.7.9, “C API Handling of Multiple Statement Execution”](#).

For some parameters, it is possible to have the value taken from an option file rather than from an explicit value in the `mysql_real_connect()` call. To do this, call `mysql_options()` with the `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP` option before calling `mysql_real_connect()`. Then, in the `mysql_real_connect()` call, specify the “no-value” value for each parameter to be read from an option file:

- For `host`, specify a value of `NULL` or the empty string (“”).

- For `user`, specify a value of `NULL` or the empty string.
- For `passwd`, specify a value of `NULL`. (For the password, a value of the empty string in the `mysql_real_connect()` call cannot be overridden in an option file, because the empty string indicates explicitly that the MySQL account must have an empty password.)
- For `db`, specify a value of `NULL` or the empty string.
- For `port`, specify a value of 0.
- For `unix_socket`, specify a value of `NULL`.

If no value is found in an option file for a parameter, its default value is used as indicated in the descriptions given earlier in this section.

Return Values

A `MYSQL*` connection handle if the connection was successful, `NULL` if the connection was unsuccessful. For a successful connection, the return value is the same as the value of the first parameter.

Errors

- `CR_CONN_HOST_ERROR`
Failed to connect to the MySQL server.
- `CR_CONNECTION_ERROR`
Failed to connect to the local MySQL server.
- `CR_IPSOCK_ERROR`
Failed to create an IP socket.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SOCKET_CREATE_ERROR`
Failed to create a Unix socket.
- `CR_UNKNOWN_HOST`
Failed to find the IP address for the hostname.
- `CR_VERSION_ERROR`
A protocol mismatch resulted from attempting to connect to a server with a client library that uses a different protocol version.
- `CR_NAMEDPIPEOPEN_ERROR`
Failed to create a named pipe on Windows.
- `CR_NAMEDPIPEWAIT_ERROR`
Failed to wait for a named pipe on Windows.
- `CR_NAMEDPIPESETSTATE_ERROR`
Failed to get a pipe handler on Windows.
- `CR_SERVER_LOST`
If `connect_timeout > 0` and it took longer than `connect_timeout` seconds to connect to the server or if the server died while executing the `init-command`.

Example

```
MYSQL mysql;
```

```
mysql_init(&mysql);
mysql_options(&mysql,MYSQL_READ_DEFAULT_GROUP,"your_prog_name");
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr,"Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}
```

By using `mysql_options()` the MySQL library reads the `[client]` and `[your_prog_name]` sections in the `my.cnf` file which ensures that your program works, even if someone has set up MySQL in some non-standard way.

Note that upon connection, `mysql_real_connect()` sets the `reconnect` flag (part of the `MYSQL` structure) to a value of `1` in versions of the API older than 5.0.3, or `0` in newer versions. A value of `1` for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. As of MySQL 5.0.13, you can use the `MYSQL_OPT_RECONNECT` option to `mysql_options()` to control reconnection behavior.

24.7.3.53. `mysql_real_escape_string()`

```
unsigned long mysql_real_escape_string(MYSQL *mysql, char *to, const char *from, unsigned long length)
```

Note that `mysql` must be a valid, open connection. This is needed because the escaping depends on the character set in use by the server.

Description

This function is used to create a legal SQL string that you can use in an SQL statement. See [Section 8.1.1, “Strings”](#).

The string in `from` is encoded to an escaped SQL string, taking into account the current character set of the connection. The result is placed in `to` and a terminating null byte is appended. Characters encoded are `NUL` (ASCII 0), `“\n”`, `“\r”`, `“\”`, `“'”`, `“”`, and `Control-Z` (see [Section 8.1, “Literal Values”](#)). (Strictly speaking, MySQL requires only that backslash and the quote character used to quote the string in the query be escaped. This function quotes the other characters to make them easier to read in log files.)

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. (In the worst case, each character may need to be encoded as using two bytes, and you need room for the terminating null byte.) When `mysql_real_escape_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null character.

If you need to change the character set of the connection, you should use the `mysql_set_character_set()` function rather than executing a `SET NAMES` (or `SET CHARACTER SET`) statement. `mysql_set_character_set()` works like `SET NAMES` but also affects the character set used by `mysql_real_escape_string()`, which `SET NAMES` does not.

Example

```
char query[1000],*end;

end = strmov(query,"INSERT INTO test_table values(");
*end++ = '\\';
end += mysql_real_escape_string(&mysql, end,"What's this",11);
*end++ = '\\';
*end++ = ',';
*end++ = '\\';
end += mysql_real_escape_string(&mysql, end,"binary data: \\0\\r\\n",16);
*end++ = '\\';
*end++ = ')';

if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
    fprintf(stderr,"Failed to insert row, Error: %s\n",
            mysql_error(&mysql));
}
```

The `strmov()` function used in the example is included in the `mysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

Return Values

The length of the value placed into `to`, not including the terminating null character.

Errors

None.

24.7.3.54. `mysql_real_query()`

```
int mysql_real_query(MYSQL *mysql, const char *stmt_str, unsigned long length)
```

Description

Executes the SQL statement pointed to by `stmt_str`, which should be a string `length` bytes long. Normally, the string must consist of a single SQL statement and you should not add a terminating semicolon (“;”) or `\g` to the statement. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See [Section 24.7.9, “C API Handling of Multiple Statement Execution”](#).

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the “\0” character, which `mysql_query()` interprets as the end of the statement string.) In addition, `mysql_real_query()` is faster than `mysql_query()` because it does not call `strlen()` on the statement string.

If you want to know whether the statement should return a result set, you can use `mysql_field_count()` to check for this. See [Section 24.7.3.22, “mysql_field_count\(\)”](#).

Return Values

Zero if the statement was successful. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

24.7.3.55. `mysql_refresh()`

```
int mysql_refresh(MYSQL *mysql, unsigned int options)
```

Description

This function flushes tables or caches, or resets replication server information. The connected user must have the `RELOAD` privilege.

The `options` argument is a bit mask composed from any combination of the following values. Multiple values can be OR'ed together to perform multiple operations with a single call.

- `REFRESH_GRANT`
Refresh the grant tables, like `FLUSH PRIVILEGES`.
- `REFRESH_LOG`
Flush the logs, like `FLUSH LOGS`.
- `REFRESH_TABLES`
Flush the table cache, like `FLUSH TABLES`.
- `REFRESH_HOSTS`
Flush the host cache, like `FLUSH HOSTS`.
- `REFRESH_STATUS`
Reset status variables, like `FLUSH STATUS`.

- [REFRESH_THREADS](#)

Flush the thread cache.

- [REFRESH_SLAVE](#)

On a slave replication server, reset the master server information and restart the slave, like [RESET SLAVE](#).

- [REFRESH_MASTER](#)

On a master replication server, remove the binary log files listed in the binary log index and truncate the index file, like [RESET MASTER](#).

Return Values

Zero for success. Non-zero if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)

Commands were executed in an improper order.

- [CR_SERVER_GONE_ERROR](#)

The MySQL server has gone away.

- [CR_SERVER_LOST](#)

The connection to the server was lost during the query.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

24.7.3.56. `mysql_reload()`

```
int mysql_reload(MYSQL *mysql)
```

Description

Asks the MySQL server to reload the grant tables. The connected user must have the [RELOAD](#) privilege.

This function is deprecated. It is preferable to use `mysql_query()` to issue an SQL [FLUSH PRIVILEGES](#) statement instead.

Return Values

Zero for success. Non-zero if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)

Commands were executed in an improper order.

- [CR_SERVER_GONE_ERROR](#)

The MySQL server has gone away.

- [CR_SERVER_LOST](#)

The connection to the server was lost during the query.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

24.7.3.57. `mysql_rollback()`

```
my_bool mysql_rollback(MYSQL *mysql)
```

Description

Rolls back the current transaction.

As of MySQL 5.0.3, the action of this function is subject to the value of the `completion_type` system variable. In particular, if the value of `completion_type` is 2, the server performs a release after terminating a transaction and closes the client connection. The client program should call `mysql_close()` to close the connection from the client side.

Return Values

Zero if successful. Non-zero if an error occurred.

Errors

None.

24.7.3.58. `mysql_row_seek()`

```
MYSQL_ROW_OFFSET mysql_row_seek(MYSQL_RES *result, MYSQL_ROW_OFFSET offset)
```

Description

Sets the row cursor to an arbitrary row in a query result set. The `offset` value is a row offset that should be a value returned from `mysql_row_tell()` or from `mysql_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_row_seek()` may be used only in conjunction with `mysql_store_result()`, not with `mysql_use_result()`.

Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_row_seek()`.

Errors

None.

24.7.3.59. `mysql_row_tell()`

```
MYSQL_ROW_OFFSET mysql_row_tell(MYSQL_RES *result)
```

Description

Returns the current position of the row cursor for the last `mysql_fetch_row()`. This value can be used as an argument to `mysql_row_seek()`.

You should use `mysql_row_tell()` only after `mysql_store_result()`, not after `mysql_use_result()`.

Return Values

The current offset of the row cursor.

Errors

None.

24.7.3.60. `mysql_select_db()`

```
int mysql_select_db(MYSQL *mysql, const char *db)
```

Description

Causes the database specified by `db` to become the default (current) database on the connection specified by `mysql`. In subsequent queries, this database is the default for table references that do not include an explicit database specifier.

`mysql_select_db()` fails unless the connected user can be authenticated as having permission to use the database.

Return Values

Zero for success. Non-zero if an error occurred.

Errors

- [CR_COMMANDS_OUT_OF_SYNC](#)
Commands were executed in an improper order.
- [CR_SERVER_GONE_ERROR](#)
The MySQL server has gone away.
- [CR_SERVER_LOST](#)
The connection to the server was lost during the query.
- [CR_UNKNOWN_ERROR](#)
An unknown error occurred.

24.7.3.61. `mysql_set_character_set()`

```
int mysql_set_character_set(MYSQL *mysql, const char *csname)
```

Description

This function is used to set the default character set for the current connection. The string `csname` specifies a valid character set name. The connection collation becomes the default collation of the character set. This function works like the `SET NAMES` statement, but also sets the value of `mysql->charset`, and thus affects the character set used by `mysql_real_escape_string()`

This function was added in MySQL 5.0.7.

Return Values

Zero for success. Non-zero if an error occurred.

Example

```
MYSQL mysql;
mysql_init(&mysql);
if (!mysql_real_connect(&mysql, "host", "user", "passwd", "database", 0, NULL, 0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}
if (!mysql_set_character_set(&mysql, "utf8"))
{
    printf("New client character set: %s\n",
            mysql_character_set_name(&mysql));
}
```

24.7.3.62. `mysql_set_local_infile_default()`

```
void mysql_set_local_infile_default(MYSQL *mysql);
```

Description

Sets the `LOAD LOCAL DATA INFILE` handler callback functions to the defaults used internally by the C client library. The library calls this function automatically if `mysql_set_local_infile_handler()` has not been called or does not supply valid functions for each of its callbacks.

The `mysql_set_local_infile_default()` function was added in MySQL 4.1.2.

Return Values

None.

Errors

None.

24.7.3.63. `mysql_set_local_infile_handler()`

```
void mysql_set_local_infile_handler(MYSQL *mysql, int (*local_infile_init)(void **,
const char *, void *), int (*local_infile_read)(void *, char *, unsigned int), void
(*local_infile_end)(void *), int (*local_infile_error)(void *, char*, unsigned int),
void *userdata);
```

Description

This function installs callbacks to be used during the execution of `LOAD DATA LOCAL INFILE` statements. It enables application programs to exert control over local (client-side) data file reading. The arguments are the connection handler, a set of pointers to callback functions, and a pointer to a data area that the callbacks can use to share information.

To use `mysql_set_local_infile_handler()`, you must write the following callback functions:

```
int
local_infile_init(void **ptr, const char *filename, void *userdata);
```

The initialization function. This is called once to do any setup necessary, open the data file, allocate data structures, and so forth. The first `void**` argument is a pointer to a pointer. You can set the pointer (that is, `*ptr`) to a value that will be passed to each of the other callbacks (as a `void*`). The callbacks can use this pointed-to value to maintain state information. The `userdata` argument is the same value that is passed to `mysql_set_local_infile_handler()`.

The initialization function should return zero for success, non-zero for an error.

```
int
local_infile_read(void *ptr, char *buf, unsigned int buf_len);
```

The data-reading function. This is called repeatedly to read the data file. `buf` points to the buffer where the read data should be stored, and `buf_len` is the maximum number of bytes that the callback can read and store in the buffer. (It can read fewer bytes, but should not read more.)

The return value is the number of bytes read, or zero when no more data could be read (this indicates EOF). Return a value less than zero if an error occurs.

```
void
local_infile_end(void *ptr)
```

The termination function. This is called once after `local_infile_read()` has returned zero (EOF) or an error. This function should deallocate any memory allocated by `local_infile_init()` and perform any other cleanup necessary. It is invoked even if the initialization function returns an error.

```
int
local_infile_error(void *ptr,
                  char *error_msg,
                  unsigned int error_msg_len);
```

The error-handling function. This is called to get a textual error message to return to the user in case any of your other functions returns an error. `error_msg` points to the buffer into which the message should be written, and `error_msg_len` is the length of the buffer. The message should be written as a null-terminated string, so the message can be at most `error_msg_len-1` bytes long.

The return value is the error number.

Typically, the other callbacks store the error message in the data structure pointed to by `ptr`, so that `local_infile_error()` can copy the message from there into `error_msg`.

After calling `mysql_set_local_infile_handler()` in your C code and passing pointers to your callback functions, you can then issue a `LOAD DATA LOCAL INFILE` statement (for example, by using `mysql_query()`). The client library automatically invokes your callbacks. The filename specified in `LOAD DATA LOCAL INFILE` will be passed as the second parameter to the `local_infile_init()` callback.

The `mysql_set_local_infile_handler()` function was added in MySQL 4.1.2.

Return Values

None.

Errors

None.

24.7.3.64. `mysql_set_server_option()`

```
int mysql_set_server_option(MYSQL *mysql, enum enum_mysql_set_option option)
```

Description

Enables or disables an option for the connection. `option` can have one of the following values:

<code>MYSQL_OPTION_MULTI_STATEMENTS_ON</code>	Enable multiple-statement support
<code>MYSQL_OPTION_MULTI_STATEMENTS_OFF</code>	Disable multiple-statement support

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 24.7.9, “C API Handling of Multiple Statement Execution”](#).

Enabling multiple-statement support with `MYSQL_OPTION_MULTI_STATEMENTS_ON` does not have quite the same effect as enabling it by passing the `CLIENT_MULTI_STATEMENTS` flag to `mysql_real_connect()`: `CLIENT_MULTI_STATEMENTS` also enables `CLIENT_MULTI_RESULTS`. If you are using the `CALL SQL` statement in your programs, multiple-result support must be enabled; this means that `MYSQL_OPTION_MULTI_STATEMENTS_ON` by itself is insufficient to allow the use of `CALL`.

Return Values

Zero for success. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `ER_UNKNOWN_COM_ERROR`
The server didn't support `mysql_set_server_option()` (which is the case that the server is older than 4.1.1) or the server didn't support the option one tried to set.

24.7.3.65. `mysql_shutdown()`

```
int mysql_shutdown(MYSQL *mysql, enum mysql_enum_shutdown_level shutdown_level)
```

Description

Asks the database server to shut down. The connected user must have `SHUTDOWN` privileges. The `shutdown_level` argument was added in MySQL 5.0.1. MySQL 5.0 servers support only one type of shutdown; `shutdown_level` must be equal to `SHUTDOWN_DEFAULT`. Additional shutdown levels are planned to make it possible to choose the desired level. Dynamically linked executables which have been compiled with older versions of the `libmysqlclient` headers and call `mysql_shutdown()` need to be used with the old `libmysqlclient` dynamic library.

The shutdown process is described in [Section 5.1.10, “The Shutdown Process”](#).

Return Values

Zero for success. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

24.7.3.66. `mysql_sqlstate()`

```
const char *mysql_sqlstate(MYSQL *mysql)
```

Description

Returns a null-terminated string containing the SQLSTATE error code for the most recently executed SQL statement. The error code consists of five characters. '00000' means “no error.” The values are specified by ANSI SQL and ODBC. For a list of possible values, see [Appendix B, Errors, Error Codes, and Common Problems](#).

SQLSTATE values returned by `mysql_sqlstate()` differ from MySQL-specific error numbers returned by `mysql_errno()`. For example, the `mysql` client program displays errors using the following format, where 1146 is the `mysql_errno()` value and '42S02' is the corresponding `mysql_sqlstate()` value:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Not all MySQL error numbers are mapped to SQLSTATE error codes. The value 'HY000' (general error) is used for unmapped error numbers.

If you call `mysql_sqlstate()` after `mysql_real_connect()` fails, `mysql_sqlstate()` might not return a useful value. For example, this happens if a host is blocked by the server and the connection is closed without any SQLSTATE value being sent to the client.

Return Values

A null-terminated character string containing the SQLSTATE error code.

See Also

See [Section 24.7.3.14, “`mysql_errno\(\)`”](#), [Section 24.7.3.15, “`mysql_error\(\)`”](#), and [Section 24.7.7.26, “`mysql_stmt_sqlstate\(\)`”](#).

24.7.3.67. `mysql_ssl_set()`

```
my_bool mysql_ssl_set(MYSQL *mysql, const char *key, const char *cert, const char *ca,
const char *capath, const char *cipher)
```

Description

`mysql_ssl_set()` is used for establishing secure connections using SSL. It must be called before `mysql_real_connect()`.

`mysql_ssl_set()` does nothing unless OpenSSL support is enabled in the client library.

`mysql` is the connection handler returned from `mysql_init()`. The other parameters are specified as follows:

- `key` is the pathname to the key file.
- `cert` is the pathname to the certificate file.

- `ca` is the pathname to the certificate authority file.
- `capath` is the pathname to a directory that contains trusted SSL CA certificates in pem format.
- `cipher` is a list of allowable ciphers to use for SSL encryption.

Any unused SSL parameters may be given as `NULL`.

Return Values

This function always returns 0. If SSL setup is incorrect, `mysql_real_connect()` returns an error when you attempt to connect.

24.7.3.68. `mysql_stat()`

```
const char *mysql_stat(MYSQL *mysql)
```

Description

Returns a character string containing information similar to that provided by the `mysqladmin status` command. This includes uptime in seconds and the number of running threads, questions, reloads, and open tables.

Return Values

A character string describing the server status. `NULL` if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

24.7.3.69. `mysql_store_result()`

```
MYSQL_RES *mysql_store_result(MYSQL *mysql)
```

Description

After invoking `mysql_query()` or `mysql_real_query()`, you must call `mysql_store_result()` or `mysql_use_result()` for every statement that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`, `CHECK TABLE`, and so forth). You must also call `mysql_free_result()` after you are done with the result set.

You don't have to call `mysql_store_result()` or `mysql_use_result()` for other statements, but it does not do any harm or cause any notable performance degradation if you call `mysql_store_result()` in all cases. You can detect whether the statement has a result set by checking whether `mysql_store_result()` returns a non-zero value (more about this later on).

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 24.7.9, "C API Handling of Multiple Statement Execution"](#).

If you want to know whether a statement should return a result set, you can use `mysql_field_count()` to check for this. See [Section 24.7.3.22, "mysql_field_count\(\)"](#).

`mysql_store_result()` reads the entire result of a query to the client, allocates a `MYSQL_RES` structure, and places the result into this structure.

`mysql_store_result()` returns a null pointer if the statement didn't return a result set (for example, if it was an `INSERT` statement).

`mysql_store_result()` also returns a null pointer if reading of the result set failed. You can check whether an error occurred by checking whether `mysql_error()` returns a non-empty string, `mysql_errno()` returns non-zero, or `mysql_field_count()` returns zero.

An empty result set is returned if there are no rows returned. (An empty result set differs from a null pointer as a return value.)

After you have called `mysql_store_result()` and gotten back a result that isn't a null pointer, you can call `mysql_num_rows()` to find out how many rows are in the result set.

You can call `mysql_fetch_row()` to fetch rows from the result set, or `mysql_row_seek()` and `mysql_row_tell()` to obtain or set the current row position within the result set.

See [Section 24.7.14.1, “Why `mysql_store_result\(\)` Sometimes Returns `NULL` After `mysql_query\(\)` Returns Success”](#).

Return Values

A `MYSQL_RES` result structure with the results. `NULL` (0) if an error occurred.

Errors

`mysql_store_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

24.7.3.70. `mysql_thread_id()`

```
unsigned long mysql_thread_id(MYSQL *mysql)
```

Description

Returns the thread ID of the current connection. This value can be used as an argument to `mysql_kill()` to kill the thread.

If the connection is lost and you reconnect with `mysql_ping()`, the thread ID changes. This means you should not get the thread ID and store it for later. You should get it when you need it.

Return Values

The thread ID of the current connection.

Errors

None.

24.7.3.71. `mysql_use_result()`

```
MYSQL_RES *mysql_use_result(MYSQL *mysql)
```

Description

After invoking `mysql_query()` or `mysql_real_query()`, you must call `mysql_store_result()` or `mysql_use_result()` for every statement that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`, `CHECK TABLE`, and so forth). You must also call `mysql_free_result()` after you are done with the result set.

`mysql_use_result()` initiates a result set retrieval but does not actually read the result set into the client like `mysql_store_result()` does. Instead, each row must be retrieved individually by making calls to `mysql_fetch_row()`. This reads the result of a query directly from the server without storing it in a temporary table or local buffer, which is somewhat faster and uses much less memory than `mysql_store_result()`. The client allocates memory only for the current row and a communication buffer that may grow up to `max_allowed_packet` bytes.

On the other hand, you shouldn't use `mysql_use_result()` if you are doing a lot of processing for each row on the client side, or if the output is sent to a screen on which the user may type a `^S` (stop scroll). This ties up the server and prevent other threads from updating any tables from which the data is being fetched.

When using `mysql_use_result()`, you must execute `mysql_fetch_row()` until a `NULL` value is returned, otherwise, the unfetched rows are returned as part of the result set for your next query. The C API gives the error `Commands out of sync; you can't run this command now` if you forget to do this!

You may not use `mysql_data_seek()`, `mysql_row_seek()`, `mysql_row_tell()`, `mysql_num_rows()`, or `mysql_affected_rows()` with a result returned from `mysql_use_result()`, nor may you issue other queries until `mysql_use_result()` has finished. (However, after you have fetched all the rows, `mysql_num_rows()` accurately returns the number of rows fetched.)

You must call `mysql_free_result()` once you are done with the result set.

When using the `libmysqld` embedded server, the memory benefits are essentially lost because memory usage incrementally increases with each row retrieved until `mysql_free_result()` is called.

Return Values

A `MYSQL_RES` result structure. `NULL` if an error occurred.

Errors

`mysql_use_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

24.7.3.72. `mysql_warning_count()`

```
unsigned int mysql_warning_count(MYSQL *mysql)
```

Description

Returns the number of warnings generated during execution of the previous SQL statement.

Return Values

The warning count.

Errors

None.

24.7.4. C API Prepared Statements

The MySQL client/server protocol provides for the use of prepared statements. This capability uses the `MYSQL_STMT` statement handler data structure returned by the `mysql_stmt_init()` initialization function. Prepared execution is an efficient way to execute a statement more than once. The statement is first parsed to prepare it for execution. Then it is executed one or more times at a later time, using the statement handle returned by the initialization function.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.

Prepared statements might not provide a performance increase in some situations. For best results, test your application both with prepared and non-prepared statements and choose whichever yields best performance.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

The following statements can be used as prepared statements: `CREATE TABLE`, `DELETE`, `DO`, `INSERT`, `REPLACE`, `SELECT`, `SET`, `UPDATE`, and most `SHOW` statements. Other statements are not supported in MySQL 5.0.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about using prepared statements in the Knowledge Base article, [How can I create server-side prepared statements?](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

24.7.5. C API Prepared Statement Data types

Prepared statements use several data structures:

- To prepare a statement, pass the statement string to `mysql_stmt_init()`, which returns a pointer to a `MYSQL_STMT` data structure.
- To provide input parameters for a prepared statement, set up `MYSQL_BIND` structures and pass them to `mysql_stmt_bind_param()`. To receive output column values, set up `MYSQL_BIND` structures and pass them to `mysql_stmt_bind_result()`.
- The `MYSQL_TIME` structure is used to transfer temporal data in both directions.

The following discussion describes the prepared statement data types in detail.

`MYSQL_STMT`

This structure represents a prepared statement. A statement is created by calling `mysql_stmt_init()`, which returns a statement handle (that is, a pointer to a `MYSQL_STMT`). The handle is used for all subsequent operations with the statement until you close it with `mysql_stmt_close()`, at which point the handle becomes invalid.

The `MYSQL_STMT` structure has no members that are intended for application use. Also, you should not try to make a copy of a `MYSQL_STMT` structure. There is no guarantee that such a copy will be usable.

Multiple statement handles can be associated with a single connection. The limit on the number of handles depends on the available system resources.

`MYSQL_BIND`

This structure is used both for statement input (data values sent to the server) and output (result values returned from the server):

- For input, `MYSQL_BIND` is used with `mysql_stmt_bind_param()` to bind parameter data values to buffers for use by `mysql_stmt_execute()`.
- For output, `MYSQL_BIND` is used with `mysql_stmt_bind_result()` to bind result set buffers for use in fetching rows with `mysql_stmt_fetch()`.

To use a `MYSQL_BIND` structure, you should zero its contents to initialize it, and then set its members appropriately. For example, to declare and initialize an array of three `MYSQL_BIND` structures, use this code:

```
MYSQL_BIND bind[3];
memset(bind, 0, sizeof(bind));
```

The `MYSQL_BIND` structure contains the following members for use by application programs. For several of the members, the manner of use depends on whether the structure is used for input or output.

- `enum enum_field_types buffer_type`

The type of the buffer. This member indicates the data type of the C language variable that you are binding to the statement parameter. The allowable `buffer_type` values are listed later in this section. For input, `buffer_type` indicates the type of the variable containing the value that you will send to the server. For output, it indicates the type of the variable into which you want a value received from the server to be stored.

- `void *buffer`

A pointer to the buffer to be used for data transfer. This is the address of a variable.

For input, `buffer` is a pointer to the variable in which a statement parameter's data value is stored. When you call `mysql_stmt_execute()`, MySQL takes the value that you have stored in the variable and uses it in place of the corresponding parameter marker in the statement.

For output, `buffer` is a pointer to the variable in which to return a result set column value. When you call `mysql_stmt_fetch()`, MySQL returns a column value and stores it in this variable. You can access the value when the call returns.

To minimize the need for MySQL to perform type conversions between C language values on the client side and SQL values on the server side, use variables that have types similar to those of the corresponding SQL values. For numeric data types, `buffer` should point to a variable of the proper numeric C type. (For `char` or integer variables, you should also indicate whether the variable has the `unsigned` attribute by setting the `is_unsigned` member, described later in this list.) For character (non-binary) and binary string data types, `buffer` should point to a character buffer. For date and time data types, `buffer` should point to a `MYSQL_TIME` structure.

See the notes about type conversions later in the section.

- `unsigned long buffer_length`

The actual size of `*buffer` in bytes. This indicates the maximum amount of data that can be stored in the buffer. For character and binary C data, the `buffer_length` value specifies the length of `*buffer` when used with `mysql_stmt_bind_param()` to specify input values, or the maximum number of output data bytes that can be fetched into the buffer when used with `mysql_stmt_bind_result()`.

- `unsigned long *length`

A pointer to an `unsigned long` variable that indicates the actual number of bytes of data stored in `*buffer`. `length` is used for character or binary C data.

For input parameter data binding, `length` points to an `unsigned long` variable that indicates the actual length of the parameter value stored in `*buffer`; this is used by `mysql_stmt_execute()`.

For output value binding, the return value of `mysql_stmt_fetch()` determines the interpretation of the length:

- If `mysql_stmt_fetch()` returns 0, `*length` indicates the actual length of the parameter value.
- If `mysql_stmt_fetch()` returns `MYSQL_DATA_TRUNCATED`, `*length` indicates the non-truncated length of the parameter value. In this case, the minimum of `*length` and `buffer_length` indicates the actual length of the value.

`length` is ignored for numeric and temporal data types because the length of the data value is determined by the `buffer_type` value.

If you need to be able to determine the length of a returned value before fetching it with `mysql_stmt_fetch()`, see [Section 24.7.7.11](#), “`mysql_stmt_fetch()`”, for some strategies.

- `my_bool *is_null`

This member points to a `my_bool` variable that is true if a value is `NULL`, false if it is not `NULL`. For input, set `*is_null` to true to indicate that you are passing a `NULL` value as a statement parameter.

The reason that `is_null` is not a boolean scalar but is instead a *pointer* to a boolean scalar is to provide flexibility in how you specify `NULL` values:

- If your data values are always `NULL`, use `MYSQL_TYPE_NULL` as the `buffer_type` value when you bind the column. The other members do not matter.
- If your data values are always `NOT NULL`, set the other members appropriately for the variable you are binding, and set `is_null = (my_bool*) 0`.
- In all other cases, set the other members appropriately, and set `is_null` to the address of a `my_bool` variable. Set that variable's value to true or false appropriately between executions to indicate whether data values are `NULL` or `NOT NULL`, respectively.

For output, the value pointed to by `is_null` is set to true after you fetch a row if the result set column value returned from the statement is `NULL`.

- `my_bool is_unsigned`

This member is used for C variables with data types that can be `unsigned` (`char`, `short int`, `int`, `long long int`). Set `is_unsigned` to true if the variable pointed to by `buffer` is `unsigned` and false otherwise. For example, if you bind a `signed char` variable to `buffer`, specify a type code of `MYSQL_TYPE_TINY` and set `is_unsigned` to false. If you bind an `unsigned char` instead, the type code is the same but `is_unsigned` should be true. (For `char`, it is not defined whether it is signed or unsigned, so it is best to be explicit about signedness by using `signed char` or `unsigned char`.)

`is_unsigned` applies only to the C language variable on the client side. It indicates nothing about the signedness of the corresponding SQL value on the server side. For example, if you use an `int` variable to supply a value for a `BIGINT UNSIGNED` column, `is_unsigned` should be false because `int` is a signed type. If you use an `unsigned int` variable to supply a value for a `BIGINT` column, `is_unsigned` should be true because `unsigned int` is an unsigned type. MySQL performs the proper conversion between signed and unsigned values in both directions, although a warning occurs if truncation results.

- `my_bool *error`

For output, set this member to point to a `my_bool` variable to have truncation information for the parameter stored there after a row fetching operation. (Truncation reporting is enabled by default, but can be controlled by calling `mysql_options()` with the `MYSQL_REPORT_DATA_TRUNCATION` option.) When truncation reporting is enabled, `mysql_stmt_fetch()` returns `MYSQL_DATA_TRUNCATED` and `*error` is true in the `MYSQL_BIND` structures for parameters in which truncation occurred. Truncation indicates loss of sign or significant digits, or that a string was too long to fit in a column. The `error` member was added in MySQL 5.0.3.

- `MYSQL_TIME`

This structure is used to send and receive `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` data directly to and from the server. Set the `buffer_type` member of a `MYSQL_BIND` structure to one of the temporal types (`MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATE`, `MYSQL_TYPE_DATETIME`, `MYSQL_TYPE_TIMESTAMP`), and set the `buffer` member to point to a `MYSQL_TIME` structure.

The `MYSQL_TIME` structure contains the members listed in the following table.

Member	Description
<code>unsigned int year</code>	The year
<code>unsigned int month</code>	The month of the year
<code>unsigned int day</code>	The day of the month
<code>unsigned int hour</code>	The hour of the day
<code>unsigned int minute</code>	The minute of the hour
<code>unsigned int second</code>	The second of the minute
<code>my_bool neg</code>	A boolean flag to indicate whether the time is negative
<code>unsigned long second_part</code>	The fractional part of the second in microseconds; currently unused

Only those parts of a `MYSQL_TIME` structure that apply to a given type of temporal value are used. The `year`, `month`, and `day` elements are used for `DATE`, `DATETIME`, and `TIMESTAMP` values. The `hour`, `minute`, and `second` elements are used for `TIME`, `DATETIME`, and `TIMESTAMP` values. See [Section 24.7.10, “C API Handling of Date and Time Values”](#).

The following table shows the allowable values that may be specified in the `buffer_type` member of `MYSQL_BIND` structures for input values. The value should be chosen according to the data type of the C language variable that you are binding. If the variable is `unsigned`, you should also set the `is_unsigned` member to true. The table shows the C variable types that you can use, the corresponding type codes, and the SQL data types for which the supplied value can be used without conversion.

Input Variable C Type	<code>buffer_type</code> Value	SQL Type of Destination Value
<code>signed char</code>	<code>MYSQL_TYPE_TINY</code>	<code>TINYINT</code>
<code>short int</code>	<code>MYSQL_TYPE_SHORT</code>	<code>SMALLINT</code>
<code>int</code>	<code>MYSQL_TYPE_LONG</code>	<code>INT</code>
<code>long long int</code>	<code>MYSQL_TYPE_LONGLONG</code>	<code>BIGINT</code>
<code>float</code>	<code>MYSQL_TYPE_FLOAT</code>	<code>FLOAT</code>
<code>double</code>	<code>MYSQL_TYPE_DOUBLE</code>	<code>DOUBLE</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_TIME</code>	<code>TIME</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_DATE</code>	<code>DATE</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_DATETIME</code>	<code>DATETIME</code>
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_TIMESTAMP</code>	<code>TIMESTAMP</code>
<code>char[]</code>	<code>MYSQL_TYPE_STRING</code> (for non-binary data)	<code>TEXT, CHAR, VARCHAR</code>
<code>char[]</code>	<code>MYSQL_TYPE_BLOB</code> (for binary data)	<code>BLOB, BINARY, VARBINARY</code>
	<code>MYSQL_TYPE_NULL</code>	<code>NULL</code>

The use of `MYSQL_TYPE_NULL` is described earlier in connection with the `is_null` member.

The following table shows the allowable values that may be specified in the `buffer_type` member of `MYSQL_BIND` structures for output values. The value should be chosen according to the data type of the C language variable that you are binding. If the variable is `unsigned`, you should also set the `is_unsigned` member to true. The table shows the SQL types of received values, the corresponding type code that such values have in result set metadata, and the recommended C language data types to bind to the `MYSQL_BIND` structure to receive the SQL values without conversion.

If there is a mismatch between the C variable type on the client side and the corresponding SQL value on the server side, MySQL performs implicit type conversions in both directions.

SQL Type of Received Value	<code>buffer_type</code> Value	Output Variable C Type
<code>TINYINT</code>	<code>MYSQL_TYPE_TINY</code>	<code>signed char</code>
<code>SMALLINT</code>	<code>MYSQL_TYPE_SHORT</code>	<code>short int</code>
<code>MEDIUMINT</code>	<code>MYSQL_TYPE_INT24</code>	<code>int</code>
<code>INT</code>	<code>MYSQL_TYPE_LONG</code>	<code>int</code>
<code>BIGINT</code>	<code>MYSQL_TYPE_LONGLONG</code>	<code>long long int</code>
<code>FLOAT</code>	<code>MYSQL_TYPE_FLOAT</code>	<code>float</code>
<code>DOUBLE</code>	<code>MYSQL_TYPE_DOUBLE</code>	<code>double</code>
<code>DECIMAL</code>	<code>MYSQL_TYPE_NEWDECIMAL</code>	<code>char[]</code>
<code>YEAR</code>	<code>MYSQL_TYPE_SHORT</code>	<code>short int</code>
<code>TIME</code>	<code>MYSQL_TYPE_TIME</code>	<code>MYSQL_TIME</code>
<code>DATE</code>	<code>MYSQL_TYPE_DATE</code>	<code>MYSQL_TIME</code>
<code>DATETIME</code>	<code>MYSQL_TYPE_DATETIME</code>	<code>MYSQL_TIME</code>
<code>TIMESTAMP</code>	<code>MYSQL_TYPE_TIMESTAMP</code>	<code>MYSQL_TIME</code>
<code>CHAR, BINARY</code>	<code>MYSQL_TYPE_STRING</code>	<code>char[]</code>
<code>VARCHAR, VARBINARY</code>	<code>MYSQL_TYPE_VAR_STRING</code>	<code>char[]</code>
<code>TINYBLOB, TINYTEXT</code>	<code>MYSQL_TYPE_TINY_BLOB</code>	<code>char[]</code>
<code>BLOB, TEXT</code>	<code>MYSQL_TYPE_BLOB</code>	<code>char[]</code>
<code>MEDIUMBLOB, MEDIUMTEXT</code>	<code>MYSQL_TYPE_MEDIUM_BLOB</code>	<code>char[]</code>
<code>LOBLOB, LONGTEXT</code>	<code>MYSQL_TYPE_LONG_BLOB</code>	<code>char[]</code>
<code>BIT</code>	<code>MYSQL_TYPE_BIT</code>	<code>char[]</code>

MySQL knows the type code for the SQL value on the server side. The `buffer_type` value indicates the MySQL the type code of the C variable that holds the value on the client side. The two codes together tell MySQL what conversion must be performed, if any. Here are some examples:

- If you use `MYSQL_TYPE_LONG` with an `int` variable to pass an integer value to the server that is to be stored into a `FLOAT` column, MySQL converts the value to floating-point format before storing it.
- If you fetch an SQL `MEDIUMINT` column value, but specify a `buffer_type` value of `MYSQL_TYPE_LONGLONG` and use a C variable of type `long long int` as the destination buffer, MySQL will convert the `MEDIUMINT` value (which requires less than 8 bytes) for storage into the `long long int` (an 8-byte variable).
- If you fetch a numeric column with a value of 255 into a `char[4]` character array and specify a `buffer_type` value of `MYSQL_TYPE_STRING`, the resulting value in the array will be a 4-byte string containing `'255\0'`.
- `DECIMAL` values are returned as strings, which is why the corresponding C type is `char[]`. `DECIMAL` values returned by the server correspond to the string representation of the original server-side value. For example, `12.345` is returned to the client as `'12.345'`. If you specify `MYSQL_TYPE_NEWDECIMAL` and bind a string buffer to the `MYSQL_BIND` structure, `mysql_stmt_fetch()` stores the value in the buffer without conversion. If instead you specify a numeric variable and type code, `mysql_stmt_fetch()` converts the string-format `DECIMAL` value to numeric form.
- For the `MYSQL_TYPE_BIT` type code, `BIT` values are returned into a string buffer (thus, the corresponding C type is `char[]` here, too). The value represents a bit string that requires interpretation on the client side. To return the value as a type that is easier to deal with, you can cause the value to be cast to integer using either of the following types of expressions:

```
SELECT bit_col + 0 FROM t
SELECT CAST(bit_col AS UNSIGNED) FROM t
```

To retrieve the value, bind an integer variable large enough to hold the value and specify the appropriate corresponding integer type code.

Before binding variables to the `MYSQL_BIND` structures that are to be used for fetching column values, you can check the type codes for each column of the result set. This might be desirable if you want to determine which variable types would be best to use to avoid type conversions. To get the type codes, call `mysql_stmt_result_metadata()` after executing the prepared statement with `mysql_stmt_execute()`. The metadata provides access to the type codes for the result set as described in [Section 24.7.7.22, “mysql_stmt_result_metadata\(\)”](#), and [Section 24.7.1, “C API Data Types”](#).

If you cause the `max_length` member of the `MYSQL_FIELD` column metadata structures to be set (by calling `mysql_stmt_attr_set()`), be aware that the `max_length` values for the result set indicate the lengths of the longest string representation of the result values, not the lengths of the binary representation. That is, `max_length` does not necessarily correspond to the size of the buffers needed to fetch the values with the binary protocol used for prepared statements. The size of the buffers should be chosen according to the types of the variables into which you fetch the values.

For input character (non-binary) string data (indicated by `MYSQL_TYPE_STRING`), the value is assumed to be in the character set indicated by the `character_set_client` system variable. If the value is stored into a column with a different character set, the appropriate conversion to that character set occurs. For input binary string data (indicated by `MYSQL_TYPE_BLOB`), the value is treated as having the `binary` character set; that is, it is treated as a byte string and no conversion occurs.

To determine whether output string values in a result set returned from the server contain binary or non-binary data, check whether the `charsetnr` value of the result set metadata is 63 (see [Section 24.7.1, “C API Data Types”](#)). If so, the character set is `binary`, which indicates binary rather than non-binary data. This enables you to distinguish `BINARY` from `CHAR`, `VARBINARY` from `VARCHAR`, and the `BLOB` types from the `TEXT` types.

24.7.6. C API Prepared Statement Function Overview

The functions available for prepared statement processing are summarized here and described in greater detail in a later section. See [Section 24.7.7, “C API Prepared Statement Function Descriptions”](#).

Function	Description
<code>mysql_stmt_affected_rows()</code>	Returns the number of rows changed, deleted, or inserted by prepared <code>UPDATE</code> , <code>DELETE</code> , or <code>INSERT</code> statement
<code>mysql_stmt_attr_get()</code>	Get value of an attribute for a prepared statement
<code>mysql_stmt_attr_set()</code>	Sets an attribute for a prepared statement
<code>mysql_stmt_bind_param()</code>	Associates application data buffers with the parameter markers in a prepared SQL statement
<code>mysql_stmt_bind_result()</code>	Associates application data buffers with columns in the result set

<code>mysql_stmt_close()</code>	Frees memory used by prepared statement
<code>mysql_stmt_data_seek()</code>	Seeks to an arbitrary row number in a statement result set
<code>mysql_stmt_errno()</code>	Returns the error number for the last statement execution
<code>mysql_stmt_error()</code>	Returns the error message for the last statement execution
<code>mysql_stmt_execute()</code>	Executes the prepared statement
<code>mysql_stmt_fetch()</code>	Fetches the next row of data from the result set and returns data for all bound columns
<code>mysql_stmt_fetch_column()</code>	Fetch data for one column of the current row of the result set
<code>mysql_stmt_field_count()</code>	Returns the number of result columns for the most recent statement
<code>mysql_stmt_free_result()</code>	Free the resources allocated to the statement handle
<code>mysql_stmt_init()</code>	Allocates memory for <code>MYSQL_STMT</code> structure and initializes it
<code>mysql_stmt_insert_id()</code>	Returns the ID generated for an <code>AUTO_INCREMENT</code> column by prepared statement
<code>mysql_stmt_num_rows()</code>	Returns total row count from the buffered statement result set
<code>mysql_stmt_param_count()</code>	Returns the number of parameters in a prepared SQL statement
<code>mysql_stmt_param_metadata()</code>	(Return parameter metadata in the form of a result set.) Currently, this function does nothing
<code>mysql_stmt_prepare()</code>	Prepares an SQL string for execution
<code>mysql_stmt_reset()</code>	Reset the statement buffers in the server
<code>mysql_stmt_result_metadata()</code>	Returns prepared statement metadata in the form of a result set
<code>mysql_stmt_row_seek()</code>	Seeks to a row offset in a statement result set, using value returned from <code>mysql_stmt_row_tell()</code>
<code>mysql_stmt_row_tell()</code>	Returns the statement row cursor position
<code>mysql_stmt_send_long_data()</code>	Sends long data in chunks to server
<code>mysql_stmt_sqlstate()</code>	Returns the SQLSTATE error code for the last statement execution
<code>mysql_stmt_store_result()</code>	Retrieves the complete result set to the client

Call `mysql_stmt_init()` to create a statement handle, then `mysql_stmt_prepare()` to prepare it, `mysql_stmt_bind_param()` to supply the parameter data, and `mysql_stmt_execute()` to execute the statement. You can repeat the `mysql_stmt_execute()` by changing parameter values in the respective buffers supplied through `mysql_stmt_bind_param()`.

If the statement is a `SELECT` or any other statement that produces a result set, `mysql_stmt_prepare()` also returns the result set metadata information in the form of a `MYSQL_RES` result set through `mysql_stmt_result_metadata()`.

You can supply the result buffers using `mysql_stmt_bind_result()`, so that the `mysql_stmt_fetch()` automatically returns data to these buffers. This is row-by-row fetching.

You can also send the text or binary data in chunks to server using `mysql_stmt_send_long_data()`. See [Section 24.7.7.25](#), “`mysql_stmt_send_long_data()`”.

When statement execution has been completed, the statement handle must be closed using `mysql_stmt_close()` so that all resources associated with it can be freed.

If you obtained a `SELECT` statement's result set metadata by calling `mysql_stmt_result_metadata()`, you should also free the metadata using `mysql_free_result()`.

Execution Steps

To prepare and execute a statement, an application follows these steps:

1. Create a prepared statement handle with `mysql_stmt_init()`. To prepare the statement on the server, call `mysql_stmt_prepare()` and pass it a string containing the SQL statement.
2. If the statement produces a result set, call `mysql_stmt_result_metadata()` to obtain the result set metadata. This metadata is itself in the form of result set, albeit a separate one from the one that contains the rows returned by the query. The metadata result set indicates how many columns are in the result and contains information about each column.
3. Set the values of any parameters using `mysql_stmt_bind_param()`. All parameters must be set. Otherwise, statement execution returns an error or produces unexpected results.

4. Call `mysql_stmt_execute()` to execute the statement.
5. If the statement produces a result set, bind the data buffers to use for retrieving the row values by calling `mysql_stmt_bind_result()`.
6. Fetch the data into the buffers row by row by calling `mysql_stmt_fetch()` repeatedly until no more rows are found.
7. Repeat steps 3 through 6 as necessary, by changing the parameter values and re-executing the statement.

When `mysql_stmt_prepare()` is called, the MySQL client/server protocol performs these actions:

- The server parses the statement and sends the okay status back to the client by assigning a statement ID. It also sends total number of parameters, a column count, and its metadata if it is a result set oriented statement. All syntax and semantics of the statement are checked by the server during this call.
- The client uses this statement ID for the further operations, so that the server can identify the statement from among its pool of statements.

When `mysql_stmt_execute()` is called, the MySQL client/server protocol performs these actions:

- The client uses the statement handle and sends the parameter data to the server.
- The server identifies the statement using the ID provided by the client, replaces the parameter markers with the newly supplied data, and executes the statement. If the statement produces a result set, the server sends the data back to the client. Otherwise, it sends an okay status and total number of rows changed, deleted, or inserted.

When `mysql_stmt_fetch()` is called, the MySQL client/server protocol performs these actions:

- The client reads the data from the packet row by row and places it into the application data buffers by doing the necessary conversions. If the application buffer type is same as that of the field type returned from the server, the conversions are straightforward.

If an error occurs, you can get the statement error code, error message, and SQLSTATE value using `mysql_stmt_errno()`, `mysql_stmt_error()`, and `mysql_stmt_sqlstate()`, respectively.

Prepared Statement Logging

For prepared statements that are executed with the `mysql_stmt_prepare()` and `mysql_stmt_execute()` C API functions, the server writes `Prepare` and `Execute` lines to the general query log so that you can tell when statements are prepared and executed.

Suppose that you prepare and execute a statement as follows:

1. Call `mysql_stmt_prepare()` to prepare the statement string `"SELECT ?"`.
2. Call `mysql_stmt_bind_param()` to bind the value `3` to the parameter in the prepared statement.
3. Call `mysql_stmt_execute()` to execute the prepared statement.

As a result of the preceding calls, the server writes the following lines to the general query log:

```
Prepare [1] SELECT ?
Execute [1] SELECT 3
```

Each `Prepare` and `Execute` line in the log is tagged with a `[N]` statement identifier so that you can keep track of which prepared statement is being logged. `N` is a positive integer. If there are multiple prepared statements active simultaneously for the client, `N` may be greater than 1. Each `Execute` lines shows a prepared statement after substitution of data values for `?` parameters.

Version notes: `Prepare` lines are displayed without `[N]` before MySQL 4.1.10. `Execute` lines are not displayed at all before MySQL 4.1.10.

24.7.7. C API Prepared Statement Function Descriptions

To prepare and execute queries, use the functions described in detail in the following sections.

All functions that operate with a `MYSQL_STMT` structure begin with the prefix `mysql_stmt_`.

To create a `MYSQL_STMT` handle, use the `mysql_stmt_init()` function.

24.7.7.1. `mysql_stmt_affected_rows()`

```
my_ulonglong mysql_stmt_affected_rows(MYSQL_STMT *stmt)
```

Description

Returns the total number of rows changed, deleted, or inserted by the last executed statement. May be called immediately after `mysql_stmt_execute()` for `UPDATE`, `DELETE`, or `INSERT` statements. For `SELECT` statements, `mysql_stmt_affected_rows()` works like `mysql_num_rows()`.

Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an `UPDATE` statement, no rows matched the `WHERE` clause in the query, or that no query has yet been executed. -1 indicates that the query returned an error or that, for a `SELECT` query, `mysql_stmt_affected_rows()` was called prior to calling `mysql_stmt_store_result()`. Because `mysql_stmt_affected_rows()` returns an unsigned value, you can check for -1 by comparing the return value to `(my_ulonglong)-1` (or to `(my_ulonglong)~0`, which is equivalent).

See [Section 24.7.3.1, “mysql_affected_rows\(\)”](#), for additional information on the return value.

Errors

None.

Example

For the usage of `mysql_stmt_affected_rows()`, refer to the Example from [Section 24.7.7.10, “mysql_stmt_execute\(\)”](#).

24.7.7.2. `mysql_stmt_attr_get()`

```
my_bool mysql_stmt_attr_get(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, void *arg)
```

Description

Can be used to get the current value for a statement attribute.

The `option` argument is the option that you want to get; the `arg` should point to a variable that should contain the option value. If the option is an integer, then `arg` should point to the value of the integer.

See [Section 24.7.7.3, “mysql_stmt_attr_set\(\)”](#), for a list of options and option types.

Note

In MySQL 5.0, `mysql_stmt_attr_get()` uses `unsigned int *`, not `my_bool *`, for `STMT_ATTR_UPDATE_MAX_LENGTH`. This was corrected in MySQL 5.1.7.

Return Values

Zero if successful. Non-zero if `option` is unknown.

Errors

None.

24.7.7.3. `mysql_stmt_attr_set()`

```
my_bool mysql_stmt_attr_set(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, const void *arg)
```

Description

Can be used to affect behavior for a prepared statement. This function may be called multiple times to set several options.

The `option` argument is the option that you want to set. The `arg` argument is the value for the option. `arg` should point to a variable that is set to the desired attribute value. The variable type is as indicated in the following table.

Possible `option` values:

Option	Argument Type	Function
<code>STMT_ATTR_UPDATE_MAX_LENGTH</code>	<code>my_bool *</code>	If set to 1, causes <code>mysql_stmt_store_result()</code> to update the metadata <code>MYSQL_FIELD->max_length</code> value.
<code>STMT_ATTR_CURSOR_TYPE</code>	<code>unsigned long *</code>	Type of cursor to open for statement when <code>mysql_stmt_execute()</code> is invoked. <code>*arg</code> can be <code>CURSOR_TYPE_NO_CURSOR</code> (the default) or <code>CURSOR_TYPE_READ_ONLY</code> .
<code>STMT_ATTR_PREFETCH_ROWS</code>	<code>unsigned long *</code>	Number of rows to fetch from server at a time when using a cursor. <code>*arg</code> can be in the range from 1 to the maximum value of <code>unsigned long</code> . The default is 1.

Note

In MySQL 5.0, `mysql_stmt_attr_get()` uses `unsigned int *`, not `my_bool *`, for `STMT_ATTR_UPDATE_MAX_LENGTH`. This is corrected in MySQL 5.1.7.

If you use the `STMT_ATTR_CURSOR_TYPE` option with `CURSOR_TYPE_READ_ONLY`, a cursor is opened for the statement when you invoke `mysql_stmt_execute()`. If there is already an open cursor from a previous `mysql_stmt_execute()` call, it closes the cursor before opening a new one. `mysql_stmt_reset()` also closes any open cursor before preparing the statement for re-execution. `mysql_stmt_free_result()` closes any open cursor.

If you open a cursor for a prepared statement, `mysql_stmt_store_result()` is unnecessary, because that function causes the result set to be buffered on the client side.

The `STMT_ATTR_CURSOR_TYPE` option was added in MySQL 5.0.2. The `STMT_ATTR_PREFETCH_ROWS` option was added in MySQL 5.0.6.

Return Values

Zero if successful. Non-zero if `option` is unknown.

Errors

None.

Example

The following example opens a cursor for a prepared statement and sets the number of rows to fetch at a time to 5:

```
MYSQL_STMT *stmt;
int rc;
unsigned long type;
unsigned long prefetch_rows = 5;

stmt = mysql_stmt_init(mysql);
type = (unsigned long) CURSOR_TYPE_READ_ONLY;
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_CURSOR_TYPE, (void*) &type);
/* ... check return value ... */
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_PREFETCH_ROWS,
                        (void*) &prefetch_rows);
/* ... check return value ... */
```

24.7.7.4. `mysql_stmt_bind_param()`

```
my_bool mysql_stmt_bind_param(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

Description

`mysql_stmt_bind_param()` is used to bind input data for the parameter markers in the SQL statement that was passed to `mysql_stmt_prepare()`. It uses `MYSQL_BIND` structures to supply the data. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each “?” parameter marker that is present in the query.

Suppose that you prepare the following statement:

```
INSERT INTO mytbl VALUES(?, ?, ?)
```

When you bind the parameters, the array of `MYSQL_BIND` structures must contain three elements, and can be declared like this:

```
MYSQL_BIND bind[3];
```

Section 24.7.5, “C API Prepared Statement Data types”, describes the members of each `MYSQL_BIND` element and how they should be set to provide input values.

Return Values

Zero if the bind operation was successful. Non-zero if an error occurred.

Errors

- `CR_UNSUPPORTED_PARAM_TYPE`
The conversion is not supported. Possibly the `buffer_type` value is illegal or is not one of the supported types.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

Example

For the usage of `mysql_stmt_bind_param()`, refer to the Example from Section 24.7.7.10, “`mysql_stmt_execute()`”.

24.7.7.5. `mysql_stmt_bind_result()`

```
my_bool mysql_stmt_bind_result(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

Description

`mysql_stmt_bind_result()` is used to associate (that is, bind) output columns in the result set to data buffers and length buffers. When `mysql_stmt_fetch()` is called to fetch data, the MySQL client/server protocol places the data for the bound columns into the specified buffers.

All columns must be bound to buffers prior to calling `mysql_stmt_fetch()`. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each column of the result set. If you do not bind columns to `MYSQL_BIND` structures, `mysql_stmt_fetch()` simply ignores the data fetch. The buffers should be large enough to hold the data values, because the protocol doesn't return data values in chunks.

A column can be bound or rebound at any time, even after a result set has been partially retrieved. The new binding takes effect the next time `mysql_stmt_fetch()` is called. Suppose that an application binds the columns in a result set and calls `mysql_stmt_fetch()`. The client/server protocol returns data in the bound buffers. Then suppose that the application binds the columns to a different set of buffers. The protocol places data into the newly bound buffers when the next call to `mysql_stmt_fetch()` occurs.

To bind a column, an application calls `mysql_stmt_bind_result()` and passes the type, address, and length of the output buffer into which the value should be stored. Section 24.7.5, “C API Prepared Statement Data types”, describes the members of each `MYSQL_BIND` element and how they should be set to receive output values.

Return Values

Zero if the bind operation was successful. Non-zero if an error occurred.

Errors

- `CR_UNSUPPORTED_PARAM_TYPE`
The conversion is not supported. Possibly the `buffer_type` value is illegal or is not one of the supported types.

- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

Example

For the usage of `mysql_stmt_bind_result()`, refer to the Example from [Section 24.7.7.11](#), “`mysql_stmt_fetch()`”.

24.7.7.6. `mysql_stmt_close()`

```
my_bool mysql_stmt_close(MYSQL_STMT *)
```

Description

Closes the prepared statement. `mysql_stmt_close()` also deallocates the statement handle pointed to by `stmt`.

If the current statement has pending or unread results, this function cancels them so that the next query can be executed.

Return Values

Zero if the statement was freed successfully. Non-zero if an error occurred.

Errors

- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

Example

For the usage of `mysql_stmt_close()`, refer to the Example from [Section 24.7.7.10](#), “`mysql_stmt_execute()`”.

24.7.7.7. `mysql_stmt_data_seek()`

```
void mysql_stmt_data_seek(MYSQL_STMT *stmt, my_ulonglong offset)
```

Description

Seeks to an arbitrary row in a statement result set. The `offset` value is a row number and should be in the range from 0 to `mysql_stmt_num_rows(stmt)-1`.

This function requires that the statement result set structure contains the entire result of the last executed query, so `mysql_stmt_data_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

Return Values

None.

Errors

None.

24.7.7.8. `mysql_stmt_errno()`

```
unsigned int mysql_stmt_errno(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_errno()` returns the error code for the most recently invoked statement API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the

MySQL `errmsg.h` header file. Server error message numbers are listed in `mysqld_error.h`. Errors also are listed at [Appendix B, Errors, Error Codes, and Common Problems](#).

Return Values

An error code value. Zero if no error occurred.

Errors

None.

24.7.7.9. `mysql_stmt_error()`

```
const char *mysql_stmt_error(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_error()` returns a null-terminated string containing the error message for the most recently invoked statement API function that can succeed or fail. An empty string ("") is returned if no error occurred. This means the following two tests are equivalent:

```
if (*mysql_stmt_errno(stmt))
{
    // an error occurred
}

if (mysql_stmt_error(stmt)[0])
{
    // an error occurred
}
```

The language of the client error messages may be changed by recompiling the MySQL client library. Currently, you can choose error messages in several different languages.

Return Values

A character string that describes the error. An empty string if no error occurred.

Errors

None.

24.7.7.10. `mysql_stmt_execute()`

```
int mysql_stmt_execute(MYSQL_STMT *stmt)
```

Description

`mysql_stmt_execute()` executes the prepared query associated with the statement handle. The currently bound parameter marker values are sent to server during this call, and the server replaces the markers with this newly supplied data.

If the statement is an `UPDATE`, `DELETE`, or `INSERT`, the total number of changed, deleted, or inserted rows can be found by calling `mysql_stmt_affected_rows()`. If this is a statement such as `SELECT` that generates a result set, you must call `mysql_stmt_fetch()` to fetch the data prior to calling any other functions that result in query processing. For more information on how to fetch the results, refer to [Section 24.7.7.11, “mysql_stmt_fetch\(\)”](#).

For statements that generate a result set, you can request that `mysql_stmt_execute()` open a cursor for the statement by calling `mysql_stmt_attr_set()` before executing the statement. If you execute a statement multiple times, `mysql_stmt_execute()` closes any open cursor before opening a new one.

Return Values

Zero if execution was successful. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.

- [CR_SERVER_GONE_ERROR](#)

The MySQL server has gone away.

- [CR_SERVER_LOST](#)

The connection to the server was lost during the query.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

Example

The following example demonstrates how to create and populate a table using `mysql_stmt_init()`, `mysql_stmt_prepare()`, `mysql_stmt_param_count()`, `mysql_stmt_bind_param()`, `mysql_stmt_execute()`, and `mysql_stmt_affected_rows()`. The `mysql` variable is assumed to be a valid connection handle.

```
#define STRING_SIZE 50

#define DROP_SAMPLE_TABLE "DROP TABLE IF EXISTS test_table"
#define CREATE_SAMPLE_TABLE "CREATE TABLE test_table(col1 INT,\
                                         col2 VARCHAR(40),\
                                         col3 SMALLINT,\
                                         col4 TIMESTAMP)"

#define INSERT_SAMPLE "INSERT INTO \
test_table(col1,col2,col3) \
VALUES(?,?,?)"

MYSQL_STMT      *stmt;
MYSQL_BIND      bind[3];
my_ulonglong    affected_rows;
int             param_count;
short          small_data;
int            int_data;
char           str_data[STRING_SIZE];
unsigned long  str_length;
my_bool       is_null;

if (mysql_query(mysql, DROP_SAMPLE_TABLE))
{
    fprintf(stderr, " DROP TABLE failed\n");
    fprintf(stderr, " %s\n", mysql_error(mysql));
    exit(0);
}

if (mysql_query(mysql, CREATE_SAMPLE_TABLE))
{
    fprintf(stderr, " CREATE TABLE failed\n");
    fprintf(stderr, " %s\n", mysql_error(mysql));
    exit(0);
}

    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Specify the data values for the first row */
int_data= 10; /* integer */
strncpy(str_data, "MySQL", STRING_SIZE); /* string */
str_length= strlen(str_data);

/* INSERT SMALLINT data as NULL */
is_null= 1;

/* Execute the INSERT statement - 1*/
if (mysql_stmt_execute(stmt))
{
    fprintf(stderr, "mysql_stmt_execute(), 1 failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Get the total number of affected rows */
affected_rows= mysql_stmt_affected_rows(stmt);
fprintf(stdout, " total affected rows(insert 1): %lu\n",
        (unsigned long) affected_rows);

if (affected_rows != 1) /* validate affected rows */
{
    fprintf(stderr, " invalid affected rows by MySQL\n");
    exit(0);
}

/* Specify data values for second row,
then re-execute the statement */
int_data= 1000;
strncpy(str_data, "
    The most popular Open Source database",
        STRING_SIZE);
str_length= strlen(str_data);
small_data= 1000; /* smallint */
is_null= 0; /* reset */

/* Execute the INSERT statement - 2*/
if (mysql_stmt_execute(stmt))
{
    fprintf(stderr, "mysql_stmt_execute, 2 failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Get the total rows affected */
affected_rows= mysql_stmt_affected_rows(stmt);
fprintf(stdout, " total affected rows(insert 2): %lu\n",
        (unsigned long) affected_rows);

if (affected_rows != 1) /* validate affected rows */
{
    fprintf(stderr, " invalid affected rows by MySQL\n");
    exit(0);
}

/* Close the statement */
if (mysql_stmt_close(stmt))
{
    fprintf(stderr, " failed while closing the statement\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

```

Note

For complete examples on the use of prepared statement functions, refer to the file [tests/mysql_client_test.c](#). This file can be obtained from a MySQL source distribution or from the Bazaar source

■ repository.

24.7.7.11. `mysql_stmt_fetch()`

```
int mysql_stmt_fetch(MYSQL_STMT *stmt)
```

Description

`mysql_stmt_fetch()` returns the next row in the result set. It can be called only while the result set exists; that is, after a call to `mysql_stmt_execute()` for a statement such as `SELECT` that creates a result set.

`mysql_stmt_fetch()` returns row data using the buffers bound by `mysql_stmt_bind_result()`. It returns the data in those buffers for all the columns in the current row set and the lengths are returned to the `length` pointer. All columns must be bound by the application before it calls `mysql_stmt_fetch()`.

By default, result sets are fetched unbuffered a row at a time from the server. To buffer the entire result set on the client, call `mysql_stmt_store_result()` after binding the data buffers and before calling `mysql_stmt_fetch()`.

If a fetched data value is a `NULL` value, the `*is_null` value of the corresponding `MYSQL_BIND` structure contains `TRUE` (1). Otherwise, the data and its length are returned in the `*buffer` and `*length` elements based on the buffer type specified by the application. Each numeric and temporal type has a fixed length, as listed in the following table. The length of the string types depends on the length of the actual data value, as indicated by `data_length`.

Type	Length
<code>MYSQL_TYPE_TINY</code>	1
<code>MYSQL_TYPE_SHORT</code>	2
<code>MYSQL_TYPE_LONG</code>	4
<code>MYSQL_TYPE_LONGLONG</code>	8
<code>MYSQL_TYPE_FLOAT</code>	4
<code>MYSQL_TYPE_DOUBLE</code>	8
<code>MYSQL_TYPE_TIME</code>	<code>sizeof(MYSQL_TIME)</code>
<code>MYSQL_TYPE_DATE</code>	<code>sizeof(MYSQL_TIME)</code>
<code>MYSQL_TYPE_DATETIME</code>	<code>sizeof(MYSQL_TIME)</code>
<code>MYSQL_TYPE_STRING</code>	<code>data_length</code>
<code>MYSQL_TYPE_BLOB</code>	<code>data_length</code>

Return Values

Return Value	Description
0	Successful, the data has been fetched to application data buffers.
1	Error occurred. Error code and message can be obtained by calling <code>mysql_stmt_errno()</code> and <code>mysql_stmt_error()</code> .
<code>MYSQL_NO_DATA</code>	No more rows/data exists
<code>MYSQL_DATA_TRUNCATED</code>	Data truncation occurred

`MYSQL_DATA_TRUNCATED` is returned when truncation reporting is enabled. (Reporting is enabled by default, but can be controlled with `mysql_options()`.) To determine which parameters were truncated when this value is returned, check the `error` members of the `MYSQL_BIND` parameter structures.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- [CR_SERVER_LOST](#)

The connection to the server was lost during the query.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

- [CR_UNSUPPORTED_PARAM_TYPE](#)

The buffer type is [MYSQL_TYPE_DATE](#), [MYSQL_TYPE_TIME](#), [MYSQL_TYPE_DATETIME](#), or [MYSQL_TYPE_TIMESTAMP](#), but the data type is not [DATE](#), [TIME](#), [DATETIME](#), or [TIMESTAMP](#).

- All other unsupported conversion errors are returned from `mysql_stmt_bind_result()`.

Example

The following example demonstrates how to fetch data from a table using `mysql_stmt_result_metadata()`, `mysql_stmt_bind_result()`, and `mysql_stmt_fetch()`. (This example expects to retrieve the two rows inserted by the example shown in [Section 24.7.10](#), “`mysql_stmt_execute()`”). The `mysql` variable is assumed to be a valid connection handle.

```
#define STRING_SIZE 50

#define SELECT_SAMPLE "SELECT col1, col2, col3, col4 \
                      FROM test_table"

MYSQL_STMT      *stmt;
MYSQL_BIND      bind[4];
MYSQL_RES       *prepare_meta_result;
MYSQL_TIME      ts;
unsigned long   length[4];
int             param_count, column_count, row_count;
short          small_data;
int            int_data;
char           str_data[STRING_SIZE];
my_bool       is_null[4];
my_bool       error[4];

/* Prepare a SELECT query to fetch data from test_table */
stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");
    exit(0);
}
if (mysql_stmt_prepare(stmt, SELECT_SAMPLE, strlen(SELECT_SAMPLE)))
{
    fprintf(stderr, " mysql_stmt_prepare(), SELECT failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}
fprintf(stdout, " prepare, SELECT successful\n");

/* Get the parameter count from the statement */
param_count = mysql_stmt_param_count(stmt);
fprintf(stdout, " total parameters in SELECT: %d\n", param_count);

if (param_count != 0) /* validate parameter count */
{
    fprintf(stderr, " invalid parameter count returned by MySQL\n");
    exit(0);
}

/* Fetch result set meta information */
prepare_meta_result = mysql_stmt_result_metadata(stmt);
if (!prepare_meta_result)
{
    fprintf(stderr,
            " mysql_stmt_result_metadata(), \
            returned no meta information\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Get total columns in the query */
column_count = mysql_num_fields(prepare_meta_result);

{
    fprintf(stderr, " mysql_stmt_bind_result() failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Now buffer all results to client (optional step) */
if (mysql_stmt_store_result(stmt))
{
    fprintf(stderr, " mysql_stmt_store_result() failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Fetch all rows */
row_count= 0;
fprintf(stdout, "Fetching results ...\n");
while (!mysql_stmt_fetch(stmt))
{
    row_count++;
    fprintf(stdout, " row %d\n", row_count);

    /* column 1 */
    fprintf(stdout, " column1 (integer) : ");
    if (is_null[0])
        fprintf(stdout, " NULL\n");
    else
        fprintf(stdout, " %d(%ld)\n", int_data, length[0]);

    /* column 2 */
    fprintf(stdout, " column2 (string) : ");
    if (is_null[1])
        fprintf(stdout, " NULL\n");
    else
        fprintf(stdout, " %s(%ld)\n", str_data, length[1]);

    /* column 3 */
    fprintf(stdout, " column3 (smallint) : ");
    if (is_null[2])
        fprintf(stdout, " NULL\n");
    else
        fprintf(stdout, " %d(%ld)\n", small_data, length[2]);

    /* column 4 */
    fprintf(stdout, " column4 (timestamp): ");
    if (is_null[3])
        fprintf(stdout, " NULL\n");
    else
        fprintf(stdout, " %04d-%02d-%02d %02d:%02d:%02d (%ld)\n",
            ts.year, ts.month, ts.day,
            ts.hour, ts.minute, ts.second,

```

```

        length[3]);
    fprintf(stdout, "\n");
}

/* Validate rows fetched */
fprintf(stdout, " total rows fetched: %d\n", row_count);
if (row_count != 2)
{
    fprintf(stderr, " MySQL failed to return all rows\n");
    exit(0);
}

/* Free the prepared result metadata */
mysql_free_result(prepare_meta_result);

/* Close the statement */
if (mysql_stmt_close(stmt))
{
    fprintf(stderr, " failed while closing the statement\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

```

In some cases you might want to determine the length of a column value before fetching it with `mysql_stmt_fetch()`. For example, the value might be a long string or `BLOB` value for which you want to know how much space must be allocated. To accomplish this, you can use these strategies:

- Before invoking `mysql_stmt_fetch()` to retrieve individual rows, invoke `mysql_stmt_store_result()` to buffer the entire result on the client side. Then the maximal length of column values will be indicated by the `max_length` member of the result set metadata returned by `mysql_stmt_result_metadata()`. This strategy requires that you pass `STMT_ATTR_UPDATE_MAX_LENGTH` to `mysql_stmt_attr_set()` or the `max_length` values will not be calculated.
- Invoke `mysql_stmt_fetch()` with a zero-length buffer for the column in question and a pointer in which the real length can be stored. Then use the real length with `mysql_stmt_fetch_column()`.

```

real_length= 0;

bind[0].buffer= 0;
bind[0].buffer_length= 0;
bind[0].length= &real_length;
mysql_stmt_bind_result(stmt, bind);

mysql_stmt_fetch(stmt);
if (real_length > 0)
{
    data= malloc(real_length);
    bind[0].buffer= data;
    bind[0].buffer_length= real_length;
    mysql_stmt_fetch_column(stmt, 0, bind, 0);
}

```

24.7.7.12. `mysql_stmt_fetch_column()`

```
int mysql_stmt_fetch_column(MYSQL_STMT *stmt, MYSQL_BIND *bind, unsigned int column, unsigned long offset)
```

Description

Fetch one column from the current result set row. `bind` provides the buffer where data should be placed. It should be set up the same way as for `mysql_stmt_bind_result()`. `column` indicates which column to fetch. The first column is numbered 0. `offset` is the offset within the data value at which to begin retrieving data. This can be used for fetching the data value in pieces. The beginning of the value is offset 0.

Return Values

Zero if the value was fetched successfully. Non-zero if an error occurred.

Errors

- `CR_INVALID_PARAMETER_NO`
Invalid column number.
- `CR_NO_DATA`
The end of the result set has already been reached.

24.7.7.13. `mysql_stmt_field_count()`

```
unsigned int mysql_stmt_field_count(MYSQL_STMT *stmt)
```

Description

Returns the number of columns for the most recent statement for the statement handler. This value is zero for statements such as `INSERT` or `DELETE` that do not produce result sets.

`mysql_stmt_field_count()` can be called after you have prepared a statement by invoking `mysql_stmt_prepare()`.

Return Values

An unsigned integer representing the number of columns in a result set.

Errors

None.

24.7.7.14. `mysql_stmt_free_result()`

```
my_bool mysql_stmt_free_result(MYSQL_STMT *stmt)
```

Description

Releases memory associated with the result set produced by execution of the prepared statement. If there is a cursor open for the statement, `mysql_stmt_free_result()` closes it.

Return Values

Zero if the result set was freed successfully. Non-zero if an error occurred.

Errors

24.7.7.15. `mysql_stmt_init()`

```
MYSQL_STMT *mysql_stmt_init(MYSQL *mysql)
```

Description

Create a `MYSQL_STMT` handle. The handle should be freed with `mysql_stmt_close(MYSQL_STMT *)`.

Return values

A pointer to a `MYSQL_STMT` structure in case of success. `NULL` if out of memory.

Errors

- `CR_OUT_OF_MEMORY`
Out of memory.

24.7.7.16. `mysql_stmt_insert_id()`

```
my_ulonglong mysql_stmt_insert_id(MYSQL_STMT *stmt)
```

Description

Returns the value generated for an `AUTO_INCREMENT` column by the prepared `INSERT` or `UPDATE` statement. Use this function after you have executed a prepared `INSERT` statement on a table which contains an `AUTO_INCREMENT` field.

See [Section 24.7.3.37](#), “`mysql_insert_id()`”, for more information.

Return Values

Value for `AUTO_INCREMENT` column which was automatically generated or explicitly set during execution of prepared statement, or value generated by `LAST_INSERT_ID(expr)` function. Return value is undefined if statement does not set `AUTO_INCREMENT` value.

Errors

None.

24.7.7.17. `mysql_stmt_num_rows()`

```
my_ulonglong mysql_stmt_num_rows(MYSQL_STMT *stmt)
```

Description

Returns the number of rows in the result set.

The use of `mysql_stmt_num_rows()` depends on whether you used `mysql_stmt_store_result()` to buffer the entire result set in the statement handle.

If you use `mysql_stmt_store_result()`, `mysql_stmt_num_rows()` may be called immediately. Otherwise, the row count is unavailable unless you count the rows as you fetch them.

`mysql_stmt_num_rows()` is intended for use with statements that return a result set, such as `SELECT`. For statements such as `INSERT`, `UPDATE`, or `DELETE`, the number of affected rows can be obtained with `mysql_stmt_affected_rows()`.

Return Values

The number of rows in the result set.

Errors

None.

24.7.7.18. `mysql_stmt_param_count()`

```
unsigned long mysql_stmt_param_count(MYSQL_STMT *stmt)
```

Description

Returns the number of parameter markers present in the prepared statement.

Return Values

An unsigned long integer representing the number of parameters in a statement.

Errors

None.

Example

For the usage of `mysql_stmt_param_count()`, refer to the Example from [Section 24.7.7.10](#), “`mysql_stmt_execute()`”.

24.7.7.19. `mysql_stmt_param_metadata()`

```
MYSQL_RES *mysql_stmt_param_metadata(MYSQL_STMT *stmt)
```

This function currently does nothing.

Description**Return Values****Errors****24.7.7.20. `mysql_stmt_prepare()`**

```
int mysql_stmt_prepare(MYSQL_STMT *stmt, const char *stmt_str, unsigned long length)
```

Description

Given the statement handle returned by `mysql_stmt_init()`, prepares the SQL statement pointed to by the string `stmt_str` and returns a status value. The string length should be given by the `length` argument. The string must consist of a single SQL

statement. You should not add a terminating semicolon (“;”) or `\g` to the statement.

The application can include one or more parameter markers in the SQL statement by embedding question mark (“?”) characters in the SQL string at the appropriate positions.

The markers are legal only in certain places in SQL statements. For example, they are allowed in the `VALUES()` list of an `INSERT` statement (to specify column values for a row), or in a comparison with a column in a `WHERE` clause to specify a comparison value. However, they are not allowed for identifiers (such as table or column names), or to specify both operands of a binary operator such as the `=` equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

The parameter markers must be bound to application variables using `mysql_stmt_bind_param()` before executing the statement.

Return Values

Zero if the statement was prepared successfully. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

If the prepare operation was unsuccessful (that is, `mysql_stmt_prepare()` returns non-zero), the error message can be obtained by calling `mysql_stmt_error()`.

Example

For the usage of `mysql_stmt_prepare()`, refer to the Example from [Section 24.7.7.10](#), “`mysql_stmt_execute()`”.

24.7.7.21. `mysql_stmt_reset()`

```
my_bool mysql_stmt_reset(MYSQL_STMT *stmt)
```

Description

Reset the prepared statement on the client and server to state after prepare. This is mainly used to reset data sent with `mysql_stmt_send_long_data()`. Any open cursor for the statement is closed.

To re-prepare the statement with another query, use `mysql_stmt_prepare()`.

Return Values

Zero if the statement was reset successfully. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

24.7.7.22. `mysql_stmt_result_metadata()`

```
MYSQL_RES *mysql_stmt_result_metadata(MYSQL_STMT *stmt)
```

Description

If a statement passed to `mysql_stmt_prepare()` is one that produces a result set, `mysql_stmt_result_metadata()` returns the result set metadata in the form of a pointer to a `MYSQL_RES` structure that can be used to process the meta information such as total number of fields and individual field information. This result set pointer can be passed as an argument to any of the field-based API functions that process result set metadata, such as:

- `mysql_num_fields()`
- `mysql_fetch_field()`
- `mysql_fetch_field_direct()`
- `mysql_fetch_fields()`
- `mysql_field_count()`
- `mysql_field_seek()`
- `mysql_field_tell()`
- `mysql_free_result()`

The result set structure should be freed when you are done with it, which you can do by passing it to `mysql_free_result()`. This is similar to the way you free a result set obtained from a call to `mysql_store_result()`.

The result set returned by `mysql_stmt_result_metadata()` contains only metadata. It does not contain any row results. The rows are obtained by using the statement handle with `mysql_stmt_fetch()`.

Return Values

A `MYSQL_RES` result structure. `NULL` if no meta information exists for the prepared query.

Errors

- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

Example

For the usage of `mysql_stmt_result_metadata()`, refer to the Example from [Section 24.7.7.11](#), “`mysql_stmt_fetch()`”.

24.7.7.23. `mysql_stmt_row_seek()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_seek(MYSQL_STMT *stmt, MYSQL_ROW_OFFSET offset)
```

Description

Sets the row cursor to an arbitrary row in a statement result set. The `offset` value is a row offset that should be a value returned from `mysql_stmt_row_tell()` or from `mysql_stmt_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_stmt_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_stmt_row_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_stmt_row_seek()`.

Errors

None.

24.7.7.24. `mysql_stmt_row_tell()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_tell(MYSQL_STMT *stmt)
```

Description

Returns the current position of the row cursor for the last `mysql_stmt_fetch()`. This value can be used as an argument to `mysql_stmt_row_seek()`.

You should use `mysql_stmt_row_tell()` only after `mysql_stmt_store_result()`.

Return Values

The current offset of the row cursor.

Errors

None.

24.7.7.25. `mysql_stmt_send_long_data()`

```
my_bool mysql_stmt_send_long_data(MYSQL_STMT *stmt, unsigned int parameter_number, const char *data, unsigned long length)
```

Description

Allows an application to send parameter data to the server in pieces (or “chunks”). Call this function after `mysql_stmt_bind_param()` and before `mysql_stmt_execute()`. It can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the `TEXT` or `BLOB` data types.

`parameter_number` indicates which parameter to associate the data with. Parameters are numbered beginning with 0. `data` is a pointer to a buffer containing data to be sent, and `length` indicates the number of bytes in the buffer.

Note

The next `mysql_stmt_execute()` call ignores the bind buffer for all parameters that have been used with `mysql_stmt_send_long_data()` since last `mysql_stmt_execute()` or `mysql_stmt_reset()`.

If you want to reset/forget the sent data, you can do it with `mysql_stmt_reset()`. See [Section 24.7.7.21](#), “`mysql_stmt_reset()`”.

Return Values

Zero if the data is sent successfully to server. Non-zero if an error occurred.

Errors

- `CR_INVALID_BUFFER_USE`

The parameter does not have a string or binary type.

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- [CR_SERVER_GONE_ERROR](#)

The MySQL server has gone away.

- [CR_OUT_OF_MEMORY](#)

Out of memory.

- [CR_UNKNOWN_ERROR](#)

An unknown error occurred.

Example

The following example demonstrates how to send the data for a `TEXT` column in chunks. It inserts the data value `'MySQL - The most popular Open Source database'` into the `text_column` column. The `mysql` variable is assumed to be a valid connection handle.

```
#define INSERT_QUERY "INSERT INTO \
                    test_long_data(text_column) VALUES(?)"

MYSQL_BIND bind[1];
long          length;

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, "mysql_stmt_init(), out of memory\n");
    exit(0);
}
if (mysql_stmt_prepare(stmt, INSERT_QUERY, strlen(INSERT_QUERY))
{
    fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}
memset(bind, 0, sizeof(bind));
bind[0].buffer_type= MYSQL_TYPE_STRING;
bind[0].length= &length;
bind[0].is_null= 0;

/* Bind the buffers */
if (mysql_stmt_bind_param(stmt, bind))
{
    fprintf(stderr, "\n param bind failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* Supply data in chunks to server */
if (mysql_stmt_send_long_data(stmt,0,"MySQL",5))
{
    fprintf(stderr, "\n send_long_data failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* Supply the next piece of data */
if (mysql_stmt_send_long_data(stmt,0,
    " - The most popular Open Source database",40))
{
    fprintf(stderr, "\n send_long_data failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* Now, execute the query */
if (mysql_stmt_execute(stmt))
{
    fprintf(stderr, "\n mysql_stmt_execute failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}
}
```

24.7.7.26. `mysql_stmt_sqlstate()`

```
const char *mysql_stmt_sqlstate(MYSQL_STMT *stmt)
```

Description

For the statement specified by `stmt`, `mysql_stmt_sqlstate()` returns a null-terminated string containing the SQLSTATE

error code for the most recently invoked prepared statement API function that can succeed or fail. The error code consists of five characters. "00000" means "no error." The values are specified by ANSI SQL and ODBC. For a list of possible values, see [Appendix B, Errors, Error Codes, and Common Problems](#).

Note that not all MySQL errors are yet mapped to SQLSTATE codes. The value "HY000" (general error) is used for unmapped errors.

Return Values

A null-terminated character string containing the SQLSTATE error code.

24.7.7.27. `mysql_stmt_store_result()`

```
int mysql_stmt_store_result(MYSQL_STMT *stmt)
```

Description

Result sets are produced by executing prepared statements for SQL statements such as `SELECT`, `SHOW`, `DESCRIBE`, and `EXPLAIN`. By default, result sets for successfully executed prepared statements are not buffered on the client and `mysql_stmt_fetch()` fetches them one at a time from the server. To cause the complete result set to be buffered on the client, call `mysql_stmt_store_result()` after binding data buffers with `mysql_stmt_bind_result()` and before calling `mysql_stmt_fetch()` to fetch rows. (For an example, see [Section 24.7.7.11](#), "mysql_stmt_fetch()".)

`mysql_stmt_store_result()` is optional for result set processing, unless you will call `mysql_stmt_data_seek()`, `mysql_stmt_row_seek()`, or `mysql_stmt_row_tell()`. Those functions require a seekable result set.

It is unnecessary to call `mysql_stmt_store_result()` after executing an SQL statement that does not produce a result set, but if you do, it does not harm or cause any notable performance problem. You can detect whether the statement produced a result set by checking if `mysql_stmt_result_metadata()` returns `NULL`. For more information, refer to [Section 24.7.7.22](#), "mysql_stmt_result_metadata()".

Note

MySQL doesn't by default calculate `MYSQL_FIELD->max_length` for all columns in `mysql_stmt_store_result()` because calculating this would slow down `mysql_stmt_store_result()` considerably and most applications doesn't need `max_length`. If you want `max_length` to be updated, you can call `mysql_stmt_attr_set(MYSQL_STMT, STMT_ATTR_UPDATE_MAX_LENGTH, &flag)` to enable this. See [Section 24.7.7.3](#), "mysql_stmt_attr_set()".

Return Values

Zero if the results are buffered successfully. Non-zero if an error occurred.

Errors

- `CR_COMMANDS_OUT_OF_SYNC`
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`
Out of memory.
- `CR_SERVER_GONE_ERROR`
The MySQL server has gone away.
- `CR_SERVER_LOST`
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`
An unknown error occurred.

24.7.8. C API Prepared Statement Problems

Here follows a list of the currently known problems with prepared statements:

- `TIME`, `TIMESTAMP`, and `DATETIME` do not support parts of seconds (for example, from `DATE_FORMAT()`).
- When converting an integer to string, `ZEROFILL` is honored with prepared statements in some cases where the MySQL server doesn't print the leading zeros. (For example, with `MIN(number-with-zerofill)`).
- When converting a floating-point number to a string in the client, the rightmost digits of the converted value may differ slightly from those of the original value.
- *Prepared statements do not use the query cache, even in cases where a query does not contain any placeholders. See Section 7.5.4.1, “How the Query Cache Operates”.*
- Prepared statements do not support multi-statements (that is, multiple statements within a single string separated by “;” characters). This also means that prepared statements cannot invoke stored procedures that return result sets, because prepared statements do not support multiple result sets.

24.7.9. C API Handling of Multiple Statement Execution

By default, `mysql_query()` and `mysql_real_query()` interpret their statement string argument as a single statement to be executed, and you process the result according to whether the statement produces a result set (a set of rows, as for `SELECT`) or an affected-rows count (as for `INSERT`, `UPDATE`, and so forth).

MySQL 5.0 also supports the execution of a string containing multiple statements separated by semicolon (“;”) characters. This capability is enabled by special options that are specified either when you connect to the server with `mysql_real_connect()` or after connecting by calling `mysql_set_server_option()`.

Executing a multiple-statement string can produce multiple result sets or row-count indicators. Processing these results involves a different approach than for the single-statement case: After handling the result from the first statement, it is necessary to check whether more results exist and process them in turn if so. To support multiple-result processing, the C API includes the `mysql_more_results()` and `mysql_next_result()` functions. These functions are used at the end of a loop that iterates as long as more results are available. *Failure to process the result this way may result in a dropped connection to the server.*

Multiple-result processing also is required if you execute `CALL` statements for stored procedures. Results from a stored procedure have these characteristics:

- Statements within the procedure may produce result sets (for example, if it executes `SELECT` statements). These result sets are returned in the order that they are produced as the procedure executes.

In general, the caller cannot know how many result sets a procedure will return. Procedure execution may depend on loops or conditional statements that cause the execution path to differ from one call to the next. Therefore, you must be prepared to retrieve multiple results.

- The final result from the procedure is a status result that includes no result set. The status indicates whether the procedure succeeded or an error occurred.

The multiple statement and result capabilities can be used only with `mysql_query()` or `mysql_real_query()`. They cannot be used with the prepared statement interface. Prepared statement handles are defined to work only with strings that contain a single statement. See Section 24.7.4, “C API Prepared Statements”.

To enable multiple-statement execution and result processing, the following options may be used:

- The `mysql_real_connect()` function has a `flags` argument for which two option values are relevant:
 - `CLIENT_MULTI_RESULTS` enables the client program to process multiple results. This option *must* be enabled if you execute `CALL` statements for stored procedures that produce result sets. Otherwise, such procedures result in an error `Error 1312 (0A000): PROCEDURE proc_name can't return a result set in the given context`.
 - `CLIENT_MULTI_STATEMENTS` enables `mysql_query()` and `mysql_real_query()` to execute statement strings containing multiple statements separated by semicolons. This option also enables `CLIENT_MULTI_RESULTS` implicitly, so a `flags` argument of `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()` is equivalent to an argument of `CLIENT_MULTI_STATEMENTS | CLIENT_MULTI_RESULTS`. That is, `CLIENT_MULTI_STATEMENTS` is sufficient to enable multiple-statement execution and all multiple-result processing.
- After the connection to the server has been established, you can use the `mysql_set_server_option()` function to enable or disable multiple-statement execution by passing it an argument of `MYSQL_OPTION_MULTI_STATEMENTS_ON` or `MYSQL_OPTION_MULTI_STATEMENTS_OFF`. Enabling multiple-statement execution with this function also enables processing of “simple” results for a multiple-statement string where each statement produces a single result, but is *not* sufficient to

allow processing of stored procedures that produce result sets.

The following procedure outlines a suggested strategy for handling multiple statements:

1. Pass `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()`, to fully enable multiple-statement execution and multiple-result processing.
2. After calling `mysql_query()` or `mysql_real_query()` and verifying that it succeeds, enter a loop within which you process statement results.
3. For each iteration of the loop, handle the current statement result, retrieving either a result set or an affected-rows count. If an error occurs, exit the loop.
4. At the end of the loop, call `mysql_next_result()` to check whether another result exists and initiate retrieval for it if so. If no more results are available, exit the loop.

One possible implementation of the preceding strategy is shown following. The final part of the loop can be reduced to a simple test of whether `mysql_next_result()` returns non-zero. The code as written distinguishes between no more results and an error, which allows a message to be printed for the latter occurrence.

```

/* connect to server with the CLIENT_MULTI_STATEMENTS option */
if (mysql_real_connect (mysql, host_name, user_name, password,
    db_name, port_num, socket_name, CLIENT_MULTI_STATEMENTS) == NULL)
{
    printf("mysql_real_connect() failed\n");
    mysql_close(mysql);
    exit(1);
}

/* execute multiple statements */
status = mysql_query(mysql,
    "DROP TABLE IF EXISTS test_table;\
    CREATE TABLE test_table(id INT);\
    INSERT INTO test_table VALUES(10);\
    UPDATE test_table SET id=20 WHERE id=10;\
    SELECT * FROM test_table;\
    DROP TABLE test_table");

if (status)
{
    printf("Could not execute statement(s)");
    mysql_close(mysql);
    exit(0);
}

/* process each statement result */
do {
    /* did current statement return data? */
    result = mysql_store_result(mysql);
    if (result)
    {
        /* yes; process rows and free the result set */
        process_result_set(mysql, result);
        mysql_free_result(result);
    }
    else /* no result set or error */
    {
        if (mysql_field_count(mysql) == 0)
        {
            printf("%lld rows affected\n",
                mysql_affected_rows(mysql));
        }
        else /* some error occurred */
        {
            printf("Could not retrieve result set\n");
            break;
        }
    }
} while ((status = mysql_next_result(mysql)) > 0);
printf("Could not execute statement\n");
mysql_close(mysql);

```

24.7.10. C API Handling of Date and Time Values

The binary (prepared statement) protocol allows you to send and receive date and time values (`DATE`, `TIME`, `DATETIME`, and `TIMESTAMP`), using the `MYSQL_TIME` structure. The members of this structure are described in [Section 24.7.5, “C API Prepared Statement Data types”](#).

To send temporal data values, create a prepared statement using `mysql_stmt_prepare()`. Then, before calling

`mysql_stmt_execute()` to execute the statement, use the following procedure to set up each temporal parameter:

1. In the `MYSQL_BIND` structure associated with the data value, set the `buffer_type` member to the type that indicates what kind of temporal value you're sending. For `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` values, set `buffer_type` to `MYSQL_TYPE_DATE`, `MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATETIME`, or `MYSQL_TYPE_TIMESTAMP`, respectively.
2. Set the `buffer` member of the `MYSQL_BIND` structure to the address of the `MYSQL_TIME` structure in which you pass the temporal value.
3. Fill in the members of the `MYSQL_TIME` structure that are appropriate for the type of temporal value to be passed.

Use `mysql_stmt_bind_param()` to bind the parameter data to the statement. Then you can call `mysql_stmt_execute()`.

To retrieve temporal values, the procedure is similar, except that you set the `buffer_type` member to the type of value you expect to receive, and the `buffer` member to the address of a `MYSQL_TIME` structure into which the returned value should be placed. Use `mysql_stmt_bind_result()` to bind the buffers to the statement after calling `mysql_stmt_execute()` and before fetching the results.

Here is a simple example that inserts `DATE`, `TIME`, and `TIMESTAMP` data. The `mysql` variable is assumed to be a valid connection handle.

```

MYSQL_TIME  ts;
MYSQL_BIND  bind[3];
MYSQL_STMT  *stmt;

strmov(query, "INSERT INTO test_table(date_field, time_field, \
            timestamp_field) VALUES(?,?,?);");

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");
    exit(0);
}
if (mysql_stmt_prepare(mysql, query, strlen(query)))
{
    fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* set up input buffers for all 3 parameters */
bind[0].buffer_type= MYSQL_TYPE_DATE;
bind[0].buffer= (char *)&ts;
bind[0].is_null= 0;
bind[0].length= 0;
...
bind[1]= bind[2]= bind[0];
...

mysql_stmt_bind_param(stmt, bind);

/* supply the data to be sent in the ts structure */
ts.year= 2002;
ts.month= 02;
ts.day= 03;

ts.hour= 10;
ts.minute= 45;
ts.second= 20;

mysql_stmt_execute(stmt);
..

```

24.7.11. C API Threaded Function Descriptions

You need to use the following functions when you want to create a threaded client. See [Section 24.7.16, “How to Make a Threaded Client”](#).

24.7.11.1. `my_init()`

```
void my_init(void)
```

Description

`my_init()` initializes some global variables that MySQL needs. If you are using a thread-safe client library, it also calls `mysql_thread_init()` for this thread.

It is necessary for `my_init()` to be called early in the initialization phase of a program's use of the MySQL library. However, `my_init()` is automatically called by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you ensure that your program invokes one of those functions before any other MySQL calls, there is no need to invoke `my_init()` explicitly.

To access `my_init()`, your program must include the `my_sys.h` header file:

```
#include <my_sys.h>
```

Return Values

None.

24.7.11.2. `mysql_thread_end()`

```
void mysql_thread_end(void)
```

Description

This function needs to be called before calling `pthread_exit()` to free memory allocated by `mysql_thread_init()`.

`mysql_thread_end()` is not invoked automatically by the client library. It must be called explicitly to avoid a memory leak.

Return Values

None.

24.7.11.3. `mysql_thread_init()`

```
my_bool mysql_thread_init(void)
```

Description

This function must be called early within each created thread to initialize thread-specific variables. However, you may not necessarily need to invoke it explicitly: `mysql_thread_init()` is automatically called by `my_init()`, which itself is automatically called by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you invoke any of those functions, `mysql_thread_init()` will be called for you.

Return Values

Zero if successful. Non-zero if an error occurred.

24.7.11.4. `mysql_thread_safe()`

```
unsigned int mysql_thread_safe(void)
```

Description

This function indicates whether the client library is compiled as thread-safe.

Return Values

1 if the client library is thread-safe, 0 otherwise.

24.7.12. C API Embedded Server Function Descriptions

MySQL applications can be written to use an embedded server. See [Section 24.6, “libmysqld, the Embedded MySQL Server Library”](#). To write such an application, you must link it against the `libmysqld` library by using the `-lmysqld` flag rather than linking it against the `libmysqlclient` client library by using the `-libmysqlclient` flag. However, the calls to initialize and finalize the library are the same whether you write a client application or one that uses the embedded server: Call `mysql_library_init()` to initialize the library and `mysql_library_end()` when you are done with it. See [Section 24.7.2, “C API Function Overview”](#).

`mysql_library_init()` and `mysql_library_end()` are available as of MySQL 5.0.3. For earlier versions of MySQL 5.0, call `mysql_server_init()` and `mysql_server_end()` instead, which are equivalent. `mysql_library_init()` and `mysql_library_end()` actually are `#define` symbols that make them equivalent to `mysql_server_init()` and `mysql_server_end()`, but the names more clearly indicate that they should be called when beginning and ending use of a MySQL C API library no matter whether the application uses `libmysqlclient` or `libmysqld`.

24.7.12.1. `mysql_server_init()`

```
int mysql_server_init(int argc, char **argv, char **groups)
```

Description

This function initializes the MySQL library, which must be done before you call any other MySQL function.

As of MySQL 5.0.3, `mysql_server_init()` is deprecated and you should call `mysql_library_init()` instead. See [Section 24.7.3.40](#), “`mysql_library_init()`”.

Return Values

Zero if successful. Non-zero if an error occurred.

24.7.12.2. `mysql_server_end()`

```
void mysql_server_end(void)
```

Description

This function finalizes the MySQL library. You should call it when you are done using the library.

As of MySQL 5.0.3, `mysql_server_end()` is deprecated and you should call `mysql_library_end()` instead. See [Section 24.7.3.39](#), “`mysql_library_end()`”.

Return Values

None.

24.7.13. Controlling Automatic Reconnect Behavior

The MySQL client library can perform an automatic reconnect to the server if it finds that the connection is down when you attempt to send a statement to the server to be executed. In this case, the library tries once to reconnect to the server and send the statement again.

If it is important for your application to know that the connection has been dropped (so that it can exit or take action to adjust for the loss of state information), be sure to disable auto-reconnect. This can be done explicitly by calling `mysql_options()` with the `MYSQL_OPT_RECONNECT` option:

```
my_bool reconnect = 0;
mysql_options(&mysql, MYSQL_OPT_RECONNECT, &reconnect);
```

In MySQL 5.0, auto-reconnect was enabled by default until MySQL 5.0.3, and disabled by default thereafter. The `MYSQL_OPT_RECONNECT` option is available as of MySQL 5.0.13.

Some client programs might provide the capability of controlling automatic reconnection. For example, `mysql` reconnects by default, but the `--skip-reconnect` option can be used to suppress this behavior.

Automatic reconnection can be convenient because you need not implement your own reconnect code, but if a reconnection does occur, several aspects of the connection state are reset and your application will not know about it. The connection-related state is affected as follows:

- Any active transactions are rolled back and autocommit mode is reset.
- All table locks are released.
- All `TEMPORARY` tables are closed (and dropped).
- Session variables are reinitialized to the values of the corresponding variables. This also affects variables that are set implicitly by statements such as `SET NAMES`.
- User variable settings are lost.
- Prepared statements are released.
- `HANDLER` variables are closed.
- The value of `LAST_INSERT_ID()` is reset to 0.

- Locks acquired with `GET_LOCK()` are released.
- `mysql_ping()` does not attempt a reconnection if the connection is down. It returns an error instead.

24.7.14. Common Questions and Problems When Using the C API

MySQL Enterprise

Subscribers to MySQL Enterprise will find articles about the C API in the MySQL Knowledge Base. Access to the Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

24.7.14.1. Why `mysql_store_result()` Sometimes Returns `NULL` After `mysql_query()` Returns Success

It is possible for `mysql_store_result()` to return `NULL` following a successful call to `mysql_query()`. When this happens, it means one of the following conditions occurred:

- There was a `malloc()` failure (for example, if the result set was too large).
- The data couldn't be read (an error occurred on the connection).
- The query returned no data (for example, it was an `INSERT`, `UPDATE`, or `DELETE`).

You can always check whether the statement should have produced a non-empty result by calling `mysql_field_count()`. If `mysql_field_count()` returns zero, the result is empty and the last query was a statement that does not return values (for example, an `INSERT` or a `DELETE`). If `mysql_field_count()` returns a non-zero value, the statement should have produced a non-empty result. See the description of the `mysql_field_count()` function for an example.

You can test for an error by calling `mysql_error()` or `mysql_errno()`.

24.7.14.2. What Results You Can Get from a Query

In addition to the result set returned by a query, you can also get the following information:

- `mysql_affected_rows()` returns the number of rows affected by the last query when doing an `INSERT`, `UPDATE`, or `DELETE`.

For a fast re-create, use `TRUNCATE TABLE`.

- `mysql_num_rows()` returns the number of rows in a result set. With `mysql_store_result()`, `mysql_num_rows()` may be called as soon as `mysql_store_result()` returns. With `mysql_use_result()`, `mysql_num_rows()` may be called only after you have fetched all the rows with `mysql_fetch_row()`.
- `mysql_insert_id()` returns the ID generated by the last query that inserted a row into a table with an `AUTO_INCREMENT` index. See [Section 24.7.3.37](#), “`mysql_insert_id()`”.
- Some queries (`LOAD DATA INFILE ...`, `INSERT INTO ... SELECT ...`, `UPDATE`) return additional information. The result is returned by `mysql_info()`. See the description for `mysql_info()` for the format of the string that it returns. `mysql_info()` returns a `NULL` pointer if there is no additional information.

24.7.14.3. How to Get the Unique ID for the Last Inserted Row

If you insert a record into a table that contains an `AUTO_INCREMENT` column, you can obtain the value stored into that column by calling the `mysql_insert_id()` function.

You can check from your C applications whether a value was stored in an `AUTO_INCREMENT` column by executing the following code (which assumes that you've checked that the statement succeeded). It determines whether the query was an `INSERT` with an `AUTO_INCREMENT` index:

```
if ((result = mysql_store_result(&mysql)) == 0 &&
    mysql_field_count(&mysql) == 0 &&
    mysql_insert_id(&mysql) != 0)
{
    used_id = mysql_insert_id(&mysql);
}
```

When a new `AUTO_INCREMENT` value has been generated, you can also obtain it by executing a `SELECT LAST_INSERT_ID()` statement with `mysql_query()` and retrieving the value from the result set returned by the statement.

For `LAST_INSERT_ID()`, the most recently generated ID is maintained in the server on a per-connection basis. It is not changed by another client. It is not even changed if you update another `AUTO_INCREMENT` column with a non-magic value (that is, a value that is not `NULL` and not `0`). Using `LAST_INSERT_ID()` and `AUTO_INCREMENT` columns simultaneously from multiple clients is perfectly valid. Each client will receive the last inserted ID for the last statement *that* client executed.

If you want to use the ID that was generated for one table and insert it into a second table, you can use SQL statements like this:

```
INSERT INTO foo (auto,text)
VALUES(NULL,'text');          # generate ID by inserting NULL
INSERT INTO foo2 (id,text)
VALUES(LAST_INSERT_ID(),'text'); # use ID in second table
```

Note that `mysql_insert_id()` returns the value stored into an `AUTO_INCREMENT` column, whether that value is automatically generated by storing `NULL` or `0` or was specified as an explicit value. `LAST_INSERT_ID()` returns only automatically generated `AUTO_INCREMENT` values. If you store an explicit value other than `NULL` or `0`, it does not affect the value returned by `LAST_INSERT_ID()`.

For more information on obtaining the last ID in an `AUTO_INCREMENT` column:

- For information on `LAST_INSERT_ID()`, which can be used within an SQL statement, see [Section 11.10.3, “Information Functions”](#).
- For information on `mysql_insert_id()`, the function you use from within the C API, see [Section 24.7.3.37, “mysql_insert_id\(\)”](#).
- For information on obtaining the auto-incremented value when using Connector/J see [Section 24.4.5, “Connector/J Notes and Tips”](#).
- For information on obtaining the auto-incremented value when using Connector/ODBC see [Section 24.1.7.1.1, “Obtaining Auto-Increment Values”](#).

24.7.14.4. Problems Linking with the C API

When linking with the C API, the following errors may occur on some systems:

```
gcc -g -o client test.o -L/usr/local/lib/mysql \
-lmysqlclient -lsocket -lnsl

Undefined      first referenced
symbol        in file
floor         /usr/local/lib/mysql/libmysqlclient.a(password.o)
ld: fatal: Symbol referencing errors. No output written to client
```

If this happens on your system, you must include the math library by adding `-lm` to the end of the compile/link line.

24.7.15. Building Client Programs

If you compile MySQL clients that you've written yourself or that you obtain from a third-party, they must be linked using the `-lmysqlclient -lz` options in the link command. You may also need to specify a `-L` option to tell the linker where to find the library. For example, if the library is installed in `/usr/local/mysql/lib`, use `-L/usr/local/mysql/lib -lmysqlclient -lz` in the link command.

For clients that use MySQL header files, you may need to specify an `-I` option when you compile them (for example, `-I/usr/local/mysql/include`), so that the compiler can find the header files.

To make it simpler to compile MySQL programs on Unix, we have provided the `mysql_config` script for you. See [Section 4.7.2, “mysql_config — Get Compile Options for Compiling Clients”](#).

You can use it to compile a MySQL client as follows:

```
CFG=/usr/local/mysql/bin/mysql_config
sh -c "gcc -o progname ` $CFG --cflags ` progname.c ` $CFG --libs `"
```

The `sh -c` is needed to get the shell not to treat the output from `mysql_config` as one word.

Subscribers to MySQL Enterprise will find an example client program in the Knowledge Base article, [Sample C program using the embedded MySQL server library](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

24.7.16. How to Make a Threaded Client

The client library is almost thread-safe. The biggest problem is that the subroutines in `net.c` that read from sockets are not interrupt safe. This was done with the thought that you might want to have your own alarm that can break a long read to a server. If you install interrupt handlers for the `SIGPIPE` interrupt, the socket handling should be thread-safe.

To avoid aborting the program when a connection terminates, MySQL blocks `SIGPIPE` on the first call to `mysql_library_init()`, `mysql_init()`, or `mysql_connect()`. If you want to use your own `SIGPIPE` handler, you should first call `mysql_library_init()` and then install your handler.

Before MySQL 4.0, binary client libraries that we provided other than those for Windows were not normally compiled with the thread-safe option. Current binary distributions should have both a normal and a thread-safe client library.

To create a threaded client where you can interrupt the client from other threads and set timeouts when talking with the MySQL server, you should use the `net_serv.o` code that the server uses and the `-lmysys`, `-lmystrings`, and `-ldbbug` libraries.

If you don't need interrupts or timeouts, you can just compile a thread-safe client library (`mysqlclient_r`) and use it. In this case, you don't have to worry about the `net_serv.o` object file or the other MySQL libraries.

When using a threaded client and you want to use timeouts and interrupts, you can make great use of the routines in the `thr_alarm.c` file. If you are using routines from the `mysys` library, the only thing you must remember is to call `my_init()` first! See [Section 24.7.11, "C API Threaded Function Descriptions"](#).

In all cases, be sure to initialize the client library by calling `mysql_library_init()` before calling any other MySQL functions. When you are done with the library, call `mysql_library_end()`.

`mysql_real_connect()` is not thread-safe by default. The following notes describe how to compile a thread-safe client library and use it in a thread-safe manner. (The notes below for `mysql_real_connect()` also apply to the older `mysql_connect()` routine as well, although `mysql_connect()` is deprecated and should no longer be used.)

To make `mysql_real_connect()` thread-safe, you must configure your MySQL distribution with this command:

```
shell> ./configure --enable-thread-safe-client
```

Then recompile the distribution to create a thread-safe client library, `libmysqlclient_r`. (Assuming that your operating system has a thread-safe `gethostbyname_r()` function.) This library is thread-safe per connection. You can let two threads share the same connection with the following caveats:

- Two threads can't send a query to the MySQL server at the same time on the same connection. In particular, you have to ensure that between calls to `mysql_query()` and `mysql_store_result()`, no other thread is using the same connection.
- Many threads can access different result sets that are retrieved with `mysql_store_result()`.
- If you use `mysql_use_result()`, you must ensure that no other thread is using the same connection until the result set is closed. However, it really is best for threaded clients that share the same connection to use `mysql_store_result()`.
- If you want to use multiple threads on the same connection, you must have a mutex lock around your pair of `mysql_query()` and `mysql_store_result()` calls. Once `mysql_store_result()` is ready, the lock can be released and other threads may query the same connection.
- If you use POSIX threads, you can use `pthread_mutex_lock()` and `pthread_mutex_unlock()` to establish and release a mutex lock.

You need to know the following if a thread that is calling MySQL functions did not create the connection to the MySQL database:

When you call `mysql_init()`, MySQL creates a thread-specific variable for the thread that is used by the debug library (among other things). If you call a MySQL function before the thread has called `mysql_init()`, the thread does not have the necessary thread-specific variables in place and you are likely to end up with a core dump sooner or later. To get things to work smoothly you must do the following:

1. Call `mysql_library_init()` before any other MySQL functions. It is not thread-safe, so call it before threads are created, or protect the call with a mutex.

2. Arrange for `mysql_thread_init()` to be called early in the thread handler before calling any MySQL function. If you call `mysql_init()`, they will call `mysql_thread_init()` for you.
3. In the thread, call `mysql_thread_end()` before calling `pthread_exit()`. This frees the memory used by MySQL thread-specific variables.

The preceding notes regarding `mysql_init()` also apply to `mysql_connect()`, which calls `mysql_init()`.

If “undefined symbol” errors occur when linking your client with `libmysqlclient_r`, in most cases this is because you haven't included the thread libraries on the link/compile command.

24.8. MySQL PHP API

PHP is a server-side, HTML-embedded scripting language that may be used to create dynamic Web pages. It is available for most operating systems and Web servers, and can access most common databases, including MySQL. PHP may be run as a separate program or compiled as a module for use with the Apache Web server.

PHP actually provides two different MySQL API extensions:

- `mysql`: Available for PHP versions 4 and 5, this extension is intended for use with MySQL versions prior to MySQL 4.1. This extension does not support the improved authentication protocol used in MySQL 4.1, nor does it support prepared statements or multiple statements. If you wish to use this extension with MySQL 4.1, you will likely want to configure the MySQL server to use the `--old-passwords` option (see Section B.1.2.4, “Client does not support authentication protocol”). This extension is documented on the PHP Web site at <http://php.net/mysql>.
- Section 24.8.2, “MySQL Improved Extension (`Mysqli`)” - Stands for “MySQL, Improved”; this extension is available only in PHP 5. It is intended for use with MySQL 4.1.1 and later. This extension fully supports the authentication protocol used in MySQL 5.0, as well as the Prepared Statements and Multiple Statements APIs. In addition, this extension provides an advanced, object-oriented programming interface. You can read the documentation for the `mysqli` extension at <http://php.net/mysqli>. Helpful article can be found at <http://devzone.zend.com/node/view/id/686> and <http://devzone.zend.com/node/view/id/687>.

If you're experiencing problems with enabling both the `mysql` and the `mysqli` extension when building PHP on Linux yourself, see Section 24.8.6, “Enabling Both `mysql` and `mysqli` in PHP”.

The PHP distribution and documentation are available from the [PHP Web site](#).

MySQL Enterprise

MySQL Enterprise subscribers will find more information about MySQL and PHP in the Knowledge Base articles found at [PHP](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/knowledgebase.html>.

Portions of this section are Copyright (c) 1997-2008 the PHP Documentation Group This material may be distributed only subject to the terms and conditions set forth in the Creative Commons Attribution 3.0 License or later. A copy of the Creative Commons Attribution 3.0 license is distributed with this manual. 24.8.1. MySQL

Copyright (c) 1997-2008 the PHP Documentation Group.

These functions allow you to access MySQL database servers. More information about MySQL can be found at <http://www.mysql.com/>.

Documentation for MySQL can be found at <http://dev.mysql.com/doc/>.

24.8.1.1. Installing/Configuring

Copyright (c) 1997-2008 the PHP Documentation Group.

24.8.1.1.1. Requirements

Copyright (c) 1997-2008 the PHP Documentation Group.

In order to have these functions available, you must compile PHP with MySQL support.

24.8.1.1.2. Installation

Copyright (c) 1997-2008 the PHP Documentation Group.

For compiling, simply use the `--with-mysql[=DIR]` configuration option where the optional `[DIR]` points to the MySQL installation directory.

Although this MySQL extension is compatible with MySQL 4.1.0 and greater, it doesn't support the extra functionality that these versions provide. For that, use the [MySQLi](#) extension.

If you would like to install the `mysql` extension along with the `mysqli` extension you have to use the same client library to avoid any conflicts.

24.8.1.1.2.1. Installation on Linux Systems

Copyright (c) 1997-2008 the PHP Documentation Group.

24.8.1.1.2.1.1. PHP 4

Copyright (c) 1997-2008 the PHP Documentation Group.

The option `--with-mysql` is enabled by default. This default behavior may be disabled with the `--without-mysql` configure option. If MySQL is enabled without specifying the path to the MySQL install DIR, PHP will use the bundled MySQL client libraries.

Users who run other applications that use MySQL (for example, `auth-mysql`) should not use the bundled library, but rather specify the path to MySQL's install directory, like so: `--with-mysql=/path/to/mysql`. This will force PHP to use the client libraries installed by MySQL, thus avoiding any conflicts.

24.8.1.1.2.1.2. PHP 5+

Copyright (c) 1997-2008 the PHP Documentation Group.

MySQL is not enabled by default, nor is the MySQL library bundled with PHP. Read this [FAQ](#) for details on why. Use the `--with-mysql[=DIR]` configure option to include MySQL support. You can download *headers and libraries* from [MySQL](#).

24.8.1.1.2.2. Installation on Windows Systems

Copyright (c) 1997-2008 the PHP Documentation Group.

24.8.1.1.2.2.1. PHP 4

Copyright (c) 1997-2008 the PHP Documentation Group.

The PHP MySQL extension is compiled into PHP.

24.8.1.1.2.2.2. PHP 5+

Copyright (c) 1997-2008 the PHP Documentation Group.

MySQL is no longer enabled by default, so the `php_mysql.dll` DLL must be enabled inside of `php.ini`. Also, PHP needs access to the MySQL client library. A file named `libmysql.dll` is included in the Windows PHP distribution and in order for PHP to talk to MySQL this file needs to be available to the Windows systems `PATH`. See the FAQ titled "[How do I add my PHP directory to the PATH on Windows](#)" for information on how to do this. Although copying `libmysql.dll` to the Windows system directory also works (because the system directory is by default in the system's `PATH`), it's not recommended.

As with enabling any PHP extension (such as `php_mysql.dll`), the PHP directive `extension_dir` should be set to the directory where the PHP extensions are located. See also the [Manual Windows Installation Instructions](#). An example `extension_dir` value for PHP 5 is `c:\php\ext`

Note

If when starting the web server an error similar to the following occurs: `"Unable to load dynamic library '.\php_mysql.dll'"`, this is because `php_mysql.dll` and/or `libmysql.dll` cannot be found by the system.

24.8.1.1.2.3. MySQL Installation Notes

Copyright (c) 1997-2008 the PHP Documentation Group.

Warning

Crashes and startup problems of PHP may be encountered when loading this extension in conjunction with the `recode` extension. See the [recode](#) extension for more information.

Note

If you need charsets other than *latin* (default), you have to install external (not bundled) `libmysql` with compiled charset support.

24.8.1.1.3. Runtime Configuration

Copyright (c) 1997-2008 the PHP Documentation Group.

The behaviour of these functions is affected by settings in `php.ini`.

Table 24.3. MySQL Configuration Options

Name	Default	Changeable	Changelog
<code>mysql.allow_persistent</code>	"1"	PHP_INI_SYSTEM	
<code>mysql.max_persistent</code>	"-1"	PHP_INI_SYSTEM	
<code>mysql.max_links</code>	"-1"	PHP_INI_SYSTEM	
<code>mysql.trace_mode</code>	"0"	PHP_INI_ALL	Available since PHP 4.3.0.
<code>mysql.default_port</code>	NULL	PHP_INI_ALL	
<code>mysql.default_socket</code>	NULL	PHP_INI_ALL	Available since PHP 4.0.1.
<code>mysql.default_host</code>	NULL	PHP_INI_ALL	
<code>mysql.default_user</code>	NULL	PHP_INI_ALL	
<code>mysql.default_password</code>	NULL	PHP_INI_ALL	
<code>mysql.connect_timeout</code>	"60"	PHP_INI_ALL	PHP_INI_SYSTEM in PHP <= 4.3.2. Available since PHP 4.3.0.

For further details and definitions of the `PHP_INI_*` constants, see the <http://www.php.net/manual/en/ini.php>.

Here's a short explanation of the configuration directives.

<code>mysql.allow_persistent</code> boolean	Whether to allow persistent connections to MySQL.
<code>mysql.max_persistent</code> integer	The maximum number of persistent MySQL connections per process.
<code>mysql.max_links</code> integer	The maximum number of MySQL connections per process, including persistent connections.
<code>mysql.trace_mode</code> boolean	Trace mode. When <code>mysql.trace_mode</code> is enabled, warnings for table/index scans, non free result sets, and SQL-Errors will be displayed. (Introduced in PHP 4.3.0)
<code>mysql.default_port</code> string	The default TCP port number to use when connecting to the database server if no other port is specified. If no default is specified, the port will be obtained from the <code>MYSQL_TCP_PORT</code> environment variable, the <code>mysql-tcp</code> entry in <code>/etc/services</code> or the compile-time <code>MYSQL_PORT</code> constant, in that order. Win32 will only use the <code>MYSQL_PORT</code> constant.
<code>mysql.default_socket</code> string	The default socket name to use when connecting to a local database server if no other socket name is specified.
<code>mysql.default_host</code> string	The default server host to use when connecting to the database server if no other host is specified. Doesn't apply in SQL safe mode .
<code>mysql.default_user</code> string	The default user name to use when connecting to the database server if no other name is specified. Doesn't apply in SQL safe mode .

string	The default password to use when connecting to the database server if no other password is specified. Doesn't apply in SQL safe mode .
<code>mysql.connect_timeout</code> integer	Connect timeout in seconds. On Linux this timeout is also used for waiting for the first answer from the server.

24.8.1.1.4. Resource Types

Copyright (c) 1997-2008 the PHP Documentation Group.

There are two resource types used in the MySQL module. The first one is the link identifier for a database connection, the second a resource which holds the result of a query.

24.8.1.2. Predefined Constants

Copyright (c) 1997-2008 the PHP Documentation Group.

The constants below are defined by this extension, and will only be available when the extension has either been compiled into PHP or dynamically loaded at runtime.

Since PHP 4.3.0 it is possible to specify additional client flags for the `mysql_connect` and `mysql_pconnect` functions. The following constants are defined:

Table 24.4. MySQL client constants

Constant	Description
<code>MYSQL_CLIENT_COMPRESS</code>	Use compression protocol
<code>MYSQL_CLIENT_IGNORE_SPACE</code>	Allow space after function names
<code>MYSQL_CLIENT_INTERACTIVE</code>	Allow interactive_timeout seconds (instead of wait_timeout) of inactivity before closing the connection.
<code>MYSQL_CLIENT_SSL</code>	Use SSL encryption. This flag is only available with version 4.x of the MySQL client library or newer. Version 3.23.x is bundled both with PHP 4 and Windows binaries of PHP 5.

The function `mysql_fetch_array` uses a constant for the different types of result arrays. The following constants are defined:

Table 24.5. MySQL fetch constants

Constant	Description
<code>MYSQL_ASSOC</code>	Columns are returned into the array having the fieldname as the array index.
<code>MYSQL_BOTH</code>	Columns are returned into the array having both a numerical index and the fieldname as the array index.
<code>MYSQL_NUM</code>	Columns are returned into the array having a numerical index to the fields. This index starts with 0, the first field in the result.

24.8.1.3. Examples

Copyright (c) 1997-2008 the PHP Documentation Group.

24.8.1.3.1. Basic

This simple example shows how to connect, execute a query, print resulting rows and disconnect from a MySQL database.

Example 24.13. MySQL extension overview example

Copyright (c) 1997-2008 the PHP Documentation Group.

```
<?php
// Connecting, selecting database
$link = mysql_connect('mysql_host', 'mysql_user', 'mysql_password')
```

```

    or die('Could not connect: ' . mysql_error());
echo 'Connected successfully';
mysql_select_db('my_database') or die('Could not select database');

// Performing SQL query
$query = 'SELECT * FROM my_table';
$result = mysql_query($query) or die('Query failed: ' . mysql_error());

// Printing results in HTML
echo "<table>\n";
while ($line = mysql_fetch_array($result, MYSQL_ASSOC)) {
    echo "\t<tr>\n";
    foreach ($line as $col_value) {
        echo "\t\t<td>$col_value</td>\n";
    }
    echo "\t</tr>\n";
}
echo "</table>\n";

// Free resultset
mysql_free_result($result);

// Closing connection
mysql_close($link);
?>

```

24.8.1.4. MySQL Functions

Copyright (c) 1997-2008 the PHP Documentation Group.

Note

Most MySQL functions accept *link_identifier* as the last optional parameter. If it is not provided, last opened connection is used. If it doesn't exist, connection is tried to establish with default parameters defined in `php.ini`. If it is not successful, functions return `FALSE`.

24.8.1.4.1. `mysql_affected_rows`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_affected_rows`

Get number of affected rows in previous MySQL operation

Description

```
int mysql_affected_rows(resource link_identifier);
```

Get the number of affected rows by the last INSERT, UPDATE, REPLACE or DELETE query associated with *link_identifier*.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns the number of affected rows on success, and -1 if the last query failed.

If the last query was a DELETE query with no WHERE clause, all of the records will have been deleted from the table but this function will return zero with MySQL versions prior to 4.1.2.

When using UPDATE, MySQL will not update columns where the new value is the same as the old value. This creates the possibility that `mysql_affected_rows` may not actually equal the number of rows matched, only the number of rows that were literally affected by the query.

The REPLACE statement first deletes the record with the same primary key and then inserts the new record. This function returns the number of deleted records plus the number of inserted records.

Examples

Example 24.14. `mysql_affected_rows` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
mysql_select_db('mydb');

/* this should return the correct numbers of deleted records */
mysql_query('DELETE FROM mytable WHERE id < 10');
printf("Records deleted: %d\n", mysql_affected_rows());

/* with a where clause that is never true, it should return 0 */
mysql_query('DELETE FROM mytable WHERE 0');
printf("Records deleted: %d\n", mysql_affected_rows());
?>
```

The above example will output something similar to:

```
Records deleted: 10
Records deleted: 0
```

Example 24.15. `mysql_affected_rows` example using transactions

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
mysql_select_db('mydb');

/* Update records */
mysql_query("UPDATE mytable SET used=1 WHERE id < 10");
printf("Updated records: %d\n", mysql_affected_rows());
mysql_query("COMMIT");
?>
```

The above example will output something similar to:

```
Updated Records: 10
```

Notes

Transactions

If you are using transactions, you need to call `mysql_affected_rows` after your INSERT, UPDATE, or DELETE query, not after the COMMIT.

SELECT Statements

To retrieve the number of rows returned by a SELECT, it is possible to use `mysql_num_rows`.

See Also

`mysql_num_rows`
`mysql_info`

24.8.1.4.2. `mysql_change_user`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_change_user`

Change logged in user of the active connection

Description

```
int mysql_change_user(string user,
                     string password,
                     string database,
                     resource link_identifier);
```

`mysql_change_user` changes the logged in user of the current active connection, or the connection given by the optional `link_identifier` parameter. If a database is specified, this will be the current database after the user has been changed. If the new user and password authorization fails, the current connected user stays active.

This function is deprecated and no longer exists in PHP.

Parameters

<code>user</code>	The new MySQL username.
<code>password</code>	The new MySQL password.
<code>database</code>	The MySQL database. If not specified, the current selected database is used.
<code>link_identifier</code>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If by chance no connection is found or established, an <code>E_WARNING</code> level error is generated.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

ChangeLog

Version	Description
3.0.14	This function was removed from PHP.

Notes

Requirements

This function requires MySQL 3.23.3 or higher.

See Also

`mysql_connect`
`mysql_select_db`
`mysql_query`

24.8.1.4.3. `mysql_client_encoding`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_client_encoding`

Returns the name of the character set

Description

```
string mysql_client_encoding(resource link_identifier);
```

Retrieves the `character_set` variable from MySQL.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns the default character set name for the current connection.

Examples

Example 24.16. `mysql_client_encoding` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$charset = mysql_client_encoding($link);

echo "The current character set is: $charset\n";
?>
```

The above example will output something similar to:

```
The current character set is: latin1
```

See Also

`mysql_set_charset`
`mysql_real_escape_string`

24.8.1.4.4. `mysql_close`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_close`

Close MySQL connection

Description

```
bool mysql_close(resource link_identifier);
```

`mysql_close` closes the non-persistent connection to the MySQL server that's associated with the specified link identifier. If `link_identifier` isn't specified, the last opened link is used.

Using `mysql_close` isn't usually necessary, as non-persistent open links are automatically closed at the end of the script's execution. See also [freeing resources](#).

Parameters

`link_identifier` The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 24.17. `mysql_close` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>
```

The above example will output:

```
Connected successfully
```

Notes

Note

`mysql_close` will not close persistent links created by `mysql_pconnect`.

See Also

[mysql_connect](#)
[mysql_free_result](#)

24.8.1.4.5. `mysql_connect`

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_connect](#)

Open a connection to a MySQL Server

Description

```
resource mysql_connect(string server,
                      string username,
                      string password,
                      bool new_link,
                      int client_flags);
```

Opens or reuses a connection to a MySQL server.

Parameters

<i>server</i>	The MySQL server. It can also include a port number. e.g. "hostname:port" or a path to a local socket e.g. ":/path/to/socket" for the localhost. If the PHP directive <code>mysql.default_host</code> is undefined (default), then the default value is 'localhost:3306'. In SQL safe mode , this parameter is ignored and value 'localhost:3306' is always used.
<i>username</i>	The username. Default value is defined by <code>mysql.default_user</code> . In SQL safe mode , this parameter is ignored and the name of the user that owns the server process is used.
<i>password</i>	The password. Default value is defined by <code>mysql.default_password</code> . In SQL safe mode , this parameter is ignored and empty password is used.
<i>new_link</i>	If a second call is made to <code>mysql_connect</code> with the same arguments, no new link will be established, but instead, the link identifier of the already opened link will be returned. The <i>new_link</i> parameter modifies this behavior and makes <code>mysql_connect</code> always open a new link, even if <code>mysql_connect</code> was called before with the same parameters. In SQL safe mode , this parameter is ignored.
<i>client_flags</i>	The <i>client_flags</i> parameter can be a combination of the following constants: 128 (enable <code>LOAD DATA LOCAL</code> handling), <code>MYSQL_CLIENT_SSL</code> , <code>MYSQL_CLIENT_COMPRESS</code> , <code>MYSQL_CLIENT_IGNORE_SPACE</code> or <code>MYSQL_CLIENT_INTERACTIVE</code> . Read the section about Table 24.4, "MySQL client constants" for further information. In SQL safe mode , this parameter is ignored.

Return Values

Returns a MySQL link identifier on success, or `FALSE` on failure.

ChangeLog

Version	Description
4.3.0	Added the <i>client_flags</i> parameter.
4.2.0	Added the <i>new_link</i> parameter.
3.0.10	Added support for ":/path/to/socket" with <i>server</i> .
3.0.0	Added support for ".:port" with <i>server</i> .

Examples

Example 24.18. `mysql_connect` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>
```

Example 24.19. `mysql_connect` example using `hostname:port` syntax

```
<?php
// we connect to example.com and port 3307
$link = mysql_connect('example.com:3307', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);

// we connect to localhost at port 3307
$link = mysql_connect('127.0.0.1:3307', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>
```

Example 24.20. `mysql_connect` example using `"/path/to/socket"` syntax

```
<?php
// we connect to localhost and socket e.g. /tmp/mysql.sock

//variant 1: omit localhost
$link = mysql_connect('/:tmp/mysql', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);

// variant 2: with localhost
$link = mysql_connect('localhost:/tmp/mysql.sock', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
echo 'Connected successfully';
mysql_close($link);
?>
```

Notes**Note**

Whenever you specify "localhost" or "localhost:port" as server, the MySQL client library will override this and try to connect to a local socket (named pipe on Windows). If you want to use TCP/IP, use "127.0.0.1" instead of "localhost". If the MySQL client library tries to connect to the wrong local socket, you should set the correct path as <http://www.php.net/manual/en/ini.mysql.default-host.php> in your PHP configuration and leave the server field blank.

Note

The link to the server will be closed as soon as the execution of the script ends, unless it's closed earlier by explicitly calling `mysql_close`.

Note

You can suppress the error message on failure by prepending a `@` to the function name.

Note

Error "Can't create TCP/IP socket (10106)" usually means that the `variables_order` configure directive doesn't contain character `E`. On Windows, if the environment is not copied the `SYSTEMROOT` environment variable won't be available and PHP will have problems loading Winsock.

See Also

[mysql_pconnect](#)
[mysql_close](#)

24.8.1.4.6. [mysql_create_db](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_create_db](#)

Create a MySQL database

Description

```
bool mysql_create_db(string database_name,
                    resource link_identifier);
```

[mysql_create_db](#) attempts to create a new database on the server associated with the specified link identifier.

Parameters

<i>database_name</i>	The name of the database being created.
<i>link_identifier</i>	The MySQL connection. If the link identifier is not specified, the last link opened by mysql_connect is assumed. If no such link is found, it will try to create one as if mysql_connect was called with no arguments. If by chance no connection is found or established, an E_WARNING level error is generated.

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

Examples

Example 24.21. [mysql_create_db](#) alternative example

The function [mysql_create_db](#) is deprecated. It is preferable to use [mysql_query](#) to issue a sql `CREATE DATABASE` statement instead.

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}

$sql = 'CREATE DATABASE my_db';
if (mysql_query($sql, $link)) {
    echo "Database my_db created successfully\n";
} else {
    echo 'Error creating database: ' . mysql_error() . "\n";
}
?>
```

The above example will output something similar to:

```
Database my_db created successfully
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_createdb`

Note

This function will not be available if the MySQL extension was built against a MySQL 4.x client library.

`mysql_query`
`mysql_select_db`

24.8.1.4.7. `mysql_data_seek`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_data_seek`

Move internal result pointer

Description

```
bool mysql_data_seek(resource result,
                    int row_number);
```

`mysql_data_seek` moves the internal row pointer of the MySQL result associated with the specified result identifier to point to the specified row number. The next call to a MySQL fetch function, such as `mysql_fetch_assoc`, would return that row.

`row_number` starts at 0. The `row_number` should be a value in the range from 0 to `mysql_num_rows` - 1. However if the result set is empty (`mysql_num_rows == 0`), a seek to 0 will fail with a **E_WARNING** and `mysql_data_seek` will return `FALSE`.

Parameters

`result` The result resource that is being evaluated. This result comes from a call to `mysql_query`.

`row_number` The desired row number of the new result pointer.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples**Example 24.22. `mysql_data_seek` example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
$db_selected = mysql_select_db('sample_db');
if (!$db_selected) {
    die('Could not select database: ' . mysql_error());
}
$query = 'SELECT last_name, first_name FROM friends';
$result = mysql_query($query);
if (!$result) {
    die('Query failed: ' . mysql_error());
}
/* fetch rows in reverse order */
for ($i = mysql_num_rows($result) - 1; $i >= 0; $i--) {
    if (!mysql_data_seek($result, $i)) {
        echo "Cannot seek to row $i: " . mysql_error() . "\n";
        continue;
    }
}
```

```

if (!($row = mysql_fetch_assoc($result))) {
    continue;
}
echo $row['last_name'] . ' ' . $row['first_name'] . "<br />\n";
}
mysql_free_result($result);
?>

```

Notes

Note

The function `mysql_data_seek` can be used in conjunction only with `mysql_query`, not with `mysql_unbuffered_query`.

[mysql_fetch_object](#)

24.8.1.4.8. `mysql_db_name`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_db_name`

Get result data

Description

```

string mysql_db_name(resource result,
                    int row,
                    mixed field);

```

Retrieve the database name from a call to `mysql_list_dbs`.

Parameters

<i>result</i>	The result pointer from a call to <code>mysql_list_dbs</code> .
<i>row</i>	The index into the result set.
<i>field</i>	The field name.

Return Values

Returns the database name on success, and `FALSE` on failure. If `FALSE` is returned, use `mysql_error` to determine the nature of the error.

Examples

Example 24.23. `mysql_db_name` example

```

<?php
error_reporting(E_ALL);

$link = mysql_connect('dbhost', 'username', 'password');

```

```

$db_list = mysql_list_dbs($link);
$i = 0;
$cnt = mysql_num_rows($db_list);
while ($i < $cnt) {
    echo mysql_db_name($db_list, $i) . "\n";
    $i++;
}
?>

```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_dbname`

See Also

`mysql_list_dbs`
`mysql_tablename`

24.8.1.4.9. `mysql_db_query`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_db_query`
Send a MySQL query

Description

```

resource mysql_db_query(string database,
                        string query,
                        resource link_identifier);

```

`mysql_db_query` selects a database, and executes a query on it.

Parameters

<i>database</i>	The name of the database that will be selected.
<i>query</i>	The MySQL query.
<i>link_identifier</i>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If by chance no connection is found or established, an <code>E_WARNING</code> level error is generated.

Return Values

Returns a positive MySQL result resource to the query result, or `FALSE` on error. The function also returns `TRUE` / `FALSE` for `INSERT/UPDATE/DELETE` queries to indicate success/failure.

ChangeLog

Version	Description
5.3.0	This function now throws an <code>E_DEPRECATED</code> notice.
4.0.6	This function is deprecated, do not use this function. Use <code>mysql_select_db</code> and <code>mysql_query</code> instead.

Examples

Example 24.24. `mysql_db_query` alternative example

```

<?php
if (!$link = mysql_connect('mysql_host', 'mysql_user', 'mysql_password')) {
    echo 'Could not connect to mysql';
    exit;
}

if (!$mysql_select_db('mysql_dbname', $link)) {
    echo 'Could not select database';
    exit;
}

$sql = 'SELECT foo FROM bar WHERE id = 42';
$result = mysql_query($sql, $link);

if (!$result) {
    echo "DB Error, could not query the database\n";
    echo 'MySQL Error: ' . mysql_error();
    exit;
}

while ($row = mysql_fetch_assoc($result)) {
    echo $row['foo'];
}

mysql_free_result($result);
?>

```

Notes**Note**

Be aware that this function does *NOT* switch back to the database you were connected before. In other words, you can't use this function to *temporarily* run a sql query on another database, you would have to manually switch back. Users are strongly encouraged to use the `database.table` syntax in their sql queries or `mysql_select_db` instead of this function.

[mysql_select_db](#)

24.8.1.4.10. `mysql_drop_db`

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_drop_db](#)

Drop (delete) a MySQL database

Description

```
bool mysql_drop_db(string database_name,
                  resource link_identifier);
```

`mysql_drop_db` attempts to drop (remove) an entire database from the server associated with the specified link identifier. This function is deprecated, it is preferable to use `mysql_query` to issue a `DROP DATABASE` statement instead.

Parameters

database_name

The name of the database that will be deleted.

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if

`mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 24.25. `mysql_drop_db` alternative example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}

$sql = 'DROP DATABASE my_db';
if (mysql_query($sql, $link)) {
    echo "Database my_db was successfully dropped\n";
} else {
    echo 'Error dropping database: ' . mysql_error() . "\n";
}
?>
```

Notes

Warning

This function will not be available if the MySQL extension was built against a MySQL 4.x client library.

Note

For backward compatibility, the following deprecated alias may be used: `mysql_dropdb`

See Also

[mysql_query](#)

24.8.1.4.11. `mysql_errno`

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_errno](#)

Returns the numerical value of the error message from previous MySQL operation

Description

```
int mysql_errno(resource link_identifier);
```

Returns the error number from the last MySQL function.

Errors coming back from the MySQL database backend no longer issue warnings. Instead, use `mysql_errno` to retrieve the error code. Note that this function only returns the error code from the most recently executed MySQL function (not including `mysql_error` and `mysql_errno`), so if you want to use it, make sure you check the value before calling another MySQL function.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if

`mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns the error number from the last MySQL function, or 0 (zero) if no error occurred.

Examples

Example 24.26. `mysql_errno` example

```
<?php
$link = mysql_connect("localhost", "mysql_user", "mysql_password");

if (!mysql_select_db("nonexistentdb", $link)) {
    echo mysql_errno($link) . ": " . mysql_error($link) . "\n";
}

mysql_select_db("kossu", $link);
if (!mysql_query("SELECT * FROM nonexistenttable", $link)) {
    echo mysql_errno($link) . ": " . mysql_error($link) . "\n";
}
?>
```

The above example will output something similar to:

```
1049: Unknown database 'nonexistentdb'
1146: Table 'kossu.nonexistenttable' doesn't exist
```

See Also

[mysql_error](#)
[MySQL error codes](#)

24.8.1.4.12. `mysql_error`

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_error](#)

Returns the text of the error message from previous MySQL operation

Description

```
string mysql_error(resource link_identifier);
```

Returns the error text from the last MySQL function. Errors coming back from the MySQL database backend no longer issue warnings. Instead, use `mysql_error` to retrieve the error text. Note that this function only returns the error text from the most recently executed MySQL function (not including `mysql_error` and `mysql_errno`), so if you want to use it, make sure you check the value before calling another MySQL function.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns the error text from the last MySQL function, or '' (empty string) if no error occurred.

Examples

Example 24.27. `mysql_error` example

```
<?php
$link = mysql_connect("localhost", "mysql_user", "mysql_password");

mysql_select_db("nonexistentdb", $link);
echo mysql_errno($link) . ": " . mysql_error($link) . "\n";

mysql_select_db("kossu", $link);
mysql_query("SELECT * FROM nonexistenttable", $link);
echo mysql_errno($link) . ": " . mysql_error($link) . "\n";
?>
```

The above example will output something similar to:

```
1049: Unknown database 'nonexistentdb'
1146: Table 'kossu.nonexistenttable' doesn't exist
```

[MySQL error codes](#)

24.8.1.4.13. `mysql_escape_string`

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_escape_string](#)

Escapes a string for use in a `mysql_query`

Description

```
string mysql_escape_string(string unescaped_string);
```

This function will escape the *unescaped_string*, so that it is safe to place it in a `mysql_query`. This function is deprecated.

This function is identical to `mysql_real_escape_string` except that `mysql_real_escape_string` takes a connection handler and escapes the string according to the current character set. `mysql_escape_string` does not take a connection argument and does not respect the current charset setting.

Parameters

unescaped_string The string that is to be escaped.

Return Values

Returns the escaped string.

ChangeLog

Version	Description
5.3.0	This function now throws an E_DEPRECATED notice.
4.3.0	This function became deprecated, do not use this function. Instead, use mysql_real_escape_string .

Examples

Example 24.28. [mysql_escape_string](#) example

```
<?php
$item = "Zak's Laptop";
$escaped_item = mysql_escape_string($item);
printf("Escaped string: %s\n", $escaped_item);
?>
```

The above example will output:

```
Escaped string: Zak\'s Laptop
```

Notes

Note

[mysql_escape_string](#) does not escape % and _.

See Also

[mysql_real_escape_string](#)
[addslashes](#)
 The [magic_quotes_gpc](#) directive.

24.8.1.4.14. [mysql_fetch_array](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_fetch_array](#)

Fetch a result row as an associative array, a numeric array, or both

Description

```
array mysql_fetch_array(resource result,
                        int result_type);
```

Returns an array that corresponds to the fetched row and moves the internal data pointer ahead.

Parameters

result

The result resource that is being evaluated. This result comes from a call to [mysql_query](#).

result_type

The type of array that is to be fetched. It's a constant and can take the following values: [MYSQL_ASSOC](#), [MYSQL_NUM](#), and the default value of [MYSQL_BOTH](#).

Return Values

Returns an array of strings that corresponds to the fetched row, or `FALSE` if there are no more rows. The type of returned array depends on how `result_type` is defined. By using `MYSQL_BOTH` (default), you'll get an array with both associative and number indices. Using `MYSQL_ASSOC`, you only get associative indices (as `mysql_fetch_assoc` works), using `MYSQL_NUM`, you only get number indices (as `mysql_fetch_row` works).

If two or more columns of the result have the same field names, the last column will take precedence. To access the other column(s) of the same name, you must use the numeric index of the column or make an alias for the column. For aliased columns, you cannot access the contents with the original column name.

Examples

Example 24.29. Query with aliased duplicate field names

```
SELECT table1.field AS foo, table2.field AS bar FROM table1, table2
```

Example 24.30. `mysql_fetch_array` with `MYSQL_NUM`

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password") or
    die("Could not connect: " . mysql_error());
mysql_select_db("mydb");

$result = mysql_query("SELECT id, name FROM mytable");

while ($row = mysql_fetch_array($result, MYSQL_NUM)) {
    printf("ID: %s Name: %s", $row[0], $row[1]);
}

mysql_free_result($result);
?>
```

Example 24.31. `mysql_fetch_array` with `MYSQL_ASSOC`

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password") or
    die("Could not connect: " . mysql_error());
mysql_select_db("mydb");

$result = mysql_query("SELECT id, name FROM mytable");

while ($row = mysql_fetch_array($result, MYSQL_ASSOC)) {
    printf("ID: %s Name: %s", $row["id"], $row["name"]);
}

mysql_free_result($result);
?>
```

Example 24.32. `mysql_fetch_array` with `MYSQL_BOTH`

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password") or
    die("Could not connect: " . mysql_error());
mysql_select_db("mydb");

$result = mysql_query("SELECT id, name FROM mytable");

while ($row = mysql_fetch_array($result, MYSQL_BOTH)) {
```

```

    printf ("ID: %s Name: %s", $row[0], $row["name"]);
}
mysql_free_result($result);
?>

```

Notes

Performance

An important thing to note is that using `mysql_fetch_array` is *not significantly* slower than using `mysql_fetch_row`, while it provides a significant added value.

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets NULL fields to the PHP `NULL` value.

See Also

[mysql_fetch_row](#)
[mysql_fetch_assoc](#)
[mysql_data_seek](#)
[mysql_query](#)

24.8.1.4.15. `mysql_fetch_assoc`

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_fetch_assoc](#)

Fetch a result row as an associative array

Description

```
array mysql_fetch_assoc(resource result);
```

Returns an associative array that corresponds to the fetched row and moves the internal data pointer ahead. `mysql_fetch_assoc` is equivalent to calling `mysql_fetch_array` with `MYSQL_ASSOC` for the optional second parameter. It only returns an associative array.

Parameters

result The result resource that is being evaluated. This result comes from a call to `mysql_query`.

Return Values

Returns an associative array of strings that corresponds to the fetched row, or `FALSE` if there are no more rows.

If two or more columns of the result have the same field names, the last column will take precedence. To access the other column(s) of the same name, you either need to access the result with numeric indices by using `mysql_fetch_row` or add alias names. See the example at the `mysql_fetch_array` description about aliases.

Examples

Example 24.33. An expanded `mysql_fetch_assoc` example

```

<?php
$conn = mysql_connect("localhost", "mysql_user", "mysql_password");
if (!$conn) {
    echo "Unable to connect to DB: " . mysql_error();
    exit;
}
if (!mysql_select_db("mydbname")) {
    echo "Unable to select mydbname: " . mysql_error();
    exit;
}
$sql = "SELECT id as userid, fullname, userstatus
        FROM sometable
        WHERE userstatus = 1";
$result = mysql_query($sql);
if (!$result) {
    echo "Could not successfully run query ($sql) from DB: " . mysql_error();
    exit;
}
if (mysql_num_rows($result) == 0) {
    echo "No rows found, nothing to print so am exiting";
    exit;
}
// While a row of data exists, put that row in $row as an associative array
// Note: If you're expecting just one row, no need to use a loop
// Note: If you put extract($row); inside the following loop, you'll
//       then create $userid, $fullname, and $userstatus
while ($row = mysql_fetch_assoc($result)) {
    echo $row["userid"];
    echo $row["fullname"];
    echo $row["userstatus"];
}
mysql_free_result($result);
?>

```

Notes

Performance

An important thing to note is that using `mysql_fetch_assoc` is *not significantly* slower than using `mysql_fetch_row`, while it provides a significant added value.

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets NULL fields to the PHP `NULL` value.

24.8.1.4.16. `mysql_fetch_field`

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_fetch_field](#)

Get column information from a result and return as an object

Description

```
object mysql_fetch_field(resource result,
                        int field_offset);
```

Returns an object containing field information. This function can be used to obtain information about fields in the provided query result.

Parameters

result The result resource that is being evaluated. This result comes from a call to `mysql_query`.

field_offset The numerical field offset. If the field offset is not specified, the next field that was not yet retrieved by this function is retrieved. The *field_offset* starts at 0.

Return Values

Returns an object containing field information. The properties of the object are:

- name - column name
- table - name of the table the column belongs to
- def - default value of the column
- max_length - maximum length of the column
- not_null - 1 if the column cannot be `NULL`
- primary_key - 1 if the column is a primary key
- unique_key - 1 if the column is a unique key
- multiple_key - 1 if the column is a non-unique key
- numeric - 1 if the column is numeric
- blob - 1 if the column is a BLOB
- type - the type of the column
- unsigned - 1 if the column is unsigned
- zerofill - 1 if the column is zero-filled

Examples

Example 24.34. `mysql_fetch_field` example

```
<?php
$conn = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$conn) {
    die('Could not connect: ' . mysql_error());
}
mysql_select_db('database');
$result = mysql_query('select * from table');
if (!$result) {
    die('Query failed: ' . mysql_error());
}
/* get column metadata */
$i = 0;
while ($i < mysql_num_fields($result)) {
    echo "Information for column $i:<br />\n";
    $meta = mysql_fetch_field($result, $i);
    if (!$meta) {
        echo "No information available<br />\n";
    }
    echo "<pre>
blob:          $meta->blob
max_length:    $meta->max_length
multiple_key:  $meta->multiple_key
```

```

name:          $meta->name
not_null:     $meta->not_null
numeric:     $meta->numeric
primary_key:  $meta->primary_key
table:       $meta->table
type:       $meta->type
default:    $meta->def
unique_key: $meta->unique_key
unsigned:   $meta->unsigned
zerofill:   $meta->zerofill
</pre>";
    $i++;
}
mysql_free_result($result);
?>

```

Notes

Note

Field names returned by this function are *case-sensitive*.

See Also

[mysql_field_seek](#)

24.8.1.4.17. [mysql_fetch_lengths](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_fetch_lengths](#)

Get the length of each output in a result

Description

```
array mysql_fetch_lengths(resource result);
```

Returns an array that corresponds to the lengths of each field in the last row fetched by MySQL.

[mysql_fetch_lengths](#) stores the lengths of each result column in the last row returned by [mysql_fetch_row](#), [mysql_fetch_assoc](#), [mysql_fetch_array](#), and [mysql_fetch_object](#) in an array, starting at offset 0.

Parameters

result The result resource that is being evaluated. This result comes from a call to [mysql_query](#).

Return Values

An array of lengths on success, or [FALSE](#) on failure.

Examples

Example 24.35. A [mysql_fetch_lengths](#) example

```

<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
$row      = mysql_fetch_assoc($result);
$lengths = mysql_fetch_lengths($result);

print_r($row);
print_r($lengths);

```

```
?>
```

The above example will output something similar to:

```
Array
(
    [id] => 42
    [email] => user@example.com
)
Array
(
    [0] => 2
    [1] => 16
)
```

See Also

[mysql_field_len](#)
[mysql_fetch_row](#)
[strlen](#)

24.8.1.4.18. [mysql_fetch_object](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_fetch_object](#)

Fetch a result row as an object

Description

```
object mysql_fetch_object(resource result,
                          string class_name,
                          array params);
```

Returns an object with properties that correspond to the fetched row and moves the internal data pointer ahead.

Parameters

- result* The result resource that is being evaluated. This result comes from a call to [mysql_query](#).
- class_name* The name of the class to instantiate, set the properties of and return. If not specified, a [stdClass](#) object is returned.
- params* An optional array of parameters to pass to the constructor for *class_name* objects.

Return Values

Returns an object with string properties that correspond to the fetched row, or [FALSE](#) if there are no more rows.

[mysql_fetch_row](#) fetches one row of data from the result associated with the specified result identifier. The row is returned as an array. Each result column is stored in an array offset, starting at offset 0.

ChangeLog

Version	Description
5.0.0	Added the ability to return as a different object.

Examples

Example 24.36. `mysql_fetch_object` example

```
<?php
mysql_connect("hostname", "user", "password");
mysql_select_db("mydb");
$result = mysql_query("select * from mytable");
while ($row = mysql_fetch_object($result)) {
    echo $row->user_id;
    echo $row->fullname;
}
mysql_free_result($result);
?>
```

Example 24.37. `mysql_fetch_object` example

```
<?php
class foo {
    public $name;
}

mysql_connect("hostname", "user", "password");
mysql_select_db("mydb");

$result = mysql_query("select name from mytable limit 1");
$obj = mysql_fetch_object($result, 'foo');
var_dump($obj);
?>
```

Notes

Performance

Speed-wise, the function is identical to `mysql_fetch_array`, and almost as quick as `mysql_fetch_row` (the difference is insignificant).

Note

`mysql_fetch_object` is similar to `mysql_fetch_array`, with one difference - an object is returned, instead of an array. Indirectly, that means that you can only access the data by the field names, and not by their offsets (numbers are illegal property names).

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets NULL fields to the PHP `NULL` value.

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_fetch_row](#)

Get a result row as an enumerated array

Description

```
array mysql_fetch_row(resource result);
```

Returns a numerical array that corresponds to the fetched row and moves the internal data pointer ahead.

Parameters

result The result resource that is being evaluated. This result comes from a call to [mysql_query](#).

Return Values

Returns an numerical array of strings that corresponds to the fetched row, or `FALSE` if there are no more rows.

[mysql_fetch_row](#) fetches one row of data from the result associated with the specified result identifier. The row is returned as an array. Each result column is stored in an array offset, starting at offset 0.

Examples

Example 24.38. Fetching one row with [mysql_fetch_row](#)

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
$row = mysql_fetch_row($result);

echo $row[0]; // 42
echo $row[1]; // the email value
?>
```

Notes

Note

This function sets NULL fields to the PHP `NULL` value.

[mysql_result](#)

24.8.1.4.20. [mysql_field_flags](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_field_flags](#)

Get the flags associated with the specified field in a result

Description

```
string mysql_field_flags(resource result,
                        int field_offset);
```

`mysql_field_flags` returns the field flags of the specified field. The flags are reported as a single word per flag separated by a single space, so that you can split the returned value using `explode`.

Parameters

`result` The result resource that is being evaluated. This result comes from a call to `mysql_query`.

`field_offset` The numerical field offset. The `field_offset` starts at 0. If `field_offset` does not exist, an error of level `E_WARNING` is also issued.

Return Values

Returns a string of flags associated with the result, or `FALSE` on failure.

The following flags are reported, if your version of MySQL is current enough to support them: `"not_null"`, `"primary_key"`, `"unique_key"`, `"multiple_key"`, `"blob"`, `"unsigned"`, `"zerofill"`, `"binary"`, `"enum"`, `"auto_increment"` and `"timestamp"`.

Examples

Example 24.39. A `mysql_field_flags` example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
$flags = mysql_field_flags($result, 0);

echo $flags;
print_r(explode(' ', $flags));
?>
```

The above example will output something similar to:

```
not_null primary_key auto_increment
Array
(
    [0] => not_null
    [1] => primary_key
    [2] => auto_increment
)
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_fieldflags`

See Also

`mysql_field_type`
`mysql_field_len`

24.8.1.4.21. `mysql_field_len`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_field_len`

Returns the length of the specified field

Description

```
int mysql_field_len(resource result,
                    int field_offset);
```

`mysql_field_len` returns the length of the specified field.

Parameters

<code>result</code>	The result resource that is being evaluated. This result comes from a call to <code>mysql_query</code> .
<code>field_offset</code>	The numerical field offset. The <code>field_offset</code> starts at 0. If <code>field_offset</code> does not exist, an error of level <code>E_WARNING</code> is also issued.

Return Values

The length of the specified field index on success, or `FALSE` on failure.

Examples

Example 24.40. `mysql_field_len` example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}

// Will get the length of the id field as specified in the database
// schema.
$length = mysql_field_len($result, 0);
echo $length;
?>
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_fieldlen`

See Also

`mysql_fetch_lengths`
`strlen`

24.8.1.4.22. `mysql_field_name`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_field_name`

Get the name of the specified field in a result

Description

```
string mysql_field_name(resource result,
                       int field_offset);
```

`mysql_field_name` returns the name of the specified field index.

Parameters

`result` The result resource that is being evaluated. This result comes from a call to `mysql_query`.

`field_offset` The numerical field offset. The `field_offset` starts at 0. If `field_offset` does not exist, an error of level `E_WARNING` is also issued.

Return Values

The name of the specified field index on success, or `FALSE` on failure.

Examples

Example 24.41. `mysql_field_name` example

```
<?php
/* The users table consists of three fields:
 * user_id
 * username
 * password.
 */
$link = @mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect to MySQL server: ' . mysql_error());
}
$dbname = 'mydb';
$db_selected = mysql_select_db($dbname, $link);
if (!$db_selected) {
    die("Could not set $dbname: " . mysql_error());
}
$res = mysql_query('select * from users', $link);

echo mysql_field_name($res, 0) . "\n";
echo mysql_field_name($res, 2);
?>
```

The above example will output:

```
user_id
password
```

Notes

Note

Field names returned by this function are *case-sensitive*.

Note

For backward compatibility, the following deprecated alias may be used: `mysql_fieldname`

See Also

`mysql_field_type`
`mysql_field_len`

24.8.1.4.23. `mysql_field_seek`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_field_seek`

Set result pointer to a specified field offset

Description

```
bool mysql_field_seek(resource result,  
                      int field_offset);
```

Seeks to the specified field offset. If the next call to `mysql_fetch_field` doesn't include a field offset, the field offset specified in `mysql_field_seek` will be returned.

Parameters

<code>result</code>	The result resource that is being evaluated. This result comes from a call to <code>mysql_query</code> .
<code>field_offset</code>	The numerical field offset. The <code>field_offset</code> starts at 0. If <code>field_offset</code> does not exist, an error of level <code>E_WARNING</code> is also issued.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

See Also

`mysql_fetch_field`

24.8.1.4.24. `mysql_field_table`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_field_table`

Get name of the table the specified field is in

Description

```
string mysql_field_table(resource result,  
                        int field_offset);
```

Returns the name of the table that the specified field is in.

Parameters

<code>result</code>	The result resource that is being evaluated. This result comes from a call to <code>mysql_query</code> .
<code>field_offset</code>	The numerical field offset. The <code>field_offset</code> starts at 0. If <code>field_offset</code> does not exist, an error of level <code>E_WARNING</code> is also issued.

Return Values

The name of the table on success.

Examples

Example 24.42. A `mysql_field_table` example

```

<?php
$query = "SELECT account.*, country.* FROM account, country WHERE country.name = 'Portugal' AND account.country_id = c
// get the result from the DB
$result = mysql_query($query);
// Lists the table name and then the field name
for ($i = 0; $i < mysql_num_fields($result); ++$i) {
    $table = mysql_field_table($result, $i);
    $field = mysql_field_name($result, $i);
    echo "$table: $field\n";
}
?>

```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_fieldtable`

See Also

[mysql_list_tables](#)

24.8.1.4.25. [mysql_field_type](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_field_type](#)

Get the type of the specified field in a result

Description

```

string mysql_field_type(resource result,
                        int field_offset);

```

`mysql_field_type` is similar to the `mysql_field_name` function. The arguments are identical, but the field type is returned instead.

Parameters

<code>result</code>	The result resource that is being evaluated. This result comes from a call to <code>mysql_query</code> .
<code>field_offset</code>	The numerical field offset. The <code>field_offset</code> starts at 0. If <code>field_offset</code> does not exist, an error of level <code>E_WARNING</code> is also issued.

Return Values

The returned field type will be one of "int", "real", "string", "blob", and others as detailed in the [MySQL documentation](#).

Examples

Example 24.43. [mysql_field_type](#) example

```

<?php
mysql_connect("localhost", "mysql_username", "mysql_password");
mysql_select_db("mysql");
$result = mysql_query("SELECT * FROM func");
$fields = mysql_num_fields($result);

```

```

$rows = mysql_num_rows($result);
$table = mysql_field_table($result, 0);
echo "Your '$table' table has $fields fields and $rows record(s)\n";
echo "The table has the following fields:\n";
for ($i=0; $i < $fields; $i++) {
    $type = mysql_field_type($result, $i);
    $name = mysql_field_name($result, $i);
    $len = mysql_field_len($result, $i);
    $flags = mysql_field_flags($result, $i);
    echo $type . " " . $name . " " . $len . " " . $flags . "\n";
}
mysql_free_result($result);
mysql_close();
?>

```

The above example will output something similar to:

```

Your 'func' table has 4 fields and 1 record(s)
The table has the following fields:
string name 64 not_null primary_key binary
int ret 1 not_null
string dl 128 not_null
string type 9 not_null enum

```

Notes

Note

For backward compatibility, the following deprecated alias may be used: [mysql_fieldtype](#)

See Also

[mysql_field_name](#)
[mysql_field_len](#)

24.8.1.4.26. [mysql_free_result](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_free_result](#)

Free result memory

Description

```
bool mysql_free_result(resource result);
```

[mysql_free_result](#) will free all memory associated with the result identifier *result*.

[mysql_free_result](#) only needs to be called if you are concerned about how much memory is being used for queries that return large result sets. All associated result memory is automatically freed at the end of the script's execution.

Parameters

result The result resource that is being evaluated. This result comes from a call to [mysql_query](#).

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

If a non-resource is used for the *result*, an error of level [E_WARNING](#) will be emitted. It's worth noting that [mysql_query](#) only returns a resource for SELECT, SHOW, EXPLAIN, and DESCRIBE queries.

Examples

Example 24.44. A `mysql_free_result` example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
/* Use the result, assuming we're done with it afterwards */
$row = mysql_fetch_assoc($result);

/* Now we free up the result and continue on with our script */
mysql_free_result($result);

echo $row['id'];
echo $row['email'];
?>
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_freeresult`

24.8.1.4.27. `mysql_get_client_info`

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_get_client_info](#)

Get MySQL client info

Description

```
string mysql_get_client_info();
```

`mysql_get_client_info` returns a string that represents the client library version.

Return Values

The MySQL client version.

Examples

Example 24.45. `mysql_get_client_info` example

```
<?php
printf("MySQL client info: %s\n", mysql_get_client_info());
?>
```

The above example will output something similar to:

```
MySQL client info: 3.23.39
```

[mysql_get_server_info](#)

24.8.1.4.28. [mysql_get_host_info](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_get_host_info](#)

Get MySQL host info

Description

```
string mysql_get_host_info(resource link_identifier);
```

Describes the type of connection in use for the connection, including the server host name.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by [mysql_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql_connect](#) was called with no arguments. If by chance no connection is found or established, an [E_WARNING](#) level error is generated.

Return Values

Returns a string describing the type of MySQL connection in use for the connection or [FALSE](#) on failure.

Examples

Example 24.46. [mysql_get_host_info](#) example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
printf("MySQL host info: %s\n", mysql_get_host_info());
?>
```

The above example will output something similar to:

```
MySQL host info: Localhost via UNIX socket
```

See Also

```

mysql_get_proto_info  
mysql_get_server_info
```

24.8.1.4.29. `mysql_get_proto_info`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_get_proto_info`

Get MySQL protocol info

Description

```
int mysql_get_proto_info(resource link_identifier);
```

Retrieves the MySQL protocol.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns the MySQL protocol on success, or `FALSE` on failure.

Examples

Example 24.47. `mysql_get_proto_info` example

```
<?php  
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');  
if (!$link) {  
    die('Could not connect: ' . mysql_error());  
}  
printf("MySQL protocol version: %s\n", mysql_get_proto_info());  
?>
```

The above example will output something similar to:

```
MySQL protocol version: 10
```

See Also

```
mysql_get_client_info  
mysql_get_host_info  
mysql_get_server_info
```

24.8.1.4.30. `mysql_get_server_info`

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_get_server_info](#)

Get MySQL server info

Description

```
string mysql_get_server_info(resource link_identifier);
```

Retrieves the MySQL server version.

Parameters

link_identifier The MySQL connection. If the link identifier is not specified, the last link opened by [mysql_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql_connect](#) was called with no arguments. If by chance no connection is found or established, an [E_WARNING](#) level error is generated.

Return Values

Returns the MySQL server version on success, or [FALSE](#) on failure.

Examples

Example 24.48. [mysql_get_server_info](#) example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
printf("MySQL server version: %s\n", mysql_get_server_info());
?>
```

The above example will output something similar to:

```
MySQL server version: 4.0.1-alpha
```

See Also

[mysql_get_client_info](#)
[mysql_get_host_info](#)
[mysql_get_proto_info](#)
[phpversion](#)

24.8.1.4.31. [mysql_info](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_info](#)

Get information about the most recent query

Description

```
string mysql_info(resource link_identifier);
```

Returns detailed information about the last query.

Parameters

link_identifier The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns information about the statement on success, or `FALSE` on failure. See the example below for which statements provide information, and what the returned value may look like. Statements that are not listed will return `FALSE`.

Examples

Example 24.49. Relevant MySQL Statements

Statements that return string values. The numbers are only for illustrating purpose; their values will correspond to the query.

```
INSERT INTO ... SELECT ...
String format: Records: 23 Duplicates: 0 Warnings: 0
INSERT INTO ... VALUES (...),(...),(...)...
String format: Records: 37 Duplicates: 0 Warnings: 0
LOAD DATA INFILE ...
String format: Records: 42 Deleted: 0 Skipped: 0 Warnings: 0
ALTER TABLE
String format: Records: 60 Duplicates: 0 Warnings: 0
UPDATE
String format: Rows matched: 65 Changed: 65 Warnings: 0
```

Notes

Note

`mysql_info` returns a non-`FALSE` value for the `INSERT ... VALUES` statement only if multiple value lists are specified in the statement.

See Also

`mysql_affected_rows`
`mysql_insert_id`
`mysql_stat`

24.8.1.4.32. `mysql_insert_id`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_insert_id`

Get the ID generated from the previous INSERT operation

Description

```
int mysql_insert_id(resource link_identifier);
```

Retrieves the ID generated for an `AUTO_INCREMENT` column by the previous `INSERT` query.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

The ID generated for an `AUTO_INCREMENT` column by the previous `INSERT` query on success, `0` if the previous query does not generate an `AUTO_INCREMENT` value, or `FALSE` if no MySQL connection was established.

Examples**Example 24.50. `mysql_insert_id` example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
mysql_select_db('mydb');

mysql_query("INSERT INTO mytable (product) values ('kossu')");
printf("Last inserted record has id %d\n", mysql_insert_id());
?>
```

Notes**Caution**

`mysql_insert_id` converts the return type of the native MySQL C API function `mysql_insert_id()` to a type of `long` (named `int` in PHP). If your `AUTO_INCREMENT` column has a column type of `BIGINT`, the value returned by `mysql_insert_id` will be incorrect. Instead, use the internal MySQL SQL function `LAST_INSERT_ID()` in an SQL query.

Note

Because `mysql_insert_id` acts on the last performed query, be sure to call `mysql_insert_id` immediately after the query that generates the value.

Note

The value of the MySQL SQL function `LAST_INSERT_ID()` always contains the most recently generated `AUTO_INCREMENT` value, and is not reset between queries.

See Also

`mysql_query`
`mysql_info`

24.8.1.4.33. `mysql_list_dbs`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_list_dbs`

List databases available on a MySQL server

Description

```
resource mysql_list_dbs(resource link_identifier);
```

Returns a result pointer containing the databases available from the current `mysql` daemon.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns a result pointer resource on success, or `FALSE` on failure. Use the `mysql_tablename` function to traverse this result pointer, or any function for result tables, such as `mysql_fetch_array`.

Examples

Example 24.51. `mysql_list_dbs` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$db_list = mysql_list_dbs($link);

while ($row = mysql_fetch_object($db_list)) {
    echo $row->Database . "\n";
}
?>
```

The above example will output something similar to:

```
database1
database2
database3
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_listdbs`

See Also

`mysql_db_name`
`mysql_select_db`

24.8.1.4.34. `mysql_list_fields`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_list_fields`

List MySQL table fields

Description

```
resource mysql_list_fields(string database_name,
                          string table_name,
                          resource link_identifier);
```

Retrieves information about the given table name.

This function is deprecated. It is preferable to use `mysql_query` to issue a SQL `SHOW COLUMNS FROM table [LIKE 'name']` statement instead.

Parameters

<code>database_name</code>	The name of the database that's being queried.
<code>table_name</code>	The name of the table that's being queried.
<code>link_identifier</code>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If by chance no connection is found or established, an <code>E_WARNING</code> level error is generated.

Return Values

A result pointer resource on success, or `FALSE` on failure.

The returned result can be used with `mysql_field_flags`, `mysql_field_len`, `mysql_field_name` and `mysql_field_type`.

Examples

Example 24.52. Alternate to deprecated `mysql_list_fields`

```
<?php
$result = mysql_query("SHOW COLUMNS FROM sometable");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}
if (mysql_num_rows($result) > 0) {
    while ($row = mysql_fetch_assoc($result)) {
        print_r($row);
    }
}
?>
```

The above example will output something similar to:

```
Array
(
    [Field] => id
    [Type] => int(7)
    [Null] =>
    [Key] => PRI
    [Default] =>
    [Extra] => auto_increment
)
Array
(
    [Field] => email
    [Type] => varchar(100)
    [Null] =>
    [Key] =>
    [Default] =>
    [Extra] =>
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_listfields`

24.8.1.4.35. mysql_list_processes

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_list_processes](#)
List MySQL processes

Description

```
resource mysql_list_processes(resource link_identifier);
```

Retrieves the current MySQL server threads.

Parameters

link_identifier The MySQL connection. If the link identifier is not specified, the last link opened by [mysql_connect](#) is assumed. If no such link is found, it will try to create one as if [mysql_connect](#) was called with no arguments. If by chance no connection is found or established, an [E_WARNING](#) level error is generated.

Return Values

A result pointer resource on success, or [FALSE](#) on failure.

Examples**Example 24.53. mysql_list_processes example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$result = mysql_list_processes($link);
while ($row = mysql_fetch_assoc($result)){
    printf("%s %s %s %s %s\n", $row["Id"], $row["Host"], $row["db"],
        $row["Command"], $row["Time"]);
}
mysql_free_result($result);
?>
```

The above example will output something similar to:

```
1 localhost test Processlist 0
4 localhost mysql sleep 5
```

[mysql_stat](#)

24.8.1.4.36. mysql_list_tables

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_list_tables`

List tables in a MySQL database

Description

```
resource mysql_list_tables(string database,
                          resource link_identifier);
```

Retrieves a list of table names from a MySQL database.

This function is deprecated. It is preferable to use `mysql_query` to issue a SQL `SHOW TABLES [FROM db_name] [LIKE 'pattern']` statement instead.

Parameters

database

The name of the database

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

A result pointer resource on success, or `FALSE` on failure.

Use the `mysql_tablename` function to traverse this result pointer, or any function for result tables, such as `mysql_fetch_array`.

ChangeLog

Version	Description
4.3.7	This function became deprecated.

Examples

Example 24.54. `mysql_list_tables` alternative example

```
<?php
$dbname = 'mysql_dbname';

if (!mysql_connect('mysql_host', 'mysql_user', 'mysql_password')) {
    echo 'Could not connect to mysql';
    exit;
}

$sql = "SHOW TABLES FROM $dbname";
$result = mysql_query($sql);

if (!$result) {
    echo "DB Error, could not list tables\n";
    echo 'MySQL Error: ' . mysql_error();
    exit;
}

while ($row = mysql_fetch_row($result)) {
    echo "Table: {$row[0]}\n";
}

mysql_free_result($result);
?>
```

24.8.1.4.37. `mysql_num_fields`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_num_fields`
Get number of fields in result

Description

```
int mysql_num_fields(resource result);
```

Retrieves the number of fields from a query.

Parameters

result The result resource that is being evaluated. This result comes from a call to `mysql_query`.

Return Values

Returns the number of fields in the result set resource on success, or `FALSE` on failure.

Examples

Example 24.55. A `mysql_num_fields` example

```
<?php
$result = mysql_query("SELECT id,email FROM people WHERE id = '42'");
if (!$result) {
    echo 'Could not run query: ' . mysql_error();
    exit;
}

/* returns 2 because id,email === two fields */
echo mysql_num_fields($result);
?>
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_numfields`

See Also

`mysql_select_db`
`mysql_query`
`mysql_fetch_field`
`mysql_num_rows`

24.8.1.4.38. `mysql_num_rows`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_num_rows`

Get number of rows in result

Description

```
int mysql_num_rows(resource result);
```

Retrieves the number of rows from a result set. This command is only valid for statements like `SELECT` or `SHOW` that return an actual result set. To retrieve the number of rows affected by a `INSERT`, `UPDATE`, `REPLACE` or `DELETE` query, use `mysql_affected_rows`.

Parameters

result The result resource that is being evaluated. This result comes from a call to `mysql_query`.

Return Values

The number of rows in a result set on success, or `FALSE` on failure.

Examples

Example 24.56. `mysql_num_rows` example

```
<?php
$link = mysql_connect("localhost", "mysql_user", "mysql_password");
mysql_select_db("database", $link);

$result = mysql_query("SELECT * FROM table1", $link);
$num_rows = mysql_num_rows($result);

echo "$num_rows Rows\n";

?>
```

Notes

Note

If you use `mysql_unbuffered_query`, `mysql_num_rows` will not return the correct value until all the rows in the result set have been retrieved.

Note

For backward compatibility, the following deprecated alias may be used: `mysql_numrows`

`mysql_query`

24.8.1.4.39. `mysql_pconnect`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_pconnect`

Open a persistent connection to a MySQL server

Description

```
resource mysql_pconnect(string server,
                       string username,
                       string password,
                       int client_flags);
```

Establishes a persistent connection to a MySQL server.

`mysql_pconnect` acts very much like `mysql_connect` with two major differences.

First, when connecting, the function would first try to find a (persistent) link that's already open with the same host, username and password. If one is found, an identifier for it will be returned instead of opening a new connection.

Second, the connection to the SQL server will not be closed when the execution of the script ends. Instead, the link will remain open for future use (`mysql_close` will not close links established by `mysql_pconnect`).

This type of link is therefore called 'persistent'.

Parameters

<code>server</code>	The MySQL server. It can also include a port number. e.g. "hostname:port" or a path to a local socket e.g. ":/path/to/socket" for the localhost. If the PHP directive <code>mysql.default_host</code> is undefined (default), then the default value is 'localhost:3306'
<code>username</code>	The username. Default value is the name of the user that owns the server process.
<code>password</code>	The password. Default value is an empty password.
<code>client_flags</code>	The <code>client_flags</code> parameter can be a combination of the following constants: 128 (enable <code>LOAD DATA LOCAL</code> handling), <code>MYSQL_CLIENT_SSL</code> , <code>MYSQL_CLIENT_COMPRESS</code> , <code>MYSQL_CLIENT_IGNORE_SPACE</code> or <code>MYSQL_CLIENT_INTERACTIVE</code> .

Return Values

Returns a MySQL persistent link identifier on success, or `FALSE` on failure.

ChangeLog

Version	Description
4.3.0	Added the <code>client_flags</code> parameter.
3.0.10	Added support for ":/path/to/socket" with <code>server</code> .
3.0.0	Added support for ":port" with <code>server</code> .

Notes

Note

Note, that these kind of links only work if you are using a module version of PHP. See the [Persistent Database Connections](#) section for more information.

Warning

Using persistent connections can require a bit of tuning of your Apache and MySQL configurations to ensure that you

do not exceed the number of connections allowed by MySQL.

Note

You can suppress the error message on failure by prepending a `@` to the function name.

See Also

[mysql_connect](#)
Persistent Database Connections

24.8.1.4.40. `mysql_ping`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_ping`

Ping a server connection or reconnect if there is no connection

Description

```
bool mysql_ping(resource link_identifier);
```

Checks whether or not the connection to the server is working. If it has gone down, an automatic reconnection is attempted. This function can be used by scripts that remain idle for a long while, to check whether or not the server has closed the connection and reconnect if necessary.

Note

Since MySQL 5.0.13, automatic reconnection feature is disabled.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns `TRUE` if the connection to the server MySQL server is working, otherwise `FALSE`.

Examples

Example 24.57. A `mysql_ping` example

```
<?php
set_time_limit(0);

$conn = mysql_connect('localhost', 'mysqluser', 'mypass');
$db = mysql_select_db('mydb');

/* Assuming this query will take a long time */
$result = mysql_query($sql);
if (!$result) {
    echo 'Query #1 failed, exiting.';
    exit;
}

/* Make sure the connection is still alive, if not, try to reconnect */
if (!mysql_ping($conn)) {
    echo 'Lost connection, exiting after query #1';
    exit;
}
mysql_free_result($result);

/* So the connection is still alive, let's run another query */
$result2 = mysql_query($sql2);
```

```
?>
```

See Also

[mysql_thread_id](#)

24.8.1.4.41. mysql_query

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_query](#)
Send a MySQL query

Description

```
resource mysql_query(string query,  
                    resource link_identifier);
```

[mysql_query](#) sends an unique query (multiple queries are not supported) to the currently active database on the server that's associated with the specified [link_identifier](#).

Parameters

query	A SQL query The query string should not end with a semicolon.
link_identifier	The MySQL connection. If the link identifier is not specified, the last link opened by mysql_connect is assumed. If no such link is found, it will try to create one as if mysql_connect was called with no arguments. If by chance no connection is found or established, an E_WARNING level error is generated.

Return Values

For SELECT, SHOW, DESCRIBE, EXPLAIN and other statements returning resultset, [mysql_query](#) returns a resource on success, or [FALSE](#) on error.

For other type of SQL statements, INSERT, UPDATE, DELETE, DROP, etc, [mysql_query](#) returns [TRUE](#) on success or [FALSE](#) on error.

The returned result resource should be passed to [mysql_fetch_array](#), and other functions for dealing with result tables, to access the returned data.

Use [mysql_num_rows](#) to find out how many rows were returned for a SELECT statement or [mysql_affected_rows](#) to find out how many rows were affected by a DELETE, INSERT, REPLACE, or UPDATE statement.

[mysql_query](#) will also fail and return [FALSE](#) if the user does not have permission to access the table(s) referenced by the query.

Examples**Example 24.58. Invalid Query**

The following query is syntactically invalid, so [mysql_query](#) fails and returns [FALSE](#) .

```
<?php  
$result = mysql_query('SELECT * WHERE 1=1');  
if (!$result) {  
    die('Invalid query: ' . mysql_error());  
}
```

```
?>
```

Example 24.59. Valid Query

The following query is valid, so `mysql_query` returns a resource.

```
<?php
// This could be supplied by a user, for example
$firstname = 'fred';
$lastname = 'fox';

// Formulate Query
// This is the best way to perform a SQL query
// For more examples, see mysql_real_escape_string()
$query = sprintf("SELECT firstname, lastname, address, age FROM friends WHERE firstname='%s' AND lastname='%s'",
    mysql_real_escape_string($firstname),
    mysql_real_escape_string($lastname));

// Perform Query
$result = mysql_query($query);

// Check result
// This shows the actual query sent to MySQL, and the error. Useful for debugging.
if (!$result) {
    $message = 'Invalid query: ' . mysql_error() . "\n";
    $message .= 'Whole query: ' . $query;
    die($message);
}

// Use result
// Attempting to print $result won't allow access to information in the resource
// One of the mysql result functions must be used
// See also mysql_result(), mysql_fetch_array(), mysql_fetch_row(), etc.
while ($row = mysql_fetch_assoc($result)) {
    echo $row['firstname'];
    echo $row['lastname'];
    echo $row['address'];
    echo $row['age'];
}

// Free the resources associated with the result set
// This is done automatically at the end of the script
mysql_free_result($result);
?>
```

```

24.8.1.4.42. `mysql_real_escape_string`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_real_escape_string`

Escapes special characters in a string for use in a SQL statement

Description

```
string mysql_real_escape_string(string unescaped_string,
    resource link_identifier);
```

Escapes special characters in the *unescaped_string*, taking into account the current character set of the connection so that it is

safe to place it in a `mysql_query`. If binary data is to be inserted, this function must be used.

`mysql_real_escape_string` calls MySQL's library function `mysql_real_escape_string`, which prepends backslashes to the following characters: `\x00`, `\n`, `\r`, `\`, `'`, `"` and `\x1a`.

This function must always (with few exceptions) be used to make data safe before sending a query to MySQL.

Parameters

<code>unescaped_string</code>	The string that is to be escaped.
<code>link_identifier</code>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If by chance no connection is found or established, an <code>E_WARNING</code> level error is generated.

Return Values

Returns the escaped string, or `FALSE` on error.

Examples

Example 24.60. Simple `mysql_real_escape_string` example

```
<?php
// Connect
$link = mysql_connect('mysql_host', 'mysql_user', 'mysql_password')
      OR die(mysql_error());

// Query
$query = sprintf("SELECT * FROM users WHERE user='%s' AND password='%s'",
                mysql_real_escape_string($user),
                mysql_real_escape_string($password));
?>
```

Example 24.61. An example SQL Injection Attack

```
<?php
// Query database to check if there are any matching users
$query = "SELECT * FROM users WHERE user='{$_POST['username']}' AND password='{$_POST['password']}'";
mysql_query($query);

// We didn't check $_POST['password'], it could be anything the user wanted! For example:
$_POST['username'] = 'aidan';
$_POST['password'] = "' OR ''='";

// This means the query sent to MySQL would be:
echo $query;
?>
```

The query sent to MySQL:

```
SELECT * FROM users WHERE user='aidan' AND password='' OR ''=''
```

This would allow anyone to log in without a valid password.

Example 24.62. A "Best Practice" query

Using `mysql_real_escape_string` around each variable prevents SQL Injection. This example demonstrates the "best practice" method for querying a database, independent of the [Magic Quotes](#) setting.

```
<?php
if (isset($_POST['product_name']) && isset($_POST['product_description']) && isset($_POST['user_id'])) {
    // Connect

    $link = mysql_connect('mysql_host', 'mysql_user', 'mysql_password');

    if(!is_resource($link)) {
        echo "Failed to connect to the server\n";
        // ... log the error properly
    } else {
        // Reverse magic_quotes_gpc/magic_quotes_sybase effects on those vars if ON.

        if(get_magic_quotes_gpc()) {
            $product_name = stripslashes($_POST['product_name']);
            $product_description = stripslashes($_POST['product_description']);
        } else {
            $product_name = $_POST['product_name'];
            $product_description = $_POST['product_description'];
        }

        // Make a safe query
        $query = sprintf("INSERT INTO products (`name`, `description`, `user_id`) VALUES ('%s', '%s', %d)",
            mysql_real_escape_string($product_name, $link),
            mysql_real_escape_string($product_description, $link),
            $_POST['user_id']);

        mysql_query($query, $link);

        if (mysql_affected_rows($link) > 0) {
            echo "Product inserted\n";
        }
    } else {
        echo "Fill the form properly\n";
    }
}
?>
```

The query will now execute correctly, and SQL Injection attacks will not work.

Notes**Note**

A MySQL connection is required before using `mysql_real_escape_string` otherwise an error of level `E_WARNING` is generated, and `FALSE` is returned. If `link_identifier` isn't defined, the last MySQL connection is used.

Note

If `magic_quotes_gpc` is enabled, first apply `stripslashes` to the data. Using this function on data which has already been escaped will escape the data twice.

Note

If this function is not used to escape data, the query is vulnerable to [SQL Injection Attacks](#).

Note

`mysql_real_escape_string` does not escape `%` and `_`. These are wildcards in MySQL if combined with `LIKE`, `GRANT`, or `REVOKE`.

 The [magic_quotes_runtime](#) directive

24.8.1.4.43. `mysql_result`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_result`

Get result data

Description

```
string mysql_result(resource result,
                   int row,
                   mixed field);
```

Retrieves the contents of one cell from a MySQL result set.

When working on large result sets, you should consider using one of the functions that fetch an entire row (specified below). As these functions return the contents of multiple cells in one function call, they're MUCH quicker than `mysql_result`. Also, note that specifying a numeric offset for the field argument is much quicker than specifying a fieldname or `tablename.fieldname` argument.

Parameters

<code>result</code>	The result resource that is being evaluated. This result comes from a call to mysql_query .
<code>row</code>	The row number from the result that's being retrieved. Row numbers start at 0.
<code>field</code>	The name or offset of the field being retrieved. It can be the field's offset, the field's name, or the field's table dot field name (<code>tablename.fieldname</code>). If the column name has been aliased ('select foo as bar from...'), use the alias instead of the column name. If undefined, the first field is retrieved.

Return Values

The contents of one cell from a MySQL result set on success, or `FALSE` on failure.

Examples

Example 24.63. `mysql_result` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Could not connect: ' . mysql_error());
}
$result = mysql_query('SELECT name FROM work.employee');
if (!$result) {
    die('Could not query:' . mysql_error());
}
echo mysql_result($result, 2); // outputs third employee's name

mysql_close($link);
?>
```

Notes

Note

Calls to `mysql_result` should not be mixed with calls to other functions that deal with the result set.

See Also

```
mysql_fetch_row
mysql_fetch_array
mysql_fetch_assoc
mysql_fetch_object
```

24.8.1.4.44. `mysql_select_db`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_select_db`

Select a MySQL database

Description

```
bool mysql_select_db(string database_name,
                    resource link_identifier);
```

Sets the current active database on the server that's associated with the specified link identifier. Every subsequent call to `mysql_query` will be made on the active database.

Parameters

<i>database_name</i>	The name of the database that is to be selected.
<i>link_identifier</i>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If by chance no connection is found or established, an <code>E_WARNING</code> level error is generated.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 24.64. `mysql_select_db` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
if (!$link) {
    die('Not connected : ' . mysql_error());
}

// make foo the current db
$db_selected = mysql_select_db('foo', $link);
if (!$db_selected) {
    die ('Can\'t use foo : ' . mysql_error());
}
?>
```

Notes

Note

For backward compatibility, the following deprecated alias may be used: `mysql_selectdb`

See Also

[mysql_connect](#)

`mysql_pconnect`
`mysql_query`

24.8.1.4.45. `mysql_set_charset`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_set_charset`

Sets the client character set

Description

```
bool mysql_set_charset(string charset,
                      resource link_identifier);
```

Sets the default character set for the current connection.

Parameters

charset

A valid character set name.

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Notes

Note

This function requires MySQL 5.0.7 or later.

Note

This is the preferred way to change the charset. Using `mysql_query` to execute `SET NAMES ..` is not recommended.

See Also

`mysql_client_encoding`
[List of character sets that MySQL supports](#)

24.8.1.4.46. `mysql_stat`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_stat`

Get current system status

Description

```
string mysql_stat(resource link_identifier);
```

`mysql_stat` returns the current server status.

Parameters

link_identifier

The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

Returns a string with the status for uptime, threads, queries, open tables, flush tables and queries per second. For a complete list of other status variables, you have to use the `SHOW STATUS SQL` command. If *link_identifier* is invalid, `NULL` is returned.

Examples**Example 24.65. `mysql_stat` example**

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$status = explode(' ', mysql_stat($link));
print_r($status);
?>
```

The above example will output something similar to:

```
Array
(
    [0] => Uptime: 5380
    [1] => Threads: 2
    [2] => Questions: 1321299
    [3] => Slow queries: 0
    [4] => Opens: 26
    [5] => Flush tables: 1
    [6] => Open tables: 17
    [7] => Queries per second avg: 245.595
)
```

Example 24.66. Alternative `mysql_stat` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$result = mysql_query('SHOW VARIABLES', $link);
while ($row = mysql_fetch_assoc($result)) {
    echo $row['Variable_name'] . ' = ' . $row['Value'] . "\n";
}
?>
```

The above example will output something similar to:

```
back_log = 50
basedir = /usr/local/
bdb_cache_size = 8388600
bdb_log_buffer_size = 32768
bdb_home = /var/db/mysql/
bdb_max_lock = 10000
bdb_logdir =
bdb_shared_data = OFF
bdb_tmpdir = /var/tmp/
...
```

[mysql_list_processes](#)

24.8.1.4.47. mysql_tablename

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysql_tablename](#)

Get table name of field

Description

```
string mysql_tablename(resource result,
                      int i);
```

Retrieves the table name from a *result*.

This function deprecated. It is preferable to use [mysql_query](#) to issue a SQL `SHOW TABLES [FROM db_name] [LIKE 'pattern']` statement instead.

Parameters

result A result pointer resource that's returned from [mysql_list_tables](#).

i The integer index (row/table number)

Return Values

The name of the table on success, or `FALSE` on failure.

Use the [mysql_tablename](#) function to traverse this result pointer, or any function for result tables, such as [mysql_fetch_array](#).

Examples**Example 24.67. mysql_tablename example**

```
<?php
mysql_connect("localhost", "mysql_user", "mysql_password");
$result = mysql_list_tables("mydb");
$num_rows = mysql_num_rows($result);
for ($i = 0; $i < $num_rows; $i++) {
    echo "Table: ", mysql_tablename($result, $i), "\n";
}

mysql_free_result($result);
?>
```

Notes**Note**

The [mysql_num_rows](#) function may be used to determine the number of tables in the result pointer.

See Also

`mysql_db_name`

24.8.1.4.48. `mysql_thread_id`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_thread_id`

Return the current thread ID

Description

```
int mysql_thread_id(resource link_identifier);
```

Retrieves the current thread ID. If the connection is lost, and a reconnect with `mysql_ping` is executed, the thread ID will change. This means only retrieve the thread ID when needed.

Parameters

link_identifier The MySQL connection. If the link identifier is not specified, the last link opened by `mysql_connect` is assumed. If no such link is found, it will try to create one as if `mysql_connect` was called with no arguments. If by chance no connection is found or established, an `E_WARNING` level error is generated.

Return Values

The thread ID on success, or `FALSE` on failure.

Examples

Example 24.68. `mysql_thread_id` example

```
<?php
$link = mysql_connect('localhost', 'mysql_user', 'mysql_password');
$thread_id = mysql_thread_id($link);
if ($thread_id){
    printf("current thread id is %d\n", $thread_id);
}
?>
```

The above example will output something similar to:

```
current thread id is 73
```

`mysql_ping`
`mysql_list_processes`

24.8.1.4.49. `mysql_unbuffered_query`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysql_unbuffered_query`

Send an SQL query to MySQL, without fetching and buffering the result rows

Description

```
resource mysql_unbuffered_query(string query,
                               resource link_identifier);
```

`mysql_unbuffered_query` sends a SQL query *query* to MySQL, without fetching and buffering the result rows automatically, as `mysql_query` does. On the one hand, this saves a considerable amount of memory with SQL queries that produce large result sets. On the other hand, you can start working on the result set immediately after the first row has been retrieved: you don't have to wait until the complete SQL query has been performed. When using multiple DB-connects, you have to specify the optional parameter *link_identifier*.

Parameters

<i>query</i>	A SQL query
<i>link_identifier</i>	The MySQL connection. If the link identifier is not specified, the last link opened by <code>mysql_connect</code> is assumed. If no such link is found, it will try to create one as if <code>mysql_connect</code> was called with no arguments. If by chance no connection is found or established, an <code>E_WARNING</code> level error is generated.

Return Values

For SELECT, SHOW, DESCRIBE or EXPLAIN statements, `mysql_unbuffered_query` returns a resource on success, or `FALSE` on error.

For other type of SQL statements, UPDATE, DELETE, DROP, etc, `mysql_unbuffered_query` returns `TRUE` on success or `FALSE` on error.

Notes**Note**

The benefits of `mysql_unbuffered_query` come at a cost: You cannot use `mysql_num_rows` and `mysql_data_seek` on a result set returned from `mysql_unbuffered_query`. You also have to fetch all result rows from an unbuffered SQL query, before you can send a new SQL query to MySQL.

24.8.2. MySQL Improved Extension (**Mysqli**)

Copyright (c) 1997-2008 the PHP Documentation Group.

The `mysqli` extension allows you to access the functionality provided by MySQL 4.1 and above. More information about the MySQL Database server can be found at <http://www.mysql.com/>

Documentation for MySQL can be found at <http://dev.mysql.com/doc/>.

Parts of this documentation included from MySQL manual with permissions of MySQL AB.

24.8.2.1. Examples

Copyright (c) 1997-2008 the PHP Documentation Group.

All Examples in the MySQLI documentation use the world database from MySQL AB. The world database can be found at <http://dev.mysql.com/get/Downloads/Manual/world.sql.gz/from/pick>

24.8.2.2. Installing/Configuring

Copyright (c) 1997-2008 the PHP Documentation Group.

24.8.2.2.1. Requirements

Copyright (c) 1997-2008 the PHP Documentation Group.

In order to have these functions available, you must compile PHP with support for the `mysqli` extension.

Note

The `mysqli` extension is designed to work with the version 4.1.3 or above of MySQL. For previous versions, please see the [MySQL](#) extension documentation.

24.8.2.2.2. Installation

Copyright (c) 1997-2008 the PHP Documentation Group.

To install the `mysqli` extension for PHP, use the `--with-mysqli=mysql_config_path/mysql_config` configuration option where `mysql_config_path` represents the location of the `mysql_config` program that comes with MySQL versions greater than 4.1.

If you would like to install the `mysql` extension along with the `mysqli` extension you have to use the same client library to avoid any conflicts.

24.8.2.2.2.1. Installation on Windows Systems

Copyright (c) 1997-2008 the PHP Documentation Group.

MySQLi is not enabled by default, so the `php_mysqli.dll` DLL must be enabled inside of `php.ini`. Also, PHP needs access to the MySQL client library. A file named `libmysql.dll` is included in the Windows PHP distribution and in order for PHP to talk to MySQL this file needs to be available to the Windows systems `PATH`. See the FAQ titled "[How do I add my PHP directory to the PATH on Windows](#)" for information on how to do this. Although copying `libmysql.dll` to the Windows system directory also works (because the system directory is by default in the system's `PATH`), it's not recommended.

As with enabling any PHP extension (such as `php_mysqli.dll`), the PHP directive `extension_dir` should be set to the directory where the PHP extensions are located. See also the [Manual Windows Installation Instructions](#). An example `extension_dir` value for PHP 5 is `c:\php\ext`

Note

If when starting the web server an error similar to the following occurs: "Unable to load dynamic library '.\php_mysqli.dll'", this is because `php_mysqli.dll` and/or `libmysql.dll` cannot be found by the system.

24.8.2.2.3. Runtime Configuration

Copyright (c) 1997-2008 the PHP Documentation Group.

The behaviour of these functions is affected by settings in `php.ini`.

Table 24.6. MySQLi Configuration Options

Name	Default	Changeable	Changelog
<code>mysqli.max_links</code>	"-1"	PHP_INI_SYSTEM	Available since PHP 5.0.0.
<code>mysqli.default_port</code>	"3306"	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.default_socket</code>	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.default_host</code>	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.default_user</code>	NULL	PHP_INI_ALL	Available since PHP 5.0.0.
<code>mysqli.default_pw</code>	NULL	PHP_INI_ALL	Available since PHP 5.0.0.

For further details and definitions of the above `PHP_INI_*` constants, see the chapter on [configuration changes](#).

Here's a short explanation of the configuration directives.

<code>mysqli.max_links</code> integer	The maximum number of MySQL connections per process.
<code>mysqli.default_port</code> string	The default TCP port number to use when connecting to the database server if no other port is specified. If no default is specified, the port will be obtained from the <code>MYSQL_TCP_PORT</code> environment variable, the <code>mysql-tcp</code> entry in <code>/etc/services</code> or the compile-time

		<code>MYSQL_PORT</code> constant, in that order. Win32 will only use the <code>MYSQL_PORT</code> constant.
<code>mysqli.default_socket</code>	string	The default socket name to use when connecting to a local database server if no other socket name is specified.
<code>mysqli.default_host</code>	string	The default server host to use when connecting to the database server if no other host is specified. Doesn't apply in safe mode .
<code>mysqli.default_user</code>	string	The default user name to use when connecting to the database server if no other name is specified. Doesn't apply in safe mode .
<code>mysqli.default_pw</code>	string	The default password to use when connecting to the database server if no other password is specified. Doesn't apply in safe mode .

24.8.2.2.4. Resource Types

Copyright (c) 1997-2008 the PHP Documentation Group.

This extension has no resource types defined.

24.8.2.3. Predefined Constants

Copyright (c) 1997-2008 the PHP Documentation Group.

<code>MYSQLI_READ_DEFAULT_GROUP</code>	Read options from the named group from <code>my.cnf</code> or the file specified with <code>MYSQLI_READ_DEFAULT_FILE</code>
<code>MYSQLI_READ_DEFAULT_FILE</code>	Read options from the named option file instead of from <code>my.cnf</code>
<code>MYSQLI_OPT_CONNECT_TIMEOUT</code>	Connect timeout in seconds
<code>MYSQLI_OPT_LOCAL_INFILE</code>	Enables command <code>LOAD LOCAL INFILE</code>
<code>MYSQLI_INIT_COMMAND</code>	Command to execute when connecting to MySQL server. Will automatically be re-executed when reconnecting.
<code>MYSQLI_CLIENT_SSL</code>	Use SSL (encrypted protocol). This option should not be set by application programs; it is set internally in the MySQL client library
<code>MYSQLI_CLIENT_COMPRESS</code>	Use compression protocol
<code>MYSQLI_CLIENT_INTERACTIVE</code>	Allow <code>interactive_timeout</code> seconds (instead of <code>wait_timeout</code> seconds) of inactivity before closing the connection. The client's session <code>wait_timeout</code> variable will be set to the value of the session <code>interactive_timeout</code> variable.
<code>MYSQLI_CLIENT_IGNORE_SPACE</code>	Allow spaces after function names. Makes all functions names reserved words.
<code>MYSQLI_CLIENT_NO_SCHEMA</code>	Don't allow the <code>db_name.tbl_name.col_name</code> syntax.
<code>MYSQLI_CLIENT_MULTI_QUERIES</code>	Allows multiple semicolon-delimited queries in a single <code>mysqli_query</code> call.
<code>MYSQLI_STORE_RESULT</code>	For using buffered resultsets
<code>MYSQLI_USE_RESULT</code>	For using unbuffered resultsets
<code>MYSQLI_ASSOC</code>	Columns are returned into the array having the fieldname as the array index.
<code>MYSQLI_NUM</code>	Columns are returned into the array having an enumerated index.
<code>MYSQLI_BOTH</code>	Columns are returned into the array having both a numerical index and the fieldname as the associative index.
<code>MYSQLI_NOT_NULL_FLAG</code>	Indicates that a field is defined as <code>NOT NULL</code>
<code>MYSQLI_PRI_KEY_FLAG</code>	Field is part of a primary index
<code>MYSQLI_UNIQUE_KEY_FLAG</code>	Field is part of a unique index.
<code>MYSQLI_MULTIPLE_KEY_FLAG</code>	Field is part of an index.

<code>MYSQLI_BLOB_FLAG</code>	Field is defined as <code>BLOB</code>
<code>MYSQLI_UNSIGNED_FLAG</code>	Field is defined as <code>UNSIGNED</code>
<code>MYSQLI_ZEROFILL_FLAG</code>	Field is defined as <code>ZEROFILL</code>
<code>MYSQLI_AUTO_INCREMENT_FLAG</code>	Field is defined as <code>AUTO_INCREMENT</code>
<code>MYSQLI_TIMESTAMP_FLAG</code>	Field is defined as <code>TIMESTAMP</code>
<code>MYSQLI_SET_FLAG</code>	Field is defined as <code>SET</code>
<code>MYSQLI_NUM_FLAG</code>	Field is defined as <code>NUMERIC</code>
<code>MYSQLI_PART_KEY_FLAG</code>	Field is part of an multi-index
<code>MYSQLI_GROUP_FLAG</code>	Field is part of <code>GROUP BY</code>
<code>MYSQLI_TYPE_DECIMAL</code>	Field is defined as <code>DECIMAL</code>
<code>MYSQLI_TYPE_NEWDECIMAL</code>	Precision math <code>DECIMAL</code> or <code>NUMERIC</code> field (MySQL 5.0.3 and up)
<code>MYSQLI_TYPE_BIT</code>	Field is defined as <code>BIT</code> (MySQL 5.0.3 and up)
<code>MYSQLI_TYPE_TINY</code>	Field is defined as <code>TINYINT</code>
<code>MYSQLI_TYPE_SHORT</code>	Field is defined as <code>INT</code>
<code>MYSQLI_TYPE_LONG</code>	Field is defined as <code>INT</code>
<code>MYSQLI_TYPE_FLOAT</code>	Field is defined as <code>FLOAT</code>
<code>MYSQLI_TYPE_DOUBLE</code>	Field is defined as <code>DOUBLE</code>
<code>MYSQLI_TYPE_NULL</code>	Field is defined as <code>DEFAULT NULL</code>
<code>MYSQLI_TYPE_TIMESTAMP</code>	Field is defined as <code>TIMESTAMP</code>
<code>MYSQLI_TYPE_LONGLONG</code>	Field is defined as <code>BIGINT</code>
<code>MYSQLI_TYPE_INT24</code>	Field is defined as <code>MEDIUMINT</code>
<code>MYSQLI_TYPE_DATE</code>	Field is defined as <code>DATE</code>
<code>MYSQLI_TYPE_TIME</code>	Field is defined as <code>TIME</code>
<code>MYSQLI_TYPE_DATETIME</code>	Field is defined as <code>DATETIME</code>
<code>MYSQLI_TYPE_YEAR</code>	Field is defined as <code>YEAR</code>
<code>MYSQLI_TYPE_NEWDATE</code>	Field is defined as <code>DATE</code>
<code>MYSQLI_TYPE_ENUM</code>	Field is defined as <code>ENUM</code>
<code>MYSQLI_TYPE_SET</code>	Field is defined as <code>SET</code>
<code>MYSQLI_TYPE_TINY_BLOB</code>	Field is defined as <code>TINYBLOB</code>
<code>MYSQLI_TYPE_MEDIUM_BLOB</code>	Field is defined as <code>MEDIUMBLOB</code>
<code>MYSQLI_TYPE_LONG_BLOB</code>	Field is defined as <code>LOB</code>
<code>MYSQLI_TYPE_BLOB</code>	Field is defined as <code>BLOB</code>
<code>MYSQLI_TYPE_VAR_STRING</code>	Field is defined as <code>VARCHAR</code>
<code>MYSQLI_TYPE_STRING</code>	Field is defined as <code>CHAR</code>
<code>MYSQLI_TYPE_GEOMETRY</code>	Field is defined as <code>GEOMETRY</code>
<code>MYSQLI_NEED_DATA</code>	More data available for bind variable

`MYSQLI_NO_DATA`

No more data available for bind variable

`MYSQLI_DATA_TRUNCATED`

Data truncation occurred. Available since PHP 5.1.0 and MySQL 5.0.5.

24.8.2.4. The MySQLi class (`mysqli`)

Copyright (c) 1997-2008 the PHP Documentation Group.

Represents a connection between PHP and a MySQL database.

```
mysqli {
    mysqli

24.8.2.4.1. `mysqli->affected_rows`, `mysqli_affected_rows`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli->affected_rows`

`mysqli_affected_rows`

Gets the number of affected rows in a previous MySQL operation

Description

Object oriented style (property):

```
mysqli {
    int affected_rows ;
}
```

Procedural style:

```
int mysqli_affected_rows(mysqli link);
```

Returns the number of rows affected by the last [INSERT](#), [UPDATE](#), [REPLACE](#) or [DELETE](#) query.

For [SELECT](#) statements `mysqli_affected_rows` works like `mysqli_num_rows`.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an [UPDATE](#) statement, no rows matched the [WHERE](#) clause in the query or that no query has yet been executed. -1 indicates that the query returned an error.

Note

If the number of affected rows is greater than maximal int value, the number of affected rows will be returned as a string.

Examples

Example 24.69. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Insert rows */
$mysqli->query("CREATE TABLE Language SELECT * from CountryLanguage");
printf("Affected rows (INSERT): %d\n", $mysqli->affected_rows);

$mysqli->query("ALTER TABLE Language ADD Status int default 0");

/* update rows */
$mysqli->query("UPDATE Language SET Status=1 WHERE Percentage > 50");
printf("Affected rows (UPDATE): %d\n", $mysqli->affected_rows);

/* delete rows */
$mysqli->query("DELETE FROM Language WHERE Percentage < 50");
printf("Affected rows (DELETE): %d\n", $mysqli->affected_rows);

/* select all rows */
$result = $mysqli->query("SELECT CountryCode FROM Language");
printf("Affected rows (SELECT): %d\n", $mysqli->affected_rows);

$result->close();

/* Delete table Language */
$mysqli->query("DROP TABLE Language");

/* close connection */
$mysqli->close();
?>
```

Example 24.70. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

if (!$link) {
    printf("Can't connect to localhost. Error: %s\n", mysqli_connect_error());
    exit();
}
```

```

/* Insert rows */
mysqli_query($link, "CREATE TABLE Language SELECT * from CountryLanguage");
printf("Affected rows (INSERT): %d\n", mysqli_affected_rows($link));

mysqli_query($link, "ALTER TABLE Language ADD Status int default 0");

/* update rows */
mysqli_query($link, "UPDATE Language SET Status=1 WHERE Percentage > 50");
printf("Affected rows (UPDATE): %d\n", mysqli_affected_rows($link));

/* delete rows */
mysqli_query($link, "DELETE FROM Language WHERE Percentage < 50");
printf("Affected rows (DELETE): %d\n", mysqli_affected_rows($link));

/* select all rows */
$result = mysqli_query($link, "SELECT CountryCode FROM Language");
printf("Affected rows (SELECT): %d\n", mysqli_affected_rows($link));

mysqli_free_result($result);

/* Delete table Language */
mysqli_query($link, "DROP TABLE Language");

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Affected rows (INSERT): 984
Affected rows (UPDATE): 168
Affected rows (DELETE): 815
Affected rows (SELECT): 169

```

[mysqli_num_rows](#)
[mysqli_info](#)

24.8.2.4.2. [mysqli::autocommit](#), [mysqli_autocommit](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli::autocommit](#)
[mysqli_autocommit](#)

Turns on or off auto-committing database modifications

Description

Object oriented style (method)

```
bool mysqli::autocommit(bool mode);
```

Procedural style:

```
bool mysqli_autocommit(mysqli link,
                        bool mode);
```

Turns on or off auto-commit mode on queries for the database connection.

To determine the current state of autocommit use the SQL command `SELECT @@autocommit`.

Parameters

<i>link</i>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<i>mode</i>	Whether to turn on auto-commit or not.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Notes

Note

This function doesn't work with non transactional table types (like MyISAM or ISAM).

Examples

Example 24.71. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* turn autocommit on */
$mysqli->autocommit(TRUE);

if ($result = $mysqli->query("SELECT @@autocommit")) {
    $row = $result->fetch_row();
    printf("Autocommit is %s\n", $row[0]);
    $result->free();
}

/* close connection */
$mysqli->close();
?>
```

Example 24.72. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

if (!$link) {
    printf("Can't connect to localhost. Error: %s\n", mysqli_connect_error());
    exit();
}

/* turn autocommit on */
mysqli_autocommit($link, TRUE);

if ($result = mysqli_query($link, "SELECT @@autocommit")) {
    $row = mysqli_fetch_row($result);
    printf("Autocommit is %s\n", $row[0]);
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Autocommit is 1
```

See Also

`mysqli_commit`
`mysqli_rollback`

24.8.2.4.3. `mysqli::change_user`, `mysqli_change_user`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::change_user`
`mysqli_change_user`

Changes the user of the specified database connection

Description

Object oriented style (method):

```
bool mysqli::change_user(string user,
                        string password,
                        string database);
```

Procedural style:

```
bool mysqli_change_user(mysqli link,
                        string user,
                        string password,
                        string database);
```

Changes the user of the specified database connection and sets the current database.

In order to successfully change users a valid *username* and *password* parameters must be provided and that user must have sufficient permissions to access the desired database. If for any reason authorization fails, the current user authentication will remain.

Parameters

<i>link</i>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<i>user</i>	The MySQL user name.
<i>password</i>	The MySQL password.
<i>database</i>	The database to change to.

If desired, the `NULL` value may be passed resulting in only changing the user and not selecting a database. To select a database in this case use the `mysqli_select_db` function.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Notes**Note**

Using this command will always cause the current database connection to behave as if was a completely new database connection, regardless of if the operation was completed successfully. This reset includes performing a rollback on any active transactions, closing all temporary tables, and unlocking all locked tables.

Examples**Example 24.73. Object oriented style**

```

<?php
/* connect database test */
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Set Variable a */
$mysqli->query("SET @a:=1");

/* reset all and select a new database */
$mysqli->change_user("my_user", "my_password", "world");

if ($result = $mysqli->query("SELECT DATABASE()")) {
    $row = $result->fetch_row();
    printf("Default database: %s\n", $row[0]);
    $result->close();
}

if ($result = $mysqli->query("SELECT @a")) {
    $row = $result->fetch_row();
    if ($row[0] === NULL) {
        printf("Value of variable a is NULL\n");
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>

```

Example 24.74. Procedural style

```

<?php
/* connect database test */
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Set Variable a */
mysqli_query($link, "SET @a:=1");

/* reset all and select a new database */
mysqli_change_user($link, "my_user", "my_password", "world");

if ($result = mysqli_query($link, "SELECT DATABASE()")) {
    $row = mysqli_fetch_row($result);
    printf("Default database: %s\n", $row[0]);
    mysqli_free_result($result);
}

if ($result = mysqli_query($link, "SELECT @a")) {
    $row = mysqli_fetch_row($result);
    if ($row[0] === NULL) {
        printf("Value of variable a is NULL\n");
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Default database: world
Value of variable a is NULL

```

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::character_set_name`
`mysqli_character_set_name`

Returns the default character set for the database connection

Description

Object oriented style (method):

```
string mysqli::character_set_name();
```

Procedural style:

```
string mysqli_character_set_name(mysqli link);
```

Returns the current character set for the database connection.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

The default character set for the current connection

Examples**Example 24.75. Object oriented style**

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Print current character set */
$charset = $mysqli->character_set_name();
printf ("Current character set is %s\n", $charset);

$mysqli->close();
?>
```

Example 24.76. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");
/* check connection */
```

```
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Print current character set */
$charset = mysqli_character_set_name($link);
printf ("Current character set is %s\n", $charset);

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Current character set is latin1_swedish_ci
```

Description

Object oriented style (method)

```
bool mysqli::commit();
```

Procedural style:

```
bool mysqli_commit(mysqli link);
```

Commits the current transaction for the database connection.

Parameters

link

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 24.77. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE Language LIKE CountryLanguage Type=InnoDB");

/* set autocommit to off */
$mysqli->autocommit(FALSE);

/* Insert some values */
$mysqli->query("INSERT INTO Language VALUES ('DEU', 'Bavarian', 'F', 11.2)");
$mysqli->query("INSERT INTO Language VALUES ('DEU', 'Swabian', 'F', 9.4)");

/* commit transaction */
$mysqli->commit();

/* drop table */
$mysqli->query("DROP TABLE Language");

/* close connection */
$mysqli->close();
?>
```

Example 24.78. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

/* check connection */
```

```

if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* set autocommit to off */
mysqli_autocommit($link, FALSE);

mysqli_query($link, "CREATE TABLE Language LIKE CountryLanguage Type=InnoDB");

/* Insert some values */
mysqli_query($link, "INSERT INTO Language VALUES ('DEU', 'Bavarian', 'F', 11.2)");
mysqli_query($link, "INSERT INTO Language VALUES ('DEU', 'Swabian', 'F', 9.4)");

/* commit transaction */
mysqli_commit($link);

/* close connection */
mysqli_close($link);
?>

```

24.8.2.4.7. mysqli->connect_errno, mysqli_connect_errno

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli->connect_errno](#)
[mysqli_connect_errno](#)

Returns the error code from last connect call

Description

```

mysqli {
    string connect_errno ;
}

```

```

int mysqli_connect_errno();

```

Returns the last error code number from the last call to [mysqli_connect](#).

Note

Client error message numbers are listed in the MySQL [errmsg.h](#) header file, server error message numbers are listed in [mysqld_error.h](#). In the MySQL source distribution you can find a complete list of error messages and error numbers in the file [Docs/mysqld_error.txt](#).

Return Values

An error code value for the last call to [mysqli_connect](#), if it failed. zero means no error occurred.

Examples**Example 24.79. mysqli_connect_errno example**

```

<?php
$link = @mysqli_connect("localhost", "nonexisting_user", "");
if (!$link) {
    printf("Can't connect to localhost. Errorcode: %d\n", mysqli_connect_errno());
}

```

```
?>
```

24.8.2.4.8. `mysqli->connect_error`, `mysqli_connect_error`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli->connect_error`
`mysqli_connect_error`

Returns a string description of the last connect error

Description

```
mysqli {  
    string connect_error ;  
}
```

```
string mysqli_connect_error();
```

Returns the last error message string from the last call to `mysqli_connect`.

Return Values

A string that describes the error. An empty string if no error occurred.

Examples

Example 24.80. `mysqli_connect_error` example

```
<?php  
$link = @mysqli_connect("localhost", "nonexisting_user", "");  
if (!$link) {  
    printf("Can't connect to localhost. Error: %s\n", mysqli_connect_error());  
}  
?>
```

```

24.8.2.4.9. `mysqli::__construct`, `mysqli_connect`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::__construct`

`mysqli_connect`

Open a new connection to the MySQL server

Description

Object oriented style (constructor):

```
mysqli::__construct(string host,
                    string username,
                    string passwd,
                    string dbname,
                    int port,
                    string socket);
```

Procedural style

```
mysqli mysqli_connect(string host,
                     string username,
                     string passwd,
                     string dbname,
                     int port,
                     string socket);
```

Opens a connection to the MySQL Server running on.

Parameters

<i>host</i>	Can be either a host name or an IP address. Passing the <code>NULL</code> value or the string "localhost" to this parameter, the local host is assumed. When possible, pipes will be used instead of the TCP/IP protocol.
<i>username</i>	The MySQL user name.
<i>passwd</i>	If not provided or <code>NULL</code> , the MySQL server will attempt to authenticate the user against those user records which have no password only. This allows one username to be used with different permissions (depending on if a password as provided or not).
<i>dbname</i>	If provided will specify the default database to be used when performing queries.
<i>port</i>	Specifies the port number to attempt to connect to the MySQL server.
<i>socket</i>	Specifies the socket or named pipe that should be used.

Note

Specifying the *socket* parameter will not explicitly determine the type of connection to be used when connecting to the MySQL server. How the connection is made to the MySQL database is determined by the *host* parameter.

Return Values

Returns a object which represents the connection to a MySQL Server.

Examples

Example 24.81. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if ($mysqli->connect_error) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

printf("Host information: %s\n", $mysqli->host_info);

/* close connection */
```

```
$mysqli->close();
?>
```

Example 24.82. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

printf("Host information: %s\n", mysqli_get_host_info($link));

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Host information: Localhost via UNIX socket
```

Notes

Note

OO syntax only: If a connection fails an object is still returned. To check if the connection failed then use the [mysqli->connect_error](#) property like in the examples above.

Note

Error "Can't create TCP/IP socket (10106)" usually means that the [variables_order](#) configure directive doesn't contain character **E**. On Windows, if the environment is not copied the [SYSTEMROOT](#) environment variable won't be available and PHP will have problems loading Winsock.

24.8.2.4.10. [mysqli::debug](#), [mysqli_debug](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli::debug](#)
[mysqli_debug](#)
Performs debugging operations

Description

Object oriented style (method):

```
bool mysqli::debug(string message);
```

Procedural style:

```
bool mysqli_debug(string message);
```

Performs debugging operations using the Fred Fish debugging library.

Parameters

message A string representing the debugging operation to perform

Return Values

Returns `TRUE`.

Notes

Note

To use the `mysqli_debug` function you must compile the MySQL client library to support debugging.

Examples

Example 24.83. Generating a Trace File

```
<?php
/* Create a trace file in '/tmp/client.trace' on the local (client) machine: */
mysqli_debug("d:t:0,/tmp/client.trace");
?>
```

See Also

`mysqli_dump_debug_info`
`mysqli_report`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::dump_debug_info`
`mysqli_dump_debug_info`
Dump debugging information into the log

Description

Object oriented style (method):

```
bool mysqli::dump_debug_info();
```

Procedural style:

```
bool mysqli_dump_debug_info(mysqli link);
```

This function is designed to be executed by a user with the SUPER privilege and is used to dump debugging information into the log for the MySQL Server relating to the connection.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

See Also

[mysqli_debug](#)

24.8.2.4.12. [mysqli->errno](#), [mysqli_errno](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli->errno](#)

[mysqli_errno](#)

Returns the error code for the most recent function call

Description

Object oriented style (property):

```
mysqli {
    int errno ;
}
```

Procedural style:

```
int mysqli_errno(mysqli link);
```

Returns the last error code for the most recent MySQLi function call that can succeed or fail.

Client error message numbers are listed in the MySQL [errmsg.h](#) header file, server error message numbers are listed in [mysqld_error.h](#). In the MySQL source distribution you can find a complete list of error messages and error numbers in the file [Docs/mysqld_error.txt](#).

Parameters

[link](#) Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

An error code value for the last call, if it failed. zero means no error occurred.

Examples**Example 24.84. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if (!$mysqli->query("SET a=1")) {
    printf("Errorcode: %d\n", $mysqli->errno);
}

/* close connection */
$mysqli->close();
?>
```

Example 24.85. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if (!mysqli_query($link, "SET a=1")) {
    printf("Errorcode: %d\n", mysqli_errno($link));
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Errorcode: 1193
```

24.8.2.4.13. [mysqli->error](#), [mysqli_error](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli->error](#)
[mysqli_error](#)

Returns a string description of the last error

Description

Object oriented style (property):

```

mysqli {
    string error ;
}

```

Procedural style:

```
string mysqli_error(mysqli link);
```

Returns the last error message for the most recent MySQLi function call that can succeed or fail.

Parameters

link

Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

A string that describes the error. An empty string if no error occurred.

Examples

Example 24.86. Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if (!$link->query("SET a=1")) {
    printf("Errormessage: %s\n", $link->error);
}

/* close connection */
$link->close();
?>
```

Example 24.87. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if (!mysqli_query($link, "SET a=1")) {
    printf("Errormessage: %s\n", mysqli_error($link));
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Errormessage: Unknown system variable 'a'
```

24.8.2.4.14. [mysqli->field_count](#), [mysqli_field_count](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli->field_count](#)
[mysqli_field_count](#)

Returns the number of columns for the most recent query

Description

Object oriented style (property):

```
mysqli_result {
    int field_count ;
}
```

Procedural style:

```
int mysqli_field_count(mysqli link);
```

Returns the number of columns for the most recent query on the connection represented by the *link* parameter. This function can be useful when using the `mysqli_store_result` function to determine if the query should have produced a non-empty result set or not without knowing the nature of the query.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

An integer representing the number of fields in a result set.

Examples

Example 24.88. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

$mysqli->query( "DROP TABLE IF EXISTS friends");
$mysqli->query( "CREATE TABLE friends (id int, name varchar(20))");
$mysqli->query( "INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

$mysqli->real_query("SELECT * FROM friends");

if ($mysqli->field_count) {
    /* this was a select/show or describe query */
    $result = $mysqli->store_result();

    /* process resultset */
    $row = $result->fetch_row();

    /* free resultset */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 24.89. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

mysqli_query($link, "DROP TABLE IF EXISTS friends");
mysqli_query($link, "CREATE TABLE friends (id int, name varchar(20))");
mysqli_query($link, "INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");
```

```

mysqli_real_query($link, "SELECT * FROM friends");
if (mysqli_field_count($link)) {
    /* this was a select/show or describe query */
    $result = mysqli_store_result($link);

    /* process resultset */
    $row = mysqli_fetch_row($result);

    /* free resultset */
    mysqli_free_result($result);
}
/* close connection */
mysqli_close($link);
?>

```

24.8.2.4.15. `mysqli::get_charset`, `mysqli_get_charset`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::get_charset`

`mysqli_get_charset`

Returns a character set object

Description

```
object mysqli::get_charset();
```

```
object mysqli_get_charset(mysqli link);
```

Returns a character set object providing several properties of the current active character set.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

The function returns a character set object with the following properties:

<i>charset</i>	Character set name
<i>collation</i>	Collation name
<i>dir</i>	Directory the charset description was fetched from (?) or "" for builtin character sets
<i>min_length</i>	Minimum character length in bytes
<i>max_length</i>	Maximum character length in bytes
<i>number</i>	Internal character set number
<i>state</i>	Character set status (?)

Examples

Example 24.90. Object oriented style

```

<?php
$db = mysqli_init();

```

```
$db->real_connect("localhost","root","","test");
var_dump($db->get_charset());
?>
```

Example 24.91. Procedural style

```
<?php
$db = mysqli_init();
mysqli_real_connect($db, "localhost", "root", "", "test");
var_dump($db->get_charset());
?>
```

The above example will output:

```
object(stdClass)#2 (7) {
  ["charset"]=>
  string(6) "latin1"
  ["collation"]=>
  string(17) "latin1_swedish_ci"
  ["dir"]=>
  string(0) ""
  ["min_length"]=>
  int(1)
  ["max_length"]=>
  int(1)
  ["number"]=>
  int(8)
  ["state"]=>
  int(801)
}
```

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli::get_client_info](#)
[mysqli_get_client_info](#)

Returns the MySQL client version as a string

Description

```
string mysqli::get_client_info();
```

```
string mysqli_get_client_info();
```

The [mysqli_get_client_info](#) function is used to return a string representing the client version being used in the MySQLi extension.

Return Values

A string that represents the MySQL client library version

Examples

Example 24.92. `mysqli_get_client_info`

```
<?php
/* We don't need a connection to determine
   the version of mysql client library */
printf("Client library version: %s\n", mysqli_get_client_info());
?>
```

- [mysqli::get_client_version](#)
[mysqli_get_client_version](#)
Get MySQL client info

Description

```
int mysqli::get_client_version();
```

```
int mysqli_get_client_version();
```

Returns client version number as an integer.

Return Values

A number that represents the MySQL client library version in format: `main_version*10000 + minor_version *100 + sub_version`. For example, 4.1.0 is returned as 40100.

This is useful to quickly determine the version of the client library to know if some capability exists.

Examples

Example 24.93. `mysqli_get_client_version`

```
<?php
/* We don't need a connection to determine
   the version of mysql client library */
printf("Client library version: %d\n", mysqli_get_client_version());
?>
```

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli->host_info`
`mysqli_get_host_info`

Returns a string representing the type of connection used

Description

Object oriented style (property):

```
mysqli {
    string host_info ;
}
```

Procdural style:

```
string mysqli_get_host_info(mysqli link);
```

The `mysqli_get_host_info` function returns a string describing the connection represented by the *link* parameter is using (including the server host name).

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

A character string representing the server hostname and the connection type.

Examples

Example 24.94. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print host information */
printf("Host info: %s\n", $mysqli->host_info);

/* close connection */
$mysqli->close();
?>
```

Example 24.95. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
```

```

/* print host information */
printf("Host info: %s\n", mysqli_get_host_info($link));

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Host info: Localhost via UNIX socket
```

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli->protocol_version](#)
- [mysqli_get_proto_info](#)

Returns the version of the MySQL protocol used

Description

Object oriented style (property):

```

mysqli {
    string protocol_version ;
}

```

Procedural style:

```
int mysqli_get_proto_info(mysqli link);
```

Returns an integer representing the MySQL protocol version used by the connection represented by the *link* parameter.

Parameters

link Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

Returns an integer representing the protocol version.

Examples

Example 24.96. Object oriented style

```

<?php
$mysqli = new mysqli("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
}

```

```

    exit();
}

/* print protocol version */
printf("Protocol version: %d\n", $mysqli->protocol_version);

/* close connection */
$mysqli->close();
?>

```

Example 24.97. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print protocol version */
printf("Protocol version: %d\n", mysqli_get_proto_info($link));

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Protocol version: 10

```

[mysqli_get_server_info](#)
Returns the version of the MySQL server

Description

Object oriented style (property):

```

mysqli {
    string server_info ;
}

```

Procedural style:

```

string mysqli_get_server_info(mysqli link);

```

Returns a string representing the version of the MySQL server that the MySQLi extension is connected to.

Parameters

[link](#) Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

A character string representing the server version.

Examples

Example 24.98. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print server version */
printf("Server version: %s\n", $mysqli->server_info);

/* close connection */
$mysqli->close();
?>
```

Example 24.99. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print server version */
printf("Server version: %s\n", mysqli_get_server_info($link));

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Server version: 4.1.2-alpha-debug
```

- `mysqli->server_version`
`mysqli_get_server_version`

Returns the version of the MySQL server as an integer

Description

Object oriented style (property):

```
mysqli {
    int server_version ;
}
```

Procedural style:

```
int mysqli_get_server_version(mysqli link);
```

The `mysqli_get_server_version` function returns the version of the server connected to (represented by the *link* parameter) as an integer.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

An integer representing the server version.

The form of this version number is `main_version * 10000 + minor_version * 100 + sub_version` (i.e. version 4.1.0 is 40100).

Examples

Example 24.100. Object oriented style

```
<?php
$link = new mysqli("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print server version */
printf("Server version: %d\n", $mysqli->server_version);

/* close connection */
$link->close();
?>
```

Example 24.101. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* print server version */
printf("Server version: %d\n", mysqli_get_server_version($link));
```

```
/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Server version: 40102
```

mysqli_get_server_info
```

24.8.2.4.22. `mysqli::get_warnings`, `mysqli_get_warnings`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::get_warnings`
`mysqli_get_warnings`

Description

```
object mysqli::get_warnings();
```

```
object mysqli_get_warnings(mysqli link);
```

Warning

This function is currently not documented; only its argument list is available.

24.8.2.4.23. `mysqli->info`, `mysqli_info`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli->info`
`mysqli_info`

Retrieves information about the most recently executed query

Description

Object oriented style (property)

```
mysqli {
    string info ;
}
```

Procedural style:

```
string mysqli_info(mysqli link);
```

The `mysqli_info` function returns a string providing information about the last query executed. The nature of this string is provided below:

Table 24.7. Possible mysqli_info return values

Query type	Example result string
INSERT INTO...SELECT...	Records: 100 Duplicates: 0 Warnings: 0
INSERT INTO...VALUES (...),(...),(...)	Records: 3 Duplicates: 0 Warnings: 0
LOAD DATA INFILE ...	Records: 1 Deleted: 0 Skipped: 0 Warnings: 0
ALTER TABLE ...	Records: 3 Duplicates: 0 Warnings: 0
UPDATE ...	Rows matched: 40 Changed: 40 Warnings: 0

Note

Queries which do not fall into one of the above formats are not supported. In these situations, `mysqli_info` will return an empty string.

Parameters*link*Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`**Return Values**

A character string representing additional information about the most recently executed query.

Examples**Example 24.102. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TEMPORARY TABLE t1 LIKE City");

/* INSERT INTO .. SELECT */
$mysqli->query("INSERT INTO t1 SELECT * FROM City ORDER BY ID LIMIT 150");
printf("%s\n", $mysqli->info);

/* close connection */
$mysqli->close();
?>
```

Example 24.103. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TEMPORARY TABLE t1 LIKE City");

/* INSERT INTO .. SELECT */
mysqli_query($link, "INSERT INTO t1 SELECT * FROM City ORDER BY ID LIMIT 150");
printf("%s\n", mysqli_info($link));

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Records: 150 Duplicates: 0 Warnings: 0
```

See Also

```
mysqli_affected_rows  
mysqli_warning_count  
mysqli_num_rows
```

24.8.2.4.24. `mysqli::init`, `mysqli_init`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::init`

```
mysqli_init
```

Initializes MySQLi and returns a resource for use with `mysqli_real_connect()`

Description

Object oriented style (method):

```
mysqli init();
```

Procedural style:

```
mysqli mysqli_init();
```

Allocates or initializes a MySQL object suitable for `mysqli_options` and `mysqli_real_connect`.

Note

Any subsequent calls to any `mysqli` function (except `mysqli_options`) will fail until `mysqli_real_connect` was called.

Return Values

Returns an object.

See Also

```
mysqli_options  
mysqli_close  
mysqli_real_connect  
mysqli_connect
```

24.8.2.4.25. `mysqli->insert_id`, `mysqli_insert_id`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli->insert_id`

```
mysqli_insert_id
```

Returns the auto generated id used in the last query

Description

Object oriented style (property):

```
mysql {
    int insert_id ;
}
```

Procedural style:

```
int mysqli_insert_id(mysqli link);
```

The `mysqli_insert_id` function returns the ID generated by a query on a table with a column having the `AUTO_INCREMENT` attribute. If the last query wasn't an `INSERT` or `UPDATE` statement or if the modified table does not have a column with the `AUTO_INCREMENT` attribute, this function will return zero.

Note

Performing an `INSERT` or `UPDATE` statement using the `LAST_INSERT_ID()` function will also modify the value returned by the `mysqli_insert_id` function.

Parameters

`link`

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

The value of the `AUTO_INCREMENT` field that was updated by the previous query. Returns zero if there was no previous query on the connection or if the query did not update an `AUTO_INCREMENT` value.

Note

If the number is greater than maximal int value, `mysqli_insert_id` will return a string.

Examples

Example 24.104. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCity LIKE City");

$query = "INSERT INTO myCity VALUES (NULL, 'Stuttgart', 'DEU', 'Stuttgart', 617000)";
$mysqli->query($query);

printf ("New Record has id %d.\n", $mysqli->insert_id);

/* drop table */
$mysqli->query("DROP TABLE myCity");

/* close connection */
$mysqli->close();
?>
```

Example 24.105. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");
```

```

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCity LIKE City");

$query = "INSERT INTO myCity VALUES (NULL, 'Stuttgart', 'DEU', 'Stuttgart', 617000)";
mysqli_query($link, $query);

printf ("New Record has id %d.\n", mysqli_insert_id($link));

/* drop table */
mysqli_query($link, "DROP TABLE myCity");

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
New Record has id 1.
```

24.8.2.4.26. `mysqli::kill`, `mysqli_kill`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::kill`
`mysqli_kill`

Asks the server to kill a MySQL thread

Description

Object oriented style (method)

```
bool mysqli::kill(int processid);
```

Procedural style:

```
bool mysqli_kill(mysqli link,
                 int processid);
```

This function is used to ask the server to kill a MySQL thread specified by the `processid` parameter. This value must be retrieved by calling the `mysqli_thread_id` function.

To stop a running query you should use the SQL command `KILL QUERY processid`.

Parameters

`link` Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 24.106. Object oriented style

```

<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* determine our thread id */
$thread_id = $mysqli->thread_id;

/* Kill connection */
$mysqli->kill($thread_id);

/* This should produce an error */
if (!$mysqli->query("CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", $mysqli->error);
    exit;
}

/* close connection */
$mysqli->close();
?>

```

Example 24.107. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* determine our thread id */
$thread_id = mysqli_thread_id($link);

/* Kill connection */
mysqli_kill($link, $thread_id);

/* This should produce an error */
if (!mysqli_query($link, "CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", mysqli_error($link));
    exit;
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Error: MySQL server has gone away
```

See Also

[mysqli_thread_id](#)

24.8.2.4.27. [mysqli::more_results](#), [mysqli_more_results](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli::more_results](#)
- [mysqli_more_results](#)

Check if there are any more query results from a multi query

Description

```
bool mysqli::more_results();
```

```
bool mysqli_more_results(mysqli link);
```

Indicates if one or more result sets are available from a previous call to `mysqli_multi_query`.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

See `mysqli_multi_query`.

See Also

```
mysqli_multi_query  
mysqli_next_result  
mysqli_store_result  
mysqli_use_result
```

24.8.2.4.28. `mysqli::multi_query`, `mysqli_multi_query`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::multi_query`

```
mysqli_multi_query
```

Performs a query on the database

Description

Object oriented style (method):

```
bool mysqli::multi_query(string query);
```

Procedural style:

```
bool mysqli_multi_query(mysqli link,  
                        string query);
```

Executes one or multiple queries which are concatenated by a semicolon.

To retrieve the resultset from the first query you can use `mysqli_use_result` or `mysqli_store_result`. All subsequent query results can be processed using `mysqli_more_results` and `mysqli_next_result`.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

query The query, as a string.

Return Values

Returns `FALSE` if the first statement failed. To retrieve subsequent errors from other statements you have to call `mysqli_next_result` first.

Examples

Example 24.108. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT CURRENT_USER()";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if ($mysqli->multi_query($query)) {
    do {
        /* store first result set */
        if ($result = $mysqli->store_result()) {
            while ($row = $result->fetch_row()) {
                printf("%s\n", $row[0]);
            }
            $result->free();
        }
        /* print divider */
        if ($mysqli->more_results()) {
            printf("-----\n");
        }
    } while ($mysqli->next_result());
}

/* close connection */
$mysqli->close();
?>
```

Example 24.109. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT CURRENT_USER()";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if (mysqli_multi_query($link, $query)) {
    do {
        /* store first result set */
        if ($result = mysqli_store_result($link)) {
            while ($row = mysqli_fetch_row($result)) {
                printf("%s\n", $row[0]);
            }
            mysqli_free_result($result);
        }
        /* print divider */
        if (mysqli_more_results($link)) {
            printf("-----\n");
        }
    } while (mysqli_next_result($link));
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output something similar to:

```
my_user@localhost
-----
Amersfoort
Maastricht
Dordrecht
Leiden
Haarlemmermeer
```

See Also

```

```

24.8.2.4.29. `mysqli::next_result`, `mysqli_next_result`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::next_result`
`mysqli_next_result`

Prepare next result from `multi_query`

Description

```
bool mysqli::next_result();
```

```
bool mysqli_next_result(mysqli link);
```

Prepares next result set from a previous call to `mysqli_multi_query` which can be retrieved by `mysqli_store_result` or `mysqli_use_result`.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

See `mysqli_multi_query`.

See Also

```
mysqli_multi_query
mysqli_more_results
mysqli_store_result
mysqli_use_result
```

24.8.2.4.30. `mysqli::options`, `mysqli_options`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::options`

`mysqli_options`

Set options

Description

Object oriented style (method)

```
bool mysqli::options(int option,
                    mixed value);
```

Procedural style:

```
bool mysqli_options(mysqli link,
                    int option,
                    mixed value);
```

Used to set extra connect options and affect behavior for a connection.

This function may be called multiple times to set several options.

`mysqli_options` should be called after `mysqli_init` and before `mysqli_real_connect`.

Parameters

link

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

option

The option that you want to set. It can be one of the following values:

Table 24.8. Valid options

Name	Description
<code>MYSQLI_OPT_CONNECT_TIMEOUT</code>	connection timeout in seconds
<code>MYSQLI_OPT_LOCAL_INFILE</code>	enable/disable use of <code>LOAD LOCAL INFILE</code>
<code>MYSQLI_INIT_COMMAND</code>	command to execute after when connecting to MySQL server
<code>MYSQLI_READ_DEFAULT_FILE</code>	Read options from named option file instead of <code>my.cnf</code>
<code>MYSQLI_READ_DEFAULT_GROUP</code>	Read options from the named group from <code>my.cnf</code> or the file specified with <code>MYSQL_READ_DEFAULT_FILE</code> .

value

The value for the option.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

See `mysqli_real_connect`.

See Also

`mysqli_init`
`mysqli_real_connect`

24.8.2.4.31. `mysqli::ping`, `mysqli_ping`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::ping`

`mysqli_ping`

Pings a server connection, or tries to reconnect if the connection has gone down

Description

Object oriented style (method):

```
bool mysqli::ping();
```

Procedural style:

```
bool mysqli_ping(mysqli link);
```

Checks whether the connection to the server is working. If it has gone down, and global option `mysqli.reconnect` is enabled an automatic reconnection is attempted.

This function can be used by clients that remain idle for a long while, to check whether the server has closed the connection and reconnect if necessary.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples**Example 24.110. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* check if server is alive */
if ($mysqli->ping()) {
    printf("Our connection is ok!\n");
} else {
    printf("Error: %s\n", $mysqli->error);
}

/* close connection */
$mysqli->close();
?>
```

Example 24.111. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* check if server is alive */
if (mysqli_ping($link)) {
    printf("Our connection is ok!\n");
} else {
```

```

    printf ("Error: %s\n", mysqli_error($link));
}
/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Our connection is ok!
```

24.8.2.4.32. `mysqli::prepare`, `mysqli_prepare`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::prepare`
`mysqli_prepare`

Prepare a SQL statement for execution

Description

Object oriented style (method)

```
mysqli_stmt prepare(string query);
```

Procedure style:

```
mysqli_stmt mysqli_prepare(mysqli link,
                           string query);
```

Prepares the SQL query pointed to by the null-terminated string query, and returns a statement handle to be used for further operations on the statement. The query must consist of a single SQL statement.

The parameter markers must be bound to application variables using `mysqli_stmt_bind_param` and/or `mysqli_stmt_bind_result` before executing the statement or fetching rows.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

query The query, as a string.

Note

You should not add a terminating semicolon or `\g` to the statement.

This parameter can include one or more parameter markers in the SQL statement by embedding question mark (?) characters at the appropriate positions.

Note

The markers are legal only in certain places in SQL statements. For example, they are allowed in the `VALUES()` list of an `INSERT` statement (to specify column values for a row), or in a comparison with a column in a `WHERE` clause to specify a comparison value.

However, they are not allowed for identifiers (such as table or column names), in the select list that names the columns to be returned by a `SELECT` statement, or to specify both operands of a binary operator such as the `=` equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. It's not al-

lowed to compare marker with `NULL` by `? IS NULL` too. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

Return Values

`mysqli_prepare` returns a statement object or `FALSE` if an error occurred.

Examples

Example 24.112. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
if ($stmt = $mysqli->prepare("SELECT District FROM City WHERE Name=?")) {

    /* bind parameters for markers */
    $stmt->bind_param("s", $city);

    /* execute query */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($district);

    /* fetch value */
    $stmt->fetch();

    printf("%s is in district %s\n", $city, $district);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 24.113. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
if ($stmt = mysqli_prepare($link, "SELECT District FROM City WHERE Name=?")) {

    /* bind parameters for markers */
    mysqli_stmt_bind_param($stmt, "s", $city);

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $district);

    /* fetch value */
    mysqli_stmt_fetch($stmt);

    printf("%s is in district %s\n", $city, $district);

    /* close statement */
    mysqli_stmt_close($stmt);
}
```

```
/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Amersfoort is in district Utrecht
```

mysqli_stmt_bind_result
mysqli_stmt_close
```

24.8.2.4.33. `mysqli::query`, `mysqli_query`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::query`

`mysqli_query`

Performs a query on the database

Description

Object oriented style (method):

```
mixed mysqli::query(string query,
                    int resultmode);
```

Procedural style:

```
mixed mysqli_query(mysqli link,
                   string query,
                   int resultmode);
```

Performs a *query* against the database.

Functionally, using this function is identical to calling `mysqli_real_query` followed either by `mysqli_use_result` or `mysqli_store_result`.

Parameters

link

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

query

The query string.

resultmode

Either the constant `MYSQLI_USE_RESULT` or `MYSQLI_STORE_RESULT` depending on the desired behavior. By default, `MYSQLI_STORE_RESULT` is used.

If you use `MYSQLI_USE_RESULT` all subsequent calls will return error `Commands out of sync` unless you call `mysqli_free_result`

Return Values

Returns **TRUE** on success or **FALSE** on failure. For **SELECT**, **SHOW**, **DESCRIBE** or **EXPLAIN** `mysqli_query` will return a result object.

Examples

Example 24.114. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Create table doesn't return a resultset */
if ($mysqli->query("CREATE TEMPORARY TABLE myCity LIKE City") === TRUE) {
    printf("Table myCity successfully created.\n");
}

/* Select queries return a resultset */
if ($result = $mysqli->query("SELECT Name FROM City LIMIT 10")) {
    printf("Select returned %d rows.\n", $result->num_rows);

    /* free result set */
    $result->close();
}

/* If we have to retrieve large amount of data we use MYSQLI_USE_RESULT */
if ($result = $mysqli->query("SELECT * FROM City", MYSQLI_USE_RESULT)) {

    /* Note, that we can't execute any functions which interact with the
    server until result set was closed. All calls will return an
    'out of sync' error */
    if (!$mysqli->query("SET @a:='this will not work'")) {
        printf("Error: %s\n", $mysqli->error);
    }
    $result->close();
}

$mysqli->close();
?>
```

Example 24.115. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Create table doesn't return a resultset */
if (mysqli_query($link, "CREATE TEMPORARY TABLE myCity LIKE City") === TRUE) {
    printf("Table myCity successfully created.\n");
}

/* Select queries return a resultset */
if ($result = mysqli_query($link, "SELECT Name FROM City LIMIT 10")) {
    printf("Select returned %d rows.\n", mysqli_num_rows($result));

    /* free result set */
    mysqli_free_result($result);
}

/* If we have to retrieve large amount of data we use MYSQLI_USE_RESULT */
if ($result = mysqli_query($link, "SELECT * FROM City", MYSQLI_USE_RESULT)) {

    /* Note, that we can't execute any functions which interact with the
    server until result set was closed. All calls will return an
    'out of sync' error */
    if (!$mysqli_query($link, "SET @a:='this will not work'")) {
        printf("Error: %s\n", mysqli_error($link));
    }
    mysqli_free_result($result);
}

mysqli_close($link);
?>
```

The above example will output:

```
Table myCity successfully created.
Select returned 10 rows.
Error: Commands out of sync; You can't run this command now
```

[mysqli_real_connect](#)

Opens a connection to a mysql server

Description

Object oriented style (method)

```
bool mysqli::real_connect(string host,
                        string username,
                        string passwd,
                        string dbname,
                        int port,
                        string socket,
                        int flags);
```

Procedural style

```
bool mysqli_real_connect(mysqli link,
                        string host,
                        string username,
                        string passwd,
                        string dbname,
                        int port,
                        string socket,
                        int flags);
```

Establish a connection to a MySQL database engine.

This function differs from [mysqli_connect](#):

- [mysqli_real_connect](#) needs a valid object which has to be created by function [mysqli_init](#).
- With function [mysqli_options](#) you can set various options for connection.
- There is a *flags* parameter.

Parameters

link Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)
host Can be either a host name or an IP address. Passing the `NULL` value or the string "localhost"

to this parameter, the local host is assumed. When possible, pipes will be used instead of the TCP/IP protocol.

username

The MySQL user name.

passwd

If provided or `NULL`, the MySQL server will attempt to authenticate the user against those user records which have no password only. This allows one username to be used with different permissions (depending on if a password as provided or not).

dbname

If provided will specify the default database to be used when performing queries.

port

Specifies the port number to attempt to connect to the MySQL server.

socket

Specifies the socket or named pipe that should be used.

Note

Specifying the *socket* parameter will not explicitly determine the type of connection to be used when connecting to the MySQL server. How the connection is made to the MySQL database is determined by the *host* parameter.

flags

With the parameter *flags* you can set different connection options:

Table 24.9. Supported flags

Name	Description
<code>MYSQLI_CLIENT_COMPRESS</code>	Use compression protocol
<code>MYSQLI_CLIENT_FOUND_ROWS</code>	return number of matched rows, not the number of affected rows
<code>MYSQLI_CLIENT_IGNORE_SPACE</code>	Allow spaces after function names. Makes all function names reserved words.
<code>MYSQLI_CLIENT_INTERACTIVE</code>	Allow <code>interactive_timeout</code> seconds (instead of <code>wait_timeout</code> seconds) of inactivity before closing the connection
<code>MYSQLI_CLIENT_SSL</code>	Use SSL (encryption)

Note

For security reasons the `MULTI_STATEMENT` flag is not supported in PHP. If you want to execute multiple queries use the `mysqli_multi_query` function.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 24.116. Object oriented style

```
<?php
/* create a connection object which is not connected */
$mysqli = mysqli_init();

/* set connection options */
$mysqli->options(MYSQLI_INIT_COMMAND, "SET AUTOCOMMIT=0");
$mysqli->options(MYSQLI_OPT_CONNECT_TIMEOUT, 5);

/* connect to server */
$mysqli->real_connect('localhost', 'my_user', 'my_password', 'world');

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

printf ("Connection: %s\n.", $mysqli->host_info);

$mysqli->close();
?>
```

Example 24.117. Procedural style

```

<?php
/* create a connection object which is not connected */
$link = mysqli_init();

/* set connection options */
mysqli_options($link, MYSQLI_INIT_COMMAND, "SET AUTOCOMMIT=0");
mysqli_options($link, MYSQLI_OPT_CONNECT_TIMEOUT, 5);

/* connect to server */
mysqli_real_connect($link, 'localhost', 'my_user', 'my_password', 'world');

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

printf ("Connection: %s\n.", mysqli_get_host_info($link));

mysqli_close($link);
?>

```

The above example will output:

```

Connection: Localhost via UNIX socket

```

24.8.2.4.35. [mysqli::real_escape_string](#), [mysqli_real_escape_string](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli::real_escape_string](#)
[mysqli_real_escape_string](#)

Escapes special characters in a string for use in a SQL statement, taking into account the current charset of the connection

Description

Object oriented style (both methods are equivalent):

```
string mysqli::escape_string(string escapestr);
```

```
string mysqli_real_escape_string(string escapestr);
```

Procedural style:

```
string mysqli_real_escape_string(mysqli link,
                                string escapestr);
```

This function is used to create a legal SQL string that you can use in an SQL statement. The given string is encoded to an escaped SQL string, taking into account the current character set of the connection.

Parameters

<i>link</i>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<i>escapestr</i>	The string to be escaped. Characters encoded are NUL (ASCII 0), <code>\n</code> , <code>\r</code> , <code>\</code> , <code>'</code> , <code>"</code> , and Control-Z.

Return Values

Returns an escaped string.

Examples

Example 24.118. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TEMPORARY TABLE myCity LIKE City");

$city = "'s Hertogenbosch";

/* this query will fail, cause we didn't escape $city */
if (!$mysqli->query("INSERT into myCity (Name) VALUES ('$city')")) {
    printf("Error: %s\n", $mysqli->sqlstate);
}

$city = $mysqli->real_escape_string($city);

/* this query with escaped $city will work */
if ($mysqli->query("INSERT into myCity (Name) VALUES ('$city')")) {
    printf("%d Row inserted.\n", $mysqli->affected_rows);
}

$mysqli->close();
?>
```

Example 24.119. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TEMPORARY TABLE myCity LIKE City");

$city = "'s Hertogenbosch";

/* this query will fail, cause we didn't escape $city */
if (!$mysqli_query($link, "INSERT into myCity (Name) VALUES ('$city')")) {
    printf("Error: %s\n", mysqli_sqlstate($link));
}

$city = mysqli_real_escape_string($link, $city);

/* this query with escaped $city will work */
if (mysqli_query($link, "INSERT into myCity (Name) VALUES ('$city')")) {
    printf("%d Row inserted.\n", mysqli_affected_rows($link));
}

mysqli_close($link);
```

```
?>
```

The above example will output:

```
Error: 42000
1 Row inserted.
```

- [mysqli::real_query](#)
[mysqli_real_query](#)
Execute an SQL query

Description

Object oriented style (method):

```
bool real_query(string query);
```

Procedural style

```
bool mysqli_real_query(mysqli link,
                       string query);
```

Executes a single query against the database whose result can then be retrieved or stored using the [mysqli_store_result](#) or [mysqli_use_result](#) functions.

In order to determine if a given query should return a result set or not, see [mysqli_field_count](#).

Parameters

link Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

query The query, as a string.

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

See Also

[mysqli_query](#)

[mysqli_use_result](#)

24.8.2.4.37. [mysqli::rollback](#), [mysqli_rollback](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::rollback`
`mysqli_rollback`
Rolls back current transaction

Description

Object oriented style (method):

```
bool mysqli::rollback();
```

Procedural style:

```
bool mysqli_rollback(mysqli link);
```

Rollbacks the current transaction for the database.

Parameters

link

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 24.120. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* disable autocommit */
$mysqli->autocommit(FALSE);

$mysqli->query("CREATE TABLE myCity LIKE City");
$mysqli->query("ALTER TABLE myCity Type=InnoDB");
$mysqli->query("INSERT INTO myCity SELECT * FROM City LIMIT 50");

/* commit insert */
$mysqli->commit();

/* delete all rows */
$mysqli->query("DELETE FROM myCity");

if ($result = $mysqli->query("SELECT COUNT(*) FROM myCity")) {
    $row = $result->fetch_row();
    printf("%d rows in table myCity.\n", $row[0]);
    /* Free result */
    $result->close();
}

/* Rollback */
$mysqli->rollback();

if ($result = $mysqli->query("SELECT COUNT(*) FROM myCity")) {
    $row = $result->fetch_row();
    printf("%d rows in table myCity (after rollback).\n", $row[0]);
    /* Free result */
    $result->close();
}

/* Drop table myCity */
$mysqli->query("DROP TABLE myCity");

$mysqli->close();
?>
```

Example 24.121. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* disable autocommit */
mysqli_autocommit($link, FALSE);

mysqli_query($link, "CREATE TABLE myCity LIKE City");
mysqli_query($link, "ALTER TABLE myCity Type=InnoDB");
mysqli_query($link, "INSERT INTO myCity SELECT * FROM City LIMIT 50");

/* commit insert */
mysqli_commit($link);

/* delete all rows */
mysqli_query($link, "DELETE FROM myCity");

if ($result = mysqli_query($link, "SELECT COUNT(*) FROM myCity")) {
    $row = mysqli_fetch_row($result);
    printf("%d rows in table myCity.\n", $row[0]);
    /* Free result */
    mysqli_free_result($result);
}

/* Rollback */
mysqli_rollback($link);

if ($result = mysqli_query($link, "SELECT COUNT(*) FROM myCity")) {
    $row = mysqli_fetch_row($result);
    printf("%d rows in table myCity (after rollback).\n", $row[0]);
    /* Free result */
    mysqli_free_result($result);
}

/* Drop table myCity */
mysqli_query($link, "DROP TABLE myCity");

mysqli_close($link);
?>

```

The above example will output:

```

0 rows in table myCity.
50 rows in table myCity (after rollback).

```

[mysqli_select_db](#)

Selects the default database for database queries

Description

Object oriented style (method):

```
bool mysqli::select_db(string dbname);
```

Procedural style:

```
bool mysqli_select_db(mysqli link,
                     string dbname);
```

Selects the default database to be used when performing queries against the database connection.

Note

This function should only be used to change the default database for the connection. You can select the default database with 4th parameter in [mysqli_connect](#).

Parameters

link Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

dbname The database name.

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

Examples

Example 24.122. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* return name of current default database */
if ($result = $mysqli->query("SELECT DATABASE()")) {
    $row = $result->fetch_row();
    printf("Default database is %s.\n", $row[0]);
    $result->close();
}

/* change db to world db */
$mysqli->select_db("world");

/* return name of current default database */
if ($result = $mysqli->query("SELECT DATABASE()")) {
    $row = $result->fetch_row();
    printf("Default database is %s.\n", $row[0]);
    $result->close();
}

$mysqli->close();
?>
```

Example 24.123. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* return name of current default database */
if ($result = mysqli_query($link, "SELECT DATABASE()")) {
    $row = mysqli_fetch_row($result);
```

```

    printf("Default database is %s.\n", $row[0]);
    mysqli_free_result($result);
}

/* change db to world db */
mysqli_select_db($link, "world");

/* return name of current default database */
if ($result = mysqli_query($link, "SELECT DATABASE()")) {
    $row = mysqli_fetch_row($result);
    printf("Default database is %s.\n", $row[0]);
    mysqli_free_result($result);
}

mysqli_close($link);
?>

```

The above example will output:

```

Default database is test.
Default database is world.

```

24.8.2.4.39. [mysqli::set_charset](#), [mysqli_set_charset](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli::set_charset](#)
[mysqli_set_charset](#)

Sets the default client character set

Description

Object oriented style (method):

```
bool mysqli::set_charset(string charset);
```

Procedural style:

```
bool mysqli_set_charset(mysqli link,
                        string charset);
```

Sets the default character set to be used when sending data from and to the database server.

Parameters

link Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)
charset The charset to be set as default.

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

Notes

Note

To use this function on a Windows platform you need MySQL client library version 4.1.11 or above (for MySQL 5.0 you need 5.0.6 or above).

Note

This is the preferred way to change the charset. Using `mysqli::query` to execute `SET NAMES ..` is not recommended.

Examples**Example 24.124. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* change character set to utf8 */
if (!$mysqli->set_charset("utf8")) {
    printf("Error loading character set utf8: %s\n", $mysqli->error);
} else {
    printf("Current character set: %s\n", $mysqli->character_set_name());
}

$mysqli->close();
?>
```

Example 24.125. Procedural style

```
<?php
$link = mysqli_connect('localhost', 'my_user', 'my_password', 'test');

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* change character set to utf8 */
if (!mysqli_set_charset($link, "utf8")) {
    printf("Error loading character set utf8: %s\n", mysqli_error($link));
} else {
    printf("Current character set: %s\n", mysqli_character_set_name($link));
}

mysqli_close($link);
?>
```

The above example will output:

```
Current character set: utf8
```

24.8.2.4.40. `mysqli::set_local_infile_default`, `mysqli_set_local_infile_default`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::set_local_infile_default`
`mysqli_set_local_infile_default`
Unsets user defined handler for load local infile command

Description

```
void mysqli_set_local_infile_default(mysqli link);
```

Deactivates a `LOAD DATA INFILE LOCAL` handler previously set with `mysqli_set_local_infile_handler`.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

No value is returned.

Examples

See `mysqli_set_local_infile_handler` examples

See Also

`mysqli_set_local_infile_handler`

24.8.2.4.41. `mysqli::set_local_infile_handler`, `mysqli_set_local_infile_handler`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::set_local_infile_handler`
`mysqli_set_local_infile_handler`
Set callback function for `LOAD DATA LOCAL INFILE` command

Description

```
bool mysqli_set_local_infile_handler(mysqli link,
                                     callback read_func);
```

Object oriented style (method)

```
mysqli {
    bool set_local_infile_handler(mysqli link,
                                 callback read_func);
}
```

Set callback function for `LOAD DATA LOCAL INFILE` command

The callback's task is to read input from the file specified in the `LOAD DATA LOCAL INFILE` and to reformat it into the format understood by `LOAD DATA INFILE`.

The returned data needs to match the format specified in the `LOAD DATA`

Parameters

<i>link</i>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<i>read_func</i>	A callback function or object method taking the following parameters:
<i>stream</i>	A PHP stream associated with the SQL commands INFILE
<i>&buffer</i>	A string buffer to store the rewritten input into
<i>buflen</i>	The maximum number of characters to be stored in the buffer
<i>&errmsg</i>	If an error occurs you can store an error message in here

The callback function should return the number of characters stored in the *buffer* or a negative value if an error occurred.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 24.126. Object oriented style

```
<?php
$db = mysqli_init();
$db->real_connect("localhost","root","","test");

function callme($stream, &$buffer, $buflen, &$errmsg)
{
    $buffer = fgets($stream);

    echo $buffer;

    // convert to upper case and replace "," delimiter with [TAB]
    $buffer = strtoupper(str_replace(",","\\t", $buffer));

    return strlen($buffer);
}

echo "Input:\\n";

$db->set_local_infile_handler("callme");
$db->query("LOAD DATA LOCAL INFILE 'input.txt' INTO TABLE t1");
$db->set_local_infile_default();

$res = $db->query("SELECT * FROM t1");

echo "\\nResult:\\n";
while ($row = $res->fetch_assoc()) {
    echo join(", ", $row). "\\n";
}
?>
```

Example 24.127. Procedural style

```
<?php
$db = mysqli_init();
mysqli_real_connect($db, "localhost","root","","test");

function callme($stream, &$buffer, $buflen, &$errmsg)
{
    $buffer = fgets($stream);

    echo $buffer;

    // convert to upper case and replace "," delimiter with [TAB]
    $buffer = strtoupper(str_replace(",","\\t", $buffer));

    return strlen($buffer);
}
```

```

echo "Input:\n";

mysqli_set_local_infile_handler($db, "callme");
mysqli_query($db, "LOAD DATA LOCAL INFILE 'input.txt' INTO TABLE t1");
mysqli_set_local_infile_default($db);

$res = mysqli_query($db, "SELECT * FROM t1");

echo "\nResult:\n";
while ($row = mysqli_fetch_assoc($res)) {
    echo join(", ", $row)."\n";
}
?>

```

The above example will output:

```

Input:
23,foo
42,bar

Output:
23,FOO
42,BAR

```

[mysqli_set_local_infile_default](#)

24.8.2.4.42. [mysqli->sqlstate](#), [mysqli_sqlstate](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli->sqlstate](#)
- [mysqli_sqlstate](#)

Returns the SQLSTATE error from previous MySQL operation

Description

Object oriented style (property):

```

mysqli {
    string sqlstate ;
}

```

Procedural style:

```

string mysqli_sqlstate(mysqli link);

```

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. '00000' means no error. The values are specified by ANSI SQL and ODBC. For a list of possible values, see <http://dev.mysql.com/doc/mysql/en/error-handling.html>.

Note

Note that not all MySQL errors are yet mapped to SQLSTATE's. The value `HY000` (general error) is used for un-mapped errors.

Parameters

[link](#)

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. '00000' means no error.

Examples

Example 24.128. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Table City already exists, so we should get an error */
if (!$mysqli->query("CREATE TABLE City (ID INT, Name VARCHAR(30))")) {
    printf("Error - SQLSTATE %s.\n", $mysqli->sqlstate);
}

$mysqli->close();
?>
```

Example 24.129. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* Table City already exists, so we should get an error */
if (!mysqli_query($link, "CREATE TABLE City (ID INT, Name VARCHAR(30))")) {
    printf("Error - SQLSTATE %s.\n", mysqli_sqlstate($link));
}

mysqli_close($link);
?>
```

The above example will output:

```
Error - SQLSTATE 42S01.
```

24.8.2.4.43. `mysqli::ssl_set`, `mysqli_ssl_set`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::ssl_set`

`mysqli_ssl_set`

Used for establishing secure connections using SSL

Description

Object oriented style (method):

```
bool mysqli::ssl_set(string key,
                    string cert,
                    string ca,
                    string capath,
                    string cipher);
```

Procedural style:

```
bool mysqli_ssl_set(mysqli link,
                    string key,
                    string cert,
                    string ca,
                    string capath,
                    string cipher);
```

Used for establishing secure connections using SSL. It must be called before `mysqli_real_connect`. This function does nothing unless OpenSSL support is enabled.

Parameters

<i>link</i>	Procedural style only: A link identifier returned by <code>mysqli_connect</code> or <code>mysqli_init</code>
<i>key</i>	The path name to the key file.
<i>cert</i>	The path name to the certificate file.
<i>ca</i>	The path name to the certificate authority file.
<i>capath</i>	The pathname to a directory that contains trusted SSL CA certificates in PEM format.
<i>cipher</i>	A list of allowable ciphers to use for SSL encryption.

Any unused SSL parameters may be given as `NULL`

Return Values

This function always returns `TRUE` value. If SSL setup is incorrect `mysqli_real_connect` will return an error when you attempt to connect.

See Also

`mysqli_options`
`mysqli_real_connect`

24.8.2.4.44. `mysqli::stat`, `mysqli_stat`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::stat`

`mysqli_stat`

Gets the current system status

Description

Object oriented style (method):

```
string mysqli::stat();
```

Procedural style:

```
string mysqli_stat(mysqli link);
```

`mysqli_stat` returns a string containing information similar to that provided by the 'mysqladmin status' command. This includes uptime in seconds and the number of running threads, questions, reloads, and open tables.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

A string describing the server status. `FALSE` if an error occurred.

Examples

Example 24.130. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

printf ("System status: %s\n", $mysqli->stat());

$mysqli->close();
?>
```

Example 24.131. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

printf("System status: %s\n", mysqli_stat($link));

mysqli_close($link);
?>
```

The above example will output:

```
System status: Uptime: 272  Threads: 1  Questions: 5340  Slow queries: 0
Opens: 13  Flush tables: 1  Open tables: 0  Queries per second avg: 19.632
Memory in use: 8496K  Max memory used: 8560K
```

See Also

`mysqli_get_server_info`

24.8.2.4.45. `mysqli::stmt_init`, `mysqli_stmt_init`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::stmt_init`
`mysqli_stmt_init`

Initializes a statement and returns an object for use with `mysqli_stmt_prepare`

Description

Object oriented style (property):

```
mysqli {  
    mysqli_stmt stmt_init();  
}
```

Procedural style :

```
mysqli_stmt mysqli_stmt_init(mysqli link);
```

Allocates and initializes a statement object suitable for `mysqli_stmt_prepare`.

Note

Any subsequent calls to any `mysqli_stmt` function will fail until `mysqli_stmt_prepare` was called.

Parameters

`link` Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns an object.

See Also

`mysqli_stmt_prepare`

24.8.2.4.46. `mysqli::store_result`, `mysqli_store_result`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::store_result`
`mysqli_store_result`

Transfers a result set from the last query

Description

Object oriented style (method):

```
mysqli_result store_result();
```

Procedural style:

```
mysqli_result mysqli_store_result(mysqli link);
```

Transfers the result set from the last query on the database connection represented by the [link](#) parameter to be used with the [mysqli_data_seek](#) function.

Parameters

[link](#) Procedural style only: A link identifier returned by [mysqli_connect](#) or [mysqli_init](#)

Return Values

Returns a buffered result object or [FALSE](#) if an error occurred.

Note

[mysqli_store_result](#) returns [FALSE](#) in case the query didn't return a result set (if the query was, for example an INSERT statement). This function also returns [FALSE](#) if the reading of the result set failed. You can check if you have got an error by checking if [mysqli_error](#) doesn't return an empty string, if [mysqli_errno](#) returns a non zero value, or if [mysqli_field_count](#) returns a non zero value. Also possible reason for this function returning [FALSE](#) after successful call to [mysqli_query](#) can be too large result set (memory for it cannot be allocated). If [mysqli_field_count](#) returns a non-zero value, the statement should have produced a non-empty result set.

Notes

Note

Although it is always good practice to free the memory used by the result of a query using the [mysqli_free_result](#) function, when transferring large result sets using the [mysqli_store_result](#) this becomes particularly important.

Examples

See [mysqli_multi_query](#).

[mysqli_real_query](#)
[mysqli_use_result](#)

24.8.2.4.47. [mysqli::thread_id](#), [mysqli_thread_id](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli::thread_id](#)
[mysqli_thread_id](#)

Returns the thread ID for the current connection

Description

Object oriented style (property):

```
mysqli {
    int thread_id ;
}
```

Procedural style:

```
int mysqli_thread_id(mysqli link);
```

The [mysqli_thread_id](#) function returns the thread ID for the current connection which can then be killed using the [mysqli_kill](#) function. If the connection is lost and you reconnect with [mysqli_ping](#), the thread ID will be other. Therefore you should get the thread ID only when you need it.

Note

The thread ID is assigned on a connection-by-connection basis. Hence, if the connection is broken and then re-established a new thread ID will be assigned.

To kill a running query you can use the SQL command `KILL QUERY processid`.

Parameters

link

Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Returns the Thread ID for the current connection.

Examples**Example 24.132. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* determine our thread id */
$thread_id = $mysqli->thread_id;

/* Kill connection */
$mysqli->kill($thread_id);

/* This should produce an error */
if (!$mysqli->query("CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", $mysqli->error);
    exit;
}

/* close connection */
$mysqli->close();
?>
```

Example 24.133. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* determine our thread id */
$thread_id = mysqli_thread_id($link);

/* Kill connection */
mysqli_kill($link, $thread_id);

/* This should produce an error */
if (!$mysqli_query($link, "CREATE TABLE myCity LIKE City")) {
    printf("Error: %s\n", mysqli_error($link));
    exit;
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Error: MySQL server has gone away
```

See Also

[mysqli_kill](#)

24.8.2.4.48. [mysqli::thread_safe](#), [mysqli_thread_safe](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli::thread_safe](#)
[mysqli_thread_safe](#)
Returns whether thread safety is given or not

Description

Procedural style:

```
bool mysqli_thread_safe();
```

Tells whether the client library is compiled as thread-safe.

Return Values

`TRUE` if the client library is thread-safe, otherwise `FALSE`.

24.8.2.4.49. [mysqli::use_result](#), [mysqli_use_result](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli::use_result](#)
[mysqli_use_result](#)
Initiate a result set retrieval

Description

Object oriented style (method):

```
mysqli_result use_result();
```

Procedural style:

```
mysqli_result mysqli_use_result(mysqli link);
```

Used to initiate the retrieval of a result set from the last query executed using the [mysqli_real_query](#) function on the database connection.

Either this or the [mysqli_store_result](#) function must be called before the results of a query can be retrieved, and one or the other must be called to prevent the next query on that database connection from failing.

Note

The [mysqli_use_result](#) function does not transfer the entire result set from the database and hence cannot be used functions such as [mysqli_data_seek](#) to move to a particular row within the set. To use this functionality,

the result set must be stored using `mysqli_store_result`. One should not use `mysqli_use_result` if a lot of processing on the client side is performed, since this will tie up the server and prevent other threads from updating any tables from which the data is being fetched.

Return Values

Returns an unbuffered result object or `FALSE` if an error occurred.

Examples

Example 24.134. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if ($mysqli->multi_query($query)) {
    do {
        /* store first result set */
        if ($result = $mysqli->use_result()) {
            while ($row = $result->fetch_row()) {
                printf("%s\n", $row[0]);
            }
            $result->close();
        }
        /* print divider */
        if ($mysqli->more_results()) {
            printf("-----\n");
        }
    } while ($mysqli->next_result());
}

/* close connection */
$mysqli->close();
?>
```

Example 24.135. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT CURRENT_USER();";
$query .= "SELECT Name FROM City ORDER BY ID LIMIT 20, 5";

/* execute multi query */
if (mysqli_multi_query($link, $query)) {
    do {
        /* store first result set */
        if ($result = mysqli_use_result($link)) {
            while ($row = mysqli_fetch_row($result)) {
                printf("%s\n", $row[0]);
            }
            mysqli_free_result($result);
        }
        /* print divider */
        if (mysqli_more_results($link)) {
            printf("-----\n");
        }
    } while (mysqli_next_result($link));
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
my_user@localhost
-----
Amersfoort
Maastricht
Dordrecht
Leiden
Haarlemmermeer
```

24.8.2.4.50. `mysqli::warning_count`, `mysqli_warning_count`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli::warning_count`
`mysqli_warning_count`

Returns the number of warnings from the last query for the given link

Description

Object oriented style (property):

```
mysqli {
    int warning_count ;
}
```

Procedural style:

```
int mysqli_warning_count(mysqli link);
```

Returns the number of warnings from the last query in the connection.

Note

For retrieving warning messages you can use the SQL command `SHOW WARNINGS [limit row_count]`.

Parameters

link Procedural style only: A link identifier returned by `mysqli_connect` or `mysqli_init`

Return Values

Number of warnings or zero if there are no warnings.

Examples

Example 24.136. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
```

```

    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCity LIKE City");

/* a remarkable city in Wales */
$query = "INSERT INTO myCity (CountryCode, Name) VALUES('GBR',
    'Llanfairpwllgwyngyllgogerychwyrndrobwlllandysiliogogoch')";

$mysqli->query($query);

if ($mysqli->warning_count) {
    if ($result = $mysqli->query("SHOW WARNINGS")) {
        $row = $result->fetch_row();
        printf("%s (%d): %s\n", $row[0], $row[1], $row[2]);
        $result->close();
    }
}

/* close connection */
$mysqli->close();
?>

```

Example 24.137. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCity LIKE City");

/* a remarkable long city name in Wales */
$query = "INSERT INTO myCity (CountryCode, Name) VALUES('GBR',
    'Llanfairpwllgwyngyllgogerychwyrndrobwlllandysiliogogoch')";

mysqli_query($link, $query);

if (mysqli_warning_count($link)) {
    if ($result = mysqli_query($link, "SHOW WARNINGS")) {
        $row = mysqli_fetch_row($result);
        printf("%s (%d): %s\n", $row[0], $row[1], $row[2]);
        mysqli_free_result($result);
    }
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Warning (1264): Data truncated for column 'Name' at row 1
```

24.8.2.5.1. `mysqli_stmt->affected_rows`, `mysqli_stmt_affected_rows`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_stmt->affected_rows`
`mysqli_stmt_affected_rows`

Returns the total number of rows changed, deleted, or inserted by the last executed statement

Description

Object oriented style (property):

```

mysqli_stmt {
    int affected_rows ;
}

```

Procedural style :

```
int mysqli_stmt_affected_rows(mysqli_stmt stmt);
```

Returns the number of rows affected by [INSERT](#), [UPDATE](#), or [DELETE](#) query.

This function only works with queries which update a table. In order to get the number of rows from a [SELECT](#) query, use [mysqli_stmt_num_rows](#) instead.

Parameters

stmt Procedural style only: A statement identifier returned by [mysqli_stmt_init](#).

Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an [UPDATE/DELETE](#) statement, no rows matched the [WHERE](#) clause in the query or that no query has yet been executed. -1 indicates that the query has returned an error.

Note

If the number of affected rows is greater than maximal PHP int value, the number of affected rows will be returned as a string value.

Examples

Example 24.138. Object oriented style

```

<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

```

```

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* create temp table */
$mysqli->query("CREATE TEMPORARY TABLE myCountry LIKE Country");

$query = "INSERT INTO myCountry SELECT * FROM Country WHERE Code LIKE ?";

/* prepare statement */
if ($stmt = $mysqli->prepare($query)) {
    /* Bind variable for placeholder */
    $code = 'A%';
    $stmt->bind_param("s", $code);

    /* execute statement */
    $stmt->execute();

    printf("rows inserted: %d\n", $stmt->affected_rows);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>

```

Example 24.139. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* create temp table */
mysqli_query($link, "CREATE TEMPORARY TABLE myCountry LIKE Country");

$query = "INSERT INTO myCountry SELECT * FROM Country WHERE Code LIKE ?";

/* prepare statement */
if ($stmt = mysqli_prepare($link, $query)) {
    /* Bind variable for placeholder */
    $code = 'A%';
    mysqli_stmt_bind_param($stmt, "s", $code);

    /* execute statement */
    mysqli_stmt_execute($stmt);

    printf("rows inserted: %d\n", mysqli_stmt_affected_rows($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
rows inserted: 17
```

24.8.2.5.4. `mysqli_stmt::bind_param`, `mysqli_stmt_bind_param`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::bind_param`
`mysqli_stmt_bind_param`

Binds variables to a prepared statement as parameters

Description

Object oriented style (method):

```
bool mysqli_stmt::bind_param(string types,
                             mixed var1,
                             mixed ...);
```

Procedural style:

```
bool mysqli_stmt_bind_param(mysqli_stmt stmt,
                             string types,
                             mixed var1,
                             mixed ...);
```

Bind variables for the parameter markers in the SQL statement that was passed to `mysqli_prepare`.

Note

If data size of a variable exceeds max. allowed packet size (`max_allowed_packet`), you have to specify `b` in `types` and use `mysqli_stmt_send_long_data` to send the data in packets.

Parameters

<code>stmt</code>	Procedural style only: A statement identifier returned by <code>mysqli_stmt_init</code> .
<code>types</code>	A string that contains one or more characters which specify the types for the corresponding bind variables:

Table 24.10. Type specification chars

Character	Description
i	corresponding variable has type integer
d	corresponding variable has type double
s	corresponding variable has type string
b	corresponding variable is a blob and will be sent in packets

`var1` The number of variables and length of string `types` must match the parameters in the statement.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples**Example 24.140. Object oriented style**

```
<?php
$mysqli = new mysqli('localhost', 'my_user', 'my_password', 'world');

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$stmt = $mysqli->prepare("INSERT INTO CountryLanguage VALUES (?, ?, ?, ?)");
$stmt->bind_param('sssd', $code, $language, $official, $percent);

$code = 'DEU';
$language = 'Bavarian';
$official = "F";
$percent = 11.2;

/* execute prepared statement */
$stmt->execute();

printf("%d Row inserted.\n", $stmt->affected_rows);

/* close statement and connection */
$stmt->close();

/* Clean up table CountryLanguage */
$mysqli->query("DELETE FROM CountryLanguage WHERE Language='Bavarian'");
printf("%d Row deleted.\n", $mysqli->affected_rows);

/* close connection */
$mysqli->close();
?>
```

Example 24.141. Procedural style

```

<?php
$link = mysqli_connect('localhost', 'my_user', 'my_password', 'world');

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$stmt = mysqli_prepare($link, "INSERT INTO CountryLanguage VALUES (?, ?, ?, ?)");
mysqli_stmt_bind_param($stmt, 'sssd', $code, $language, $official, $percent);

$code = 'DEU';
$language = 'Bavarian';
$official = "F";
$percent = 11.2;

/* execute prepared statement */
mysqli_stmt_execute($stmt);

printf("%d Row inserted.\n", mysqli_stmt_affected_rows($stmt));

/* close statement and connection */
mysqli_stmt_close($stmt);

/* Clean up table CountryLanguage */
mysqli_query($link, "DELETE FROM CountryLanguage WHERE Language='Bavarian'");
printf("%d Row deleted.\n", mysqli_affected_rows($link));

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

1 Row inserted.
1 Row deleted.

```

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli_stmt::bind_result](#)

[mysqli_stmt_bind_result](#)

Binds variables to a prepared statement for result storage

Description

Object oriented style (method):

```

bool mysqli_stmt::bind_result(mixed var1,
                             mixed ...);

```

Procedural style:

```

bool mysqli_stmt_bind_result(mysqli_stmt stmt,
                             mixed var1,
                             mixed ...);

```

Binds columns in the result set to variables.

When `mysqli_stmt_fetch` is called to fetch data, the MySQL client/server protocol places the data for the bound columns into the specified variables `var1`,

Note

Note that all columns must be bound after `mysqli_stmt_execute` and prior to calling `mysqli_stmt_fetch`. Depending on column types bound variables can silently change to the corresponding PHP type.

A column can be bound or rebound at any time, even after a result set has been partially retrieved. The new binding takes effect the next time `mysqli_stmt_fetch` is called.

Parameters

<code>stmt</code>	Procedural style only: A statement identifier returned by <code>mysqli_stmt_init</code> .
<code>var1</code>	The variable to be bound.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples

Example 24.142. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* prepare statement */
if ($stmt = $mysqli->prepare("SELECT Code, Name FROM Country ORDER BY Name LIMIT 5")) {
    $stmt->execute();

    /* bind variables to prepared statement */
    $stmt->bind_result($col1, $col2);

    /* fetch values */
    while ($stmt->fetch()) {
        printf("%s %s\n", $col1, $col2);
    }

    /* close statement */
    $stmt->close();
}
/* close connection */
$mysqli->close();

?>
```

Example 24.143. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* prepare statement */
if ($stmt = mysqli_prepare($link, "SELECT Code, Name FROM Country ORDER BY Name LIMIT 5")) {
    mysqli_stmt_execute($stmt);

    /* bind variables to prepared statement */
    mysqli_stmt_bind_result($stmt, $col1, $col2);
```

```
/* fetch values */
while (mysqli_stmt_fetch($stmt)) {
    printf("%s %s\n", $col1, $col2);
}

/* close statement */
mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
AFG Afghanistan
ALB Albania
DZA Algeria
ASM American Samoa
AND Andorra
```

24.8.2.5.6. `mysqli_stmt::close`, `mysqli_stmt_close`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::close`
`mysqli_stmt_close`

Closes a prepared statement

Description

Object oriented style (method):

```
bool mysqli_stmt::close();
```

Procedural style:

```
bool mysqli_stmt_close(mysqli_stmt stmt);
```

Closes a prepared statement. `mysqli_stmt_close` also deallocates the statement handle. If the current statement has pending or unread results, this function cancels them so that the next query can be executed.

Parameters

stmt

Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

See Also

`mysqli_prepare`

24.8.2.5.7. `mysqli_stmt::data_seek`, `mysqli_stmt_data_seek`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::data_seek`
`mysqli_stmt_data_seek`

Seeks to an arbitrary row in statement result set

Description

Object oriented style (method):

```
void mysqli_stmt::data_seek(int offset);
```

Procedural style:

```
void mysqli_stmt_data_seek(mysqli_stmt stmt,
int offset);
```

Seeks to an arbitrary result pointer in the statement result set.

Parameters

<code>stmt</code>	Procedural style only: A statement identifier returned by <code>mysqli_stmt_init</code> .
<code>offset</code>	Must be between zero and the total number of rows minus one (<code>mysqli_stmt_num_rows - 1</code>).

Return Values

No value is returned.

Examples

Example 24.144. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* execute query */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($name, $code);

    /* store result */
    $stmt->store_result();

    /* seek to row no. 400 */
    $stmt->data_seek(399);

    /* fetch values */
```

```

$stmt->fetch();

printf ("City: %s  Countrycode: %s\n", $name, $code);

/* close statement */
$stmt->close();
}

/* close connection */
mysqli->close();
?>

```

Example 24.145. Procedural style

```

<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $name, $code);

    /* store result */
    mysqli_stmt_store_result($stmt);

    /* seek to row no. 400 */
    mysqli_stmt_data_seek($stmt, 399);

    /* fetch values */
    mysqli_stmt_fetch($stmt);

    printf ("City: %s  Countrycode: %s\n", $name, $code);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
City: Benin City  Countrycode: NGA
```

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli_stmt->errno](#)
- [mysqli_stmt_errno](#)

Returns the error code for the most recent statement call

Description

Object oriented style (property):

```
mysqli_stmt {
    int errno ;
}
```

Procedural style :

```
int mysqli_stmt_errno(mysqli_stmt stmt);
```

Returns the error code for the most recently invoked statement function that can succeed or fail.

Client error message numbers are listed in the MySQL [errmsg.h](#) header file, server error message numbers are listed in [mysqld_error.h](#). In the MySQL source distribution you can find a complete list of error messages and error numbers in the file [Docs/mysqld_error.txt](#).

Parameters

stmt Procedural style only: A statement identifier returned by [mysqli_stmt_init](#).

Return Values

An error code value. Zero means no error occurred.

Examples

Example 24.146. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCountry LIKE Country");
$mysqli->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* drop table */
    $mysqli->query("DROP TABLE myCountry");

    /* execute query */
    $stmt->execute();

    printf("Error: %d.\n", $stmt->errno);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 24.147. Procedural style

```

<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* drop table */
    mysqli_query($link, "DROP TABLE myCountry");

    /* execute query */
    mysqli_stmt_execute($stmt);

    printf("Error: %d.\n", mysqli_stmt_errno($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Error: 1146.
```

- [mysqli_stmt->error](#)
[mysqli_stmt_error](#)

Returns a string description for last statement error

Description

Object oriented style (property):

```

mysqli_stmt {
    string error ;
}

```

Procedural style:

```
string mysqli_stmt_error(mysqli_stmt stmt);
```

Returns a containing the error message for the most recently invoked statement function that can succeed or fail.

Parameters*stmt*Procedural style only: A statement identifier returned by `mysqli_stmt_init`.**Return Values**

A string that describes the error. An empty string if no error occurred.

Examples**Example 24.148. Object oriented style**

```

<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCountry LIKE Country");
$mysqli->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* drop table */
    $mysqli->query("DROP TABLE myCountry");

    /* execute query */
    $stmt->execute();

    printf("Error: %s.\n", $stmt->error);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>

```

Example 24.149. Procedural style

```

<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* drop table */
    mysqli_query($link, "DROP TABLE myCountry");

    /* execute query */
    mysqli_stmt_execute($stmt);

    printf("Error: %s.\n", mysqli_stmt_error($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);

```

```
?>
```

The above example will output:

```
Error: Table 'world.myCountry' doesn't exist.
```

[mysqli_stmt_execute](#)

Executes a prepared Query

Description

Object oriented style (method):

```
bool mysqli_stmt::execute();
```

Procedural style:

```
bool mysqli_stmt_execute(mysqli_stmt stmt);
```

Executes a query that has been previously prepared using the [mysqli_prepare](#) function. When executed any parameter markers which exist will automatically be replaced with the appropriate data.

If the statement is [UPDATE](#), [DELETE](#), or [INSERT](#), the total number of affected rows can be determined by using the [mysqli_stmt_affected_rows](#) function. Likewise, if the query yields a result set the [mysqli_stmt_fetch](#) function is used.

Note

When using [mysqli_stmt_execute](#), the [mysqli_stmt_fetch](#) function must be used to fetch the data prior to performing any additional queries.

Parameters

stmt Procedural style only: A statement identifier returned by [mysqli_stmt_init](#).

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

Examples

Example 24.150. Object oriented style

```

<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCity LIKE City");

/* Prepare an insert statement */
$query = "INSERT INTO myCity (Name, CountryCode, District) VALUES (?, ?, ?)";
$stmt = $mysqli->prepare($query);

$stmt->bind_param("sss", $vall, $val2, $val3);

$vall = 'Stuttgart';
$val2 = 'DEU';
$val3 = 'Baden-Wuerttemberg';

/* Execute the statement */
$stmt->execute();

$vall = 'Bordeaux';
$val2 = 'FRA';
$val3 = 'Aquitaine';

/* Execute the statement */
$stmt->execute();

/* close statement */
$stmt->close();

/* retrieve all rows from myCity */
$query = "SELECT Name, CountryCode, District FROM myCity";
if ($result = $mysqli->query($query)) {
    while ($row = $result->fetch_row()) {
        printf("%s (%s,%s)\n", $row[0], $row[1], $row[2]);
    }
    /* free result set */
    $result->close();
}

/* remove table */
$mysqli->query("DROP TABLE myCity");

/* close connection */
$mysqli->close();
?>

```

Example 24.151. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCity LIKE City");

/* Prepare an insert statement */
$query = "INSERT INTO myCity (Name, CountryCode, District) VALUES (?, ?, ?)";
$stmt = mysqli_prepare($link, $query);

mysqli_stmt_bind_param($stmt, "sss", $vall, $val2, $val3);

$vall = 'Stuttgart';
$val2 = 'DEU';
$val3 = 'Baden-Wuerttemberg';

/* Execute the statement */
mysqli_stmt_execute($stmt);

$vall = 'Bordeaux';
$val2 = 'FRA';
$val3 = 'Aquitaine';

/* Execute the statement */
mysqli_stmt_execute($stmt);

/* close statement */
mysqli_stmt_close($stmt);

/* retrieve all rows from myCity */

```

```

$query = "SELECT Name, CountryCode, District FROM myCity";
if ($result = mysqli_query($link, $query)) {
    while ($row = mysqli_fetch_row($result)) {
        printf("%s (%s,%s)\n", $row[0], $row[1], $row[2]);
    }
    /* free result set */
    mysqli_free_result($result);
}

/* remove table */
mysqli_query($link, "DROP TABLE myCity");

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Stuttgart (DEU,Baden-Wuerttemberg)
Bordeaux (FRA,Aquitaine)

```

Fetch results from a prepared statement into the bound variables

Description

Object oriented style (method):

```
bool mysqli_stmt::fetch();
```

Procedural style:

```
bool mysqli_stmt_fetch(mysqli_stmt stmt);
```

Fetch the result from a prepared statement into the variables bound by [mysqli_stmt_bind_result](#).

Note

Note that all columns must be bound by the application before calling [mysqli_stmt_fetch](#).

Parameters

stmt

Procedural style only: A statement identifier returned by [mysqli_stmt_init](#).

Return Values

Table 24.11. Return Values

Value	Description
TRUE	Success. Data has been fetched
FALSE	Error occurred
NULL	No more rows/data exists or data truncation occurred

Examples

Example 24.152. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 150,5";

if ($stmt = $mysqli->prepare($query)) {

    /* execute statement */
    $stmt->execute();

    /* bind result variables */
    $stmt->bind_result($name, $code);

    /* fetch values */
    while ($stmt->fetch()) {
        printf ("%s (%s)\n", $name, $code);
    }

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 24.153. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 150,5";

if ($stmt = mysqli_prepare($link, $query)) {

    /* execute statement */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $name, $code);

    /* fetch values */
    while (mysqli_stmt_fetch($stmt)) {
        printf ("%s (%s)\n", $name, $code);
    }

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Rockford (USA)
Tallahassee (USA)
Salinas (USA)
Santa Clarita (USA)
Springfield (USA)
```

`mysqli_stmt_free_result`

Frees stored result memory for the given statement handle

Description

Object oriented style (method):

```
void mysqli_stmt::free_result();
```

Procedural style:

```
void mysqli_stmt_free_result(mysqli_stmt stmt);
```

Frees the result memory associated with the statement, which was allocated by `mysqli_stmt_store_result`.

Parameters

stmt

Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

No value is returned.

See Also

    int insert_id ;  
}
```

```
mixed mysqli_stmt_insert_id(mysqli_stmt stmt);
```

Warning

This function is currently not documented; only its argument list is available.

24.8.2.5.16. `mysqli_stmt::num_rows`, `mysqli_stmt_num_rows`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::num_rows`
`mysqli_stmt_num_rows`
Return the number of rows in statements result set

Description

Object oriented style (property):

```
mysql_stmt {
    int num_rows ;
}
```

Procedural style :

```
int mysql_stmt_num_rows(mysql_stmt stmt);
```

Returns the number of rows in the result set. The use of `mysql_stmt_num_rows` depends on whether or not you used `mysql_stmt_store_result` to buffer the entire result set in the statement handle.

If you use `mysql_stmt_store_result`, `mysql_stmt_num_rows` may be called immediately.

Parameters

stmt

Procedural style only: A statement identifier returned by `mysql_stmt_init`.

Return Values

An integer representing the number of rows in result set.

Examples

Example 24.154. Object oriented style

```
<?php
/* Open a connection */
$link = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = $mysqli->prepare($query)) {

    /* execute query */
    $stmt->execute();

    /* store result */
    $stmt->store_result();

    printf("Number of rows: %d.\n", $stmt->num_rows);

    /* close statement */
    $stmt->close();
}

/* close connection */
$link->close();
?>
```

Example 24.155. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
```

```

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* store result */
    mysqli_stmt_store_result($stmt);

    printf("Number of rows: %d.\n", mysqli_stmt_num_rows($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Number of rows: 20.
```

[mysqli_stmt_param_count](#)

Returns the number of parameter for the given statement

Description

Object oriented style (property):

```

mysqli_stmt {
    int param_count ;
}

```

Procedural style:

```
int mysqli_stmt_param_count(mysqli_stmt stmt);
```

Returns the number of parameter markers present in the prepared statement.

Parameters

stmt Procedural style only: A statement identifier returned by [mysqli_stmt_init](#).

Return Values

Returns an integer representing the number of parameters.

Examples

Example 24.156. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($stmt = $mysqli->prepare("SELECT Name FROM Country WHERE Name=? OR Code=?")) {

    $marker = $stmt->param_count;
    printf("Statement has %d markers.\n", $marker);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 24.157. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($stmt = mysqli_prepare($link, "SELECT Name FROM Country WHERE Name=? OR Code=?")) {

    $marker = mysqli_stmt_param_count($stmt);
    printf("Statement has %d markers.\n", $marker);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Statement has 2 markers.
```

- [mysqli_stmt_prepare](#)

Prepare a SQL statement for execution

Description

Object oriented style (method)

```
mixed mysqli_stmt::prepare(string query);
```

Procedure style:

```
bool mysqli_stmt_prepare(mysqli_stmt stmt,
                        string query);
```

Prepares the SQL query pointed to by the null-terminated string query.

The parameter markers must be bound to application variables using [mysqli_stmt_bind_param](#) and/or [mysqli_stmt_bind_result](#) before executing the statement or fetching rows.

Parameters

<i>stmt</i>	Procedural style only: A statement identifier returned by mysqli_stmt_init .
<i>query</i>	The query, as a string. It must consist of a single SQL statement. You can include one or more parameter markers in the SQL statement by embedding question mark (?) characters at the appropriate positions.

Note

You should not add a terminating semicolon or `\g` to the statement.

Note

The markers are legal only in certain places in SQL statements. For example, they are allowed in the VALUES() list of an INSERT statement (to specify column values for a row), or in a comparison with a column in a WHERE clause to specify a comparison value.

However, they are not allowed for identifiers (such as table or column names), in the select list that names the columns to be returned by a SELECT statement, or to specify both operands of a binary operator such as the = equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

Examples

Example 24.158. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
$stmt = $mysqli->stmt_init();
if ($stmt->prepare("SELECT District FROM City WHERE Name=?") {

    /* bind parameters for markers */
    $stmt->bind_param("s", $city);
```

```

/* execute query */
$stmt->execute();

/* bind result variables */
$stmt->bind_result($district);

/* fetch value */
$stmt->fetch();

printf("%s is in district %s\n", $city, $district);

/* close statement */
$stmt->close();
}

/* close connection */
mysqli->close();
?>

```

Example 24.159. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$city = "Amersfoort";

/* create a prepared statement */
$stmt = mysqli_stmt_init($link);
if (mysqli_stmt_prepare($stmt, 'SELECT District FROM City WHERE Name=?')) {

    /* bind parameters for markers */
    mysqli_stmt_bind_param($stmt, "s", $city);

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* bind result variables */
    mysqli_stmt_bind_result($stmt, $district);

    /* fetch value */
    mysqli_stmt_fetch($stmt);

    printf("%s is in district %s\n", $city, $district);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Amersfoort is in district Utrecht
```

24.8.2.5.19. [mysqli_stmt::reset](#), [mysqli_stmt_reset](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::reset`
`mysqli_stmt_reset`
Resets a prepared statement

Description

Object oriented style (method):

```
bool mysqli_stmt::reset();
```

Procedural style:

```
bool mysqli_stmt_reset(mysqli_stmt stmt);
```

Resets a prepared statement on client and server to state after prepare.

For now this is mainly used to reset data sent with `mysqli_stmt_send_long_data`.

To prepare a statement with another query use function `mysqli_stmt_prepare`.

Parameters

stmt Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

See Also

`mysqli_prepare`

24.8.2.5.20. `mysqli_stmt::result_metadata`, `mysqli_stmt_result_metadata`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::result_metadata`
`mysqli_stmt_result_metadata`
Returns result set metadata from a prepared statement

Description

Object oriented style (method):

```
mysqli_result mysqli_stmt::result_metadata();
```

Procedural style:

```
mysqli_result mysqli_stmt_result_metadata(mysqli_stmt stmt);
```

If a statement passed to `mysqli_prepare` is one that produces a result set, `mysqli_stmt_result_metadata` returns the result object that can be used to process the meta information such as total number of fields and individual field information.

Note

This result set pointer can be passed as an argument to any of the field-based functions that process result set metadata, such as:

- `mysqli_num_fields`
- `mysqli_fetch_field`
- `mysqli_fetch_field_direct`
- `mysqli_fetch_fields`
- `mysqli_field_count`
- `mysqli_field_seek`
- `mysqli_field_tell`
- `mysqli_free_result`

The result set structure should be freed when you are done with it, which you can do by passing it to `mysqli_free_result`

Note

The result set returned by `mysqli_stmt_result_metadata` contains only metadata. It does not contain any row results. The rows are obtained by using the statement handle with `mysqli_stmt_fetch`.

Parameters

`stmt` Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns a result object or `FALSE` if an error occurred.

Examples

Example 24.160. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "test");

$mysqli->query("DROP TABLE IF EXISTS friends");
$mysqli->query("CREATE TABLE friends (id int, name varchar(20))");

$mysqli->query("INSERT INTO friends VALUES (1,'Hartmut'), (2, 'Ulf')");

$stmt = $mysqli->prepare("SELECT id, name FROM friends");
$stmt->execute();

/* get resultset for metadata */
$result = $stmt->result_metadata();

/* retrieve field information from metadata result set */
$field = $result->fetch_field();

printf("Fieldname: %s\n", $field->name);

/* close resultset */
$result->close();

/* close connection */
$mysqli->close();
?>
```

Example 24.161. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "test");
mysqli_query($link, "DROP TABLE IF EXISTS friends");
```

```

mysqli_query($link, "CREATE TABLE friends (id int, name varchar(20))");
mysqli_query($link, "INSERT INTO friends VALUES (1, 'Hartmut'), (2, 'Ulf')");

$stmt = mysqli_prepare($link, "SELECT id, name FROM friends");
mysqli_stmt_execute($stmt);

/* get resultset for metadata */
$result = mysqli_stmt_result_metadata($stmt);

/* retrieve field information from metadata result set */
$field = mysqli_fetch_field($result);

printf("Fieldname: %s\n", $field->name);

/* close resultset */
mysqli_free_result($result);

/* close connection */
mysqli_close($link);
?>

```

24.8.2.5.21. [mysqli_stmt::send_long_data](#), [mysqli_stmt_send_long_data](#)

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli_stmt::send_long_data](#)
[mysqli_stmt_send_long_data](#)

Send data in blocks

Description

Object oriented style (method)

```
bool mysqli_stmt::send_long_data(int param_nr,
                                string data);
```

Procedural style:

```
bool mysqli_stmt_send_long_data(mysqli_stmt stmt,
                                int param_nr,
                                string data);
```

Allows to send parameter data to the server in pieces (or chunks), e.g. if the size of a blob exceeds the size of [max_allowed_packet](#). This function can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the TEXT or BLOB datatypes.

Parameters

<i>stmt</i>	Procedural style only: A statement identifier returned by mysqli_stmt_init .
<i>param_nr</i>	Indicates which parameter to associate the data with. Parameters are numbered beginning with 0.
<i>data</i>	A string containing data to be sent.

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

Examples

Example 24.162. Object oriented style

```
<?php
$stmt = $mysqli->prepare("INSERT INTO messages (message) VALUES (?)");
$null = NULL;
$stmt->bind_param("b", $null);
$fp = fopen("messages.txt", "r");
while (!feof($fp)) {
    $stmt->send_long_data(0, fread($fp, 8192));
}
fclose($fp);
$stmt->execute();
?>
```

24.8.2.5.22. `mysqli_stmt::sqlstate`, `mysqli_stmt_sqlstate`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::sqlstate`
`mysqli_stmt_sqlstate`

Returns SQLSTATE error from previous statement operation

Description

Object oriented style (property):

```
mysqli_stmt {
    string sqlstate ;
}
```

Procedural style:

```
string mysqli_stmt_sqlstate(mysqli_stmt stmt);
```

Returns a string containing the SQLSTATE error code for the most recently invoked prepared statement function that can succeed or fail. The error code consists of five characters. '00000' means no error. The values are specified by ANSI SQL and ODBC. For a list of possible values, see <http://dev.mysql.com/doc/mysql/en/error-handling.html>.

Parameters

stmt Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns a string containing the SQLSTATE error code for the last error. The error code consists of five characters. '00000' means no error.

Notes**Note**

Note that not all MySQL errors are yet mapped to SQLSTATE's. The value `HY000` (general error) is used for un-mapped errors.

Examples

Example 24.163. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$mysqli->query("CREATE TABLE myCountry LIKE Country");
$mysqli->query("INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = $mysqli->prepare($query)) {

    /* drop table */
    $mysqli->query("DROP TABLE myCountry");

    /* execute query */
    $stmt->execute();

    printf("Error: %s.\n", $stmt->sqlstate);

    /* close statement */
    $stmt->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 24.164. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

mysqli_query($link, "CREATE TABLE myCountry LIKE Country");
mysqli_query($link, "INSERT INTO myCountry SELECT * FROM Country");

$query = "SELECT Name, Code FROM myCountry ORDER BY Name";
if ($stmt = mysqli_prepare($link, $query)) {

    /* drop table */
    mysqli_query($link, "DROP TABLE myCountry");

    /* execute query */
    mysqli_stmt_execute($stmt);

    printf("Error: %s.\n", mysqli_stmt_sqlstate($stmt));

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Error: 42S02.
```

24.8.2.5.23. `mysqli_stmt::store_result`, `mysqli_stmt_store_result`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_stmt::store_result`
`mysqli_stmt_store_result`

Transfers a result set from a prepared statement

Description

Object oriented style (method):

```
bool mysqli_stmt::store_result();
```

Procedural style:

```
bool mysqli_stmt_store_result(mysqli_stmt $stmt);
```

You must call `mysqli_stmt_store_result` for every query that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`), and only if you want to buffer the complete result set by the client, so that the subsequent `mysqli_stmt_fetch` call returns buffered data.

Note

It is unnecessary to call `mysqli_stmt_store_result` for other queries, but if you do, it will not harm or cause any notable performance in all cases. You can detect whether the query produced a result set by checking if `mysqli_stmt_result_metadata` returns `NULL`.

Parameters

stmt Procedural style only: A statement identifier returned by `mysqli_stmt_init`.

Return Values

Returns `TRUE` on success or `FALSE` on failure.

Examples**Example 24.165. Object oriented style**

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = $mysqli->prepare($query)) {

    /* execute query */
    $stmt->execute();

    /* store result */
```

```

$stmt->store_result();

printf("Number of rows: %d.\n", $stmt->num_rows);

/* free result */
$stmt->free_result();

/* close statement */
$stmt->close();
}

/* close connection */
mysqli->close();
?>

```

Example 24.166. Procedural style

```

<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name LIMIT 20";
if ($stmt = mysqli_prepare($link, $query)) {

    /* execute query */
    mysqli_stmt_execute($stmt);

    /* store result */
    mysqli_stmt_store_result($stmt);

    printf("Number of rows: %d.\n", mysqli_stmt_num_rows($stmt));

    /* free result */
    mysqli_stmt_free_result($stmt);

    /* close statement */
    mysqli_stmt_close($stmt);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Number of rows: 20.
```

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_result->current_field`

`mysqli_field_tell`

Get current field offset of a result pointer

Description

Object oriented style (property):

```

mysqli_result {
    int current_field ;
}

```

Procedural style:

```

int mysqli_field_tell(mysqli_result result);

```

Returns the position of the field cursor used for the last `mysqli_fetch_field` call. This value can be used as an argument to `mysqli_field_seek`.

Parameters

result Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns current offset of field cursor.

Examples

Example 24.167. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = $mysqli->query($query)) {

    /* Get field information for all columns */
    while ($finfo = $result->fetch_field()) {

        /* get fieldpointer offset */
        $currentfield = $result->current_field;

        printf("Column %d:\n", $currentfield);
        printf("Name:      %s\n", $finfo->name);
        printf("Table:     %s\n", $finfo->table);
        printf("max. Len:  %d\n", $finfo->max_length);
        printf("Flags:      %d\n", $finfo->flags);
        printf("Type:       %d\n\n", $finfo->type);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 24.168. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = mysqli_query($link, $query)) {

    /* Get field information for all fields */
    while ($finfo = mysqli_fetch_field($result)) {

        /* get fieldpointer offset */
        $currentfield = mysqli_field_tell($result);

        printf("Column %d:\n", $currentfield);
        printf("Name:      %s\n", $finfo->name);
        printf("Table:     %s\n", $finfo->table);
        printf("max. Len:  %d\n", $finfo->max_length);
        printf("Flags:      %d\n", $finfo->flags);
        printf("Type:       %d\n\n", $finfo->type);
    }
}
```

```

    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Column 1:
Name:      Name
Table:     Country
max. Len:  11
Flags:     1
Type:      254

Column 2:
Name:      SurfaceArea
Table:     Country
max. Len:  10
Flags:     32769
Type:      4

```

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli_result::data_seek](#)
[mysqli_data_seek](#)

Adjusts the result pointer to an arbitrary row in the result

Description

Object oriented style (method):

```
bool mysqli_result::data_seek(int offset);
```

Procedural style:

```
bool mysqli_data_seek(mysqli_result result,
                      int offset);
```

The [mysqli_data_seek](#) function seeks to an arbitrary result pointer specified by the *offset* in the result set.

Parameters

- | | |
|---------------|--|
| <i>result</i> | Procedural style only: A result set identifier returned by mysqli_query , mysqli_store_result or mysqli_use_result . |
| <i>offset</i> | The field offset. Must be between zero and the total number of rows minus one (0.. mysqli_num_rows - 1). |

Return Values

Returns **TRUE** on success or **FALSE** on failure.

Notes

Note

This function can only be used with buffered results attained from the use of the `mysqli_store_result` or `mysqli_query` functions.

Examples

Example 24.169. Object oriented style

```
<?php
/* Open a connection */
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($result = $mysqli->query($query)) {

    /* seek to row no. 400 */
    $result->data_seek(399);

    /* fetch row */
    $row = $result->fetch_row();

    printf("City: %s Countrycode: %s\n", $row[0], $row[1]);

    /* free result set*/
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 24.170. Procedural style

```
<?php
/* Open a connection */
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (!$link) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER BY Name";
if ($result = mysqli_query($link, $query)) {

    /* seek to row no. 400 */
    mysqli_data_seek($result, 399);

    /* fetch row */
    $row = mysqli_fetch_row($result);

    printf("City: %s Countrycode: %s\n", $row[0], $row[1]);

    /* free result set*/
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
City: Benin City Countrycode: NGA
```

```
mysqli_store_result
mysqli_fetch_row
mysqli_fetch_array
mysqli_fetch_assoc
mysqli_fetch_object
mysqli_query
mysqli_num_rows
```

24.8.2.6.3. `mysqli_result::fetch_array`, `mysqli_fetch_array`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_result::fetch_array`
`mysqli_fetch_array`

Fetch a result row as an associative, a numeric array, or both

Description

Object oriented style (method):

```
mixed mysqli_result::fetch_array(int resulttype);
```

Procedural style:

```
mixed mysqli_fetch_array(mysqli_result result,
                          int resulttype);
```

Returns an array that corresponds to the fetched row or `NULL` if there are no more rows for the resultset represented by the `result` parameter.

`mysqli_fetch_array` is an extended version of the `mysqli_fetch_row` function. In addition to storing the data in the numeric indices of the result array, the `mysqli_fetch_array` function can also store the data in associative indices, using the field names of the result set as keys.

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets `NULL` fields to the PHP `NULL` value.

If two or more columns of the result have the same field names, the last column will take precedence and overwrite the earlier data. In order to access multiple columns with the same name, the numerically indexed version of the row must be used.

Parameters

`result` Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

`resulttype` This optional parameter is a constant indicating what type of array should be produced from the current row data. The possible values for this parameter are the constants `MYSQLI_ASSOC`, `MYSQLI_NUM`, or `MYSQLI_BOTH`. Defaults to `MYSQLI_BOTH`.

By using the `MYSQLI_ASSOC` constant this function will behave identically to the

`mysqli_fetch_assoc`, while `MYSQLI_NUM` will behave identically to the `mysqli_fetch_row` function. The final option `MYSQLI_BOTH` will create a single array with the attributes of both.

Return Values

Returns an array of strings that corresponds to the fetched row or `NULL` if there are no more rows in resultset.

Examples

Example 24.171. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID LIMIT 3";
$result = $mysqli->query($query);

/* numeric array */
$row = $result->fetch_array(MYSQLI_NUM);
printf ("%s (%s)\n", $row[0], $row[1]);

/* associative array */
$row = $result->fetch_array(MYSQLI_ASSOC);
printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);

/* associative and numeric array */
$row = $result->fetch_array(MYSQLI_BOTH);
printf ("%s (%s)\n", $row[0], $row["CountryCode"]);

/* free result set */
$result->close();

/* close connection */
$mysqli->close();
?>
```

Example 24.172. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID LIMIT 3";
$result = mysqli_query($link, $query);

/* numeric array */
$row = mysqli_fetch_array($result, MYSQLI_NUM);
printf ("%s (%s)\n", $row[0], $row[1]);

/* associative array */
$row = mysqli_fetch_array($result, MYSQLI_ASSOC);
printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);

/* associative and numeric array */
$row = mysqli_fetch_array($result, MYSQLI_BOTH);
printf ("%s (%s)\n", $row[0], $row["CountryCode"]);

/* free result set */
mysqli_free_result($result);

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Kabul (AFG)
Qandahar (AFG)
Herat (AFG)
```

```
mysqli_fetch_assoc
mysqli_fetch_row
mysqli_fetch_object
mysqli_query
mysqli_data_seek
```

24.8.2.6.4. `mysqli_result::fetch_assoc`, `mysqli_fetch_assoc`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_result::fetch_assoc`
`mysqli_fetch_assoc`
Fetch a result row as an associative array

Description

Object oriented style (method):

```
array mysqli_result::fetch_assoc();
```

Procedural style:

```
array mysqli_fetch_assoc(mysqli_result result);
```

Returns an associative array that corresponds to the fetched row or `NULL` if there are no more rows.

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets `NULL` fields to the PHP `NULL` value.

Parameters

result Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns an associative array of strings representing the fetched row in the result set, where each key in the array represents the name of one of the result set's columns or `NULL` if there are no more rows in resultset.

If two or more columns of the result have the same field names, the last column will take precedence. To access the other column(s) of the same name, you either need to access the result with numeric indices by using `mysqli_fetch_row` or add alias names.

Examples

Example 24.173. Object oriented style

```

<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";
if ($result = $mysqli->query($query)) {

    /* fetch associative array */
    while ($row = $result->fetch_assoc()) {
        printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);
    }

    /* free result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>

```

Example 24.174. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";
if ($result = mysqli_query($link, $query)) {

    /* fetch associative array */
    while ($row = mysqli_fetch_assoc($result)) {
        printf ("%s (%s)\n", $row["Name"], $row["CountryCode"]);
    }

    /* free result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)

```

24.8.2.6.5. `mysqli_result::fetch_field_direct`, `mysqli_fetch_field_direct`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_result::fetch_field_direct`
`mysqli_fetch_field_direct`
Fetch meta-data for a single field

Description

Object oriented style (method):

```
object mysqli_result::fetch_field_direct(int fieldnr);
```

Procedural style:

```
object mysqli_fetch_field_direct(mysqli_result result,
                                int fieldnr);
```

Returns an object which contains field definition informations from specified resultset.

Parameters

- result* Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.
- fieldnr* The field number. This value must be in the range from 0 to `number of fields - 1`.

Return Values

Returns an object which contains field definition information or `FALSE` if no field information for specified `fieldnr` is available.

Table 24.12. Object attributes

Attribute	Description
<code>name</code>	The name of the column
<code>orgname</code>	Original column name if an alias was specified
<code>table</code>	The name of the table this field belongs to (if not calculated)
<code>orgtable</code>	Original table name if an alias was specified
<code>def</code>	The default value for this field, represented as a string
<code>max_length</code>	The maximum width of the field for the result set.
<code>length</code>	The width of the field, as specified in the tabl definition.
<code>charsetnr</code>	The character set number for the field.
<code>flags</code>	An integer representing the bit-flags for the field.
<code>type</code>	The data type used for this field
<code>decimals</code>	The number of decimals used (for integer fields)

Examples

Example 24.175. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");
```

```

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Name LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for column 'SurfaceArea' */
    $finfo = $result->fetch_field_direct(1);

    printf("Name:      %s\n", $finfo->name);
    printf("Table:     %s\n", $finfo->table);
    printf("max. Len:  %d\n", $finfo->max_length);
    printf("Flags:    %d\n", $finfo->flags);
    printf("Type:     %d\n", $finfo->type);

    $result->close();
}

/* close connection */
$mysqli->close();
?>

```

Example 24.176. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Name LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for column 'SurfaceArea' */
    $finfo = mysqli_fetch_field_direct($result, 1);

    printf("Name:      %s\n", $finfo->name);
    printf("Table:     %s\n", $finfo->table);
    printf("max. Len:  %d\n", $finfo->max_length);
    printf("Flags:    %d\n", $finfo->flags);
    printf("Type:     %d\n", $finfo->type);

    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Name:      SurfaceArea
Table:     Country
max. Len:  10
Flags:     32769
Type:      4

```

- `mysqli_result::fetch_field`

`mysqli_fetch_field`

Returns the next field in the result set

Description

Object oriented style (method):

```
object mysqli_result::fetch_field();
```

Procedural style:

```
object mysqli_fetch_field(mysqli_result result);
```

Returns the definition of one column of a result set as an object. Call this function repeatedly to retrieve information about all columns in the result set.

Parameters

result Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns an object which contains field definition information or `FALSE` if no field information is available.

Table 24.13. Object properties

Property	Description
<code>name</code>	The name of the column
<code>orgname</code>	Original column name if an alias was specified
<code>table</code>	The name of the table this field belongs to (if not calculated)
<code>orgtable</code>	Original table name if an alias was specified
<code>def</code>	The default value for this field, represented as a string
<code>max_length</code>	The maximum width of the field for the result set.
<code>length</code>	The width of the field, as specified in the table definition.
<code>charsetnr</code>	The character set number for the field.
<code>flags</code>	An integer representing the bit-flags for the field.
<code>type</code>	The data type used for this field
<code>decimals</code>	The number of decimals used (for integer fields)

Examples

Example 24.177. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
```

```

}
$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = $mysqli->query($query)) {
    /* Get field information for all columns */
    while ($finfo = $result->fetch_field()) {
        printf("Name:      %s\n", $finfo->name);
        printf("Table:     %s\n", $finfo->table);
        printf("max. Len:  %d\n", $finfo->max_length);
        printf("Flags:    %d\n", $finfo->flags);
        printf("Type:     %d\n\n", $finfo->type);
    }
    $result->close();
}
/* close connection */
$mysqli->close();
?>

```

Example 24.178. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");
/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}
$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = mysqli_query($link, $query)) {
    /* Get field information for all fields */
    while ($finfo = mysqli_fetch_field($result)) {
        printf("Name:      %s\n", $finfo->name);
        printf("Table:     %s\n", $finfo->table);
        printf("max. Len:  %d\n", $finfo->max_length);
        printf("Flags:    %d\n", $finfo->flags);
        printf("Type:     %d\n\n", $finfo->type);
    }
    mysqli_free_result($result);
}
/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Name:      Name
Table:     Country
max. Len:  11
Flags:     1
Type:      254

Name:      SurfaceArea
Table:     Country
max. Len:  10
Flags:     32769
Type:      4

```

`mysqli_field_seek`

24.8.2.6.7. `mysqli_result::fetch_fields`, `mysqli_fetch_fields`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_result::fetch_fields`

`mysqli_fetch_fields`

Returns an array of objects representing the fields in a result set

Description

Object oriented style (method):

```
array mysqli_result::fetch_fields();
```

Procedural Style:

```
array mysqli_fetch_fields(mysqli_result result);
```

This function serves an identical purpose to the `mysqli_fetch_field` function with the single difference that, instead of returning one object at a time for each field, the columns are returned as an array of objects.

Parameters

result

Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns an array of objects which contains field definition information or `FALSE` if no field information is available.

Table 24.14. Object properties

Property	Description
name	The name of the column
orgname	Original column name if an alias was specified
table	The name of the table this field belongs to (if not calculated)
orgtable	Original table name if an alias was specified
def	The default value for this field, represented as a string
max_length	The maximum width of the field for the result set.
length	The width of the field, as specified in the table definition.
charsetnr	The character set number for the field.
flags	An integer representing the bit-flags for the field.
type	The data type used for this field
decimals	The number of decimals used (for integer fields)

Examples

Example 24.179. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
```

```

    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = $mysqli->query($query)) {

    /* Get field information for all columns */
    $finfo = $result->fetch_fields();

    foreach ($finfo as $val) {
        printf("Name:      %s\n", $val->name);
        printf("Table:     %s\n", $val->table);
        printf("max. Len:  %d\n", $val->max_length);
        printf("Flags:    %d\n", $val->flags);
        printf("Type:     %d\n\n", $val->type);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>

```

Example 24.180. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for all columns */
    $finfo = mysqli_fetch_fields($result);

    foreach ($finfo as $val) {
        printf("Name:      %s\n", $val->name);
        printf("Table:     %s\n", $val->table);
        printf("max. Len:  %d\n", $val->max_length);
        printf("Flags:    %d\n", $val->flags);
        printf("Type:     %d\n\n", $val->type);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Name:      Name
Table:     Country
max. Len:  11
Flags:     1
Type:      254

Name:      SurfaceArea
Table:     Country
max. Len:  10
Flags:     32769
Type:      4

```

See Also

```

24.8.2.6.8. `mysqli_result::fetch_object`, `mysqli_fetch_object`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_result::fetch_object`

```
mysqli_fetch_object
```

Returns the current row of a result set as an object

Description

Object oriented style (method):

```
object mysqli_result::fetch_object(string class_name,
                                   array params);
```

Procedural style:

```
object mysqli_fetch_object(mysqli_result result,
                           string class_name,
                           array params);
```

The `mysqli_fetch_object` will return the current row result set as an object where the attributes of the object represent the names of the fields found within the result set.

Parameters

result Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

class_name
params

Return Values

Returns an object with string properties that corresponds to the fetched row or `NULL` if there are no more rows in resultset.

Note

Field names returned by this function are *case-sensitive*.

Note

This function sets `NULL` fields to the PHP `NULL` value.

ChangeLog

Version	Description
5.0.0	Added the ability to return as a different object.

Examples

Example 24.181. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
```

```

    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";
if ($result = $mysqli->query($query)) {
    /* fetch object array */
    while ($obj = $result->fetch_object()) {
        printf ("%s (%s)\n", $obj->Name, $obj->CountryCode);
    }

    /* free result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>

```

Example 24.182. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";
if ($result = mysqli_query($link, $query)) {
    /* fetch associative array */
    while ($obj = mysqli_fetch_object($result)) {
        printf ("%s (%s)\n", $obj->Name, $obj->CountryCode);
    }

    /* free result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)

```

- `mysqli_result::fetch_row`

`mysqli_fetch_row`

Get a result row as an enumerated array

Description

Object oriented style (method):

```
mixed mysqli_result::fetch_row();
```

Procedural style:

```
mixed mysqli_fetch_row(mysqli_result result);
```

Fetches one row of data from the result set and returns it as an enumerated array, where each column is stored in an array offset starting from 0 (zero). Each subsequent call to this function will return the next row within the result set, or `NULL` if there are no more rows.

Parameters

result Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

`mysqli_fetch_row` returns an array of strings that corresponds to the fetched row or `NULL` if there are no more rows in result set.

Note

This function sets `NULL` fields to the PHP `NULL` value.

Examples

Example 24.183. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";
if ($result = $mysqli->query($query)) {
    /* fetch object array */
    while ($row = $result->fetch_row()) {
        printf ("%s (%s)\n", $row[0], $row[1]);
    }

    /* free result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 24.184. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, CountryCode FROM City ORDER by ID DESC LIMIT 50,5";
if ($result = mysqli_query($link, $query)) {

    /* fetch associative array */
    while ($row = mysqli_fetch_row($result)) {
        printf ("%s (%s)\n", $row[0], $row[1]);
    }

    /* free result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Pueblo (USA)
Arvada (USA)
Cape Coral (USA)
Green Bay (USA)
Santa Clara (USA)

```

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli_result->field_count](#)
[mysqli_num_fields](#)

Get the number of fields in a result

Description

Object oriented style (property):

```

mysqli_result {
    int field_count ;
}

```

Procedural style:

```

int mysqli_num_fields(mysqli_result result);

```

Returns the number of fields from specified result set.

Parameters

result Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

The number of fields from a result set.

Examples

Example 24.185. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($result = $mysqli->query("SELECT * FROM City ORDER BY ID LIMIT 1")) {

    /* determine number of fields in result set */
    $field_cnt = $result->field_count;

    printf("Result set has %d fields.\n", $field_cnt);

    /* close result set */
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 24.186. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($result = mysqli_query($link, "SELECT * FROM City ORDER BY ID LIMIT 1")) {

    /* determine number of fields in result set */
    $field_cnt = mysqli_num_fields($result);

    printf("Result set has %d fields.\n", $field_cnt);

    /* close result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Result set has 5 fields.
```

See Also`mysqli_fetch_field`**24.8.2.6.11. `mysqli_result::field_seek`, `mysqli_field_seek`**

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_result::field_seek`

`mysqli_field_seek`

Set result pointer to a specified field offset

Description

Object oriented style (method):

```
bool mysqli_result::field_seek(int fieldnr);
```

Procedural style:

```
bool mysqli_field_seek(mysqli_result result,
                       int fieldnr);
```

Sets the field cursor to the given offset. The next call to `mysqli_fetch_field` will retrieve the field definition of the column associated with that offset.

Note

To seek to the beginning of a row, pass an offset value of zero.

Parameters

result Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

fieldnr The field number. This value must be in the range from 0 to `number of fields - 1`.

Return ValuesReturns `TRUE` on success or `FALSE` on failure.**Examples****Example 24.187. Object oriented style**

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";
if ($result = $mysqli->query($query)) {

    /* Get field information for 2nd column */
    $result->field_seek(1);
    $finfo = $result->fetch_field();

    printf("Name:      %s\n", $finfo->name);
    printf("Table:     %s\n", $finfo->table);
    printf("max. Len:  %d\n", $finfo->max_length);
    printf("Flags:    %d\n", $finfo->flags);
    printf("Type:    %d\n\n", $finfo->type);
}
```

```

    $result->close();
}

/* close connection */
mysqli->close();
?>

```

Example 24.188. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT Name, SurfaceArea from Country ORDER BY Code LIMIT 5";

if ($result = mysqli_query($link, $query)) {

    /* Get field information for 2nd column */
    mysqli_field_seek($result, 1);
    $finfo = mysqli_fetch_field($result);

    printf("Name:      %s\n", $finfo->name);
    printf("Table:     %s\n", $finfo->table);
    printf("max. Len:  %d\n", $finfo->max_length);
    printf("Flags:     %d\n", $finfo->flags);
    printf("Type:      %d\n\n", $finfo->type);

    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```

Name:      SurfaceArea
Table:     Country
max. Len:  10
Flags:     32769
Type:      4

```

[mysqli_free_result](#)

Frees the memory associated with a result

Description

Object oriented style (all methods are equivalent):

```
void mysqli_result::free();
```

```
void mysqli_result::close();
```

```
void mysqli_result::free_result();
```

Procedural style:

```
void mysqli_free_result(mysqli_result result);
```

Frees the memory associated with the result.

Note

You should always free your result with `mysqli_free_result`, when your result object is not needed anymore.

Parameters

result Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

No value is returned.

See Also

```
mysqli_query  
mysqli_stmt_store_result  
mysqli_store_result  
mysqli_use_result
```

24.8.2.6.13. `mysqli_result->lengths`, `mysqli_fetch_lengths`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_result->lengths`
`mysqli_fetch_lengths`

Returns the lengths of the columns of the current row in the result set

Description

Object oriented style (property):

```
mysqli_result {  
    array lengths ;  
}
```

Procedural style:

```
array mysqli_fetch_lengths(mysqli_result result);
```

The `mysqli_fetch_lengths` function returns an array containing the lengths of every column of the current row within the result set.

Parameters

result Procedural style only: A result set identifier returned by `mysqli_query`,

`mysqli_store_result` or `mysqli_use_result`.

Return Values

An array of integers representing the size of each column (not including any terminating null characters). `FALSE` if an error occurred.

`mysqli_fetch_lengths` is valid only for the current row of the result set. It returns `FALSE` if you call it before calling `mysqli_fetch_row/array/object` or after retrieving all rows in the result.

Examples

Example 24.189. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT * from Country ORDER BY Code LIMIT 1";

if ($result = $mysqli->query($query)) {
    $row = $result->fetch_row();

    /* display column lengths */
    foreach ($result->lengths as $i => $val) {
        printf("Field %2d has Length %2d\n", $i+1, $val);
    }
    $result->close();
}

/* close connection */
$mysqli->close();
?>
```

Example 24.190. Procedural style

```
<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$query = "SELECT * from Country ORDER BY Code LIMIT 1";

if ($result = mysqli_query($link, $query)) {
    $row = mysqli_fetch_row($result);

    /* display column lengths */
    foreach (mysqli_fetch_lengths($result) as $i => $val) {
        printf("Field %2d has Length %2d\n", $i+1, $val);
    }
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>
```

The above example will output:

```
Field 1 has Length 3
```

```
Field 2 has Length 5
Field 3 has Length 13
Field 4 has Length 9
Field 5 has Length 6
Field 6 has Length 1
Field 7 has Length 6
Field 8 has Length 4
Field 9 has Length 6
Field 10 has Length 6
Field 11 has Length 5
Field 12 has Length 44
Field 13 has Length 7
Field 14 has Length 3
Field 15 has Length 2
```

24.8.2.6.14. `mysqli_result->num_rows`, `mysqli_num_rows`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_result->num_rows`
`mysqli_num_rows`

Gets the number of rows in a result

Description

Object oriented style (property):

```
mysqli_result {
    int num_rows ;
}
```

Procedural style:

```
int mysqli_num_rows(mysqli_result result);
```

Returns the number of rows in the result set.

The use of `mysqli_num_rows` depends on whether you use buffered or unbuffered result sets. In case you use unbuffered result-sets `mysqli_num_rows` will not correct the correct number of rows until all the rows in the result have been retrieved.

Parameters

result Procedural style only: A result set identifier returned by `mysqli_query`, `mysqli_store_result` or `mysqli_use_result`.

Return Values

Returns number of rows in the result set.

Note

If the number of rows is greater than maximal int value, the number will be returned as a string.

Examples

Example 24.191. Object oriented style

```
<?php
$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
```

```

    exit();
}
if ($result = $mysqli->query("SELECT Code, Name FROM Country ORDER BY Name")) {
    /* determine number of rows result set */
    $row_cnt = $result->num_rows;

    printf("Result set has %d rows.\n", $row_cnt);

    /* close result set */
    $result->close();
}
/* close connection */
$mysqli->close();
?>

```

Example 24.192. Procedural style

```

<?php
$link = mysqli_connect("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

if ($result = mysqli_query($link, "SELECT Code, Name FROM Country ORDER BY Name")) {
    /* determine number of rows result set */
    $row_cnt = mysqli_num_rows($result);

    printf("Result set has %d rows.\n", $row_cnt);

    /* close result set */
    mysqli_free_result($result);
}

/* close connection */
mysqli_close($link);
?>

```

The above example will output:

```
Result set has 239 rows.
```

24.8.2.8.14. `mysqli_report`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_report`

Enables or disables internal report functions

Description

```
bool mysqli_report(int flags);
```

`mysqli_report` is a powerful function to improve your queries and code during development and testing phase. Depending on the flags it reports errors from `mysqli` function calls or queries which don't use an index (or use a bad index).

Parameters

flags

Table 24.15. Supported flags

Name	Description
MYSQLI_REPORT_OFF	Turns reporting off
MYSQLI_REPORT_ERROR	Report errors from mysqli function calls
MYSQLI_REPORT_STRICT	Report warnings from mysqli function calls
MYSQLI_REPORT_INDEX	Report if no index or bad index was used in a query
MYSQLI_REPORT_ALL	Set all options (report all)

Return Values

Returns [TRUE](#) on success or [FALSE](#) on failure.

Examples

Example 24.193. Object oriented style

```
<?php
/* activate reporting */
mysqli_report(MYSQLI_REPORT_ALL);

$mysqli = new mysqli("localhost", "my_user", "my_password", "world");

/* check connection */
if (mysqli_connect_errno()) {
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

/* this query should report an error */
$result = $mysqli->query("SELECT Name FROM Nonexistingtable WHERE population > 50000");

/* this query should report a warning */
$result = $mysqli->query("SELECT Name FROM City WHERE population > 50000");
$result->close();

$mysqli->close();
?>
```

Copyright (c) 1997-2008 the PHP Documentation Group.

- [mysqli_rpl_parse_enabled](#)

Check if RPL parse is enabled

Description

```
int mysqli_rpl_parse_enabled(mysqli link);
```

Warning

This function is currently not documented; only its argument list is available.

Warning

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

24.8.2.8.16. `mysqli_rpl_probe`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_rpl_probe`

RPL probe

Description

```
bool mysqli_rpl_probe(mysqli link);
```

Warning

This function is currently not documented; only its argument list is available.

Warning

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

24.8.2.8.17. `mysqli_rpl_query_type`, `mysqli->rpl_query_type`

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_rpl_query_type`
`mysqli->rpl_query_type`

Returns RPL query type

Description

Procedural style:

```
int mysqli_rpl_query_type(mysqli link,  
                          string query);
```

Object oriented style (method)

```
mysqli {  
    int rpl_query_type(string query);  
}
```

Returns `MYSQLI_RPL_MASTER`, `MYSQLI_RPL_SLAVE` or `MYSQLI_RPL_ADMIN` depending on a query type. `INSERT`, `UPDATE` and similar are *master* queries, `SELECT` is *slave*, and `FLUSH`, `REPAIR` and similar are *admin*.

Warning

This function is currently not documented; only its argument list is available.

Warning

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

24.8.2.8.18. `mysqli_send_long_data`

Copyright (c) 1997-2008 the PHP Documentation Group.

Copyright (c) 1997-2008 the PHP Documentation Group.

- `mysqli_slave_query`
Force execution of a query on a slave in a master/slave setup

Description

```
bool mysqli_slave_query(mysqli link,
                        string query);
```

Warning

This function is currently not documented; only its argument list is available.

Warning

This function has been *DEPRECATED* and *REMOVED* as of PHP 5.3.0.

24.8.3. MySQL Functions (PDO_MYSQL)

Copyright (c) 1997-2008 the PHP Documentation Group.

PDO_MYSQL is a driver that implements the [PHP Data Objects \(PDO\) interface](#) to enable access from PHP to MySQL 3.x, 4.x and 5.x databases.

PDO_MYSQL will take advantage of native prepared statement support present in MySQL 4.1 and higher. If you're using an older version of the mysql client libraries, PDO will emulate them for you.

Warning

Beware: Some MySQL table types (storage engines) do not support transactions. When writing transactional database code using a table type that does not support transactions, MySQL will pretend that a transaction was initiated successfully. In addition, any DDL queries issued will implicitly commit any pending transactions.

The constants below are defined by this driver, and will only be available when the extension has been either compiled into PHP or dynamically loaded at runtime. In addition, these driver-specific constants should only be used if you are using this driver. Using mysql-specific attributes with the postgres driver may result in unexpected behaviour. `PDO::getAttribute` may be used to obtain the `PDO_ATTR_DRIVER_NAME` attribute to check the driver, if your code can run against multiple drivers.

`PDO::MYSQL_ATTR_USE_BUFFERED_QUERY` (integer) If this attribute is set to `TRUE` on a `PDOStatement`, the MySQL driver will use the buffered versions of the MySQL API. If you're writing portable code, you should use `PDOStatement::fetchAll` instead.

Example 24.194. Forcing queries to be buffered in mysql

```
<?php
if ($db->getAttribute(PDO::ATTR_DRIVER_NAME) == 'mysql') {
    $stmt = $db->prepare('select * from foo',
        array(PDO::MYSQL_ATTR_USE_BUFFERED_QUERY => true));
} else {
    die("my application only works with mysql; I should use \$stmt->fetchAll() instead");
}
?>
```

`PDO::MYSQL_ATTR_LOCAL_INFILE` (integer) Enable `LOAD LOCAL INFILE`.

`PDO::MYSQL_ATTR_INIT_COMMAND` (integer) Command to execute when connecting to the MySQL server. Will automatically be re-executed when reconnecting.

`PDO::MYSQL_ATTR_READ_DEFAULT_FILE` (integer) Read options from the named option file instead of from `my.cnf`.

`PDO::MYSQL_ATTR_READ_DEFAULT_GROUP` (integer) Read options from the named group from `my.cnf` or the file specified with `MYSQL_READ_DEFAULT_FILE`.

`PDO::MYSQL_ATTR_MAX_BUFFER_SIZE` (integer) Maximum buffer size. Defaults to 1 MiB.

`PDO::MYSQL_ATTR_DIRECT_QUERY` (integer) Perform direct queries, don't use prepared statements.

24.8.3.1. PDO_MYSQL DSN

Copyright (c) 1997-2008 the PHP Documentation Group.

- [PDO_MYSQL DSN](#)

Connecting to MySQL databases

Description

The PDO_MYSQL Data Source Name (DSN) is composed of the following elements:

DSN prefix	The DSN prefix is <code>mysql:</code> .
<code>host</code>	The hostname on which the database server resides.
<code>port</code>	The port number where the database server is listening.
<code>dbname</code>	The name of the database.
<code>unix_socket</code>	The MySQL Unix socket (shouldn't be used with <code>host</code> or <code>port</code>).

Examples

Example 24.195. PDO_MYSQL DSN examples

The following example shows a PDO_MYSQL DSN for connecting to MySQL databases:

```
mysql:host=localhost;dbname=testdb
```

More complete examples:

```
mysql:host=localhost;port=3307;dbname=testdb
mysql:unix_socket=/tmp/mysql.sock;dbname=testdb
```

24.8.4. Connector/PHP

The MySQL Connector/PHP is a version of the `mysql` and `mysql_i` extensions for PHP optimized for the Windows operating system. Later versions of the main PHP `mysql/mysql_i` drivers are compatible with Windows and a separate, Windows specific driver is no longer required.

For PHP for all platforms, including Windows, you should use the `mysql` or `mysql_i` extensions shipped with the PHP sources. See [Section 24.8, "MySQL PHP API"](#).

24.8.5. Common Problems with MySQL and PHP

- **Error: Maximum Execution Time Exceeded:** This is a PHP limit; go into the `php.ini` file and set the maximum execution time up from 30 seconds to something higher, as needed. It is also not a bad idea to double the RAM allowed per script to 16MB instead of 8MB.
- **Fatal error: Call to unsupported or undefined function mysql_connect() in ...:** This means that your PHP version isn't compiled with MySQL support. You can either compile a dynamic MySQL module and load it into PHP or recompile PHP with built-in MySQL support. This process is described in detail in the PHP manual.
- **Error: Undefined reference to 'uncompress':** This means that the client library is compiled with support for a compressed client/server protocol. The fix is to add `-lz` last when linking with `-lmysqlclient`.
- **Error: Client does not support authentication protocol:** This is most often encountered when trying to use the older `mysql` extension with MySQL 4.1.1 and later. Possible solutions are: downgrade to MySQL 4.0; switch to PHP 5 and the newer `mysql_i` extension; or configure the MySQL server with `--old-passwords`. (See [Section B.1.2.4](#),

Client does not support authentication protocol”, for more information.)

Those with PHP4 legacy code can make use of a compatibility layer for the old and new MySQL libraries, such as this one: <http://www.coggeshall.org/oss/mysql2i>.

24.8.6. Enabling Both `mysql` and `mysqli` in PHP

If you're experiencing problems with enabling both the `mysql` and the `mysqli` extension when building PHP on Linux yourself, you should try the following procedure.

1. Configure PHP like this:

```
./configure --with-mysqli=/usr/bin/mysql_config --with-mysql=/usr
```

2. Edit the `Makefile` and search for a line that starts with `EXTRA_LIBS`. It might look like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl  
-lxml2 -lz -lm -lxml2 -lz -lm -lmysqlclient -lz -lcrypt -lnsl -lm  
-lxml2 -lz -lm -lcrypt -lxml2 -lz -lm -lcrypt
```

Remove all duplicates, so that the line looks like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl  
-lxml2
```

3. Build and install PHP:

```
make  
make install
```

MySQL Enterprise

MySQL Enterprise subscribers will find more information about the `mysqli` extension in the Knowledge Base articles found at [mysql](http://mysql.com). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

24.9. MySQL Perl API

The Perl `DBI` module provides a generic interface for database access. You can write a `DBI` script that works with many different database engines without change. To use `DBI`, you must install the `DBI` module, as well as a DataBase Driver (DBD) module for each type of server you want to access. For MySQL, this driver is the `DBD: :mysql` module.

Perl `DBI` is the recommended Perl interface. It replaces an older interface called `mysqlperl`, which should be considered obsolete.

Installation instructions for Perl `DBI` support are given in [Section 2.4.21, “Perl Installation Notes”](#).

`DBI` information is available at the command line, online, or in printed form:

- Once you have the `DBI` and `DBD: :mysql` modules installed, you can get information about them at the command line with the `perldoc` command:

```
shell> perldoc DBI  
shell> perldoc DBI::FAQ  
shell> perldoc DBD::mysql
```

You can also use `pod2man`, `pod2html`, and so forth to translate this information into other formats.

- For online information about Perl `DBI`, visit the `DBI` Web site, <http://dbi.perl.org/>. That site hosts a general `DBI` mailing list. MySQL AB hosts a list specifically about `DBD: :mysql`; see [Section 1.6.1, “MySQL Mailing Lists”](#).
- For printed information, the official `DBI` book is *Programming the Perl DBI* (Alligator Descartes and Tim Bunce, O'Reilly & Associates, 2000). Information about the book is available at the `DBI` Web site, <http://dbi.perl.org/>.

For information that focuses specifically on using `DBI` with MySQL, see *MySQL and Perl for the Web* (Paul DuBois, New Riders, 2001). This book's Web site is <http://www.kitebird.com/mysql-perl/>.

24.10. MySQL C++ API

`MySQL++` is a MySQL API for C++. Warren Young has taken over this project. More information can be found at <http://tangentsoft.net/mysql++/doc>.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about using C++ with the MySQL API in the MySQL Knowledge Base articles found at [C++](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

24.11. MySQL Python API

`MySQLdb` provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at <http://sourceforge.net/projects/mysql-python/>.

MySQL Enterprise

MySQL Enterprise subscribers will find more information about using Python with the MySQL API in the MySQL Knowledge Base articles found at [Python](#). Access to the MySQL Knowledge Base collection of articles is one of the advantages of subscribing to MySQL Enterprise. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

24.12. MySQL Ruby APIs

Two APIs available for Ruby programmers. The MySQL/Ruby API is based on the `libmysql` API library. The Ruby/MySQL API is written to use the native MySQL network protocol (a native driver).

For more information on Ruby, see [Ruby Programming Language](#).

For information on installing and using the MySQL/Ruby API, see [Section 24.12.1, “The MySQL/Ruby API”](#).

For information on installing and using the Ruby/MySQL API, see [Section 24.12.2, “The Ruby/MySQL API”](#).

24.12.1. The MySQL/Ruby API

The MySQL/Ruby module provides access to MySQL databases using Ruby through `libmysql`.

For information on installing the module, and the functions exposed, see [MySQL/Ruby](#).

24.12.2. The Ruby/MySQL API

The Ruby/MySQL module provides access to MySQL databases using Ruby through a native driver interface using the MySQL network protocol.

For information on installing the module, and the functions exposed, see [Ruby/MySQL](#).

24.13. MySQL Tcl API

`MySQLtcl` is a simple API for accessing a MySQL database server from the Tcl programming language. It can be found at <http://www.xdobry.de/mysqltcl/>.

24.14. MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the Eiffel programming language, written by Michael Ravits. It can be found at <http://efsa.sourceforge.net/archive/ravits/mysql.htm>.

Chapter 25. Extending MySQL

25.1. MySQL Internals

This chapter describes a lot of things that you need to know when working on the MySQL code. If you plan to contribute to MySQL development, want to have access to the bleeding-edge versions of the code, or just want to keep track of development, follow the instructions in [Section 2.4.15.3, “Installing from the Development Source Tree”](#). If you are interested in MySQL internals, you should also subscribe to our [internals](#) mailing list. This list has relatively low traffic. For details on how to subscribe, please see [Section 1.6.1, “MySQL Mailing Lists”](#). All developers at MySQL AB are on the [internals](#) list and we help other people who are working on the MySQL code. Feel free to use this list both to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

25.1.1. MySQL Threads

The MySQL server creates the following threads:

- Connection manager threads handle client connection requests on the network interfaces that the server listens to. On all platforms, one manager thread handles TCP/IP connection requests. On Unix, this manager thread also handles Unix socket file connection requests. On Windows, a manager thread handles shared-memory connection requests, and another handles named-pipe connection requests. The server does not create threads to handle interfaces that it does not listen to. For example, a Windows server that does not have support for named-pipe connections enabled does not create a thread to handle them.
- Connection manager threads associate each client connection with a thread dedicated to it that handles authentication and request processing for that connection. Manager threads create a new thread when necessary but try to avoid doing so by consulting the thread cache first to see whether it contains a thread that can be used for the connection. When a connection ends, its thread is returned to the thread cache if the cache is not full.

For information about tuning the parameters that control thread resources, see [Section 7.5.7, “How MySQL Uses Threads for Client Connections”](#).

- On a master replication server, connections from slave servers are handled like client connections: There is one thread per connected slave.
- On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.
- A signal thread handles all signals. This thread also normally handles alarms and calls `process_alarm()` to force timeouts on connections that have been idle too long.
- If `InnoDB` is used, there will be 4 additional threads by default. Those are file I/O threads, controlled by the `innodb_file_io_threads` parameter. See [Section 13.2.4, “InnoDB Startup Options and System Variables”](#).
- If `mysqld` is compiled with `-DUSE_ALARM_THREAD`, a dedicated thread that handles alarms is created. This is only used on some systems where there are problems with `sigwait()` or if you want to use the `thr_alarm()` code in your application without a dedicated signal handling thread.
- If the server is started with the `--flush_time=val` option, a dedicated thread is created to flush all tables every `val` seconds.
- Each table for which `INSERT DELAYED` statements are issued gets its own thread. See [Section 12.2.5.2, “INSERT DELAYED Syntax”](#).

`mysqladmin processlist` only shows the connection, `INSERT DELAYED`, and replication threads.

MySQL Enterprise

For expert advice on thread management subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

25.1.2. MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform regression tests on the MySQL code. These tests can be run on Unix.

The current set of test cases doesn't test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code.

We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (`mysqltest`), a Perl script to run all tests (`mysql-test-run.pl`), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type `make test` from the source root directory, or change location to the `mysql-test` directory and type `./mysql-test-run.pl`. If you have installed a binary distribution, change location to the `mysql-test` directory under the installation root directory (for example, `/usr/local/mysql/mysql-test`), and run `./mysql-test-run.pl`. All tests should succeed. If any do not, feel free to try to find out why and report the problem if it indicates a bug in MySQL. See [Section 1.7, “How to Report Bugs or Problems”](#).

If one test fails, you should run `mysql-test-run.pl` with the `--force` option to check whether any other tests fail.

If you have a copy of `mysqld` running on the machine where you want to run the test suite, you do not have to stop it, as long as it is not using ports `9306` or `9307`. If either of those ports is taken, you should set the `MTR_BUILD_THREAD` environment variable to an appropriate value, and the test suite will use a different set of ports for master, slave, NDB, and Instance Manager). For example:

```
shell> export MTR_BUILD_THREAD=31
shell> ./mysql-test-run.pl [options] [test_name]
```

In the `mysql-test` directory, you can run an individual test case with `./mysql-test-run.pl test_name`.

You can use the `mysqltest` language to write your own test cases. This is documented in the MySQL Test Framework manual, available at <http://dev.mysql.com/doc/>.

If you have a question about the test suite, or have a test case to contribute, send an email message to the MySQL [internals](#) mailing list. See [Section 1.6.1, “MySQL Mailing Lists”](#). This list does not accept attachments, so you should FTP all the relevant files to: <ftp://ftp.mysql.com/pub/mysql/upload/>

25.2. Adding New Functions to MySQL

There are three ways to add new functions to MySQL:

- You can add functions through the user-defined function (UDF) interface. User-defined functions are compiled as object files and then added to and removed from the server dynamically using the `CREATE FUNCTION` and `DROP FUNCTION` statements. See [Section 12.5.3.1, “CREATE FUNCTION Syntax”](#).
- You can add functions as native (built-in) MySQL functions. Native functions are compiled into the `mysqld` server and become available on a permanent basis.
- Another way to add functions is by creating stored functions. These are written using SQL statements rather than by compiling object code. The syntax for writing stored functions is not covered here. See [Section 21.2, “Using Stored Routines \(Procedures and Functions\)”](#).

Each method of creating compiled functions has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function into the server, you don't need to do that.
- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a binary MySQL distribution. No access to MySQL source is necessary.
- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a newer version for which the UDF interface changes. For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add new functions, they can be invoked in SQL statements just like native functions such as `ABS()` or `SOUNDEX()`.

See [Section 8.2.3, “Function Name Parsing and Resolution”](#), for the rules describing how the server interprets references to different kinds of functions.

The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the `sql/udf_example.c` file that is provided in MySQL source distributions.

25.2.1. Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values and can accept arguments of those same types.
- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.
- Information is provided to functions that enables them to check the number, types, and names of the arguments passed to them.
- You can tell MySQL to coerce arguments to a given type before passing them to a function.
- You can indicate that a function returns `NULL` or that an error occurred.

25.2.2. Adding a New User-Defined Function

For the UDF mechanism to work, functions must be written in C or C++ (or another language that can use C calling conventions), and your operating system must support dynamic loading. The MySQL source distribution includes a file `sql/udf_example.c` that defines 5 new functions. Consult this file to see how UDF calling conventions work. UDF-related symbols and data structures are defined in the `include/mysql_com.h` header file. (You need not include this header file directly because it is included by `mysql.h`.)

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libc++` library. Note that these constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see [Section 2.4.15.2, “Typical configure Options”](#), and [Section 2.4.15.4, “Dealing with Problems Compiling MySQL”](#).

To be able to use UDFs, you need to link `mysqld` dynamically. Don't configure MySQL using `-with-mysqld-ldflags=-all-static`. If you want to use a UDF that needs to access symbols from `mysqld` (for example, the `metaphone` function in `sql/udf_example.c` that uses `default_charset_info`), you must link the program with `-rdynamic` (see `man dlopen`). If you plan to use UDFs, the rule of thumb is to configure MySQL with `-with-mysqld-ldflags=-rdynamic` unless you have a very good reason not to.

For each function that you want to use in SQL statements, you should define corresponding C (or C++) functions. In the following discussion, the name “xxx” is used for an example function name. To distinguish between SQL and C/C++ usage, `XXX()` (uppercase) indicates an SQL function call, and `xxx()` (lowercase) indicates a C/C++ function call.

The C/C++ functions that you write to implement the interface for `XXX()` are:

- `xxx()` (required)

The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C/C++ function is shown here:

SQL Type	C/C++ Type
<code>STRING</code>	<code>char *</code>
<code>INTEGER</code>	<code>long long</code>
<code>REAL</code>	<code>double</code>

It is also possible to declare a `DECIMAL` function, but currently the value is returned as a string, so you should write the UDF as though it were a `STRING` function. `ROW` functions are not implemented.

- `xxx_init()` (optional)

The initialization function for `xxx()`. It can be used for the following purposes:

- To check the number of arguments to `XXX()`.
- To check that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the types you want when the main function is called.

- To allocate any memory required by the main function.
- To specify the maximum length of the result.
- To specify (for `REAL` functions) the maximum number of decimal places in the result.
- To specify whether the result can be `NULL`.
- `xxx_deinit()` (optional)

The deinitialization function for `xxx()`. It should deallocate any memory allocated by the initialization function.

When an SQL statement invokes `xxx()`, MySQL calls the initialization function `xxx_init()` to let it perform any required setup, such as argument checking or memory allocation. If `xxx_init()` returns an error, MySQL aborts the SQL statement with an error message and does not call the main or deinitialization functions. Otherwise, MySQL calls the main function `xxx()` once for each row. After all rows have been processed, MySQL calls the deinitialization function `xxx_deinit()` so that it can perform any required cleanup.

For aggregate functions that work like `SUM()`, you must also provide the following functions:

- `xxx_clear()`
Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.
- `xxx_add()`
Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. Call `xxx_init()` to let the aggregate function allocate any memory it needs for storing results.
2. Sort the table according to the `GROUP BY` expression.
3. Call `xxx_clear()` for the first row in each new group.
4. Call `xxx_add()` for each row that belongs in the same group.
5. Call `xxx()` to get the result for the aggregate when the group changes or after the last row has been processed.
6. Repeat 3-5 until all rows has been processed
7. Call `xxx_deinit()` to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not allowed to allocate any global or static variables that change! If you need memory, you should allocate it in `xxx_init()` and free it in `xxx_deinit()`.

25.2.2.1. UDF Calling Sequences for Simple Functions

This section describes the different functions that you need to define when you create a simple UDF. [Section 25.2.2, “Adding a New User-Defined Function”](#), describes the order in which MySQL calls these functions.

The main `xxx()` function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function `xxx()` to return `STRING`, `INTEGER`, or `REAL` in the `CREATE FUNCTION` statement:

For `STRING` functions:

```
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
         char *result, unsigned long *length,
         char *is_null, char *error);
```

For `INTEGER` functions:

```
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
```

```
char *is_null, char *error);
```

For **REAL** functions:

```
double xxx(UDF_INIT *initid, UDF_ARGS *args,
           char *is_null, char *error);
```

DECIMAL functions return string values and should be declared the same way as **STRING** functions. **ROW** functions are not implemented.

The initialization and deinitialization functions are declared like this:

```
my_bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);
void xxx_deinit(UDF_INIT *initid);
```

The `initid` parameter is passed to all three functions. It points to a **UDF_INIT** structure that is used to communicate information between functions. The **UDF_INIT** structure members follow. The initialization function should fill in any members that it wishes to change. (To use the default for a member, leave it unchanged.)

- `my_bool maybe_null`

`xxx_init()` should set `maybe_null` to 1 if `xxx()` can return **NULL**. The default value is 1 if any of the arguments are declared `maybe_null`.

- `unsigned int decimals`

The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. For example, if the function is passed `1.34`, `1.345`, and `1.3`, the default would be 3, because `1.345` has 3 decimal digits.

For arguments that have no fixed number of decimals, the `decimals` value is set to 31, which is 1 more than the maximum number of decimals allowed for the **DECIMAL**, **FLOAT**, and **DOUBLE** data types.

A `decimals` value of 31 is used for arguments in cases such as a **FLOAT** or **DOUBLE** column declared without an explicit number of decimals (for example, **FLOAT** rather than **FLOAT(10,3)**) and for floating-point constants such as `1345E-3`. It is also used for string and other non-number arguments that might be converted within the function to numeric form.

The value to which the `decimals` member is initialized is only a default. It can be changed within the function to reflect the actual calculation performed. The default is determined such that the largest number of decimals of the arguments is used. If the number of decimals is 31 for even one of the arguments, that is the value used for `decimals`.

- `unsigned int max_length`

The maximum length of the result. The default `max_length` value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is 21 digits. For real functions, the default is 13 plus the number of decimal digits indicated by `initid->decimals`. (For numeric functions, the length includes any sign or decimal point characters.)

If you want to return a blob value, you can set `max_length` to 65KB or 16MB. This memory is not allocated, but the value is used to decide which data type to use if there is a need to temporarily store the data.

- `char *ptr`

A pointer that the function can use for its own purposes. For example, functions can use `initid->ptr` to communicate allocated memory among themselves. `xxx_init()` should allocate the memory and assign it to this pointer:

```
initid->ptr = allocated_memory;
```

In `xxx()` and `xxx_deinit()`, refer to `initid->ptr` to use or deallocate the memory.

- `my_bool const_item`

`xxx_init()` should set `const_item` to 1 if `xxx()` always returns the same value and to 0 otherwise.

25.2.2.2. UDF Calling Sequences for Aggregate Functions

This section describes the different functions that you need to define when you create an aggregate UDF. [Section 25.2.2, “Adding a](#)

[New User-Defined Function](#)”, describes the order in which MySQL calls these functions.

- `xxx_reset()`

This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given `UDF_ARGS` argument as the first value in your internal summary value for the group. Declare `xxx_reset()` as follows:

```
void xxx_reset(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

`xxx_reset()` is not needed or used in MySQL 5.0, in which the UDF interface uses `xxx_clear()` instead. However, you can define both `xxx_reset()` and `xxx_clear()` if you want to have your UDF work with older versions of the server. (If you do include both functions, the `xxx_reset()` function in many cases can be implemented internally by calling `xxx_clear()` to reset all variables, and then calling `xxx_add()` to add the `UDF_ARGS` argument as the first value in the group.)

- `xxx_clear()`

This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare `xxx_clear()` as follows:

```
void xxx_clear(UDF_INIT *initid, char *is_null, char *error);
```

`is_null` is set to point to `CHAR(0)` before calling `xxx_clear()`.

If something went wrong, you can store a value in the variable to which the `error` argument points. `error` points to a single-byte variable, not to a string buffer.

`xxx_clear()` is required by MySQL 5.0.

- `xxx_add()`

This function is called for all rows that belong to the same group. You should use it to add the value in the `UDF_ARGS` argument to your internal summary variable.

```
void xxx_add(UDF_INIT *initid, UDF_ARGS *args,
            char *is_null, char *error);
```

The `xxx()` function for an aggregate UDF should be declared the same way as for a non-aggregate UDF. See [Section 25.2.2.1, “UDF Calling Sequences for Simple Functions”](#).

For an aggregate UDF, MySQL calls the `xxx()` function after all rows in the group have been processed. You should normally never access its `UDF_ARGS` argument here but instead return a value based on your internal summary variables.

Return value handling in `xxx()` should be done the same way as for a non-aggregate UDF. See [Section 25.2.2.4, “UDF Return Values and Error Handling”](#).

The `xxx_reset()` and `xxx_add()` functions handle their `UDF_ARGS` argument the same way as functions for non-aggregate UDFs. See [Section 25.2.2.3, “UDF Argument Processing”](#).

The pointer arguments to `is_null` and `error` are the same for all calls to `xxx_reset()`, `xxx_clear()`, `xxx_add()` and `xxx()`. You can use this to remember that you got an error or whether the `xxx()` function should return `NULL`. You should not store a string into `*error`! `error` points to a single-byte variable, not to a string buffer.

`*is_null` is reset for each group (before calling `xxx_clear()`). `*error` is never reset.

If `*is_null` or `*error` are set when `xxx()` returns, MySQL returns `NULL` as the result for the group function.

25.2.2.3. UDF Argument Processing

The `args` parameter points to a `UDF_ARGS` structure that has the members listed here:

- `unsigned int arg_count`

The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

```
if (args->arg_count != 2)
```

```
{
    strcpy(message, "XXX() requires two arguments");
    return 1;
}
```

For other `UDF_ARGS` member values that are arrays, array references are zero-based. That is, refer to array members using index values from 0 to `args->arg_count - 1`.

- `enum Item_result *arg_type`

A pointer to an array containing the types for each argument. The possible type values are `STRING_RESULT`, `INT_RESULT`, `REAL_RESULT`, and `DECIMAL_RESULT`.

To make sure that arguments are of a given type and return an error if they are not, check the `arg_type` array in the initialization function. For example:

```
if (args->arg_type[0] != STRING_RESULT ||
    args->arg_type[1] != INT_RESULT)
{
    strcpy(message, "XXX() requires a string and an integer");
    return 1;
}
```

Arguments of type `DECIMAL_RESULT` are passed as strings, so you should handle them the same way as `STRING_RESULT` values.

As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the `arg_type` elements to the types you want. This causes MySQL to coerce arguments to those types for each call to `xxx()`. For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in `xxx_init()`:

```
args->arg_type[0] = STRING_RESULT;
args->arg_type[1] = INT_RESULT;
```

Exact-value decimal arguments such as `1.3` or `DECIMAL` column values are passed with a type of `DECIMAL_RESULT`. However, the values are passed as strings. If you want to receive a number, use the initialization function to specify that the argument should be coerced to a `REAL_RESULT` value:

```
args->arg_type[2] = REAL_RESULT;
```

Note

Prior to MySQL 5.0.3, decimal arguments were passed as `REAL_RESULT` values. If you upgrade to a newer version and find that your UDF now receives string values, use the initialization function to coerce the arguments to numbers as just described.

- `char **args`

`args->args` communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument `i`, `args->args[i]` points to the argument value. (See below for instructions on how to access the value properly.) For a non-constant argument, `args->args[i]` is 0. A constant argument is an expression that uses only constants, such as `3` or `4*7-2` or `SIN(3.14)`. A non-constant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with non-constant arguments.

For each invocation of the main function, `args->args` contains the actual arguments that are passed for the row currently being processed.

If argument `i` represents `NULL`, `args->args[i]` is a null pointer (0). If the argument is not `NULL`, functions can refer to it as follows:

- An argument of type `STRING_RESULT` is given as a string pointer plus a length, to allow handling of binary data or data of arbitrary length. The string contents are available as `args->args[i]` and the string length is `args->lengths[i]`. Do not assume that the string is null-terminated.
- For an argument of type `INT_RESULT`, you must cast `args->args[i]` to a `long long` value:

```
long long int_val;
int_val = *((long long*) args->args[i]);
```

- For an argument of type `REAL_RESULT`, you must cast `args->args[i]` to a `double` value:

```
double    real_val;
real_val = *((double*) args->args[i]);
```

- For an argument of type `DECIMAL_RESULT`, the value is passed as a string and should be handled like a `STRING_RESULT` value.
- `ROW_RESULT` arguments are not implemented.
- `unsigned long *lengths`

For the initialization function, the `lengths` array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, `lengths` contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types `INT_RESULT` or `REAL_RESULT`, `lengths` still contains the maximum length of the argument (as for the initialization function).

- `char *maybe_null`

For the initialization function, the `maybe_null` array indicates for each argument whether the argument value might be null (0 if no, 1 if yes).

- `char **attributes`

`args->attributes` communicates information about the names of the UDF arguments. For argument `i`, the attribute name is available as a string in `args->attributes[i]` and the attribute length is `args->attribute_lengths[i]`. Do not assume that the string is null-terminated.

By default, the name of a UDF argument is the text of the expression used to specify the argument. For UDFs, an argument may also have an optional `[AS] alias_name` clause, in which case the argument name is `alias_name`. The `attributes` value for each argument thus depends on whether an alias was given.

Suppose that a UDF `my_udf()` is invoked as follows:

```
SELECT my_udf(expr1, expr2 AS alias1, expr3 alias2);
```

In this case, the `attributes` and `attribute_lengths` arrays will have these values:

```
args->attributes[0] = "expr1"
args->attribute_lengths[0] = 5

args->attributes[1] = "alias1"
args->attribute_lengths[1] = 6

args->attributes[2] = "alias2"
args->attribute_lengths[2] = 6
```

- `unsigned long *attribute_lengths`

The `attribute_lengths` array indicates the length of each argument name.

25.2.2.4. UDF Return Values and Error Handling

The initialization function should return `0` if no error occurred and `1` otherwise. If an error occurs, `xxx_init()` should store a null-terminated error message in the `message` parameter. The message is returned to the client. The message buffer is `MYSQL_ERRMSG_SIZE` characters long, but you should try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function `xxx()` is the function value, for `long long` and `double` functions. A string function should return a pointer to the result and set `*result` and `*length` to the contents and length of the return value. For example:

```
memcpy(result, "result string", 13);
*length = 13;
```

The `result` buffer that is passed to the `xxx()` function is 255 bytes long. If your result fits in this, you don't have to worry about memory allocation for results.

If your string function needs to return a string longer than 255 bytes, you must allocate the space for it with `malloc()` in your `xxx_init()` function or your `xxx()` function and free it in your `xxx_deinit()` function. You can store the allocated memory in the `ptr` slot in the `UDF_INIT` structure for reuse by future `xxx()` calls. See Section 25.2.2.1, “UDF Calling Sequences for Simple Functions”.

To indicate a return value of `NULL` in the main function, set `*is_null` to 1:

```
*is_null = 1;
```

To indicate an error return in the main function, set `*error` to 1:

```
*error = 1;
```

If `xxx()` sets `*error` to 1 for any row, the function value is `NULL` for the current row and for any subsequent rows processed by the statement in which `xxx()` was invoked. (`xxx()` is not even called for subsequent rows.)

25.2.2.5. Compiling and Installing User-Defined Functions

Files implementing UDFs must be compiled and installed on the host where the server runs. This process is described below for the example UDF file `sql/udf_example.c` that is included in the MySQL source distribution.

The immediately following instructions are for Unix. Instructions for Windows are given later in this section.

The `udf_example.c` file contains the following functions:

- `metaphon()` returns a metaphon string of the string argument. This is something like a soundex string, but it's more tuned for English.
- `myfunc_double()` returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.
- `myfunc_int()` returns the sum of the length of its arguments.
- `sequence([const int])` returns a sequence starting from the given number or 1 if no number has been given.
- `lookup()` returns the IP number for a hostname.
- `reverse_lookup()` returns the hostname for an IP number. The function may be called either with a single string argument of the form `'xxx.xxx.xxx.xxx'` or with four numbers.

A dynamically loadable file should be compiled as a sharable object file, using a command something like this:

```
shell> gcc -shared -o udf_example.so udf_example.c
```

If you are using `gcc` with `configure` and `libtool` (which is how MySQL is configured), you should be able to create `udf_example.so` with a simpler command:

```
shell> make udf_example.la
```

After you compile a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from `udf_example.c` using `gcc` directly produces a file named `udf_example.so`. Compiling the shared object using `make` produces a file named something like `udf_example.so.0.0.0` in the `.libs` directory (the exact name may vary from platform to platform). Copy the shared object to some directory such as `/usr/lib` that is searched by your system's dynamic (runtime) linker, or add the directory in which you placed the shared object to the linker configuration file (for example, `/etc/ld.so.conf`).

The dynamic linker name is system-specific (for example, `ld-elf.so.1` on FreeBSD, `ld.so` on Linux, or `dyld` on Mac OS X). Consult your system documentation for information about the linker name and how to configure it.

On many systems, you can also set the `LD_LIBRARY` or `LD_LIBRARY_PATH` environment variable to point at the directory where you have the files for your UDF. The `dlopen` manual page tells you which variable you should use on your system. You should set this in `mysql.server` or `mysqld_safe` startup scripts and restart `mysqld`.

On some systems, the `ldconfig` program that configures the dynamic linker does not recognize a shared object unless its name begins with `lib`. In this case you should rename a file such as `udf_example.so` to `libudf_example.so`.

On Windows, you can compile user-defined functions by using the following procedure:

1. You need to obtain the Bazaar source repository for MySQL 5.0. See [Section 2.4.15.3, "Installing from the Development Source Tree"](#).

2. You must obtain the CMake build utility from <http://www.cmake.org>. (Version 2.4.2 or later is required).
3. In the source repository, look in the `sql` directory. There are files named `udf_example.def` and `udf_example.c` there. Copy both files from this directory to your working directory.
4. Create a CMake `makefile` (`CMakeLists.txt`) with these contents:

```
PROJECT(udf_example)

# Path for MySQL include directory
INCLUDE_DIRECTORIES("c:/mysql/include")

ADD_DEFINITIONS("-DHAVE_DLOPEN")
ADD_LIBRARY(udf_example MODULE udf_example.c udf_example.def)
TARGET_LINK_LIBRARIES(udf_example wsock32)
```

5. Create the VC project and solution files:

```
cmake -G "<Generator>"
```

Invoking `cmake --help` shows you a list of valid Generators.

6. Create `udf_example.dll`:

```
devenv udf_example.sln /build Release
```

After the shared object file has been installed, notify `mysqld` about the new functions with these statements:

```
mysql> CREATE FUNCTION metaphon RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE FUNCTION myfunc_double RETURNS REAL SONAME 'udf_example.dll';
mysql> CREATE FUNCTION myfunc_int RETURNS INTEGER SONAME 'udf_example.dll';
mysql> CREATE FUNCTION sequence RETURNS INTEGER SONAME 'udf_example.dll';
mysql> CREATE FUNCTION lookup RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE FUNCTION reverse_lookup
-> RETURNS STRING SONAME 'udf_example.dll';
mysql> CREATE AGGREGATE FUNCTION avgcost
-> RETURNS REAL SONAME 'udf_example.dll';
```

Functions can be deleted using `DROP FUNCTION`:

```
mysql> DROP FUNCTION metaphon;
mysql> DROP FUNCTION myfunc_double;
mysql> DROP FUNCTION myfunc_int;
mysql> DROP FUNCTION sequence;
mysql> DROP FUNCTION lookup;
mysql> DROP FUNCTION reverse_lookup;
mysql> DROP FUNCTION avgcost;
```

The `CREATE FUNCTION` and `DROP FUNCTION` statements update the `func` system table in the `mysql` database. The function's name, type and shared library name are saved in the table. You must have the `INSERT` and `DELETE` privileges for the `mysql` database to create and drop functions.

You should not use `CREATE FUNCTION` to add a function that has previously been created. If you need to reinstall a function, you should remove it with `DROP FUNCTION` and then reinstall it with `CREATE FUNCTION`. You would need to do this, for example, if you recompile a new version of your function, so that `mysqld` gets the new version. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

If the new function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

25.2.2.6. User-Defined Function Security Precautions

MySQL takes the following measures to prevent misuse of user-defined functions.

You must have the `INSERT` privilege to be able to use `CREATE FUNCTION` and the `DELETE` privilege to be able to use `DROP FUNCTION`. This is necessary because these statements add and delete rows from the `mysql.func` table.

UDFs should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` func-

tions. As of MySQL 5.0.3, `mysqld` supports an `--allow-suspicious-udfs` option that controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off, to prevent attempts at loading functions from shared object files other than those containing legitimate UDFs. If you have older UDFs that contain only the `xxx` symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the `--allow-suspicious-udfs` option. Otherwise, you should avoid enabling this capability.

UDF object files cannot be placed in arbitrary directories. They must be located in some system directory that the dynamic linker is configured to search. To enforce this restriction and prevent attempts at specifying pathnames outside of directories searched by the dynamic linker, MySQL checks the shared object file name specified in `CREATE FUNCTION` statements for pathname delimiter characters. As of MySQL 5.0.3, MySQL also checks for pathname delimiters in filenames stored in the `mysql.func` table when it loads functions. This prevents attempts at specifying illegitimate pathnames through direct manipulation of the `mysql.func` table. For information about UDFs and the runtime linker, see [Section 25.2.2.5, “Compiling and Installing User-Defined Functions”](#).

25.2.3. Adding a New Native Function

To add a new native MySQL function, use the procedure described here, which requires that you use a source distribution. You cannot add native functions to a binary distribution because it is necessary to modify MySQL source code and compile MySQL from the modified source. If you migrate to another version of MySQL (for example, when a new version is released), you must repeat the procedure with the new version.

If the new native function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

To add a new native function, follow these steps to modify source files in the `sql` directory:

1. Add one line to `lex.h` that defines the function name in the `sql_functions[]` array.
2. If the function prototype is simple (just takes zero, one, two, or three arguments), add a line to the `sql_functions[]` array in `lex.h` that specifies `SYM(FUNC_ARGN)` as the second argument (where `N` is the number of arguments the function takes). Also, add a function in `item_create.cc` that creates a function object. Look at `"ABS"` and `create_funcs_abs()` for an example of this.

If the function prototype is not simple (for example, if it takes a variable number of arguments), you should make two changes to `sql_yacc.yy`. One is a line that indicates the preprocessor symbol that `yacc` should define; this should be added at the beginning of the file. The other is an “item” to be added to the `simple_expr` parsing rule that defines the function parameters. You will need an item for each syntax with which the function can be called. For an example that shows how this is done, check all occurrences of `ATAN` in `sql_yacc.yy`.

3. In `item_func.h`, declare a class inheriting from `Item_num_func` or `Item_str_func`, depending on whether your function returns a number or a string.
4. In `item_func.cc`, add one of the following declarations, depending on whether you are defining a numeric or string function:

```
double Item_func_newname::val()
longlong Item_func_newname::val_int()
String *Item_func_newname::Str(String *str)
```

If you inherit your object from any of the standard items (like `Item_num_func`), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the `Item_str_func` class defines a `val()` function that executes `atof()` on the value returned by `::str()`.

5. If the function is non-deterministic, include the following statement in the item constructor to indicate that function results should not be cached:

```
current_thd->lex->safe_to_cache_query=0;
```

A function is non-deterministic if, given fixed values for its arguments, it can return different results for different invocations.

6. You should probably also define the following object function:

```
void Item_func_newname::fix_length_and_dec()
```

This function should at least calculate `max_length` based on the given arguments. `max_length` is the maximum number of characters the function may return. This function should also set `maybe_null = 0` if the main function can't return a `NULL` value. The function can check whether any of the function arguments can return `NULL` by checking the arguments' `maybe_null` variable. Look at `Item_func_mod::fix_length_and_dec` for a typical example of how to do this.

All functions must be thread-safe. In other words, do not use any global or static variables in the functions without protecting them with mutexes.

If you want to return `NULL` from `::val()`, `::val_int()`, or `::str()`, you should set `null_value` to 1 and return 0.

For `::str()` object functions, there are additional considerations to be aware of:

- The `String *str` argument provides a string buffer that may be used to hold the result. (For more information about the `String` type, take a look at the `sql_string.h` file.)
- The `::str()` function should return the string that holds the result, or `(char*) 0` if the result is `NULL`.
- All current string functions try to avoid allocating any memory unless absolutely necessary!

25.3. Adding New Procedures to MySQL

In MySQL, you can define a procedure in C++ that can access and modify the data in a query before it is sent to the client. The modification can be done on a row-by-row or `GROUP BY` level.

We have created an example procedure to show you what can be done.

Additionally, we recommend that you take a look at `mylua`. With this you can use the LUA language to load a procedure at runtime into `mysqld`.

25.3.1. PROCEDURE ANALYSE

```
analyse([max_elements[,max_memory]])
```

This procedure is defined in the `sql/sql_analyse.cc` file. It examines the result from a query and returns an analysis of the results that suggests optimal data types for each column. To obtain this analysis, append `PROCEDURE ANALYSE` to the end of a `SELECT` statement:

```
SELECT ... FROM ... WHERE ... PROCEDURE ANALYSE([max_elements,[max_memory]])
```

For example:

```
SELECT col1, col2 FROM table1 PROCEDURE ANALYSE(10, 2000);
```

The results show some statistics for the values returned by the query, and propose an optimal data type for the columns. This can be helpful for checking your existing tables, or after importing new data. You may need to try different settings for the arguments so that `PROCEDURE ANALYSE()` does not suggest the `ENUM` data type when it is not appropriate.

The arguments are optional and are used as follows:

- `max_elements` (default 256) is the maximum number of distinct values that `analyse` notices per column. This is used by `analyse` to check whether the optimal data type should be of type `ENUM`; if there are more than `max_elements` distinct values, then `ENUM` is not a suggested type.
- `max_memory` (default 8192) is the maximum amount of memory that `analyse` should allocate per column while trying to find all distinct values.

25.3.2. Writing a Procedure

For the moment, the only documentation for this is the source.

You can find all information about procedures by examining the following files:

- `sql/sql_analyse.cc`
- `sql/procedure.h`
- `sql/procedure.cc`
- `sql/sql_select.cc`

25.4. Debugging and Porting MySQL

This appendix helps you port MySQL to other operating systems. Do check the list of currently supported operating systems first. See [Section 2.4.2, “Operating Systems Supported by MySQL Community Server”](#). If you have created a new port of MySQL, please let us know so that we can list it here and on our Web site (<http://www.mysql.com/>), recommending it to other users.

Note: If you create a new port of MySQL, you are free to copy and distribute it under the GPL license, but it does not make you a copyright holder of MySQL.

A working POSIX thread library is needed for the server. On Solaris 2.5 we use Sun PThreads (the native thread support in 2.4 and earlier versions is not good enough), on Linux we use LinuxThreads by Xavier Leroy, <Xavier.Leroy@inria.fr>.

The hard part of porting to a new Unix variant without good native thread support is probably to port MIT-pthreads. See [mit-pthreads/README](#) and Programming POSIX Threads (<http://www.humanfactor.com/pthreads/>).

Up to MySQL 4.0.2, the MySQL distribution included a patched version of Chris Provenzano's Pthreads from MIT (see the MIT Pthreads Web page at <http://www.mit.edu/afs/sipb/project/pthreads/> and a programming introduction at http://www.mit.edu:8001/people/proven/IAP_2000/). These can be used for some operating systems that do not have POSIX threads. See [Section 2.4.15.5, “MIT-pthreads Notes”](#).

It is also possible to use another user level thread package named FSU Pthreads (see <http://moss.csc.ncsu.edu/~mueller/pthreads/>). This implementation is being used for the SCO port.

See the `thr_lock.c` and `thr_alarm.c` programs in the `mysys` directory for some tests/examples of these problems.

Both the server and the client need a working C++ compiler. We use `gcc` on many platforms. Other compilers that are known to work are SPARCworks, Sun Forte, Irix `cc`, HP-UX `aCC`, IBM AIX `x1C_r`, Intel `ecc/icc` and Compaq `cxx`.

Important

If you are trying to build MySQL 5.1 with `icc` on the IA64 platform, and need support for MySQL Cluster, you should first ensure that you are using `icc` version 9.1.043 or later. (For details, see [Bug#21875](#).)

To compile only the client use `./configure --without-server`.

There is currently no support for only compiling the server, nor is it likely to be added unless someone has a good reason for it.

If you want/need to change any `Makefile` or the configure script you also need GNU Automake and Autoconf. See [Section 2.4.15.3, “Installing from the Development Source Tree”](#).

All steps needed to remake everything from the most basic files.

```
/bin/rm */.deps/*.P
/bin/rm -f config.cache
aclocal
autoheader
aclocal
automake
autoconf
./configure --with-debug=full --prefix='your installation directory'

# The makefiles generated above need GNU make 3.75 or newer.
# (called gmake below)
gmake clean all install init-db
```

If you run into problems with a new port, you may have to do some debugging of MySQL! See [Section 25.4.1, “Debugging a MySQL Server”](#).

Note

Before you start debugging `mysqld`, first get the test programs `mysys/thr_alarm` and `mysys/thr_lock` to work. This ensures that your thread installation has even a remote chance to work!

25.4.1. Debugging a MySQL Server

If you are using some functionality that is very new in MySQL, you can try to run `mysqld` with the `--skip-new` (which disables all new, potentially unsafe functionality) or with `--safe-mode` which disables a lot of optimization that may cause problems. See [Section B.1.4.2, “What to Do If MySQL Keeps Crashing”](#).

If `mysqld` doesn't want to start, you should verify that you don't have any `my.cnf` files that interfere with your setup! You can check your `my.cnf` arguments with `mysqld --print-defaults` and avoid using them by starting with `mysqld --no-defaults ...`

If `mysqld` starts to eat up CPU or memory or if it “hangs,” you can use `mysqladmin processlist status` to find out if someone is executing a query that takes a long time. It may be a good idea to run `mysqladmin -i10 processlist status` in some window if you are experiencing performance problems or problems when new clients can't connect.

The command `mysqladmin debug` dumps some information about locks in use, used memory and query usage to the MySQL log file. This may help solve some problems. This command also provides some useful information even if you haven't compiled MySQL for debugging!

If the problem is that some tables are getting slower and slower you should try to optimize the table with `OPTIMIZE TABLE` or `myisamchk`. See [Chapter 5, MySQL Server Administration](#). You should also check the slow queries with `EXPLAIN`.

You should also read the OS-specific section in this manual for problems that may be unique to your environment. See [Section 2.4.19, “Operating System-Specific Notes”](#).

25.4.1.1. Compiling MySQL for Debugging

If you have some very specific problem, you can always try to debug MySQL. To do this you must configure MySQL with the `--with-debug` or the `--with-debug=full` option. You can check whether MySQL was compiled with debugging by doing: `mysqld --help`. If the `--debug` flag is listed with the options then you have debugging enabled. `mysqladmin ver` also lists the `mysqld` version as `mysql ... --debug` in this case.

If you are using `gcc`, the recommended `configure` line is:

```
CC=gcc CFLAGS="-O2" CXX=gcc CXXFLAGS="-O2 -felide-constructors \
-fno-exceptions -fno-rtti" ./configure --prefix=/usr/local/mysql \
--with-debug --with-extra-charsets=complex
```

This avoids problems with the `libstdc++` library and with C++ exceptions (many compilers have problems with C++ exceptions in threaded code) and compile a MySQL version with support for all character sets.

If you suspect a memory overrun error, you can configure MySQL with `--with-debug=full`, which installs a memory allocation (`SAFEMALLOC`) checker. However, running with `SAFEMALLOC` is quite slow, so if you get performance problems you should start `mysqld` with the `--skip-safemalloc` option. This disables the memory overrun checks for each call to `malloc()` and `free()`.

If `mysqld` stops crashing when you compile it with `--with-debug`, you probably have found a compiler bug or a timing bug within MySQL. In this case, you can try to add `-g` to the `CFLAGS` and `CXXFLAGS` variables above and not use `--with-debug`. If `mysqld` dies, you can at least attach to it with `gdb` or use `gdb` on the core file to find out what happened.

When you configure MySQL for debugging you automatically enable a lot of extra safety check functions that monitor the health of `mysqld`. If they find something “unexpected,” an entry is written to `stderr`, which `mysqld_safe` directs to the error log! This also means that if you are having some unexpected problems with MySQL and are using a source distribution, the first thing you should do is to configure MySQL for debugging! (The second thing is to send mail to a MySQL mailing list and ask for help. See [Section 1.6.1, “MySQL Mailing Lists”](#). If you believe that you have found a bug, please use the instructions at [Section 1.7, “How to Report Bugs or Problems”](#)).

In the Windows MySQL distribution, `mysqld.exe` is by default compiled with support for trace files. See also [Section 25.4.1.2, “Creating Trace Files”](#).

25.4.1.2. Creating Trace Files

If the `mysqld` server doesn't start or if you can cause it to crash quickly, you can try to create a trace file to find the problem.

To do this, you must have a `mysqld` that has been compiled with debugging support. You can check this by executing `mysqld -V`. If the version number ends with `-debug`, it's compiled with support for trace files. (On Windows, the debugging server is named `mysqld-debug` rather than `mysqld` as of MySQL 4.1.)

Start the `mysqld` server with a trace log in `/tmp/mysqld.trace` on Unix or `C:\mysqld.trace` on Windows:

```
shell> mysqld --debug
```

On Windows, you should also use the `--standalone` flag to not start `mysqld` as a service. In a console window, use this command:

```
C:\> mysqld-debug --debug --standalone
```

After this, you can use the `mysql.exe` command-line tool in a second console window to reproduce the problem. You can stop the `mysqld` server with `mysqladmin shutdown`.

Note that the trace file become **very big**! If you want to generate a smaller trace file, you can use debugging options something like this:

```
mysqld --debug=d,info,error,query,general,where:0,/tmp/mysqld.trace
```

This only prints information with the most interesting tags to the trace file.

If you make a bug report about this, please only send the lines from the trace file to the appropriate mailing list where something seems to go wrong! If you can't locate the wrong place, you can ftp the trace file, together with a full bug report, to <ftp://ftp.mysql.com/pub/mysql/upload/> so that a MySQL developer can take a look at it.

The trace file is made with the **DEBUG** package by Fred Fish. See [Section 25.4.3, “The DEBUG Package”](#).

25.4.1.3. Using `pdb` to create a Windows crashdump

Starting with MySQL 5.0.24 the Program Database files (extension `pdb`) are included in the Noinstall distribution of MySQL. These files provide information for debugging your MySQL installation in the event of a problem.

The PDB file contains more detailed information about `mysqld` and other tools that enables more detailed trace and dump files to be created. You can use these with Dr Watson, `WinDbg` and Visual Studio to debug `mysqld`.

For more information on PDB files, see [Microsoft Knowledge Base Article 121366](#). For more information on the debugging options available, see [Debugging Tools for Windows](#).

Dr Watson is installed with all Windows distributions, but if you have installed Windows development tools, Dr Watson may have been replaced with `WinDbg`, the debugger included with Visual Studio, or the debugging tools provided with Borland or Delphi.

To generate a crash file using Dr Watson, follow these steps:

1. Start Dr Watson by running `drwtsn32.exe` interactively using the `-i` option:

```
C:\> drwtsn32 -i
```

2. Set the **LOG FILE PATH** to the directory where you want to store trace files.
3. Make sure **DUMP ALL THREAD CONTEXTS** and **APPEND TO EXISTING LOG FILE**.
4. Uncheck **DUMP SYMBOL TABLE**, **VISUAL NOTIFICATION**, **SOUND NOTIFICATION** and **CREATE CRASH DUMP FILE**.
5. Set the **NUMBER OF INSTRUCTIONS** to a suitable value to capture enough calls in the stacktrace. A value of at 25 should be enough.

Note that the file generated can be very large.

25.4.1.4. Debugging `mysqld` under `gdb`

On most systems you can also start `mysqld` from `gdb` to get more information if `mysqld` crashes.

With some older `gdb` versions on Linux you must use `run --one-thread` if you want to be able to debug `mysqld` threads. In this case, you can only have one thread active at a time. We recommend you to upgrade to `gdb` 5.1 ASAP as thread debugging works much better with this version!

NPTL threads (the new thread library on Linux) may cause problems while running `mysqld` under `gdb`. Some symptoms are:

- `mysqld` hangs during startup (before it writes `ready for connections`).
- `mysqld` crashes during a `pthread_mutex_lock()` or `pthread_mutex_unlock()` call.

In this case, you should set the following environment variable in the shell before starting `gdb`:

```
LD_ASSUME_KERNEL=2.4.1
export LD_ASSUME_KERNEL
```

When running `mysqld` under `gdb`, you should disable the stack trace with `--skip-stack-trace` to be able to catch segfaults within `gdb`.

In MySQL 4.0.14 and above you should use the `--gdb` option to `mysqld`. This installs an interrupt handler for `SIGINT` (needed to stop `mysqld` with `^C` to set breakpoints) and disable stack tracing and core file handling.

It's very hard to debug MySQL under `gdb` if you do a lot of new connections the whole time as `gdb` doesn't free the memory for old threads. You can avoid this problem by starting `mysqld` with `thread_cache_size` set to a value equal to `max_connections + 1`. In most cases just using `--thread_cache_size=5` helps a lot!

If you want to get a core dump on Linux if `mysqld` dies with a `SIGSEGV` signal, you can start `mysqld` with the `--core-file` option. This core file can be used to make a backtrace that may help you find out why `mysqld` died:

```
shell> gdb mysqld core
gdb> backtrace full
gdb> quit
```

See [Section B.1.4.2, "What to Do If MySQL Keeps Crashing"](#).

If you are using `gdb` 4.17.x or above on Linux, you should install a `.gdb` file, with the following information, in your current directory:

```
set print sevenbit off
handle SIGUSR1 nostop noprint
handle SIGUSR2 nostop noprint
handle SIGWAITING nostop noprint
handle SIGLWP nostop noprint
handle SIGPIPE nostop
handle SIGALRM nostop
handle SIGHUP nostop
handle SIGTERM nostop noprint
```

If you have problems debugging threads with `gdb`, you should download `gdb` 5.x and try this instead. The new `gdb` version has very improved thread handling!

Here is an example how to debug `mysqld`:

```
shell> gdb /usr/local/libexec/mysqld
gdb> run
...
backtrace full # Do this when mysqld crashes
```

Include the above output in a bug report, which you can file using the instructions in [Section 1.7, "How to Report Bugs or Problems"](#).

If `mysqld` hangs you can try to use some system tools like `strace` or `/usr/proc/bin/pstack` to examine where `mysqld` has hung.

```
strace /tmp/log libexec/mysqld
```

If you are using the Perl `DBI` interface, you can turn on debugging information by using the `trace` method or by setting the `DBI_TRACE` environment variable.

25.4.1.5. Using a Stack Trace

On some operating systems, the error log contains a stack trace if `mysqld` dies unexpectedly. You can use this to find out where (and maybe why) `mysqld` died. See [Section 5.2.1, "The Error Log"](#). To get a stack trace, you must not compile `mysqld` with the `-fomit-frame-pointer` option to gcc. See [Section 25.4.1.1, "Compiling MySQL for Debugging"](#).

If the error file contains something like the following:

```
mysqld got signal 11;
The manual section 'Debugging a MySQL server' tells you how to
use a stack trace and/or the core file to produce a readable
backtrace that may help in finding out why mysqld died
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...
stack range sanity check, ok, backtrace follows
0x40077552
0x81281a0
0x8128f47
0x8127be0
0x8127995
0x8104947
0x80ff28f
0x810131b
0x80ee4bc
0x80c3c91
0x80c6b43
0x80c1fd9
```

```
0x80c1686
```

you can find where `mysqld` died by doing the following:

1. Copy the preceding numbers to a file, for example `mysqld.stack`.
2. Make a symbol file for the `mysqld` server:

```
nm -n libexec/mysqld > /tmp/mysqld.sym
```

If you have not linked `mysqld` statically, use the following command:

```
nm -D -n libexec/mysqld > /tmp/mysqld.sym
```

If you want to decode C++ symbols, use the `--demangle`, if available, to `nm`. If your version of `nm` does not have this option, you will need to use the `c++filt` command after the stack dump has been produced to demangle the C++ names.

Note that most MySQL binary distributions (except for the "debug" packages, where this information is included inside of the binaries themselves) ship with the above file, named `mysqld.sym.gz`. In this case, you can simply unpack it by doing:

```
gunzip < bin/mysqld.sym.gz > /tmp/mysqld.sym
```

3. Execute the following line:

```
resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack
```

If you were not able to include demangled C++ names in your symbol file, use `c++filt` on the output:

```
resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack|c++filt
```

This prints out where `mysqld` died. If this doesn't help you find out why `mysqld` died, you should make a bug report and include the output from the above command with the bug report.

Note however that in most cases it does not help us to just have a stack trace to find the reason for the problem. To be able to locate the bug or provide a workaround, we would in most cases need to know the query that killed `mysqld` and preferable a test case so that we can repeat the problem! See [Section 1.7, "How to Report Bugs or Problems"](#).

25.4.1.6. Using Server Logs to Find Causes of Errors in `mysqld`

Note that before starting `mysqld` with `--log` you should check all your tables with `myisamchk`. See [Chapter 5, MySQL Server Administration](#).

If `mysqld` dies or hangs, you should start `mysqld` with `--log`. When `mysqld` dies again, you can examine the end of the log file for the query that killed `mysqld`.

If you are using `--log` without a file name, the log is stored in the database directory as `host_name.log`. In most cases it is the last query in the log file that killed `mysqld`, but if possible you should verify this by restarting `mysqld` and executing the found query from the `mysql` command-line tools. If this works, you should also test all complicated queries that didn't complete.

You can also try the command `EXPLAIN` on all `SELECT` statements that takes a long time to ensure that `mysqld` is using indexes properly. See [Section 12.3.2, "EXPLAIN Syntax"](#).

You can find the queries that take a long time to execute by starting `mysqld` with `--log-slow-queries`. See [Section 5.2.4, "The Slow Query Log"](#).

If you find the text `mysqld restarted` in the error log file (normally named `hostname.err`) you probably have found a query that causes `mysqld` to fail. If this happens, you should check all your tables with `myisamchk` (see [Chapter 5, MySQL Server Administration](#)), and test the queries in the MySQL log files to see whether one fails. If you find such a query, try first upgrading to the newest MySQL version. If this doesn't help and you can't find anything in the `mysql` mail archive, you should report the bug to a MySQL mailing list. The mailing lists are described at <http://lists.mysql.com/>, which also has links to online list archives.

If you have started `mysqld` with `--myisam-recover`, MySQL automatically checks and tries to repair MyISAM tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file 'Warning: Checking table ...' which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further. See [Section 5.1.2, "Command Options"](#).

It is not a good sign if `mysqld` did die unexpectedly, but in this case, you should not investigate the `Checking table...` messages, but instead try to find out why `mysqld` died.

25.4.1.7. Making a Test Case If You Experience Table Corruption

If you get corrupted tables or if `mysqld` always fails after some update commands, you can test whether this bug is reproducible by doing the following:

- Take down the MySQL daemon (with `mysqladmin shutdown`).
- Make a backup of the tables (to guard against the very unlikely case that the repair does something bad).
- Check all tables with `myisamchk -s database/*.MYI`. Repair any wrong tables with `myisamchk -r database/table.MYI`.
- Make a second backup of the tables.
- Remove (or move away) any old log files from the MySQL data directory if you need more space.
- Start `mysqld` with `--log-bin`. See Section 5.2.3, “The Binary Log”. If you want to find a query that crashes `mysqld`, you should use `--log --log-bin`.
- When you have gotten a crashed table, stop the `mysqld` server.
- Restore the backup.
- Restart the `mysqld` server **without** `--log-bin`
- Re-execute the commands with `mysqlbinlog binary-log-file | mysql`. The binary log is saved in the MySQL database directory with the name `hostname-bin.#`.
- If the tables are corrupted again or you can get `mysqld` to die with the above command, you have found reproducible bug that should be easy to fix! FTP the tables and the binary log to <ftp://ftp.mysql.com/pub/mysql/upload/> and report it in our bugs database using the instructions given in Section 1.7, “How to Report Bugs or Problems”. (Please note that the `/pub/mysql/upload/` FTP directory is not listable, so you'll not see what you've uploaded in your FTP client.) If you are a support customer, you can use the MySQL Customer Support Center <https://support.mysql.com/> to alert the MySQL team about the problem and have it fixed as soon as possible.

You can also use the script `mysql_find_rows` to just execute some of the update statements if you want to narrow down the problem.

The preceding discussion applies only to RHEL4. The patch is unnecessary for RHEL5.

25.4.2. Debugging a MySQL Client

To be able to debug a MySQL client with the integrated debug package, you should configure MySQL with `--with-debug` or `--with-debug=full`. See Section 2.4.15.2, “Typical configure Options”.

Before running a client, you should set the `MYSQL_DEBUG` environment variable:

```
shell> MYSQL_DEBUG=d:t:O,/tmp/client.trace
shell> export MYSQL_DEBUG
```

This causes clients to generate a trace file in `/tmp/client.trace`.

If you have problems with your own client code, you should attempt to connect to the server and run your query using a client that is known to work. Do this by running `mysql` in debugging mode (assuming that you have compiled MySQL with debugging on):

```
shell> mysql --debug=d:t:O,/tmp/client.trace
```

This provides useful information in case you mail a bug report. See Section 1.7, “How to Report Bugs or Problems”.

If your client crashes at some 'legal' looking code, you should check that your `mysql.h` include file matches your MySQL library file. A very common mistake is to use an old `mysql.h` file from an old MySQL installation with new MySQL library.

25.4.3. The DBUG Package

The MySQL server and most MySQL clients are compiled with the DBUG package originally created by Fred Fish. When you have configured MySQL for debugging, this package makes it possible to get a trace file of what the program is debugging. See [Section 25.4.1.2, “Creating Trace Files”](#).

This section summarizes the argument values that you can specify in debug options on the command line for MySQL programs that have been built with debugging support. For more information about programming with the DBUG package, see the DBUG manual in the `debug` directory of MySQL source distributions. It's best to use a recent distribution to get the most updated DBUG manual.

You use the debug package by invoking a program with the `--debug="..."` or the `-#...` option.

Most MySQL programs have a default debug string that is used if you don't specify an option to `--debug`. The default trace file is usually `/tmp/program_name.trace` on Unix and `\program_name.trace` on Windows.

The debug control string is a sequence of colon-separated fields as follows:

```
<field_1>:<field_2>:...:<field_N>
```

Each field consists of a mandatory flag character followed by an optional “,” and comma-separated list of modifiers:

```
flag[,modifier,modifier,...,modifier]
```

The currently recognized flag characters are:

Flag	Description
<code>d</code>	Enable output from <code>DEBUG_<N></code> macros for the current state. May be followed by a list of keywords which selects output only for the DBUG macros with that keyword. An empty list of keywords implies output for all macros.
<code>D</code>	Delay after each debugger output line. The argument is the number of tenths of seconds to delay, subject to machine capabilities. For example, <code>-#D,20</code> specifies a delay of two seconds.
<code>f</code>	Limit debugging, tracing, and profiling to the list of named functions. Note that a null list disables all functions. The appropriate <code>d</code> or <code>t</code> flags must still be given; this flag only limits their actions if they are enabled.
<code>F</code>	Identify the source file name for each line of debug or trace output.
<code>i</code>	Identify the process with the PID or thread ID for each line of debug or trace output.
<code>g</code>	Enable profiling. Create a file called <code>debugmon.out</code> containing information that can be used to profile the program. May be followed by a list of keywords that select profiling only for the functions in that list. A null list implies that all functions are considered.
<code>L</code>	Identify the source file line number for each line of debug or trace output.
<code>n</code>	Print the current function nesting depth for each line of debug or trace output.
<code>N</code>	Number each line of debug output.
<code>o</code>	Redirect the debugger output stream to the specified file. The default output is <code>stderr</code> .
<code>O</code>	Like <code>o</code> , but the file is really flushed between each write. When needed, the file is closed and reopened between each write.
<code>p</code>	Limit debugger actions to specified processes. A process must be identified with the <code>DEBUG_PROCESS</code> macro and match one in the list for debugger actions to occur.
<code>P</code>	Print the current process name for each line of debug or trace output.
<code>r</code>	When pushing a new state, do not inherit the previous state's function nesting level. Useful when the output is to start at the left margin.
<code>S</code>	Do function <code>_sanity(_file_,_line_)</code> at each debugged function until <code>_sanity()</code> returns something that differs from 0. (Mostly used with <code>safemalloc</code> to find memory leaks)
<code>t</code>	Enable function call/exit trace lines. May be followed by a list (containing only one modifier) giving a numeric maximum trace level, beyond which no output occurs for either debugging or tracing macros. The default is a compile time option.

Some examples of debug control strings that might appear on a shell command line (the `-#` is typically used to introduce a control string to an application program) are:

```
-#d:t
-#d:f,main,subr1:F:L:t,20
-#d,input,output,files:n
-#d:t:i:0,\mysqld.trace
```

In MySQL, common tags to print (with the `d` option) are `enter`, `exit`, `error`, `warning`, `info`, and `loop`.

25.4.4. Comments about RTS Threads

I have tried to use the RTS thread packages with MySQL but stumbled on the following problems:

They use old versions of many POSIX calls and it is very tedious to make wrappers for all functions. I am inclined to think that it would be easier to change the thread libraries to the newest POSIX specification.

Some wrappers are currently written. See [mysys/my_pthread.c](#) for more info.

At least the following should be changed:

`pthread_get_specific` should use one argument. `sigwait` should take two arguments. A lot of functions (at least `pthread_cond_wait`, `pthread_cond_timedwait()`) should return the error code on error. Now they return -1 and set `errno`.

Another problem is that user-level threads use the `ALRM` signal and this aborts a lot of functions (`read`, `write`, `open`...). MySQL should do a retry on interrupt on all of these but it is not that easy to verify it.

The biggest unsolved problem is the following:

To get thread-level alarms I changed `mysys/thr_alarm.c` to wait between alarms with `pthread_cond_timedwait()`, but this aborts with error `EINTR`. I tried to debug the thread library as to why this happens, but couldn't find any easy solution.

If someone wants to try MySQL with RTS threads I suggest the following:

- Change functions MySQL uses from the thread library to POSIX. This shouldn't take that long.
- Compile all libraries with the `-DHAVE_rts_threads`.
- Compile `thr_alarm`.
- If there are some small differences in the implementation, they may be fixed by changing `my_pthread.h` and `my_pthread.c`.
- Run `thr_alarm`. If it runs without any “warning,” “error,” or aborted messages, you are on the right track. Here is a successful run on Solaris:

```

Main thread: 1
Thread 0 (5) started
Thread: 5 Waiting
process_alarm
Thread 1 (6) started
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 1 (1) sec
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 2 (2) sec
Thread: 6 Simulation of no alarm needed
Thread: 6 Slept for 0 (3) sec
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 4 (4) sec
Thread: 6 Waiting
process_alarm
thread_alarm
Thread: 5 Slept for 10 (10) sec
Thread: 5 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 5 (5) sec
Thread: 6 Waiting
process_alarm
process_alarm
...
thread_alarm
Thread: 5 Slept for 0 (1) sec
end

```

25.4.5. Differences Between Thread Packages

MySQL is very dependent on the thread package used. So when choosing a good platform for MySQL, the thread package is very important.

There are at least three types of thread packages:

- User threads in a single process. Thread switching is managed with alarms and the threads library manages all non-thread-safe functions with locks. Read, write and select operations are usually managed with a thread-specific select that switches to another thread if the running threads have to wait for data. If the user thread packages are integrated in the standard libs (FreeBSD and BSDI threads) the thread package requires less overhead than thread packages that have to map all unsafe calls (MIT-pthreads, FSU Pthreads and RTS threads). In some environments (for example, SCO), all system calls are thread-safe so the mapping can be done very easily (FSU Pthreads on SCO). Downside: All mapped calls take a little time and it's quite tricky to be able to handle all situations. There are usually also some system calls that are not handled by the thread package (like MIT-pthreads and sockets). Thread scheduling isn't always optimal.
- User threads in separate processes. Thread switching is done by the kernel and all data are shared between threads. The thread package manages the standard thread calls to allow sharing data between threads. LinuxThreads is using this method. Downside: Lots of processes. Thread creating is slow. If one thread dies the rest are usually left hanging and you must kill them all before restarting. Thread switching is somewhat expensive.
- Kernel threads. Thread switching is handled by the thread library or the kernel and is very fast. Everything is done in one process, but on some systems, `ps` may show the different threads. If one thread aborts, the whole process aborts. Most system calls are thread-safe and should require very little overhead. Solaris, HP-UX, AIX and OSF/1 have kernel threads.

In some systems kernel threads are managed by integrating user level threads in the system libraries. In such cases, the thread switching can only be done by the thread library and the kernel isn't really "thread aware."

Appendix A. MySQL 5.0 Frequently Asked Questions

A.1. MySQL 5.0 FAQ — General

Questions

- [27.1.1](#): Which version of MySQL is production-ready (GA)?
- [27.1.2](#): Can MySQL 5.0 do subqueries?
- [27.1.3](#): Can MySQL 5.0 perform multiple-table inserts, updates, and deletes?
- [27.1.4](#): Does MySQL 5.0 have a Query Cache? Does it work on Server, Instance or Database?
- [27.1.5](#): Does MySQL 5.0 have Sequences?
- [27.1.6](#): Does MySQL 5.0 have a `NOW()` function with fractions of seconds?
- [27.1.7](#): Does MySQL 5.0 work with multi-core processors?
- [27.1.8](#): Is there a hot backup tool for MyISAM like InnoDB Hot Backup?
- [27.1.9](#): Have there been there any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?
- [27.1.10](#): Can MySQL 5.0 perform ACID transactions?

Questions and Answers

27.1.1: Which version of MySQL is production-ready (GA)?

MySQL 5.0 became Generally Available (GA) with MySQL 5.0.15, which was released for production use on 19 October 2005. We are now working on MySQL 5.1, which is currently a Release Candidate. Development work on MySQL 6.0 has started; currently, MySQL 6.0 is in alpha status.

27.1.2: Can MySQL 5.0 do subqueries?

Yes. See [Section 12.2.9](#), “Subquery Syntax”.

27.1.3: Can MySQL 5.0 perform multiple-table inserts, updates, and deletes?

Yes. For the syntax required to perform multiple-table updates, see [Section 12.2.11](#), “UPDATE Syntax”; for that required to perform multiple-table deletes, see [Section 12.2.2](#), “DELETE Syntax”.

A multiple-table insert can be accomplished using a trigger whose `FOR EACH ROW` clause contains multiple `INSERT` statements within a `BEGIN . . . END` block. See [Section 21.3](#), “Using Triggers”.

27.1.4: Does MySQL 5.0 have a Query Cache? Does it work on Server, Instance or Database?

Yes. The query cache operates on the server level, caching complete result sets matched with the original query string. If an exactly identical query is made (which often happens, particularly in web applications), no parsing or execution is necessary; the result is sent directly from the cache. Various tuning options are available. See [Section 7.5.4](#), “The MySQL Query Cache”.

27.1.5: Does MySQL 5.0 have Sequences?

No. However, MySQL has an `AUTO_INCREMENT` system, which in MySQL 5.0 can also handle inserts in a multi-master replication setup. With the `--auto-increment-increment` and `--auto-increment-offset` startup options, you can set each server to generate auto-increment values that don't conflict with other servers. The `--auto-increment-increment` value should be greater than the number of servers, and each server should have a unique offset.

27.1.6: Does MySQL 5.0 have a `NOW()` function with fractions of seconds?

No. This is on the MySQL roadmap as a “rolling feature”. This means that it is not a flagship feature, but will be implemented, development time permitting. Specific customer demand may change this scheduling.

However, MySQL does parse time strings with a fractional component. See [Section 10.3.2](#), “The TIME Type”.

27.1.7: Does MySQL 5.0 work with multi-core processors?

Yes. MySQL is fully multi-threaded, and will make use of multiple CPUs, provided that the operating system supports them.

27.1.8: Is there a hot backup tool for MyISAM like InnoDB Hot Backup?

This is currently under development for a future MySQL release.

27.1.9: Have there been there any improvements in error reporting when foreign keys fail? Does MySQL now report which column and reference failed?

The foreign key support in `InnoDB` has seen improvements in each major version of MySQL. Foreign key support generic to all storage engines is scheduled for MySQL 6.x; this should resolve any inadequacies in the current storage engine specific implementation.

27.1.10: Can MySQL 5.0 perform ACID transactions?

Yes. All current MySQL versions support transactions. The `InnoDB` storage engine offers full ACID transactions with row-level locking, multi-versioning, non-locking repeatable reads, and all four SQL standard isolation levels.

The `NDB` storage engine supports the `READ COMMITTED` transaction isolation level only.

A.2. MySQL 5.0 FAQ — Storage Engines

Questions

- [27.2.1](#): Where can I obtain complete documentation for MySQL storage engines?
- [27.2.2](#): Are there any new storage engines in MySQL 5.0?
- [27.2.3](#): Have any storage engines been removed in MySQL 5.0?
- [27.2.4](#): What are the unique benefits of the `ARCHIVE` storage engine?
- [27.2.5](#): Do the new features in MySQL 5.0 apply to all storage engines?

Questions and Answers

27.2.1: Where can I obtain complete documentation for MySQL storage engines?

See [Chapter 13, *Storage Engines*](#). That chapter contains information about all MySQL storage engines except for the `NDB` storage engine used for MySQL Cluster; `NDB` is covered in [Chapter 19, *MySQL Cluster*](#).

27.2.2: Are there any new storage engines in MySQL 5.0?

Yes. The `FEDERATED` storage engine, new in MySQL 5.0, allows the server to access tables on other (remote) servers. See [Section 13.7, “The `FEDERATED` Storage Engine”](#).

27.2.3: Have any storage engines been removed in MySQL 5.0?

Yes. MySQL 5.0 no longer supports the `ISAM` storage engine. If you have any existing `ISAM` tables from previous versions of MySQL, you should convert these to `MyISAM` before upgrading to MySQL 5.0.

27.2.4: What are the unique benefits of the `ARCHIVE` storage engine?

The `ARCHIVE` storage engine is ideally suited for storing large amounts of data without indexes; it has a very small footprint, and performs selects using table scans. See [Section 13.8, “The `ARCHIVE` Storage Engine”](#), for details.

27.2.5: Do the new features in MySQL 5.0 apply to all storage engines?

The general new features such as views, stored procedures, triggers, `INFORMATION_SCHEMA`, precision math (`DECIMAL` column type), and the `BIT` column type, apply to all storage engines. There are also additions and changes for specific storage engines.

A.3. MySQL 5.0 FAQ — Server SQL Mode

Questions

- [27.3.1](#): What are server SQL modes?

- [27.3.2](#): How many server SQL modes are there?
- [27.3.3](#): How do you determine the server SQL mode?
- [27.3.4](#): Is the mode dependent on the database or connection?
- [27.3.5](#): Can the rules for strict mode be extended?
- [27.3.6](#): Does strict mode impact performance?
- [27.3.7](#): What is the default server SQL mode when MySQL 5.0 is installed?

Questions and Answers

27.3.1: What are server SQL modes?

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server apply these modes individually to different clients. For more information, see [Section 5.1.7, “SQL Modes”](#).

27.3.2: How many server SQL modes are there?

Each mode can be independently switched on and off. See [Section 5.1.7, “SQL Modes”](#), for a complete list of available modes.

27.3.3: How do you determine the server SQL mode?

You can set the default SQL mode (for `mysqld` startup) with the `--sql-mode` option. Using the statement `SET [SESSION|GLOBAL] sql_mode='modes'`, you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a `SELECT @@sql_mode` statement.

27.3.4: Is the mode dependent on the database or connection?

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. you can change these settings using `SET [SESSION|GLOBAL] sql_mode='modes'`.

27.3.5: Can the rules for strict mode be extended?

When we refer to *strict mode*, we mean a mode where at least one of the modes `TRADITIONAL`, `STRICT_TRANS_TABLES`, or `STRICT_ALL_TABLES` is enabled. Options can be combined, so you can add additional restrictions to a mode. See [Section 5.1.7, “SQL Modes”](#), for more information.

27.3.6: Does strict mode impact performance?

The intensive validation of input data that some settings requires more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However — if you do require it — strict mode can provide such validation.

27.3.7: What is the default server SQL mode when MySQL 5.0 is installed?

By default, no special modes are enabled. See [Section 5.1.7, “SQL Modes”](#), for information about all available modes and MySQL's default behavior.

A.4. MySQL 5.0 FAQ — Stored Procedures and Functions

Questions

- [27.4.1](#): Does MySQL 5.0 support stored procedures and functions?
- [27.4.2](#): Where can I find documentation for MySQL stored procedures and stored functions?
- [27.4.3](#): Is there a discussion forum for MySQL stored procedures?
- [27.4.4](#): Where can I find the ANSI SQL 2003 specification for stored procedures?
- [27.4.5](#): How do you manage stored routines?
- [27.4.6](#): Is there a way to view all stored procedures and stored functions in a given database?

- [27.4.7](#): Where are stored procedures stored?
- [27.4.8](#): Is it possible to group stored procedures or stored functions into packages?
- [27.4.9](#): Can a stored procedure call another stored procedure?
- [27.4.10](#): Can a stored procedure call a trigger?
- [27.4.11](#): Can a stored procedure access tables?
- [27.4.12](#): Do stored procedures have a statement for raising application errors?
- [27.4.13](#): Do stored procedures provide exception handling?
- [27.4.14](#): Can MySQL 5.0 stored routines return result sets?
- [27.4.15](#): Is `WITH RECOMPILE` supported for stored procedures?
- [27.4.16](#): Is there a MySQL equivalent to using `mod_php` as a gateway on Apache to talk directly to a stored procedure in the database?
- [27.4.17](#): Can I pass an array as input to a stored procedure?
- [27.4.18](#): Can I pass a cursor as an `IN` parameter to a stored procedure?
- [27.4.19](#): Can I return a cursor as an `OUT` parameter from a stored procedure?
- [27.4.20](#): Can I print out a variable's value within a stored routine for debugging purposes?
- [27.4.21](#): Can I commit or roll back transactions inside a stored procedure?
- [27.4.22](#): Do MySQL 5.0 stored procedures and functions work with replication?
- [27.4.23](#): Are stored procedures and functions created on a master server replicated to a slave?
- [27.4.24](#): How are actions that take place inside stored procedures and functions replicated?
- [27.4.25](#): Are there special security requirements for using stored procedures and functions together with replication?
- [27.4.26](#): What limitations exist for replicating stored procedure and function actions?
- [27.4.27](#): Do the preceding limitations affect MySQL's ability to do point-in-time recovery?
- [27.4.28](#): What is being done to correct the aforementioned limitations?

Questions and Answers

27.4.1: Does MySQL 5.0 support stored procedures and functions?

Yes. MySQL 5.0 supports two types of stored routines — stored procedures and stored functions.

27.4.2: Where can I find documentation for MySQL stored procedures and stored functions?

See [Section 21.2, “Using Stored Routines \(Procedures and Functions\)”](#).

27.4.3: Is there a discussion forum for MySQL stored procedures?

Yes. See <http://forums.mysql.com/list.php?98>.

27.4.4: Where can I find the ANSI SQL 2003 specification for stored procedures?

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books — such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer — which give a comprehensive overview of the standard, including coverage of stored procedures.

27.4.5: How do you manage stored routines?

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with `CREATE [FUNCTION|PROCEDURE]`, `ALTER [FUNCTION|PROCEDURE]`, `DROP [FUNCTION|PROCEDURE]`, and `SHOW CREATE [FUNCTION|PROCEDURE]`. You can obtain information about existing stored procedures using the `ROUTINES` table in the `INFORMATION_SCHEMA` database (see [Section 22.14, “The INFORMATION_SCHEMA ROUTINES Table”](#)).

27.4.6: Is there a way to view all stored procedures and stored functions in a given database?

Yes. For a database named *dbname*, use this query on the `INFORMATION_SCHEMA.ROUTINES` table:

```
SELECT ROUTINE_TYPE, ROUTINE_NAME
FROM INFORMATION_SCHEMA.ROUTINES
WHERE ROUTINE_SCHEMA= 'dbname' ;
```

For more information, see [Section 22.14, “The INFORMATION_SCHEMA ROUTINES Table”](#).

The body of a stored routine can be viewed using `SHOW CREATE FUNCTION` (for a stored function) or `SHOW CREATE PROCEDURE` (for a stored procedure). See [Section 12.5.5.7, “SHOW CREATE PROCEDURE and SHOW CREATE FUNCTION Syntax”](#), for more information.

27.4.7: Where are stored procedures stored?

In the `proc` table of the `mysql` system database. However, you should not access the tables in the system database directly. Instead, use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See [Section 12.5.5.7, “SHOW CREATE PROCEDURE and SHOW CREATE FUNCTION Syntax”](#), for more information about these statements.

You can also query the `ROUTINES` table in the `INFORMATION_SCHEMA` database — see [Section 22.14, “The INFORMATION_SCHEMA ROUTINES Table”](#), for information about this table.

27.4.8: Is it possible to group stored procedures or stored functions into packages?

No. This is not supported in MySQL 5.0.

27.4.9: Can a stored procedure call another stored procedure?

Yes.

27.4.10: Can a stored procedure call a trigger?

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to activate.

27.4.11: Can a stored procedure access tables?

Yes. A stored procedure can access one or more tables as required.

27.4.12: Do stored procedures have a statement for raising application errors?

Not in MySQL 5.0. We intend to implement the SQL standard `SIGNAL` and `RESIGNAL` statements in a future MySQL release.

27.4.13: Do stored procedures provide exception handling?

MySQL implements `HANDLER` definitions according to the SQL standard. See [Section 12.8.4.2, “DECLARE Handlers”](#), for details.

27.4.14: Can MySQL 5.0 stored routines return result sets?

Stored procedures can, but stored functions cannot. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or above) client-server protocol for this to work. This means that — for instance — in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

27.4.15: Is `WITH RECOMPILE` supported for stored procedures?

Not in MySQL 5.0.

27.4.16: Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?

There is no equivalent in MySQL 5.0.

27.4.17: Can I pass an array as input to a stored procedure?

Not in MySQL 5.0.

27.4.18: Can I pass a cursor as an `IN` parameter to a stored procedure?

In MySQL 5.0, cursors are available inside stored procedures only.

27.4.19: Can I return a cursor as an `OUT` parameter from a stored procedure?

In MySQL 5.0, cursors are available inside stored procedures only. However, if you do not open a cursor on a `SELECT`, the result will be sent directly to the client. You can also `SELECT INTO` variables. See [Section 12.2.8, “SELECT Syntax”](#).

27.4.20: Can I print out a variable's value within a stored routine for debugging purposes?

Yes, you can do this in a *stored procedure*, but not in a stored function. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You will need to use the MySQL 4.1 (or above) client-server protocol for this to work. This means that — for instance — in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

27.4.21: Can I commit or roll back transactions inside a stored procedure?

Yes. However, you cannot perform transactional operations within a stored function.

27.4.22: Do MySQL 5.0 stored procedures and functions work with replication?

Yes, standard actions carried out in stored procedures and functions are replicated from a master MySQL server to a slave server. There are a few limitations that are described in detail in [Section 21.5, “Binary Logging of Stored Programs”](#).

27.4.23: Are stored procedures and functions created on a master server replicated to a slave?

Yes, creation of stored procedures and functions carried out through normal DDL statements on a master server are replicated to a slave, so the objects will exist on both servers. `ALTER` and `DROP` statements for stored procedures and functions are also replicated.

27.4.24: How are actions that take place inside stored procedures and functions replicated?

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a slave server. The actual calls made to execute stored procedures are not replicated.

Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

27.4.25: Are there special security requirements for using stored procedures and functions together with replication?

Yes. Because a slave server has authority to execute any statement read from a master's binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active, then MySQL DBAs have two security options open to them:

1. Any user wishing to create stored functions must be granted the `SUPER` privilege.
2. Alternatively, a DBA can set the `log_bin_trust_function_creators` system variable to 1, which enables anyone with the standard `CREATE ROUTINE` privilege to create stored functions.

27.4.26: What limitations exist for replicating stored procedure and function actions?

Non-deterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced, and therefore, random actions replicated to a slave will not mirror those performed on a master. Note that declaring stored functions to be `DETERMINISTIC` or setting the `log_bin_trust_function_creators` system variable to 0 will not allow random-valued operations to be invoked.

In addition, time-based actions cannot be reproduced on a slave because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, non-transactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a master may be partially updated from DML activity, but no updates are done to the slave because of the errors that occurred. A workaround is for a function's DML actions to be carried out with the `IGNORE` keyword so that updates on the master that cause errors are ignored and updates that do not cause errors are replicated to the slave.

27.4.27: Do the preceding limitations affect MySQL's ability to do point-in-time recovery?

The same limitations that affect replication do affect point-in-time recovery.

27.4.28: What is being done to correct the aforementioned limitations?

MySQL 5.1 implements *row-based replication*, which resolves the limitations mentioned earlier.

We do not plan to backport row-based replication to MySQL 5.0. For additional information, see [Replication Formats](#), in the *MySQL 5.1 Manual*.

A.5. MySQL 5.0 FAQ — Triggers

Questions

- [27.5.1](#): Where can I find the documentation for MySQL 5.0 triggers?
- [27.5.2](#): Is there a discussion forum for MySQL Triggers?
- [27.5.3](#): Does MySQL 5.0 have statement-level or row-level triggers?
- [27.5.4](#): Are there any default triggers?
- [27.5.5](#): How are triggers managed in MySQL?
- [27.5.6](#): Is there a way to view all triggers in a given database?
- [27.5.7](#): Where are triggers stored?
- [27.5.8](#): Can a trigger call a stored procedure?
- [27.5.9](#): Can triggers access tables?
- [27.5.10](#): Can triggers call an external application through a UDF?
- [27.5.11](#): Is possible for a trigger to update tables on a remote server?
- [27.5.12](#): Do triggers work with replication?
- [27.5.13](#): How are actions carried out through triggers on a master replicated to a slave?

Questions and Answers

27.5.1: Where can I find the documentation for MySQL 5.0 triggers?

See [Section 21.3](#), “Using Triggers”.

27.5.2: Is there a discussion forum for MySQL Triggers?

Yes. It is available at <http://forums.mysql.com/list.php?99>.

27.5.3: Does MySQL 5.0 have statement-level or row-level triggers?

In MySQL 5.0, all triggers are `FOR EACH ROW` — that is, the trigger is activated for each row that is inserted, updated, or deleted. MySQL 5.0 does not support triggers using `FOR EACH STATEMENT`.

27.5.4: Are there any default triggers?

Not explicitly. MySQL does have specific special behavior for some `TIMESTAMP` columns, as well as for columns which are defined using `AUTO_INCREMENT`.

27.5.5: How are triggers managed in MySQL?

In MySQL 5.0, triggers can be created using the `CREATE TRIGGER` statement, and dropped using `DROP TRIGGER`. See [Section 12.1.10](#), “`CREATE TRIGGER Syntax`”, and [Section 12.1.17](#), “`DROP TRIGGER Syntax`”, for more about these statements.

Information about triggers can be obtained by querying the `INFORMATION_SCHEMA.TRIGGERS` table. See [Section 22.16](#), “[The INFORMATION_SCHEMA TRIGGERS Table](#)”.

27.5.6: Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database `dbname` using a query on the `INFORMATION_SCHEMA.TRIGGERS` table such as the one shown here:

```
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
FROM INFORMATION_SCHEMA.TRIGGERS
WHERE TRIGGER_SCHEMA= 'dbname' ;
```

For more information about this table, see [Section 22.16](#), “[The INFORMATION_SCHEMA TRIGGERS Table](#)”.

You can also use the `SHOW TRIGGERS` statement, which is specific to MySQL. See [Section 12.5.5.31](#), “`SHOW TRIGGERS Syntax`”.

27.5.7: Where are triggers stored?

Triggers for a table are currently stored in `.TRG` files, with one such file one per table.

27.5.8: Can a trigger call a stored procedure?

Yes.

27.5.9: Can triggers access tables?

A trigger can access both old and new data in its own table. Through a stored procedure, or a multiple-table update or delete statement, a trigger can also affect other tables.

27.5.10: Can triggers call an external application through a UDF?

No, not at present.

27.5.11: Is possible for a trigger to update tables on a remote server?

Yes. A table on a remote server could be updated using the `FEDERATED` storage engine. (See [Section 13.7, “The FEDERATED Storage Engine”](#)).

27.5.12: Do triggers work with replication?

Triggers and replication in MySQL 5.0 work in the same way as in most other database systems: Actions carried out through triggers on a master are not replicated to a slave server. Instead, triggers that exist on tables that reside on a MySQL master server need to be created on the corresponding tables on any MySQL slave servers so that the triggers activate on the slaves as well as the master.

27.5.13: How are actions carried out through triggers on a master replicated to a slave?

First, the triggers that exist on a master must be re-created on the slave server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table `EMP` that has an `AFTER` insert trigger, which exists on a master MySQL server. The same `EMP` table and `AFTER` insert trigger exist on the slave server as well. The replication flow would be:

1. An `INSERT` statement is made to `EMP`.
2. The `AFTER` trigger on `EMP` activates.
3. The `INSERT` statement is written to the binary log.
4. The replication slave picks up the `INSERT` statement to `EMP` and executes it.
5. The `AFTER` trigger on `EMP` that exists on the slave activates.

A.6. MySQL 5.0 FAQ — Views

Questions

- [27.6.1](#): Where can I find documentation covering MySQL Views?
- [27.6.2](#): Is there a discussion forum for MySQL Views?
- [27.6.3](#): What happens to a view if an underlying table is dropped or renamed?
- [27.6.4](#): Does MySQL 5.0 have table snapshots?
- [27.6.5](#): Does MySQL 5.0 have materialized views?
- [27.6.6](#): Can you insert into views that are based on joins?

Questions and Answers

27.6.1: Where can I find documentation covering MySQL Views?

See [Section 21.4, “Using Views”](#).

27.6.2: Is there a discussion forum for MySQL Views?

Yes. See <http://forums.mysql.com/list.php?100>

27.6.3: What happens to a view if an underlying table is dropped or renamed?

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the `CHECK TABLE` statement. (See [Section 12.5.2.3, “CHECK TABLE Syntax”](#).)

27.6.4: Does MySQL 5.0 have table snapshots?

No.

27.6.5: Does MySQL 5.0 have materialized views?

No.

27.6.6: Can you insert into views that are based on joins?

It is possible, provided that your `INSERT` statement has a column list that makes it clear there's only one table involved.

You *cannot* insert into multiple tables with a single insert on a view.

A.7. MySQL 5.0 FAQ — INFORMATION_SCHEMA

Questions

- [27.7.1](#): Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?
- [27.7.2](#): Is there a discussion forum for `INFORMATION_SCHEMA`?
- [27.7.3](#): Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?
- [27.7.4](#): What is the difference between the Oracle Data Dictionary and MySQL's `INFORMATION_SCHEMA`?
- [27.7.5](#): Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

Questions and Answers

27.7.1: Where can I find documentation for the MySQL `INFORMATION_SCHEMA` database?

See [Chapter 22, `INFORMATION_SCHEMA` Tables](#)

27.7.2: Is there a discussion forum for `INFORMATION_SCHEMA`?

See <http://forums.mysql.com/list.php?101>.

27.7.3: Where can I find the ANSI SQL 2003 specification for `INFORMATION_SCHEMA`?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available — such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer — which give a comprehensive overview of the standard, including `INFORMATION_SCHEMA`.

27.7.4: What is the difference between the Oracle Data Dictionary and MySQL's `INFORMATION_SCHEMA`?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. MySQL's implementation is more similar to those found in DB2 and SQL Server, which also support `INFORMATION_SCHEMA` as defined in the SQL standard.

27.7.5: Can I add to or otherwise modify the tables found in the `INFORMATION_SCHEMA` database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, *MySQL AB cannot support bugs or other issues which result from modifying `INFORMATION_SCHEMA` tables or data.*

A.8. MySQL 5.0 FAQ — Migration

Questions

- [27.8.1](#): Where can I find information on how to migrate from MySQL 4.1 to MySQL 5.0?
- [27.8.2](#): How has storage engine (table type) support changed in MySQL 5.0 from previous versions?

Questions and Answers

27.8.1: Where can I find information on how to migrate from MySQL 4.1 to MySQL 5.0?

For detailed upgrade information, see [Section 2.4.17, “Upgrading MySQL”](#). We recommend that you do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major version to the next in each step. This may seem more complicated, but it will you save time and trouble — if you encounter problems during the upgrade, their origin will be easier to identify, either by you or — if you have a MySQL Enterprise subscription — by MySQL support.

27.8.2: How has storage engine (table type) support changed in MySQL 5.0 from previous versions?

Storage engine support has changed as follows:

- Support for [ISAM](#) tables was removed in MySQL 5.0 and you should now use the [MyISAM](#) storage engine in place of [ISAM](#). To convert a table `tblname` from [ISAM](#) to [MyISAM](#), simply issue a statement such as this one:

```
ALTER TABLE tblname ENGINE=MYISAM;
```

- Internal [RAID](#) for [MyISAM](#) tables was also removed in MySQL 5.0. This was formerly used to allow large tables in file systems that did not support file sizes greater than 2GB. All modern file systems allow for larger tables; in addition, there are now other solutions such as [MERGE](#) tables and views.
- The [VARCHAR](#) column type now retains trailing spaces in all storage engines.
- [MEMORY](#) tables (formerly known as [HEAP](#) tables) can also contain [VARCHAR](#) columns.

A.9. MySQL 5.0 FAQ — Security

Questions

- [27.9.1](#): Where can I find documentation that addresses security issues for MySQL?
- [27.9.2](#): Does MySQL 5.0 have native support for SSL?
- [27.9.3](#): Is SSL support be built into MySQL binaries, or must I recompile the binary myself to enable it?
- [27.9.4](#): Does MySQL 5.0 have built-in authentication against LDAP directories?
- [27.9.5](#): Does MySQL 5.0 include support for Roles Based Access Control (RBAC)?

Questions and Answers

27.9.1: Where can I find documentation that addresses security issues for MySQL?

The best place to start is [Section 5.3, “General Security Issues”](#).

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- [Section 5.3.1, “General Security Guidelines”](#).
- [Section 5.3.2, “Making MySQL Secure Against Attackers”](#).
- [Section B.1.4.1, “How to Reset the Root Password”](#).
- [Section 5.3.5, “How to Run MySQL as a Normal User”](#).
- [Section 25.2.2.6, “User-Defined Function Security Precautions”](#).
- [Section 5.3.3, “Security-Related `mysqld` Options”](#).

- [Section 5.3.4, “Security Issues with LOAD DATA LOCAL”](#).
- [Section 2.4.16, “Post-Installation Setup and Testing”](#).
- [Section 2.4.19.1.11, “SELinux Notes”](#).
- [Section 5.5.7.1, “Basic SSL Concepts”](#).

MySQL Enterprise

The MySQL Enterprise Monitor enforces best practices for maximizing the security of your servers. For more information see <http://www.mysql.com/products/enterprise/advisors.html>.

27.9.2: Does MySQL 5.0 have native support for SSL?

Most 5.0 binaries have support for SSL connections between the client and server. We can't currently build with the new YaSSL library everywhere, as it's still quite new and does not compile on all platforms yet. See [Section 5.5.7, “Using SSL for Secure Connections”](#).

You can also tunnel a connection via SSH, if (for instance) if the client application doesn't support SSL connections. For an example, see [Section 5.5.7.5, “Connecting to MySQL Remotely from Windows with SSH”](#).

27.9.3: Is SSL support be built into MySQL binaries, or must I recompile the binary myself to enable it?

Most 5.0 binaries have SSL enabled for client-server connections that are secured, authenticated, or both. However, the YaSSL library currently does not compile on all platforms. See [Section 5.5.7, “Using SSL for Secure Connections”](#), for a complete listing of supported and unsupported platforms.

27.9.4: Does MySQL 5.0 have built-in authentication against LDAP directories?

No. Support for external authentication methods is on the MySQL roadmap as a “rolling feature”, which means that we plan to implement it in the future, but we have not yet determined when this will be done.

27.9.5: Does MySQL 5.0 include support for Roles Based Access Control (RBAC)?

No. Support for roles is on the MySQL roadmap as a “rolling feature”, which means that we plan to implement it in the future, but we have not yet determined when this will be done.

A.10. MySQL 5.0 FAQ — MySQL Cluster

In the following section, we answer questions that are frequently asked about MySQL Cluster and the `NDBCLUSTER` storage engine.

Questions

- [27.10.1](#): Which versions of the MySQL software support Cluster? Do I have to compile from source?
- [27.10.2](#): What does “NDB” mean?
- [27.10.3](#): What is the difference between using MySQL Cluster vs using MySQL replication?
- [27.10.4](#): Do I need to do any special networking to run MySQL Cluster? How do computers in a cluster communicate?
- [27.10.5](#): How many computers do I need to run a MySQL Cluster, and why?
- [27.10.6](#): What do the different computers do in a MySQL Cluster?
- [27.10.7](#): With which operating systems can I use Cluster?
- [27.10.8](#): What are the hardware requirements for running MySQL Cluster?
- [27.10.9](#): How much RAM do I need to use MySQL Cluster? Is it possible to use disk memory at all?
- [27.10.10](#): What filesystems can I use with MySQL Cluster? What about network filesystems or network shares?
- [27.10.11](#): Can I run MySQL Cluster nodes inside virtual machines (such as those created by VMWare, Parallels, or Xen)?
- [27.10.12](#): I am trying to populate a MySQL Cluster database. The loading process terminates prematurely and I get an error message like this one: `ERROR 1114: THE TABLE 'MY_CLUSTER_TABLE' IS FULL` Why is this happening?

- [27.10.13](#): MySQL Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or more nodes in remote locations?
- [27.10.14](#): Do I have to learn a new programming or query language to use MySQL Cluster?
- [27.10.15](#): How do I find out what an error or warning message means when using MySQL Cluster?
- [27.10.16](#): Is MySQL Cluster transaction-safe? What isolation levels are supported?
- [27.10.17](#): What storage engines are supported by MySQL Cluster?
- [27.10.18](#): In the event of a catastrophic failure — say, for instance, the whole city loses power *and* my UPS fails — would I lose all my data?
- [27.10.19](#): Is it possible to use `FULLTEXT` indexes with MySQL Cluster?
- [27.10.20](#): Can I run multiple nodes on a single computer?
- [27.10.21](#): Can I add data nodes to a MySQL Cluster without restarting it?
- [27.10.22](#): Are there any limitations that I should be aware of when using MySQL Cluster?
- [27.10.23](#): How do I import an existing MySQL database into a MySQL Cluster?
- [27.10.24](#): How do cluster nodes communicate with one another?
- [27.10.25](#): What is an *arbiter*?
- [27.10.26](#): What data types are supported by MySQL Cluster?
- [27.10.27](#): How do I start and stop MySQL Cluster?
- [27.10.28](#): What happens to MySQL Cluster data when the cluster is shut down?
- [27.10.29](#): Is it a good idea to have more than one management node for a MySQL Cluster?
- [27.10.30](#): Can I mix different kinds of hardware and operating systems in one MySQL Cluster?
- [27.10.31](#): Can I run two data nodes on a single host? Two SQL nodes?
- [27.10.32](#): Can I use hostnames with MySQL Cluster?
- [27.10.33](#): How do I handle MySQL users in a MySQL Cluster having multiple MySQL servers?
- [27.10.34](#): How do I continue to send queries in the event that one of the SQL nodes fails?

Questions and Answers

27.10.1: Which versions of the MySQL software support Cluster? Do I have to compile from source?

MySQL Cluster is supported in all server binaries in the 5.0 release series for operating systems on which MySQL Cluster is available. See [Section 4.3.1, “mysqld — The MySQL Server”](#). You can determine whether your server has NDB support using either either of the statements `SHOW VARIABLES LIKE 'have_%%'` or `SHOW ENGINES`.

Linux users should note that NDB is *not* included in the standard MySQL server RPMs. Beginning with MySQL 5.0.4, there are separate RPM packages for the NDB storage engine and accompanying management and other tools; see the [NDB RPM Downloads](#) section of the [MySQL 5.0 Downloads](#) page for these. (Prior to 5.0.4, you had to use the `-max` binaries supplied as `.tar.gz` archives. This is still possible, but is not required, so you can use your Linux distribution’s RPM manager if you prefer.)

You can also obtain NDB support by compiling MySQL from source, but it is not necessary to do so simply to use MySQL Cluster. To download the latest binary, RPM, or source distribution in the MySQL 5.0 series, visit <http://dev.mysql.com/downloads/mysql/5.0.html>.

However, you should use MySQL NDB Cluster NDB 6.2 or 6.3 for new deployments, and if you are already using MySQL 5.0 with clustering support, to upgrade to one of these MySQL Cluster NDB 6.x release series. For an overview of improvements made in MySQL Cluster NDB 6.2 and 6.3, see [Features Added in MySQL Cluster NDB 6.2](#), and [Features Added in MySQL Cluster NDB 6.3](#).

27.10.2: What does “NDB” mean?

This stands for “Network Database”. NDB (also known as `NDBCLUSTER`) is the storage engine that enables clustering in MySQL.

27.10.3: What is the difference between using MySQL Cluster vs using MySQL replication?

In traditional MySQL replication, a master MySQL server updates one or more slaves. Transactions are committed sequentially, and a slow transaction can cause the slave to lag behind the master. This means that if the master fails, it is possible that the slave might not have recorded the last few transactions. If a transaction-safe engine such as [InnoDB](#) is being used, a transaction will either be complete on the slave or not applied at all, but replication does not guarantee that all data on the master and the slave will be consistent at all times. In MySQL Cluster, all data nodes are kept in synchrony, and a transaction committed by any one data node is committed for all data nodes. In the event of a data node failure, all remaining data nodes remain in a consistent state.

In short, whereas standard MySQL replication is *asynchronous*, MySQL Cluster is *synchronous*.

We have implemented (asynchronous) replication for Cluster in MySQL 5.1 and MySQL Cluster NDB 6.x. This includes the capability to replicate both between two clusters, and from a MySQL cluster to a non-Cluster MySQL server. However, we do not plan to backport this functionality to MySQL 5.0. See [MySQL Cluster Replication](#).

27.10.4: Do I need to do any special networking to run MySQL Cluster? How do computers in a cluster communicate?

MySQL Cluster is intended to be used in a high-bandwidth environment, with computers connecting via TCP/IP. Its performance depends directly upon the connection speed between the cluster's computers. The minimum connectivity requirements for MySQL Cluster include a typical 100-megabit Ethernet network or the equivalent. We recommend you use gigabit Ethernet whenever available.

The faster SCI protocol is also supported, but requires special hardware. See [Section 19.11, "Using High-Speed Interconnects with MySQL Cluster"](#), for more information about SCI.

27.10.5: How many computers do I need to run a MySQL Cluster, and why?

A minimum of three computers is required to run a viable cluster. However, the minimum **recommended** number of computers in a MySQL Cluster is four: one each to run the management and SQL nodes, and two computers to serve as data nodes. The purpose of the two data nodes is to provide redundancy; the management node must run on a separate machine to guarantee continued arbitration services in the event that one of the data nodes fails.

To provide increased throughput and high availability, you should use multiple SQL nodes (MySQL Servers connected to the cluster). It is also possible (although not strictly necessary) to run multiple management servers.

27.10.6: What do the different computers do in a MySQL Cluster?

A MySQL Cluster has both a physical and logical organization, with computers being the physical elements. The logical or functional elements of a cluster are referred to as *nodes*, and a computer housing a cluster node is sometimes referred to as a *cluster host*. There are three types of nodes, each corresponding to a specific role within the cluster. These are:

- **Management node.** This node provides management services for the cluster as a whole, including startup, shutdown, backups, and configuration data for the other nodes. The management node server is implemented as the application `ndb_mgmd`; the management client used to control MySQL Cluster is `ndb_mgm`.
- **Data node.** This type of node stores and replicates data. Data node functionality is handled by instances of the [NDB](#) data node process `ndbd`.
- **SQL node.** This is simply an instance of MySQL Server (`mysqld`) that is built with support for the [NDBCLUSTER](#) storage engine and started with the `--ndb-cluster` option to enable the engine and the `--ndb-connectstring` option to enable it to connect to a MySQL Cluster management server. For more about these options, see [Section 19.4.2, "MySQL Cluster-Related Command Options for mysqld"](#).

Note

An *API node* is any application that makes direct use of Cluster data nodes for data storage and retrieval. An SQL node can thus be considered a type of API node that uses a MySQL Server to provide an SQL interface to the Cluster. You can write such applications (that do not depend on a MySQL Server) using the [NDB API](#), which supplies a direct, object-oriented transaction and scanning interface to Cluster data; see [The NDB API](#), for more information.

27.10.7: With which operating systems can I use Cluster?

MySQL Cluster is supported on most Unix-like operating systems, including Linux, Mac OS X, Solaris, and HP-UX. MySQL Cluster is *not* supported on Windows at this time. We are working to add MySQL Cluster support for other platforms, including Windows; eventually we intend to offer MySQL Cluster on all platforms for which MySQL itself is supported.

For more detailed information concerning the level of support which is offered for MySQL Cluster on various operating system versions, OS distributions, and hardware platforms, please refer to <http://www.mysql.com/support/supportedplatforms/cluster.html>.

27.10.8: What are the hardware requirements for running MySQL Cluster?

MySQL Cluster should run on any platform for which NDB-enabled binaries are available. For data nodes, faster CPUs and more memory are likely to improve performance, and 64-bit CPUs are likely to be more effective than 32-bit processors. There must be sufficient memory on machines used for data nodes to hold each node's share of the database (see *How much RAM do I Need?* for more information). Nodes can communicate via a standard TCP/IP network and hardware. For SCI support, special networking hardware is required (see [Section 19.11, "Using High-Speed Interconnects with MySQL Cluster"](#)).

27.10.9: How much RAM do I need to use MySQL Cluster? Is it possible to use disk memory at all?

In MySQL 5.0, Cluster is in-memory only. This means that all table data (including indexes) is stored in RAM. Therefore, if your data takes up 1 GB of space and you want to replicate it once in the cluster, you need 2 GB of memory to do so (1 GB per replica). This is in addition to the memory required by the operating system and any applications running on the cluster computers.

If a data node's memory usage exceeds what is available in RAM, then the system will attempt to use swap space up to the limit set for `DataMemory`. However, this will at best result in severely degraded performance, and may cause the node to be dropped due to slow response time (missed heartbeats). We do not recommend on relying on disk swapping in a production environment for this reason. In any case, once the `DataMemory` limit is reached, any operations requiring additional memory (such as inserts) will fail.

(We have implemented disk data storage for MySQL Cluster in MySQL 5.1, including MySQL Cluster NDB 6.2 and 6.3, but we have no plans to add this capability in MySQL 5.0. See [MySQL Cluster Disk Data Tables](#), for more information.)

You can use the following formula for obtaining a rough estimate of how much RAM is needed for each data node in the cluster:

```
(SizeofDatabase × NumberOfReplicas × 1.1 ) / NumberOfDataNodes
```

To calculate the memory requirements more exactly requires determining, for each table in the cluster database, the storage space required per row (see [Section 10.5, "Data Type Storage Requirements"](#), for details), and multiplying this by the number of rows. You must also remember to account for any column indexes as follows:

- Each primary key or hash index created for an `NDBCLUSTER` table requires 21–25 bytes per record. These indexes use `IndexMemory`.
- Each ordered index requires 10 bytes storage per record, using `DataMemory`.
- Creating a primary key or unique index also creates an ordered index, unless this index is created with `USING HASH`. In other words:
 - A primary key or unique index on a Cluster table normally takes up 31 to 35 bytes per record.
 - However, if the primary key or unique index is created with `USING HASH`, then it requires only 21 to 25 bytes per record.

Note that creating MySQL Cluster tables with `USING HASH` for all primary keys and unique indexes will generally cause table updates to run more quickly — in some cases by a much as 20 to 30 percent faster than updates on tables where `USING HASH` was not used in creating primary and unique keys. This is due to the fact that less memory is required (because no ordered indexes are created), and that less CPU must be utilized (because fewer indexes must be read and possibly updated). However, it also means that queries that could otherwise use range scans must be satisfied by other means, which can result in slower selects.

When calculating Cluster memory requirements, you may find useful the `ndb_size.pl` utility which is available in recent MySQL 5.0 releases. This Perl script connects to a current (non-Cluster) MySQL database and creates a report on how much space that database would require if it used the `NDBCLUSTER` storage engine. For more information, see [Section 19.10.14, "ndb_size.pl — NDBCLUSTER Size Requirement Estimator"](#).

It is especially important to keep in mind that *every MySQL Cluster table must have a primary key*. The NDB storage engine creates a primary key automatically if none is defined, and this primary key is created without `USING HASH`.

There is no easy way to determine exactly how much memory is being used for storage of Cluster indexes at any given time; however, warnings are written to the Cluster log when 80% of available `DataMemory` or `IndexMemory` is in use, and again when use reaches 85%, 90%, and so on.

27.10.10: What filesystems can I use with MySQL Cluster? What about network filesystems or network shares?

Generally, any filesystem that is native to the host operating system should work well with MySQL Cluster. If you find that a given filesystem works particularly well (or not so especially well) with MySQL Cluster, we invite you to discuss your findings in the [MySQL Cluster Forums](#).

We do not test MySQL Cluster with `FAT` or `VFAT` filesystems on Linux. Because of this, and due to the fact that these are not very useful for any purpose other than sharing disk partitions between Linux and Windows operating systems on multi-boot computers, we do not recommend their use with MySQL Cluster.

MySQL Cluster is implemented as a shared-nothing solution; the idea behind this is that the failure of a single piece of hardware should not cause the failure of multiple cluster nodes, or possibly even the failure of the cluster as a whole. For this reason, the use of network shares or network filesystems is not supported for MySQL Cluster. This also applies to shared storage devices such as SANs.

27.10.11: Can I run MySQL Cluster nodes inside virtual machines (such as those created by VMWare, Parallels, or Xen)?

This is possible but not recommended for a production environment.

We have found that running MySQL Cluster processes inside a virtual machine can give rise to issues with timing and disk subsystems that have a strong negative impact on the operation of the cluster. The behavior of the cluster is often unpredictable in these cases.

If an issue can be reproduced outside the virtual environment, then we may be able to provide assistance. Otherwise, we cannot support it at this time.

27.10.12: I am trying to populate a MySQL Cluster database. The loading process terminates prematurely and I get an error message like this one: `ERROR 1114: THE TABLE 'MY_CLUSTER_TABLE' IS FULL` Why is this happening?

The cause is very likely to be that your setup does not provide sufficient RAM for all table data and all indexes, *including the primary key required by the NDB storage engine and automatically created in the event that the table definition does not include the definition of a primary key.*

It is also worth noting that all data nodes should have the same amount of RAM, since no data node in a cluster can use more memory than the least amount available to any individual data node. For example, if there are four computers hosting Cluster data nodes, and three of these have 3GB of RAM available to store Cluster data while the remaining data node has only 1GB RAM, then each data node can devote at most 1GB to MySQL Cluster data and indexes.

27.10.13: MySQL Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or more nodes in remote locations?

It is *very* unlikely that a cluster would perform reliably under such conditions, as MySQL Cluster was designed and implemented with the assumption that it would be run under conditions guaranteeing dedicated high-speed connectivity such as that found in a LAN setting using 100 Mbps or gigabit Ethernet — preferably the latter. We neither test nor warrant its performance using anything slower than this.

Also, it is extremely important to keep in mind that communications between the nodes in a MySQL Cluster are not secure; they are neither encrypted nor safeguarded by any other protective mechanism. The most secure configuration for a cluster is in a private network behind a firewall, with no direct access to any Cluster data or management nodes from outside. (For SQL nodes, you should take the same precautions as you would with any other instance of the MySQL server.) For more information, see [Section 19.8, “MySQL Cluster Security Issues”](#).

27.10.14: Do I have to learn a new programming or query language to use MySQL Cluster?

No. Although some specialized commands are used to manage and configure the cluster itself, only standard (My)SQL queries and commands are required for the following operations:

- Creating, altering, and dropping tables
- Inserting, updating, and deleting table data
- Creating, changing, and dropping primary and unique indexes

Some specialized configuration parameters and files are required to set up a MySQL Cluster — see [Section 19.3.4, “Configuration File”](#), for information about these.

A few simple commands are used in the MySQL Cluster management client (`ndb_mgm`) for tasks such as starting and stopping cluster nodes. See [Section 19.7.2, “Commands in the MySQL Cluster Management Client”](#).

27.10.15: How do I find out what an error or warning message means when using MySQL Cluster?

There are two ways in which this can be done:

- From within the `mysql` client, use `SHOW ERRORS` or `SHOW WARNINGS` immediately upon being notified of the error or warning condition. Errors and warnings also be displayed in MySQL Query Browser.
-

From a system shell prompt, use `percona --ndb error_code`.

27.10.16: Is MySQL Cluster transaction-safe? What isolation levels are supported?

Yes: For tables created with the `NDB` storage engine, transactions are supported. Currently, MySQL Cluster supports only the `READ COMMITTED` transaction isolation level.

27.10.17: What storage engines are supported by MySQL Cluster?

Clustering with MySQL is supported only by the `NDB` storage engine. That is, in order for a table to be shared between nodes in a MySQL Cluster, the table must be created using `ENGINE=NDB` (or the equivalent option `ENGINE=NDBCLUSTER`).

It is possible to create tables using other storage engines (such as `MyISAM` or `InnoDB`) on a MySQL server being used with a MySQL Cluster, but these non-`NDB` tables do *not* participate in clustering; they are strictly local to the individual MySQL server instance on which they are created.

27.10.18: In the event of a catastrophic failure — say, for instance, the whole city loses power and my UPS fails — would I lose all my data?

All committed transactions are logged. Therefore, although it is possible that some data could be lost in the event of a catastrophe, this should be quite limited. Data loss can be further reduced by minimizing the number of operations per transaction. (It is not a good idea to perform large numbers of operations per transaction in any case.)

27.10.19: Is it possible to use `FULLTEXT` indexes with MySQL Cluster?

`FULLTEXT` indexing is not supported by any storage engine other than `MyISAM`. We are working to add this capability to MySQL Cluster tables in a future release.

27.10.20: Can I run multiple nodes on a single computer?

It is possible but not advisable. One of the chief reasons to run a cluster is to provide redundancy. To obtain the full benefits of this redundancy, each node should reside on a separate machine. If you place multiple nodes on a single machine and that machine fails, you lose all of those nodes. Given that MySQL Cluster can be run on commodity hardware loaded with a low-cost (or even no-cost) operating system, the expense of an extra machine or two is well worth it to safeguard mission-critical data. It also worth noting that the requirements for a cluster host running a management node are minimal. This task can be accomplished with a 200 MHz Pentium CPU and sufficient RAM for the operating system plus a small amount of overhead for the `ndb_mgmd` and `ndb_mgm` processes.

It is acceptable to run multiple cluster data nodes on a single host for learning about MySQL Cluster, or for testing purposes; however, this is not generally supported for production use.

27.10.21: Can I add data nodes to a MySQL Cluster without restarting it?

Not at present. A rolling restart is all that is required for adding new management or SQL nodes to a MySQL Cluster (see [Section 19.5.1, “Performing a Rolling Restart of the Cluster”](#)). Adding data nodes is more complex, and requires the following steps:

1. Make a complete backup of all Cluster data.
2. Completely shut down the cluster and all cluster node processes.
3. Restart the cluster, using the `--initial` startup option for all instances of `ndbd`.

Warning

Never use the `--initial` when starting `ndbd` except when necessary to clear the data node filesystem. See [Section 19.6.5.1, “Command Options for `ndbd`”](#), for information about when this is required.

4. Restore all cluster data from the backup.

In a future MySQL Cluster release series, we hope to implement a “hot” reconfiguration capability for MySQL Cluster to minimize (if not eliminate) the requirement for restarting the cluster when adding new nodes. However, this is not planned for MySQL 5.0.

27.10.22: Are there any limitations that I should be aware of when using MySQL Cluster?

Limitations on `NDB` tables in MySQL 5.0 include the following:

- Temporary tables are not supported; a `CREATE TEMPORARY TABLE` statement using `ENGINE=NDB` or `ENGINE=NDBCLUSTER` fails with an error.
- `FULLTEXT` indexes and index prefixes are not supported. Only complete columns may be indexed.
- As of MySQL 5.0.16, MySQL Cluster supports spatial data types. However, spatial indexes are not supported. See [Chapter 20, Spatial Extensions](#).
- Only complete rollbacks for transactions are supported. Partial rollbacks and rollbacks to save points are not supported.
- The maximum number of attributes allowed per table is 128, and attribute names cannot be any longer than 31 characters. For each table, the maximum combined length of the table and database names is 122 characters.
- The maximum size for a table row is 8 kilobytes, not counting `BLOB` values. There is no set limit for the number of rows per table. Table size limits depend on a number of factors, in particular on the amount of RAM available to each data node.
- The `NDB` engine does not support foreign key constraints. As with `MyISAM` tables, if these are specified in a `CREATE TABLE` or `ALTER TABLE` statement, they are ignored.

For a complete listing of limitations in MySQL Cluster, see [Section 19.12, “Known Limitations of MySQL Cluster”](#).

27.10.23: How do I import an existing MySQL database into a MySQL Cluster?

You can import databases into MySQL Cluster much as you would with any other version of MySQL. Other than the limitations mentioned elsewhere in this FAQ, the only other special requirement is that any tables to be included in the cluster must use the `NDB` storage engine. This means that the tables must be created with `ENGINE=NDB` or `ENGINE=NDBCLUSTER`.

It is also possible to convert existing tables using other storage engines to `NDBCLUSTER` using one or more `ALTER TABLE` statement. However, the definition of the table must be compatible with the `NDBCLUSTER` storage engine prior to making the conversion. In MySQL 5.0, an additional workaround is also required.

See [Section 19.12, “Known Limitations of MySQL Cluster”](#), for details.

27.10.24: How do cluster nodes communicate with one another?

Cluster nodes can communicate via any of three different transport mechanisms: TCP/IP, SHM (shared memory), and SCI (Scalable Coherent Interface). Where available, SHM is used by default between nodes residing on the same cluster host; however, this is considered experimental. SCI is a high-speed (1 gigabit per second and higher), high-availability protocol used in building scalable multi-processor systems; it requires special hardware and drivers. See [Section 19.11, “Using High-Speed Interconnects with MySQL Cluster”](#), for more about using SCI as a transport mechanism for MySQL Cluster.

27.10.25: What is an arbitrator?

If one or more nodes in a cluster fail, it is possible that not all cluster nodes will be able to “see” one another. In fact, it is possible that two sets of nodes might become isolated from one another in a network partitioning, also known as a “split brain” scenario. This type of situation is undesirable because each set of nodes tries to behave as though it is the entire cluster.

When cluster nodes go down, there are two possibilities. If more than 50% of the remaining nodes can communicate with each other, we have what is sometimes called a “majority rules” situation, and this set of nodes is considered to be the cluster. The arbitrator comes into play when there is an even number of nodes: in such cases, the set of nodes to which the arbitrator belongs is considered to be the cluster, and nodes not belonging to this set are shut down.

The preceding information is somewhat simplified. A more complete explanation taking into account node groups follows:

When all nodes in at least one node group are alive, network partitioning is not an issue, because no one portion of the cluster can form a functional cluster. The real problem arises when no single node group has all its nodes alive, in which case network partitioning (the “split-brain” scenario) becomes possible. Then an arbitrator is required. All cluster nodes recognize the same node as the arbitrator, which is normally the management server; however, it is possible to configure any of the MySQL Servers in the cluster to act as the arbitrator instead. The arbitrator accepts the first set of cluster nodes to contact it, and tells the remaining set to shut down. Arbitrator selection is controlled by the `ArbitrationRank` configuration parameter for MySQL Server and management server nodes. (See [Section 19.3.4.4, “Defining the Management Server”](#), for details.)

The role of arbitrator does not in and of itself impose any heavy demands upon the host so designated, and thus the arbitrator host does not need to be particularly fast or to have extra memory especially for this purpose.

27.10.26: What data types are supported by MySQL Cluster?

In MySQL 5.0, MySQL Cluster supports all of the usual MySQL data types, including (beginning with MySQL 5.0.16) those associated with MySQL's spatial extensions; however, the `NDBCLUSTER` storage engine does not support spatial indexes. (Spatial indexes are supported only by `MyISAM`; see [Chapter 20, Spatial Extensions](#), for more information.) In addition, there are some differ-

ences with regard to indexes when used with `NDB` tables.

Note

MySQL Cluster tables (that is, tables created with `ENGINE=NDBCLUSTER`) have only fixed-width rows. This means that (for example) each record containing a `VARCHAR(255)` column will require space for 255 characters (as required for the character set and collation being used for the table), regardless of the actual number of characters stored therein. This issue is expected to be fixed in a future MySQL release series.

See [Section 19.12, “Known Limitations of MySQL Cluster”](#), for more information about these issues.

27.10.27: How do I start and stop MySQL Cluster?

It is necessary to start each node in the cluster separately, in the following order:

1. Start the management node, using the `ndb_mgmd` command.

You must include the `-f` or `--config-file` option to tell the management node where its configuration file can be found.

2. Start each data node with the `ndbd` command.

Each data node must be started with the `-c` or `--connect-string` option so that the data node knows how to connect to the management server.

3. Start each MySQL Server (SQL node) using your preferred startup script, such as `mysqld_safe`.

Each MySQL Server must be started with the `--ndbcluster` and `--ndb-connectstring` options. These options cause `mysqld` to enable `NDBCLUSTER` storage engine support and how to connect to the management server.

Each of these commands must be run from a system shell on the machine housing the affected node. (You do not have to be physically present at the machine — a remote login shell can be used for this purpose.) You can verify that the cluster is running by starting the `NDB` management client `ndb_mgm` on the machine housing the management node and issuing the `SHOW` or `ALL STATUS` command.

To shut down a running cluster, issue the command `SHUTDOWN` in the management client. Alternatively, you may enter the following command in a system shell:

```
shell> ndb_mgm -e "SHUTDOWN"
```

(The quotation marks are optional; in addition, the `SHUTDOWN` command is not case-sensitive.)

Either of these commands causes the `ndb_mgm`, `ndb_mgm`, and any `ndbd` processes to terminate gracefully. MySQL servers running as Cluster SQL nodes can be stopped using `mysqladmin shutdown`.

For more information, see [Section 19.7.2, “Commands in the MySQL Cluster Management Client”](#), and [Section 19.2.6, “Safe Shutdown and Restart”](#).

27.10.28: What happens to MySQL Cluster data when the cluster is shut down?

The data that was held in memory by the cluster's data nodes is written to disk, and is reloaded into memory the next time that the cluster is started.

27.10.29: Is it a good idea to have more than one management node for a MySQL Cluster?

It can be helpful as a fail-safe. Only one management node controls the cluster at any given time, but it is possible to configure one management node as primary, and one or more additional management nodes to take over in the event that the primary management node fails.

See [Section 19.3.4, “Configuration File”](#), for information on how to configure MySQL Cluster management nodes.

27.10.30: Can I mix different kinds of hardware and operating systems in one MySQL Cluster?

Yes, as long as all machines and operating systems have the same “endianness” (all big-endian or all little-endian). We are working to overcome this limitation in a future MySQL Cluster release.

It is also possible to use software different MySQL Cluster releases on different nodes. However, we support this only as part of a rolling upgrade procedure (see [Section 19.5.1, “Performing a Rolling Restart of the Cluster”](#)).

27.10.31: Can I run two data nodes on a single host? Two SQL nodes?

Yes, it is possible to do this. In the case of multiple data nodes, it is advisable (but not required) for each node to use a different data directory. If you want to run multiple SQL nodes on one machine, each instance of `mysqld` must use a different TCP/IP port. However, running more than one cluster node of a given type per machine is generally not encouraged or supported for production use.

We also advise against running data nodes and SQL nodes together on the same host, since the `ndbd` and `mysqld` processes may compete for memory.

27.10.32: Can I use hostnames with MySQL Cluster?

Yes, it is possible to use DNS and DHCP for cluster hosts. However, if your application requires “five nines” availability, we recommend using fixed (numeric) IP addresses. Making communication between Cluster hosts dependent on services such as DNS and DHCP introduces additional potential points of failure.

27.10.33: How do I handle MySQL users in a MySQL Cluster having multiple MySQL servers?

MySQL user accounts and privileges are not automatically propagated between different MySQL servers accessing the same MySQL Cluster. Therefore, you must make sure that these are copied between the SQL nodes yourself. You can do this manually, or automate the task with scripts.

Warning

Do not attempt to work around this issue by converting the MySQL system tables to use the `NDBCLUSTER` storage engine. Only the `MyISAM` storage engine is supported for these tables.

27.10.34: How do I continue to send queries in the event that one of the SQL nodes fails?

MySQL Cluster does not provide any sort of automatic failover between SQL nodes. Your application must be prepared to handle the loss of SQL nodes and to fail over between them.

A.11. MySQL 5.0 FAQ — MySQL Chinese, Japanese, and Korean Character Sets

This set of Frequently Asked Questions derives from the experience of MySQL's Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

Questions

- [27.11.1](#): What CJK character sets are available in MySQL?
- [27.11.2](#): I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?
- [27.11.3](#): What problems should I be aware of when working with the Big5 Chinese character set?
- [27.11.4](#): Why do Japanese character set conversions fail?
- [27.11.5](#): What should I do if I want to convert SJIS 81CA to cp932?
- [27.11.6](#): How does MySQL represent the Yen (¥) sign?
- [27.11.7](#): Do MySQL plan to make a separate character set where 5C is the Yen sign, as at least one other major DBMS does?
- [27.11.8](#): Of what issues should I be aware when working with Korean character sets in MySQL?
- [27.11.9](#): Why do I get `DATA TRUNCATED` error messages?
- [27.11.10](#): Why does my GUI front end or browser not display CJK characters correctly in my application using Access, PHP, or another API?
- [27.11.11](#): I've upgraded to MySQL 5.0. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?
- [27.11.12](#): Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?
- [27.11.13](#): How do I know whether character `X` is available in all character sets?
- [27.11.14](#): Why don't CJK strings sort correctly in Unicode? (I)
- [27.11.15](#): Why don't CJK strings sort correctly in Unicode? (II)

- [27.11.16](#): Why are my supplementary characters rejected by MySQL?
- [27.11.17](#): Shouldn't it be “CJKV”?
- [27.11.18](#): Does MySQL allow CJK characters to be used in database and table names?
- [27.11.19](#): Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?
- [27.11.20](#): Where can I get help with CJK and related issues in MySQL?

Questions and Answers

27.11.1: What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the `ucjps` character set was not supported prior to MySQL 5.0.3 (see [Section E.1.27](#), “Changes in MySQL 5.0.3 (23 March 2005: Beta)”). However, since the name of the applicable language appears in the `DESCRIPTION` column for every entry in the `INFORMATION_SCHEMA.CHARACTER_SETS` table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
-> FROM INFORMATION_SCHEMA.CHARACTER_SETS
-> WHERE DESCRIPTION LIKE '%Chinese%'
-> OR DESCRIPTION LIKE '%Japanese%'
-> OR DESCRIPTION LIKE '%Korean%'
-> ORDER BY CHARACTER_SET_NAME;
```

CHARACTER_SET_NAME	DESCRIPTION
big5	Big5 Traditional Chinese
cp932	SJIS for Windows Japanese
ucjps	UJIS for Windows Japanese
euckr	EUC-KR Korean
gb2312	GB2312 Simplified Chinese
gbk	GBK Simplified Chinese
sjis	Shift-JIS Japanese
ujis	EUC-JP Japanese

8 rows in set (0.01 sec)

(See [Section 22.9](#), “The `INFORMATION_SCHEMA.CHARACTER_SETS` Table”, for more information.)

MySQL supports the two common variants of the *GB* (*Guojia Biaozhun*, or *National Standard*, or *Simplified Chinese*) character sets which are official in the People's Republic of China: `gb2312` and `gbk`. Sometimes people try to insert `gbk` characters into `gb2312`, and it works most of the time because `gbk` is a superset of `gb2312` — but eventually they try to insert a rarer Chinese character and it doesn't work. (See [Bug#16072](#) for an example).

Here, we try to clarify exactly what characters are legitimate in `gb2312` or `gbk`, with reference to the official documents. Please check these references before reporting `gb2312` or `gbk` bugs.

- For a complete listing of the `gb2312` characters, ordered according to the `gb2312_chinese_ci` collation: [gb2312](#)
- MySQL's `gbk` is in reality “Microsoft code page 936”. This differs from the official `gbk` for characters `A1A4` (middle dot), `A1AA` (em dash), `A6E0–A6F5`, and `A8BB–A8C0`. For a listing of the differences, see <http://recode.progiciels-bpi.ca/showfile.html?name=dist/libiconv/gbk.h>.
- For a listing of `gbk`/Unicode mappings, see <http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT>.
- For MySQL's listing of `gbk` characters, see [gbk](#).

27.11.2: I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?

This problem is usually due to a setting in MySQL that doesn't match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:

- *Be certain of what MySQL version you are using.*
Use the statement `SELECT VERSION();` to determine this.
- *Make sure that the database is actually using the desired character set.*

People often think that the client character set is always the same as either the server character set or the character set used for

display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or — better — yet by using this statement:

```
SELECT character_set_name, collation_name
FROM information_schema.columns
WHERE table_schema = your_database_name
AND table_name = your_table_name
AND column_name = your_column_name;
```

- Determine the hexadecimal value of the character or characters that are not being displayed correctly.

You can obtain this information for a column `column_name` in the table `table_name` using the following query:

```
SELECT HEX(column_name)
FROM table_name;
```

`3F` is the encoding for the `?` character; this means that `?` is the character actually stored in the column. This most often happens because of a problem converting a particular character from your client character set to the target character set.

- Make sure that a round trip possible — that is, when you select *literal* (or *introducer hexadecimal-value*), you obtain *literal* as a result.

For example, the Japanese *Katakana* character *Pe* (Ⓜ) exists in all CJK character sets, and has the code point value (hexadecimal coding) `0x30da`. To test a round trip for this character, use this query:

```
SELECT 'Ⓜ' AS `Ⓜ`; /* or SELECT _ucs2 0x30da; */
```

If the result is not also `Ⓜ`, then the round trip has failed.

For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX('Ⓜ');`. Then we can determine whether the client encoding is correct.

- Make sure that the problem is not with the browser or other application, rather than with MySQL.

Use the `mysql` client program (on Windows: `mysql.exe`) to accomplish this task. If `mysql` displays correctly but your application doesn't, then your problem is probably due to system settings.

To find out what your settings are, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | utf8 |
| character_set_connection | utf8 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | utf8 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysql/charsets/ |
+-----+-----+
8 rows in set (0.03 sec)
```

These are typical character-set settings for an international-oriented client (notice the use of `utf8` Unicode) connected to a server in the West (`latin1` is a West Europe character set and a default for MySQL).

Although Unicode (usually the `utf8` variant on Unix, and the `ucs2` variant on Windows) is preferable to Latin, it's often not what your operating system utilities support best. Many Windows users find that a Microsoft character set, such as `cp932` for Japanese Windows, is what's suitable.

If you cannot control the server settings, and you have no idea what your underlying computer is, then try changing to a common character set for the country that you're in (`euckr` = Korea; `gb2312` or `gbk` = People's Republic of China; `big5` = Taiwan; `sjis`, `ujis`, `cp932`, or `eucjpms` = Japan; `ucs2` or `utf8` = anywhere). Usually it is necessary to change only the client and connection and results settings. There is a simple statement which changes all three at once: `SET NAMES`. For example:

```
SET NAMES 'big5';
```

Once the setting is correct, you can make it permanent by editing `my.cnf` or `my.ini`. For example you might add lines looking like these:

```
[mysqld]
character-set-server=big5
[client]
default-character-set=big5
```

It is also possible that there are issues with the API configuration setting being used in your application; see *Why does my GUI front end or browser not display CJK characters correctly...?* for more information.

27.11.3: What problems should I be aware of when working with the Big5 Chinese character set?

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). MySQL's `big5` is in reality Microsoft code page 950, which is very similar to the original `big5` character set. We changed to this character set starting with MySQL version 4.1.16 / 5.0.16 (as a result of [Bug#12476](#)). For example, the following statements work in current versions of MySQL, but not in old versions:

```
mysql> CREATE TABLE big5 (BIG5 CHAR(1) CHARACTER SET BIG5);
Query OK, 0 rows affected (0.13 sec)

mysql> INSERT INTO big5 VALUES (0xf9dc);
Query OK, 1 row affected (0.00 sec)

mysql> SELECT * FROM big5;
+-----+
| big5 |
+-----+
| 嫻 |
+-----+
1 row in set (0.02 sec)
```

A feature request for adding `HKSCS` extensions has been filed. People who need this extension may find the suggested patch for [Bug#13577](#) to be of interest.

27.11.4: Why do Japanese character set conversions fail?

MySQL supports the `sjis`, `ujis`, `cp932`, and `eucjpms` character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with `sjis` or `ujis`) and a Windows client (typically with `cp932`).

In the following conversion table, the `ucs2` column represents the source, and the `sjis`, `cp932`, `ujis`, and `eucjpms` columns represent the destinations — that is, the last 4 columns provide the hexadecimal result when we use `CONVERT(ucs2)` or we assign a `ucs2` column containing the value to an `sjis`, `cp932`, `ujis`, or `eucjpms` column.

Character Name	ucs2	sjis	cp932	ujis	eucjpms
BROKEN BAR	00A6	3F	3F	8FA2C3	3F
FULLWIDTH BROKEN BAR	FFE4	3F	FA55	3F	8FA2
YEN SIGN	00A5	3F	3F	20	3F
FULLWIDTH YEN SIGN	FFE5	818F	818F	A1EF	3F
TILDE	007E	7E	7E	7E	7E
OVERLINE	203E	3F	3F	20	3F
HORIZONTAL BAR	2015	815C	815C	A1BD	A1BD
EM DASH	2014	3F	3F	3F	3F
REVERSE SOLIDUS	005C	815F	5C	5C	5C
FULLWIDTH ""	FF3C	3F	815F	3F	A1C0
WAVE DASH	301C	8160	3F	A1C1	3F
FULLWIDTH TILDE	FF5E	3F	8160	3F	A1C1
DOUBLE VERTICAL LINE	2016	8161	3F	A1C2	3F
PARALLEL TO	2225	3F	8161	3F	A1C2
MINUS SIGN	2212	817C	3F	A1DD	3F
FULLWIDTH HYPHEN-MINUS	FF0D	3F	817C	3F	A1DD
CENT SIGN	00A2	8191	3F	A1F1	3F
FULLWIDTH CENT SIGN	FFE0	3F	8191	3F	A1F1
POUND SIGN	00A3	8192	3F	A1F2	3F
FULLWIDTH POUND SIGN	FFE1	3F	8192	3F	A1F2
NOT SIGN	00AC	81CA	3F	A2CC	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA	3F	A2CC

Now consider this portion of the table:

	ucs2	sjis	cp932
NOT SIGN	00AC	81CA	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA

This means that MySQL converts the `NOT SIGN` (Unicode `U+00AC`) to `sjis` code point `0x81CA` and to `cp932` code point `3F`. (`3F` is the question mark (“?”) — this is what is always used when the conversion cannot be performed.

27.11.5: What should I do if I want to convert SJIS 81CA to cp932?

Our answer is: “?”. There are serious complaints about this: many people would prefer a “loose” conversion, so that `81CA (NOT SIGN)` in `sjis` becomes `81CA (FULLWIDTH NOT SIGN)` in `cp932`. We are considering a change to this behavior.

27.11.6: How does MySQL represent the Yen (¥) sign?

A problem arises because some versions of Japanese character sets (both `sjis` and `eur`) treat `5C` as a *reverse solidus* (`\` — also known as a backslash), and others treat it as a yen sign (¥).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, `5C` is always the *reverse solidus* (`\`).

27.11.7: Do MySQL plan to make a separate character set where 5C is the Yen sign, as at least one other major DBMS does?

This is one possible solution to the Yen sign issue; however, this will not happen in MySQL 5.1 or 5.2.

27.11.8: Of what issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the `euckr` (*Extended Unix Code Korea*) character set, only one problem has been noted.

We use the “ASCII” variant of EUC-KR, in which the code point `0x5c` is REVERSE SOLIDUS, that is `\`, instead of the “KS-Roman” variant of EUC-KR, in which the code point `0x5c` is WON SIGN(₩). This means that you cannot convert Unicode `U+20A9` to `euckr`:

```
mysql> SELECT
->     CONVERT('₩' USING euckr) AS euckr,
->     HEX(CONVERT('₩' USING euckr)) AS hexeuckr;
+-----+-----+
| euckr | hexeuckr |
+-----+-----+
| ?     | 3F       |
+-----+-----+
1 row in set (0.00 sec)
```

MySQL's graphic Korean chart is here: [euckr](#).

27.11.9: Why do I get DATA TRUNCATED error messages?

For illustration, we'll create a table with one Unicode (`ucs2`) column and one Chinese (`gb2312`) column.

```
mysql> CREATE TABLE ch
-> (ucs2 CHAR(3) CHARACTER SET ucs2,
->  gb2312 CHAR(3) CHARACTER SET gb2312);
Query OK, 0 rows affected (0.05 sec)
```

We'll try to place the rare character `㄀` in both columns.

```
mysql> INSERT INTO ch VALUES ('A㄀B','A㄀B');
Query OK, 1 row affected, 1 warning (0.00 sec)
```

Ah, there's a warning. Let's see what it is.

```
mysql> SHOW WARNINGS;
+-----+-----+-----+
| Level | Code | Message
+-----+-----+-----+
| Warning | 1265 | Data truncated for column 'gb2312' at row 1
+-----+-----+-----+
1 row in set (0.00 sec)
```

So it's a warning about the `gb2312` column only.

```
mysql> SELECT ucs2,HEX(ucs2),gb2312,HEX(gb2312) FROM ch;
+-----+-----+-----+-----+
| ucs2 | HEX(ucs2) | gb2312 | HEX(gb2312) |
+-----+-----+-----+-----+
| A㄀B | 00416C4C0042 | A?B | 413F42 |
+-----+-----+-----+-----+
```

```
+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

There are several things that need explanation here.

1. The fact that it's a “warning” rather than an “error” is characteristic of MySQL. We like to try to do what we can, to get the best fit, rather than give up.
2. The 𐀀 character isn't in the `gb2312` character set. We described that problem earlier.
3. Admittedly the message is misleading. We didn't “truncate” in this case, we replaced with a question mark. We've had a complaint about this message (See [Bug#9337](#)). But until we come up with something better, just accept that error/warning code 2165 can mean a variety of things.
4. With `SQL_MODE=TRADITIONAL`, there would be an error message, but instead of error 2165 you would see: `ERROR 1406 (22001): Data too long for column 'gb2312' at row 1.`

27.11.10: Why does my GUI front end or browser not display CJK characters correctly in my application using Access, PHP, or another API?

Obtain a direct connection to the server using the `mysql` client (Windows: `mysql.exe`), and try the same query there. If `mysql` responds correctly, then the trouble may be that your application interface requires initialization. Use `mysql` to tell you what character set or sets it uses with the statement `SHOW VARIABLES LIKE 'char%'`. If you are using Access, then you are most likely connecting with MyODBC. In this case, you should check [Section 24.1.4, “Connector/ODBC Configuration”](#). If, for instance, you use `big5`, you would enter `SET NAMES 'big5'`. (Note that no `;` is required in this case). If you are using ASP, you might need to add `SET NAMES` in the code. Here is an example that has worked in the past:

```
<%
Session.CodePage=0
Dim strConnection
Dim Conn
strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username;" \
& "pwd=password;database=database;stmt=SET NAMES 'big5';"
Set Conn = Server.CreateObject("ADODB.Connection")
Conn.Open strConnection
%>
```

In much the same way, if you are using any character set other than `latin1` with Connector/NET, then you must specify the character set in the connection string. See [Section 24.2.5.1, “Connecting to MySQL Using Connector/NET”](#), for more information.

If you are using PHP, try this:

```
<?php
$link = mysql_connect($host, $usr, $pwd);

mysql_select_db($db);

if( mysql_error() ) { print "Database ERROR: " . mysql_error(); }
mysql_query("SET NAMES 'utf8'", $link);
?>
```

In this case, we used `SET NAMES` to change `character_set_client` and `character_set_connection` and `character_set_results`.

We encourage the use of the newer `mysqli` extension, rather than `mysql`. Using `mysqli`, the previous example could be rewritten as shown here:

```
<?php
$link = new mysqli($host, $usr, $pwd, $db);

if( mysqli_connect_errno() )
{
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$link->query("SET NAMES 'utf8'");
?>
```

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a `<meta>` tag suffices to correct the problem: for example, to insure that the user agent interprets page content as UTF-8, you should include `<meta http-equiv="Content-Type" content="text/html; charset=utf-8">` in the `<head>` of the HTML page.

If you are using Connector/J, see [Section 24.4.4.4, “Using Character Sets and Unicode”](#).

27.11.11: I've upgraded to MySQL 5.0. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single “global” character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a “handshake”, as described in [Section 9.1.4, “Connection Character Sets and Collations”](#):

When a client connects, it sends to the server the name of the character set that it wants to use. The server uses the name to set the `character_set_client`, `character_set_results`, and `character_set_connection` system variables. In effect, the server performs a `SET NAMES` operation using the character set name.

The effect of this is that you cannot control the client character set by starting `mysqld` with `-character-set-server=utf8`. However, some of our Asian customers have said that they prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a `mysqld` switch, `--character-set-client-handshake`, which can be turned off with `--skip-character-set-client-handshake`. If you start `mysqld` with `-skip-character-set-client-handshake`, then, when a client connects, it sends to the server the name of the character set that it wants to use — however, *the server ignores this request from the client*.

By way of example, suppose that your favorite server character set is `latin1` (unlikely in a CJK area, but this is the default value). Suppose further that the client uses `utf8` because this is what the client's operating system supports. Now, start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The current settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | utf8 |
| character_set_connection | utf8 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | utf8 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysql/charsets/ |
+-----+-----+
8 rows in set (0.01 sec)
```

Now stop the client, and then stop the server using `mysqldadmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```

Start the client with `utf8` once again as the default character set, then display the current settings:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | latin1 |
| character_set_connection | latin1 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | latin1 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysql/charsets/ |
+-----+-----+
8 rows in set (0.01 sec)
```

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client's initial settings if the `-skip-character-set-client-handshake` is used.

27.11.12: Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?

There is a very simple problem with `LIKE` searches on `BINARY` and `BLOB` columns: we need to know the end of a character. With multi-byte character sets, different characters might have different octet lengths. For example, in `utf8`, `A` requires one byte but `À` requires three bytes, as shown here:

```
+-----+-----+
| OCTET_LENGTH(_utf8 'A') | OCTET_LENGTH(_utf8 'À') |
+-----+-----+
| 1 | 3 |
+-----+-----+
1 row in set (0.00 sec)
```

If we don't know where the first character ends, then we don't know where the second character begins, in which case even very

simple searches such as `LIKE '_A%'` fail. The solution is to use a regular CJK character set in the first place, or to convert to a CJK character set before comparing.

This is one reason why MySQL cannot allow encodings of nonexistent characters. If it is not strict about rejecting bad input, then it has no way of knowing where characters end.

For `FULLTEXT` searches, we need to know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary — the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a comprehensive word list, which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

27.11.13: How do I know whether character *x* is available in all character sets?

The majority of simplified Chinese and basic non-halfwidth Japanese *Kana* characters appear in all CJK character sets. This stored procedure accepts a `UCS-2` Unicode character, converts it to all other character sets, and displays the results in hexadecimal.

```
DELIMITER //
CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN
CREATE TABLE tj
(ucs2 CHAR(1) character set ucs2,
utf8 CHAR(1) character set utf8,
big5 CHAR(1) character set big5,
cp932 CHAR(1) character set cp932,
eucjpms CHAR(1) character set eucjpms,
euckr CHAR(1) character set euckr,
gb2312 CHAR(1) character set gb2312,
gbk CHAR(1) character set gbk,
sjis CHAR(1) character set sjis,
ujis CHAR(1) character set ujis);
INSERT INTO tj (ucs2) VALUES (ucs2_char);
UPDATE tj SET utf8=ucs2,
big5=ucs2,
cp932=ucs2,
eucjpms=ucs2,
euckr=ucs2,
gb2312=ucs2,
gbk=ucs2,
sjis=ucs2,
ujis=ucs2;
/* If there's a conversion problem, UPDATE will produce a warning. */
SELECT hex(ucs2) AS ucs2,
hex(utf8) AS utf8,
hex(big5) AS big5,
hex(cp932) AS cp932,
hex(eucjpms) AS eucjpms,
hex(euckr) AS euckr,
hex(gb2312) AS gb2312,
hex(gbk) AS gbk,
hex(sjis) AS sjis,
hex(ujis) AS ujis
FROM tj;
DROP TABLE tj;
END//
```

The input can be any single `ucs2` character, or it can be the code point value (hexadecimal representation) of that character. For example, from Unicode's list of `ucs2` encodings and names (<http://www.unicode.org/Public/UNIDATA/UnicodeData.txt>), we know that the *Katakana* character *Pe* appears in all CJK character sets, and that its code point value is `0x30da`. If we use this value as the argument to `p_convert()`, the result is as shown here:

```
mysql> CALL p_convert(0x30da)//
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| ucs2 | utf8 | big5 | cp932 | eucjpms | euckr | gb2312 | gbk | sjis | ujis |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 30DA | E3839A | C772 | 8379 | A5DA | ABDA | A5DA | A5DA | 8379 | A5DA |
+-----+-----+-----+-----+-----+-----+-----+-----+
1 row in set (0.04 sec)
```

Since none of the column values is `3F` — that is, the question mark character (?) — we know that every conversion worked.

27.11.14: Why don't CJK strings sort correctly in Unicode? (I)

Sometimes people observe that the result of a `utf8_unicode_ci` or `ucs2_unicode_ci` search, or of an `ORDER BY` sort is not what they think a native would expect. Although we never rule out the possibility that there is a bug, we have found in the past that many people do not read correctly the standard table of weights for the Unicode Collation Algorithm. MySQL uses the table found at <http://www.unicode.org/Public/UCA/4.0.0/allkeys-4.0.0.txt>. This is not the first table you will find by navigating from the

unicode.org home page, because MySQL uses the older 4.0.0 “allkeys” table, rather than the more recent 4.1.0 table. This is because we are very wary about changing ordering which affects indexes, lest we bring about situations such as that reported in [Bug#16526](#), illustrated as follows:

```
mysql> CREATE TABLE tj (s1 CHAR(1) CHARACTER SET utf8 COLLATE utf8_unicode_ci);
Query OK, 0 rows affected (0.05 sec)

mysql> INSERT INTO tj VALUES ('が'),('か');
Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM tj WHERE s1 = 'か';
+-----+
| s1    |
+-----+
| が    |
| か    |
+-----+
2 rows in set (0.00 sec)
```

The character in the first result row is not the one that we searched for. Why did MySQL retrieve it? First we look for the Unicode code point value, which is possible by reading the hexadecimal number for the `ucs2` version of the characters:

```
mysql> SELECT s1, HEX(CONVERT(s1 USING ucs2)) FROM tj;
+-----+-----+
| s1    | HEX(CONVERT(s1 USING ucs2)) |
+-----+-----+
| が    | 304C                          |
| か    | 304B                          |
+-----+-----+
2 rows in set (0.03 sec)
```

Now we search for 304B and 304C in the 4.0.0 `allkeys` table, and find these lines:

```
304B ; [.1E57.0020.000E.304B] # HIRAGANA LETTER KA
304C ; [.1E57.0020.000E.304B][.0000.0140.0002.3099] # HIRAGANA LETTER GA; QOCM
```

The official Unicode names (following the “#” mark) tell us the Japanese syllabary (Hiragana), the informal classification (letter, digit, or punctuation mark), and the Western identifier (`KA` or `GA`, which happen to be voiced and unvoiced components of the same letter pair). More importantly, the *primary weight* (the first hexadecimal number inside the square brackets) is `1E57` on both lines. For comparisons in both searching and sorting, MySQL pays attention to the primary weight only, ignoring all the other numbers. This means that we are sorting `が` and `か` correctly according to the Unicode specification. If we wanted to distinguish them, we’d have to use a non-UCA (Unicode Collation Algorithm) collation (`utf8_bin` or `utf8_general_ci`), or to compare the `HEX()` values, or use `ORDER BY CONVERT(s1 USING sjis)`. Being correct “according to Unicode” isn’t enough, of course: the person who submitted the bug was equally correct. We plan to add another collation for Japanese according to the JIS X 4061 standard, in which voiced/unvoiced letter pairs like `KA/GA` are distinguishable for ordering purposes.

27.11.15: Why don't CJK strings sort correctly in Unicode? (II)

If you are using Unicode (`ucs2` or `utf8`), and you know what the Unicode sort order is (see [Section A.11, “MySQL 5.0 FAQ — MySQL Chinese, Japanese, and Korean Character Sets”](#)), but MySQL still seems to sort your table incorrectly, then you should first verify the table character set:

```
mysql> SHOW CREATE TABLE t\G
***** 1. row *****
Table: t
Create Table: CREATE TABLE `t` (
`s1` char(1) CHARACTER SET ucs2 DEFAULT NULL
) ENGINE=MyISAM DEFAULT CHARSET=latin1
1 row in set (0.00 sec)
```

Since the character set appears to be correct, let’s see what information the `INFORMATION_SCHEMA.COLUMNS` table can provide about this column:

```
mysql> SELECT COLUMN_NAME, CHARACTER_SET_NAME, COLLATION_NAME
-> FROM INFORMATION_SCHEMA.COLUMNS
-> WHERE COLUMN_NAME = 's1'
-> AND TABLE_NAME = 't';
+-----+-----+-----+
| COLUMN_NAME | CHARACTER_SET_NAME | COLLATION_NAME |
+-----+-----+-----+
| s1          | ucs2               | ucs2_general_ci |
+-----+-----+-----+
1 row in set (0.01 sec)
```

(See [Section 22.3, “The INFORMATION_SCHEMA COLUMNS Table”](#), for more information.)

You can see that the collation is `ucs2_general_ci` instead of `ucs2_unicode_ci`. The reason why this is so can be found using `SHOW CHARSET`, as shown here:

```
mysql> SHOW CHARSET LIKE 'ucs2%';
+-----+-----+-----+-----+
| Charset | Description | Default collation | Maxlen |
+-----+-----+-----+-----+
| ucs2    | UCS-2 Unicode | ucs2_general_ci   | 2      |
+-----+-----+-----+-----+
```

```
1 row in set (0.00 sec)
```

For `ucs2` and `utf8`, the default collation is “general”. To specify a Unicode collation, use `COLLATE ucs2_unicode_ci`.

27.11.16: Why are my supplementary characters rejected by MySQL?

Before MySQL 6.0.4, MySQL does not support supplementary characters — that is, characters which need more than 3 bytes — for `UTF-8`. We support only what Unicode calls the *Basic Multilingual Plane / Plane 0*. Only a few very rare Han characters are supplementary; support for them is uncommon. This has led to reports such as that found in [Bug#12600](#), which we rejected as “not a bug”. With `utf8`, we must truncate an input string when we encounter bytes that we don't understand. Otherwise, we wouldn't know how long the bad multi-byte character is.

One possible workaround is to use `ucs2` instead of `utf8`, in which case the “bad” characters are changed to question marks; however, no truncation takes place. You can also change the data type to `BLOB` or `BINARY`, which perform no validity checking.

As of MySQL 6.0.4, Unicode support is extended to include supplementary characters by means of additional Unicode character sets: `utf16`, `utf32`, and 4-byte `utf8`. These character sets support supplementary Unicode characters outside the Basic Multilingual Plane (BMP).

27.11.17: Shouldn't it be “CJKV”?

No. The term “CJKV” (*Chinese Japanese Korean Vietnamese*) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL has no plan to support the old Vietnamese script using Han characters. MySQL does of course support the modern Vietnamese script with Western characters.

[Bug#4745](#) is a request for a specialized Vietnamese collation, which we might add in the future if there is sufficient demand for it.

27.11.18: Does MySQL allow CJK characters to be used in database and table names?

This issue is fixed in MySQL 5.1, by automatically rewriting the names of the corresponding directories and files.

For example, if you create a database named 楢 on a server whose operating system does not support CJK in directory names, MySQL creates a directory named `@0w@00a5@00ae`. which is just a fancy way of encoding `E6A5AE` — that is, the Unicode hexadecimal representation for the 楢 character. However, if you run a `SHOW DATABASES` statement, you can see that the database is listed as 楢.

27.11.19: Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?

A Simplified Chinese version of the Manual, current for MySQL 5.1.12, can be found at <http://dev.mysql.com/doc/>. The Japanese translation of the MySQL 4.1 manual can be downloaded from <http://dev.mysql.com/doc/>.

27.11.20: Where can I get help with CJK and related issues in MySQL?

The following resources are available:

- A listing of MySQL user groups can be found at <http://dev.mysql.com/user-groups/>.
- You can contact a sales engineer at the MySQL KK Japan office using any of the following:

```
Tel: +81(0)3-5326-3133
Fax: +81(0)3-5326-3001
Email: dsaito@mysql.com
```

- View feature requests relating to character set issues at <http://tinyurl.com/y6xcuf>.
- Visit the MySQL [Character Sets, Collation, Unicode Forum](#). We are also in the process of adding foreign-language forums at <http://forums.mysql.com/>.

A.12. MySQL 5.0 FAQ — Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- [Section 24.7.14, “Common Questions and Problems When Using the C API”](#)
- [Section 24.8.5, “Common Problems with MySQL and PHP”](#)
- [Section 24.1.7, “Connector/ODBC Notes and Tips”](#)

- [Section 24.2.5, “Connector/NET Notes and Tips”](#)
- [Section 24.4.5, “Connector/J Notes and Tips”](#)
- [Section 24.5.6, “Connector/MXJ Notes and Tips”](#)

A.13. MySQL 5.0 FAQ — Replication

For answers to common queries and question regarding Replication within MySQL, see [Section 18.3.4, “Replication FAQ”](#).

A.14. MySQL 5.0 FAQ — MySQL, DRBD, and Heartbeat

A.14.1. Distributed Replicated Block Device (DRBD)

In the following section, we provide answers to questions that are most frequently asked about Distributed Replicated Block Device (DRBD).

Questions

- [27.14.1.1: What is DRBD?](#)
- [27.14.1.2: What are “Block Devices”?](#)
- [27.14.1.3: How is DRBD licensed?](#)
- [27.14.1.4: Where can I download DRBD?](#)
- [27.14.1.5: If I find a bug in DRBD, to whom do I submit the issue?](#)
- [27.14.1.6: Where can I get more technical and business information concerning MySQL and DRBD?](#)

Questions and Answers

27.14.1.1: What is DRBD?

DRBD is an acronym for Distributed Replicated Block Device. DRBD is an open source Linux kernel block device which leverages synchronous replication to achieve a consistent view of data between two systems, typically an Active and Passive system. DRBD currently supports all the major flavors of Linux and comes bundled in several major Linux distributions. The DRBD project is maintained by [LINBIT](#).

27.14.1.2: What are “Block Devices”?

Block devices are the type of device used to represent storage in the Linux Kernel. All physical disk devices present a “block device” interface. Additionally, virtual disk systems like LVM or DRBD present a “block device” interface. In this way, the file system or other software that might want to access a disk device can be used with any number of real or virtual devices without having to know anything about their underlying implementation details.

27.14.1.3: How is DRBD licensed?

DRBD is licensed under the GPL.

27.14.1.4: Where can I download DRBD?

Please see <http://www.drbd.org/download.html>

27.14.1.5: If I find a bug in DRBD, to whom do I submit the issue?

Bug reports should be submitted to the DRBD mailing list. Please see: <http://lists.linbit.com/> .

27.14.1.6: Where can I get more technical and business information concerning MySQL and DRBD?

Please visit: <http://mysql.com/drbd/>

A.14.2. Linux Heartbeat

In the following section, we provide answers to questions that are most frequently asked about Linux Heartbeat.

Questions

- [27.14.2.1](#): What is Linux Heartbeat?
- [27.14.2.2](#): How is Linux Heartbeat licensed?
- [27.14.2.3](#): Where can I download Linux Heartbeat?
- [27.14.2.4](#): If I find a bug with Linux Heartbeat, to whom do I submit the issue?

Questions and Answers

27.14.2.1: What is Linux Heartbeat?

The Linux-HA project (<http://www.linux-ha.org/>) offers a high availability solution commonly referred to as Linux Heartbeat. Linux Heartbeat ships as part of several Linux distributions, as well as within several embedded high availability systems. This solution can also be used for other applications besides databases servers, such as mail servers, web servers, file servers, and DNS servers.

Linux Heartbeat implements a heartbeat-protocol. A heartbeat-protocol means that messages are sent at regular intervals between two or more nodes. If a message is not received from a node within a given interval, then it is assumed the node has failed and some type of failover or recovery action is required. Linux Heartbeat is typically configured to send these heartbeat messages over standard Ethernet interfaces, but it does also support other methods, such as serial-line links.

27.14.2.2: How is Linux Heartbeat licensed?

Linux Heartbeat is licensed under the GPL.

27.14.2.3: Where can I download Linux Heartbeat?

Please see <http://linux-ha.org/download/index.html>.

27.14.2.4: If I find a bug with Linux Heartbeat, to whom do I submit the issue?

Bug reports should be submitted to <http://www.linux-ha.org/ClusterResourceManager/BugReports>.

A.14.3. DRBD Architecture

In the following section, we provide answers to questions that are most frequently asked about DRBD Architecture.

Questions

- [27.14.3.1](#): Is an Active/Active option available for MySQL with DRBD?
- [27.14.3.2](#): What MySQL storage engines are supported with DRBD?
- [27.14.3.3](#): How long does a failover take?
- [27.14.3.4](#): How long does it take to resynchronize data after a failure?
- [27.14.3.5](#): Are there any situations where you shouldn't use DRBD?
- [27.14.3.6](#): Are there any limitations to DRBD?
- [27.14.3.7](#): Where can I find more information on sample architectures?

Questions and Answers

27.14.3.1: Is an Active/Active option available for MySQL with DRBD?

Currently, MySQL does not support Active/Active configurations using DRBD “out of the box”.

27.14.3.2: What MySQL storage engines are supported with DRBD?

All of the MySQL transactional storage engines are supported by DRBD, including InnoDB and Falcon. For archived or read-only data, MyISAM or Archive can also be used.

27.14.3.3: How long does a failover take?

Failover time is dependent on many things, some of which are configurable. After activating the passive host, MySQL will have to start and run a normal recovery process. If the InnoDB log files have been configured to a large size and there was heavy write traffic, this may take a reasonably long period of time. However, under normal circumstances, failover tends to take less than a minute.

27.14.3.4: How long does it take to resynchronize data after a failure?

Resynchronization time depends on how long the two machines are out of communication and how much data was written during that period of time. Resynchronization time is a function of data to be synced, network speed and disk speed. DRBD maintains a bitmap of changed blocks on the primary machine, so only those blocks that have changed will need to be transferred.

27.14.3.5: Are there any situations where you shouldn't use DRBD?

See [When Not To Use DRBD](#).

27.14.3.6: Are there any limitations to DRBD?

See [DRBD limitations \(or are they?\)](#).

27.14.3.7: Where can I find more information on sample architectures?

For an example of a Heartbeat R1-compatible resource configuration involving a MySQL database backed by DRBD, see [DRBD User's Guide](#).

For an example of the same DRBD-backed configuration for a MySQL database in a Heartbeat CRM cluster, see [DRBD User's Guide](#).

A.14.4. DRBD and MySQL Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication Scale-out.

Questions

- [27.14.4.1](#): What is the difference between MySQL Cluster and DRBD?
- [27.14.4.2](#): What is the difference between MySQL Replication and DRBD?
- [27.14.4.3](#): How can I combine MySQL Replication scale-out with DRBD?

Questions and Answers

27.14.4.1: What is the difference between MySQL Cluster and DRBD?

Both MySQL Cluster and DRBD replicate data synchronously. MySQL Cluster leverages a shared-nothing storage architecture in which the cluster can be architected beyond an Active/Passive configuration. DRBD operates at a much lower level within the “stack”, at the disk I/O level. For a comparison of various high availability features between these two options, please refer to [Chapter 14, High Availability and Scalability](#).

27.14.4.2: What is the difference between MySQL Replication and DRBD?

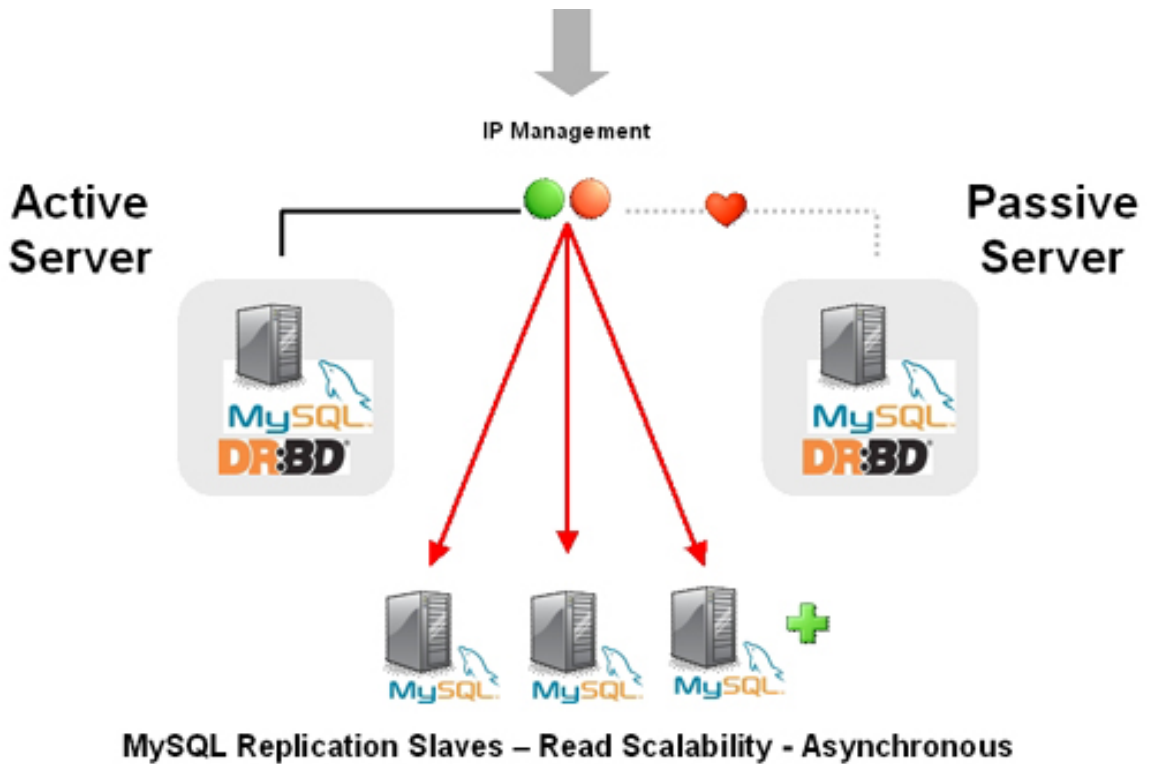

MySQL Replication replicates data asynchronously while DRBD replicates data synchronously. Also, MySQL Replication replicates MySQL statements, while DRBD replicates the underlying block device that stores the MySQL data files. For a comparison of various high availability features between these two options, please refer to the high availability comparison grid, [Chapter 14, High Availability and Scalability](#).

27.14.4.3: How can I combine MySQL Replication scale-out with DRBD?

MySQL Replication is typically deployed in a Master to many Slaves configuration. In this configuration, having many Slaves provides read scalability. DRBD is used to provide high-availability for the Master MySQL Server in an Active/Passive configuration. This provides for automatic failover, safeguards against data loss, and automatically synchronizes the failed MySQL Master after a failover.

The most likely scenario in which MySQL Replication scale-out can be leveraged with DRBD is in the form of attaching replicated MySQL “read-slaves” off of the Active-Master MySQL Server, shown in [Figure A.1, “Active-Master MySQL server”](#). Since DRBD replicates an entire block device, master information such as the binary logs are also replicated. In this way, all of the slaves can attach to the Virtual IP Address managed by Linux Heartbeat. In the event of a failure, the asynchronous nature of MySQL Replication allows the slaves to continue with the new Active machine as their master with no intervention needed.

Figure A.1. Active-Master MySQL server

A.14.5. DRBD and File Systems

In the following section, we provide answers to questions that are most frequently asked about DRBD and file systems.

Questions

- [27.14.5.1: Can XFS be used with DRBD?](#)

Questions and Answers

27.14.5.1: Can XFS be used with DRBD?

Yes. XFS uses dynamic block size, thus DRBD 0.7 or later is needed.

A.14.6. DRBD and LVM

In the following section, we provide answers to questions that are most frequently asked about DRBD and LVM.

Questions

- [27.14.6.1: Can I use DRBD on top of LVM?](#)
- [27.14.6.2: Can I use LVM on top of DRBD?](#)
- [27.14.6.3: Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?](#)

Questions and Answers

27.14.6.1: Can I use DRBD on top of LVM?

Yes, DRBD supports on-line resizing. If you enlarge your logical volume that acts as a backing device for DRBD, you can enlarge DRBD itself too, and of course your file system if it supports resizing.

27.14.6.2: Can I use LVM on top of DRBD?

Yes, you can use DRBD as a Physical Volume (PV) for LVM. Depending on the default LVM configuration shipped with your distribution, you may need to add the `/dev/drbd*` device files to the `filter` option in your `lvm.conf` so LVM scans your DRBDs for PV signatures.

27.14.6.3: Can I use DRBD on top of LVM while at the same time running LVM on top of that DRBD?

This requires careful tuning of your LVM configuration to avoid duplicate PV scans, but yes, it is possible.

A.14.7. DRBD and Virtualization

In the following section, we provide answers to questions that are most frequently asked about DRBD and virtualization.

Questions

- [27.14.7.1: Can I use DRBD with OpenVZ?](#)
- [27.14.7.2: Can I use DRBD with Xen and/or KVM?](#)

Questions and Answers

27.14.7.1: Can I use DRBD with OpenVZ?

See http://wiki.openvz.org/HA_cluster_with_DRBD_and_Heartbeat.

27.14.7.2: Can I use DRBD with Xen and/or KVM?

Yes. If you are looking for professional consultancy or expert commercial support for Xen- or KVM-based virtualization clusters with DRBD, contact LINBIT (<http://www.linbit.com>).

A.14.8. DRBD and Security

In the following section, we provide answers to questions that are most frequently asked about DRBD and security.

Questions

- [27.14.8.1: Can I encrypt/compress the exchanged data?](#)
- [27.14.8.2: Does DRBD do mutual node authentication?](#)

Questions and Answers

27.14.8.1: Can I encrypt/compress the exchanged data?

Yes. But there is no option within DRBD to allow for this. You'll need to leverage a VPN and the network layer should do the rest.

27.14.8.2: Does DRBD do mutual node authentication?

Yes, starting with DRBD 8 shared-secret mutual node authentication is supported.

A.14.9. DRBD and System Requirements

In the following section, we provide answers to questions that are most frequently asked about DRBD and System Requirements.

Questions

- [27.14.9.1: What other packages besides DRBD are required?](#)
- [27.14.9.2: How many machines are required to set up DRBD?](#)
- [27.14.9.3: Does DRBD only run on Linux?](#)

Questions and Answers

27.14.9.1: What other packages besides DRBD are required?

When using pre-built binary packages, none except a matching kernel, plus packages for [glibc](#) and your favorite shell. When compiling DRBD from source additional prerequisite packages may be required. They include but are not limited to:

- glib-devel
- openssl
- devel
- libgcrypt-devel
- glib2-devel
- pkgconfig
- ncurses-devel
- rpm-build
- rpm-devel
- redhat-rpm-config
- gcc
- gcc-c++
- bison
- flex
- gnutls-devel
- lm_sensors-devel
- net-snmp-devel
- python-devel
- bzip2-devel
- libselenium-devel
- perl-DBI
- libnet

Pre-built x86 and x86_64 packages for specific kernel versions are available with a support subscription from LINBIT. Please note that if the kernel is upgraded, DRBD must be as well.

27.14.9.2: How many machines are required to set up DRBD?

Two machines are required to achieve the minimum degree of high availability. Although at any one given point in time one will be primary and one will be secondary, it is better to consider the machines as part of a mirrored pair without a “natural” primary machine.

27.14.9.3: Does DRBD only run on Linux?

DRBD is a Linux Kernel Module, and can work with many popular Linux distributions. DRBD is currently not available for non-Linux operating systems.

A.14.10. DRBD and Support and Consulting

In the following section, we provide answers to questions that are most frequently asked about DRBD and resources.

Questions

- [27.14.10.1](#): Does MySQL offer professional consulting to help with designing a DRBD system?
- [27.14.10.2](#): Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?
- [27.14.10.3](#): Are pre-built binaries or RPMs available?
- [27.14.10.4](#): Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?
- [27.14.10.5](#): Is there a dedicated discussion forum for MySQL High-Availability?
- [27.14.10.6](#): Where can I get more information about MySQL for DRBD?

Questions and Answers

27.14.10.1: Does MySQL offer professional consulting to help with designing a DRBD system?

Yes. MySQL offers consulting for the design, installation, configuration, and monitoring of high availability DRBD. For more information concerning a High Availability Jumpstart, please see: <http://www.mysql.com/consulting/packaged/scaleout.html>.

27.14.10.2: Does MySQL offer support for DRBD and Linux Heartbeat from MySQL?

Yes. Support for DRBD is available with an add-on subscription to MySQL Enterprise called “DRBD for MySQL”. For more information about support options for DRBD see: <http://mysql.com/products/enterprise/features.html>.

For the list of supported Linux distributions, please see: <http://www.mysql.com/support/supportedplatforms/enterprise.html>.

Note

DRBD is only available on Linux. DRBD is not available on Windows, MacOS, Solaris, HP-UX, AIX, FreeBSD, or other non-Linux platforms.

27.14.10.3: Are pre-built binaries or RPMs available?

Yes. “DRBD for MySQL” is an add-on subscription to MySQL Enterprise, which provides pre-built binaries for DRBD. For more information, see: <http://mysql.com/products/enterprise/features.html>.

27.14.10.4: Does MySQL have documentation to help me with the installation and configuration of DRBD and Linux Heartbeat?

For MySQL-specific DRBD documentation, see [Section 14.1](#), “Using MySQL with DRBD for High Availability”.

For general DRBD documentation, see [DRBD User's Guide](#).

27.14.10.5: Is there a dedicated discussion forum for MySQL High-Availability?

Yes, <http://forums.mysql.com/list.php?144>.

27.14.10.6: Where can I get more information about MySQL for DRBD?

For more information about MySQL for DRBD, including a technical white paper please see: [DRBD for MySQL High Availability](#).

Appendix B. Errors, Error Codes, and Common Problems

This appendix lists common problems and errors that may occur and potential resolutions, in addition to listing the errors that may appear when you call MySQL from any host language. The first section covers problems and resolutions. Detailed information on errors is provided; The first list displays server error messages. The second list displays client program messages.

MySQL Enterprise

The MySQL Enterprise Monitor provides a “Virtual DBA” to assist with problem solving. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

B.1. Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

B.1.1. How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problem (such as memory, motherboard, CPU, or hard disk) or kernel problem:
 - The keyboard doesn't work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light doesn't change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
 - The mouse pointer doesn't move.
 - The machine doesn't answer to a remote machine's pings.
 - Other programs that are not related to MySQL don't behave correctly.
 - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as `glibc`) are up to date.

It's always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See [Section 5.2, “MySQL Server Logs”](#).
- If you don't think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it doesn't want to die, there is probably a bug in the operating system.

If after you have examined all other possibilities and you have concluded that the MySQL server or a MySQL client is causing the problem, it's time to create a bug report for our mailing list or our support team. In the bug report, try to give a very detailed description of how the system is behaving and what you think is happening. You should also state why you think that MySQL is causing the problem. Take into consideration all the situations in this chapter. State any problems exactly how they appear when you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system doesn't work.” This doesn't provide us with any information about what could be the problem.

If a program fails, it's always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in [Section 1.7, “How to Report Bugs or Problems”](#).

B.1.2. Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

B.1.2.1. Access denied

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server allows client programs to use when connecting. See [Section 5.4.7, “Causes of Access denied Errors”](#), and [Section 5.4.2, “How the Privilege System Works”](#).

B.1.2.2. Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the filesystem (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you don't specify a hostname or if you specify the special hostname `localhost`.

If the MySQL server is running on Windows, you can connect via TCP/IP. If the server is started with the `-enable-named-pipe` option, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you don't give a hostname when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that doesn't work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the hostname.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket filename or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See [Section 2.4.16.2.3, “Starting and Troubleshooting the MySQL Server”](#).

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket filename might be different in your setup. `host_ip` represents the IP number of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotes with the `hostname` command; these cause the output of `hostname` (that is, the current hostname) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the hostname of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with `--skip-networking`, it will not accept TCP/IP connections at all. If the server was started with `--bind-address=127.0.0.1`, it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or the Windows XP personal firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: [Section B.1.2.2.1, "Connection to MySQL Server Failing on Windows"](#).
- You are running on a system that uses MIT-pthreads. If you are running on a system that doesn't have native threads, `mysqld` uses the MIT-pthreads package. See [Section 2.4.2, "Operating Systems Supported by MySQL Community Server"](#). However, not all MIT-pthreads versions support Unix socket files. On a system without socket file support, you must always specify the hostname explicitly when connecting to the server. Try using this command to check the connection to the server:

```
shell> mysqladmin -h `hostname` version
```

- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See [Section B.1.4.5, "How to Protect or Change the MySQL Unix Socket File"](#).
- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket pathname for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

```
shell> netstat -ln | grep mysql
```

See [Section B.1.4.5, "How to Protect or Change the MySQL Unix Socket File"](#).

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill` or with the `mysql_zap` script) before you can restart the MySQL server. See [Section B.1.4.2, "What to Do If MySQL Keeps Crashing"](#).
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket filename in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.
- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)
- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, make sure you have disabled SELinux protection for the `mysqld` process.

B.1.2.2.1. Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows doesn't allow for enough ephemeral (short-lived) ports to serve those connections.

By default, Windows allows 5000 ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a

`TIME_WAIT` status for 120 seconds. This status allows the connection to be reused at a much lower cost than reinitializing a brand new connection. However, the port will not be available again until this time expires.

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

IMPORTANT: The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore the registry if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: <http://support.microsoft.com/kb/256986/EN-US/>.

1. Start Registry Editor (`Regedt32.exe`).
2. Locate the following key in the registry:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
```

3. On the `Edit` menu, click `Add Value`, and then add the following registry value:

```
Value Name: MaxUserPort
Data Type: REG_DWORD
Value: 65534
```

This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the `Edit` menu, click `Add Value`, and then add the following registry value:

```
Value Name: TcpTimedWaitDelay
Data Type: REG_DWORD
Value: 30
```

This sets the number of seconds to hold a TCP port connection in `TIME_WAIT` state before closing. The valid range is between 0 (zero) and 300 (decimal). The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

B.1.2.3. Lost connection to MySQL server

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes “during query,” this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing `net_read_timeout` from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your `connect_timeout` value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using `SHOW STATUS LIKE 'aborted_connections'`. It will increase by one for each initial connection attempt that the server aborts. You may see “reading authorization packet” as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with `BLOB` values that are larger than `max_allowed_packet`, which can cause this error with some clients. Sometime you may see “packet too large” as part of the error message, and that confirms that you need to increase `max_allowed_packet`.

B.1.2.4. Client does not support authentication protocol

MySQL 5.0 uses an authentication protocol based on a password hashing algorithm that is incompatible with that used by older (pre-4.1) clients. If you upgrade the server from 4.0, attempts to connect to it with an older client may fail with the following message:

```
shell> mysql
Client does not support authentication protocol requested
by server; consider upgrading MySQL client
```

To solve this problem, you should use one of the following approaches:

- Upgrade all client programs to use a 4.1.1 or newer client library.
- When connecting to the server with a pre-4.1 client program, use an account that still has a pre-4.1-style password.
- Reset the password to pre-4.1 style for each user that needs to use a pre-4.1 client program. This can be done using the `SET PASSWORD` statement and the `OLD_PASSWORD()` function:

```
mysql> SET PASSWORD FOR
-> 'some_user'@'some_host' = OLD_PASSWORD('newpwd');
```

Alternatively, use `UPDATE` and `FLUSH PRIVILEGES`:

```
mysql> UPDATE mysql.user SET Password = OLD_PASSWORD('newpwd')
-> WHERE Host = 'some_host' AND User = 'some_user';
mysql> FLUSH PRIVILEGES;
```

Substitute the password you want to use for “`newpwd`” in the preceding examples. MySQL cannot tell you what the original password was, so you’ll need to pick a new one.

- Tell the server to use the older password hashing algorithm:
 1. Start `mysqld` with the `--old-passwords` option.
 2. Assign an old-format password to each account that has had its password updated to the longer 4.1 format. You can identify these accounts with the following query:

```
mysql> SELECT Host, User, Password FROM mysql.user
-> WHERE LENGTH>Password) > 16;
```

For each account record displayed by the query, use the `Host` and `User` values and assign a password using the `OLD_PASSWORD()` function and either `SET PASSWORD` or `UPDATE`, as described earlier.

Note

In older versions of PHP, the `mysql` extension does not support the authentication protocol in MySQL 4.1.1 and higher. This is true regardless of the PHP version being used. If you wish to use the `mysql` extension with MySQL 4.1 or newer, you may need to follow one of the options discussed above for configuring MySQL to work with old clients. The `mysqli` extension (stands for “MySQL, Improved”; added in PHP 5) is compatible with the improved password hashing employed in MySQL 4.1 and higher, and no special configuration of MySQL need be done to use this MySQL client library. For more information about the `mysqli` extension, see <http://php.net/mysqli>.

It may also be possible to compile the older `mysql` extension against the new MySQL client library. This is beyond the scope of this Manual; consult the PHP documentation for more information. You also be able to obtain assistance with these issues in our [MySQL with PHP forum](#).

For additional background on password hashing and authentication, see [Section 5.4.8, “Password Hashing as of MySQL 4.1”](#).

B.1.2.5. Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when

you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

B.1.2.6. Host '*host_name*' is blocked

If you get the following error, it means that `mysqld` has received many connect requests from the host '*host_name*' that have been interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqladmin flush-hosts'
```

The number of interrupted connect requests allowed is determined by the value of the `max_connect_errors` system variable. After `max_connect_errors` failed requests, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you execute a `mysqladmin flush-hosts` command or issue a `FLUSH HOSTS` statement. See [Section 5.1.3, “System Variables”](#).

By default, `mysqld` blocks a host after 10 connection errors. You can adjust the value by starting the server like this:

```
shell> mysqld_safe --max_connect_errors=10000 &
```

If you get this error message for a given host, you should first verify that there isn't anything wrong with TCP/IP connections from that host. If you are having network problems, it does you no good to increase the value of the `max_connect_errors` variable.

B.1.2.7. Too many connections

If you get a `Too many connections` error when you try to connect to the `mysqld` server, this means that all available connections are in use by other clients.

The number of connections allowed is controlled by the `max_connections` system variable. Its default value is 100. If you need to support more connections, you should set a larger value for this variable.

MySQL Enterprise

Subscribers to the MySQL Enterprise Monitor receive advice on dynamically configuring the `max_connections` variable — avoiding failed connection attempts. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

`mysqld` actually allows `max_connections+1` clients to connect. The extra connection is reserved for use by accounts that have the `SUPER` privilege. By granting the `SUPER` privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See [Section 12.5.5.24, “SHOW PROCESSLIST Syntax”](#).

The maximum number of connections MySQL can support depends on the quality of the thread library on a given platform. Linux or Solaris should be able to support 500-1000 simultaneous connections, depending on how much RAM you have and what your clients are doing. Static Linux binaries provided by MySQL AB can support up to 4000 connections.

B.1.2.8. Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

B.1.2.9. MySQL server has gone away

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent):

Error Code	Description
------------	-------------

<code>CR_SERVER_GONE_ERROR</code>	The client couldn't send a question to the server.
<code>CR_SERVER_LOST</code>	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See [Section 5.1.3, “System Variables”](#).

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

The problem on Windows is that in some cases MySQL doesn't get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

Prior to MySQL 5.0.19, even if the `reconnect` flag in the `MYSQL` structure is equal to 1, MySQL does not automatically reconnect and re-issue the query as it doesn't know if the server did get the original query or not.

The solution to this is to either do a `mysql_ping()` on the connection if there has been a long time since the last query (this is what `MyODBC` does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 1MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in [Section B.1.2.10, “Packet too large”](#).

An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.

- You also get a lost connection if you are sending a packet 16MB or larger if your client is older than 4.0.8 and your server is 4.0.8 and above, or the other way around.
- It is also possible to see this error if hostname lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working — from MySQL's point of view the problem is indistinguishable from any other network timeout.

You may also see the `MySQL server has gone away` error if MySQL is started with the `--skip-networking` option.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See [Section B.1.4.2, “What to Do If MySQL Keeps Crashing”](#).

You can get more information about the lost connections by starting `mysqld` with the `--log-warnings=2` option. This logs some of the disconnected errors in the `hostname.err` file. See [Section 5.2.1, “The Error Log”](#).

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See [Section B.1.4.2, “What to Do If MySQL Keeps Crashing”](#).
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See [MySQL Internals: Porting](#).
- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the `--log` option to determine whether the problem query appears in the log?

See also [Section B.1.2.11, “Communication Errors and Aborted Connections”](#), and [Section 1.7, “How to Report Bugs or Problems”](#).

B.1.2.10. Packet too large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

The largest possible packet that can be transmitted to or from a MySQL 5.0 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues a `Packet too large` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 1MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 16MB, start the server like this:

```
shell> mysqld --max_allowed_packet=16M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 16MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=16M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

B.1.2.11. Communication Errors and Aborted Connections

The server error log can be a useful source of information about connection problems. See [Section 5.2.1, “The Error Log”](#). If you start the server with the `--log-warnings` option, you might find messages like this in your error log:

```
010301 14:38:23 Aborted connection 854 to db: 'users' user: 'josh'
```

If `Aborted connections` messages appear in the error log, the cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See [Section 5.1.3, “System Variables”](#).
- The client program ended abruptly in the middle of a data transfer.

When any of these things happen, the server increments the `Aborted_clients` status variable.

The server increments the `Aborted_connects` status variable when the following things happen:

- A client doesn't have privileges to connect to a database.
- A client uses an incorrect password.
- A connection packet doesn't contain the right information.
- It takes more than `connect_timeout` seconds to get a connect packet. See [Section 5.1.3, “System Variables”](#).

If these kinds of things happen, it might indicate that someone is trying to break into your server!

MySQL Enterprise

For reasons of security and performance the advisors provided by the MySQL Enterprise Monitor pay special attention to the `Aborted_connections` status variable. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

Other reasons for problems with aborted clients or aborted connections:

- Use of Ethernet protocol with Linux, both half and full duplex. Many Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file via FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. The only solution is switching the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and testing the results to determine the best setting.
- Some problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.
- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See [Section B.1.2.10, “Packet too large”](#).

See also [Section B.1.2.9, “MySQL server has gone away”](#).

B.1.2.12. The table is full

The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. The following table lists some examples of operating system file-size limits. This is only a rough guide and is not intended to be definitive. For the most up-to-date information, be sure to check the documentation specific to your operating system.

Operating System	File-size Limit
Win32 w/ FAT/FAT32	2GB/4GB
Win32 w/ NTFS	2TB (possibly larger)
Linux 2.2-Intel 32-bit	2GB (LFS: 4GB)
Linux 2.4+	(using ext3 filesystem) 4TB

Solaris 9/10	16TB
MacOS X w/ HFS+	2TB
NetWare w/NSS filesystem	8TB

Windows users, please note that FAT and VFAT (FAT32) are *not* considered suitable for production use with MySQL. Use NTFS instead.

On Linux 2.2, you can get [MyISAM](#) tables larger than 2GB in size by using the Large File Support (LFS) patch for the ext2 filesystem. Most current Linux distributions are based on kernel 2.4 or higher and include all the required LFS patches. On Linux 2.4, patches also exist for ReiserFS to get support for big files (up to 2TB). With JFS and XFS, petabyte and larger files are possible on Linux.

For a detailed overview about LFS in Linux, have a look at Andreas Jaeger's *Large File Support in Linux* page at http://www.suse.de/~aj/linux_lfs.html.

If you do encounter a full-table error, there are several reasons why it might have occurred:

- The [InnoDB](#) storage engine maintains [InnoDB](#) tables within a tablespace that can be created from several files. This allows a table to exceed the maximum individual file size. The tablespace can include raw disk partitions, which allows extremely large tables. The maximum tablespace size is 64TB.

If you are using [InnoDB](#) tables and run out of room in the [InnoDB](#) tablespace. In this case, the solution is to extend the [InnoDB](#) tablespace. See [Section 13.2.7, “Adding and Removing InnoDB Data and Log Files”](#).

- You are using [MyISAM](#) tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.
- You are using a [MyISAM](#) table and the space required for the table exceeds what is allowed by the internal pointer size. [MyISAM](#) creates data and index table files to allow up to 4GB by default (256TB as of MySQL 5.0.6), but this limit can be changed up to the maximum allowable size of 65,536TB ($256^7 - 1$ bytes).

If you need a [MyISAM](#) table that is larger than the default limit and your operating system supports large files, the [CREATE TABLE](#) statement supports [AVG_ROW_LENGTH](#) and [MAX_ROWS](#) options. See [Section 12.1.9, “CREATE TABLE Syntax”](#). The server uses these options to determine how large a table to allow.

If the pointer size is too small for an existing table, you can change the options with [ALTER TABLE](#) to increase a table's maximum allowable size. See [Section 12.1.3, “ALTER TABLE Syntax”](#).

```
ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
```

You have to specify [AVG_ROW_LENGTH](#) only for tables with [BLOB](#) or [TEXT](#) columns; in this case, MySQL can't optimize the space required based only on the number of rows.

To change the default size limit for [MyISAM](#) tables, set the [myisam_data_pointer_size](#), which sets the number of bytes used for internal row pointers. The value is used to set the pointer size for new tables if you do not specify the [MAX_ROWS](#) option. The value of [myisam_data_pointer_size](#) can be from 2 to 7. A value of 4 allows tables up to 4GB; a value of 6 allows tables up to 256TB.

You can check the maximum data and index sizes by using this statement:

```
SHOW TABLE STATUS FROM db_name LIKE 'tbl_name';
```

You also can use [myisamchk -dv /path/to/table-index-file](#). See [Section 12.5.5, “SHOW Syntax”](#), or [Section 4.6.3, “myisamchk — MyISAM Table-Maintenance Utility”](#).

Other ways to work around file-size limits for [MyISAM](#) tables are as follows:

- If your large table is read only, you can use [myisampack](#) to compress it. [myisampack](#) usually compresses a table by at least 50%, so you can have, in effect, much bigger tables. [myisampack](#) also can merge multiple tables into a single table. See [Section 4.6.5, “myisampack — Generate Compressed, Read-Only MyISAM Tables”](#).
- MySQL includes a [MERGE](#) library that allows you to handle a collection of [MyISAM](#) tables that have identical structure as a single [MERGE](#) table. See [Section 13.3, “The MERGE Storage Engine”](#).
- You are using the [NDB](#) storage engine, in which case you need to increase the values for the [DataMemory](#) and [IndexMemory](#) configuration parameters in your [config.ini](#) file. See [Section 19.3.5.1, “Data Node Configuration Parameters”](#).

- You are using the `MEMORY` (`HEAP`) storage engine; in this case you need to increase the value of the `max_heap_table_size` system variable. See [Section 5.1.3, “System Variables”](#).

B.1.2.13. Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See [Section 4.2.3.2, “Using Option Files”](#).

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `perror`. One reason the server cannot write to a table is that the filesystem is full:

```
shell> perror 28
OS error code 28: No space left on device
```

If you get an error of the following type during startup, it indicates that the filesystem and/or directory used for storing data files is write protected. Providing the write error is to a test file, This error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

B.1.2.14. Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

B.1.2.15. Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system.

The following list indicates possible causes of and fixes for this problem:

- You may be running a new version of `mysqld` with an old `user` table. You can check this by executing `mysqlshow mysql user` to see whether the `Password` column is shorter than 16 characters. If so, you can correct this condition by running the `scripts/add_long_password` script.
- The account has an old password (eight characters long). Update the account in the `user` table to have a new password.
- You have specified a password in the `user` table without using the `PASSWORD()` function. Use `mysql` to update the account in the `user` table with a new password, making sure to use the `PASSWORD()` function:

```
mysql> UPDATE user SET Password=PASSWORD('newpwd')
-> WHERE User='some_user' AND Host='some_host';
```

B.1.2.16. Table 'tbl_name' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a filesystem that has case-sensitive filenames.
- Even for filesystems that are not case sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See [Section 12.5.5, “SHOW Syntax”](#).

B.1.2.17. Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multi-byte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `configure` with the `--with-charset=charset_name` or `--with-extra-charsets=charset_name` option. See [Section 2.4.15.2, “Typical configure Options”](#).

All standard MySQL binaries are compiled with `--with-extra-character-sets=complex`, which enables support for all multi-byte character sets. See [Section 9.2, “The Character Set Used for Data and Sorting”](#).

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

- Recompile the client with support for the character set. See [Section 2.4.15.2, “Typical configure Options”](#).
- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
- Copy the character definition files to the path where the client expects them to be.

B.1.2.18. 'FILE' NOT FOUND and Similar Errors

If you get `ERROR '...' not found (errno: 23)`, `Can't open file: ... (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you haven't allocated enough file descriptors for the MySQL server. You can use the `pererror` utility to get a description of what the error number means:

```
shell> pererror 23
OS error code 23: File table overflow
shell> pererror 24
OS error code 24: Too many open files
shell> pererror 11
OS error code 11: Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_cache` system variable (the default value is 64). Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or set the `open_files_limit` system variable. See [Section 5.1.3, “System Variables”](#). The easiest way to set these values is to add an option to your option file. See [Section 4.2.3.2, “Using Option Files”](#). If you have an old version of `mysqld` that doesn't support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the “#” character to uncomment this line, and change the number 256 to set the

number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

Note

If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

B.1.2.19. Table-Corruption Issues

If you have started `mysqld` with `--myisam-recover`, MySQL automatically checks and tries to repair MyISAM tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file 'Warning: Checking table ...' which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further.

See also [Section 5.1.2, “Command Options”](#), and [Section 25.4.1.7, “Making a Test Case If You Experience Table Corruption”](#).

B.1.3. Installation-Related Issues

B.1.3.1. Problems Linking to the MySQL Client Library

When you are linking an application program to use the MySQL client library, you might get undefined reference errors for symbols that start with `mysql_`, such as those shown here:

```
/tmp/ccFKsdPa.o: In function `main':
/tmp/ccFKsdPa.o(.text+0xb): undefined reference to `mysql_init'
/tmp/ccFKsdPa.o(.text+0x31): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x57): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x69): undefined reference to `mysql_error'
/tmp/ccFKsdPa.o(.text+0x9a): undefined reference to `mysql_close'
```

You should be able to solve this problem by adding `-Ldir_path -lmysqlclient` at the end of your link command, where `dir_path` represents the pathname of the directory where the client library is located. To determine the correct directory, try this command:

```
shell> mysql_config --libs
```

The output from `mysql_config` might indicate other libraries that should be specified on the link command as well.

If you get `undefined reference` errors for the `uncompress` or `compress` function, add `-lz` to the end of your link command and try again.

If you get `undefined reference` errors for a function that should exist on your system, such as `connect`, check the manual page for the function in question to determine which libraries you should add to the link command.

You might get `undefined reference` errors such as the following for functions that don't exist on your system:

```
mf_format.o(.text+0x201): undefined reference to `__lxstat'
```

This usually means that your MySQL client library was compiled on a system that is not 100% compatible with yours. In this case, you should download the latest MySQL source distribution and compile MySQL yourself. See [Section 2.4.15, “MySQL Installation Using a Source Distribution”](#).

You might get undefined reference errors at runtime when you try to execute a MySQL program. If these errors specify symbols that start with `mysql_` or indicate that the `mysqlclient` library can't be found, it means that your system can't find the shared `libmysqlclient.so` library. The fix for this is to tell your system to search for shared libraries where the library is located. Use whichever of the following methods is appropriate for your system:

- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY_PATH` environment variable.
- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY` environment variable.
- Copy `libmysqlclient.so` to some directory that is searched by your system, such as `/lib`, and update the shared library information by executing `ldconfig`.

Another way to solve this problem is by linking your program statically with the `-static` option, or by removing the dynamic MySQL libraries before linking your code. Before trying the second method, you should be sure that no other programs are using the dynamic libraries.

B.1.3.2. Problems with File Permissions

If you have problems with file permissions, the `UMASK` environment variable might be set incorrectly when `mysqld` starts. For example, MySQL might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/filename.frm' (Errcode: 13)
```

The default `UMASK` value is `0660`. You can change this behavior by starting `mysqld_safe` as follows:

```
shell> UMASK=384 # = 600 in octal
shell> export UMASK
shell> mysqld_safe &
```

By default, MySQL creates database and `RAID` directories with an access permission value of `0700`. You can modify this behavior by setting the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, if you want to give group access to all new directories, you can do this:

```
shell> UMASK_DIR=504 # = 770 in octal
shell> export UMASK_DIR
shell> mysqld_safe &
```

In MySQL 3.23.25 and above, MySQL assumes that the value for `UMASK` and `UMASK_DIR` is in octal if it starts with a zero.

See [Section 2.4.20, “Environment Variables”](#).

B.1.4. Administration-Related Issues

B.1.4.1. How to Reset the Root Password

If you have never set a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, it is recommended to set a password for each account. See [Section 5.3.1, “General Security Guidelines”](#).

If you set a `root` password previously, but have forgotten what it was, you can set a new password. The next two sections show procedures for Windows and Unix systems, respectively.

B.1.4.1.1. Resetting the Root Password on Windows Systems

Use the following procedure for resetting the password for any MySQL `root` accounts on Windows:

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager:

```
Start Menu -> Control Panel -> Administrative Tools -> Services
```

Then find the MySQL service in the list, and stop it.

If your server is not running as a service, you may need to use the Task Manager to force it to stop.

3. Create a text file and place the following statements in it. Replace the password with the password that you want to use.

```
UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
FLUSH PRIVILEGES;
```

The `UPDATE` and `FLUSH` statements each must be written on a single line. The `UPDATE` statement resets the password for all existing `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory.

4. Save the file. For this example, the file will be named `C:\mysql-init.txt`.
5. Open a console window to get to the command prompt:

```
Start Menu -> Run -> cmd
```

6. Start the MySQL server with the special `--init-file` option:

```
C:\> C:\mysql\bin\mysqld-nt --init-file=C:\mysql-init.txt
```

If you installed MySQL to a location other than `C:\mysql`, adjust the command accordingly.

The server executes the contents of the file named by the `--init-file` option at startup, changing each `root` account password.

You can also add the `--console` option to the command if you want server output to appear in the console window rather than in a log file.

If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option:

```
C:\> "C:\Program Files\MySQL\MySQL Server 5.0\bin\mysqld-nt.exe"
      --defaults-file="C:\Program Files\MySQL\MySQL Server 5.0\my.ini"
      --init-file=C:\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager:

```
Start Menu -> Control Panel -> Administrative Tools -> Services
```

Find the MySQL service in the list, right-click on it, and choose the `Properties` option. The `Path to executable` field contains the `--defaults-file` setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.
8. Stop the MySQL server, then restart it in normal mode again. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

You should now be able to connect to MySQL as `root` using the new password.

B.1.4.1.2. Resetting the Root Password on Unix Systems

MySQL Enterprise

For expert advice on security-related issues, subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

Use the following procedure for resetting the password for any MySQL `root` accounts on Unix. The instructions assume that you will start the server so that it runs using the Unix login account that you normally use for running the server. For example, if you run the server using the `mysql` login account, you should log in as `mysql` before using the instructions. (Alternatively, you can log in as `root`, but in this case you *must* start `mysqld` with the `--user=mysql` option. If you start the server as `root` without using `--user=mysql`, the server may create `root`-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you will need to either change the ownership of the files to `mysql` or remove them.)

1. Log on to your system as the Unix `mysql` user that the `mysqld` server runs as.
2. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, hostname, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the filename has an extension of `.pid` and begins with either `mysqld` or your system's hostname.

You can stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process, using the pathname of the `.pid` file in the following command:

```
shell> kill `cat /mysql-data-directory/host_name.pid`
```

Note the use of backticks rather than forward quotes with the `cat` command; these cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file and place the following statements in it. Replace the password with the password that you want to use.

```
UPDATE mysql.user SET Password=PASSWORD('MyNewPass') WHERE User='root';
FLUSH PRIVILEGES;
```

The `UPDATE` and `FLUSH` statements each must be written on a single line. The `UPDATE` statement resets the password for all existing `root` accounts, and the `FLUSH` statement tells the server to reload the grant tables into memory.

4. Save the file. For this example, the file will be named `/home/me/mysql-init`. The file contains the password, so it should not be saved where it can be read by other users.
5. Start the MySQL server with the special `--init-file` option:

```
shell> mysqld_safe --init-file=/home/me/mysql-init &
```

The server executes the contents of the file named by the `--init-file` option at startup, changing each `root` account password.

6. After the server has started successfully, delete `/home/me/mysql-init`.

You should now be able to connect to MySQL as `root` using the new password.

Alternatively, on any platform, you can set the new password using the `mysql` client (but this approach is less secure):

1. Stop `mysqld` and restart it with the `--skip-grant-tables` option.
2. Connect to the `mysqld` server with this command:

```
shell> mysql
```

3. Issue the following statements in the `mysql` client. Replace the password with the password that you want to use.

```
mysql> UPDATE mysql.user SET Password=PASSWORD('MyNewPass')
-> WHERE User='root';
mysql> FLUSH PRIVILEGES;
```

You should now be able to connect to MySQL as `root` using the new password.

B.1.4.2. What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This doesn't mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See [Section 5.2.1, "The Error Log"](#).

On some systems, you can find in the error log a stack trace of where `mysqld` died that you can resolve with the `resolve_stack_dump` program. See [MySQL Internals: Porting](#). Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with `-delay-key-write`, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that doesn't support good filesystem locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it's at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Please try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all MyISAM tables, and restart `mysqld`. This ensures that you are running from a clean state. See [Chapter 5, MySQL Server Administration](#).
- Start `mysqld` with the `--log` option and try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See [Section 5.2.2, “The General Query Log”](#). If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have been able to locate the bug and should submit a bug report for it. See [Section 1.7, “How to Report Bugs or Problems”](#).
- Try to make a test case that we can use to repeat the problem. See [MySQL Internals: Porting](#).
- Try running the tests in the `mysql-test` directory and the MySQL benchmarks. See [Section 25.1.2, “MySQL Test Suite”](#). They should test MySQL rather well. You can also add code to the benchmarks that simulates your application. The benchmarks can be found in the `sql-bench` directory in a source distribution or, for a binary distribution, in the `sql-bench` directory under your MySQL installation directory.
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- If you configure MySQL for debugging, it is much easier to gather information about possible errors if something goes wrong. Configuring MySQL for debugging causes a safe memory allocator to be included that can find some errors. It also provides a lot of output about what is happening. Reconfigure MySQL with the `--with-debug` or `--with-debug=full` option to [configure](#) and then recompile. See [MySQL Internals: Porting](#).
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- Have you tried `mysqladmin -u root processlist` when `mysqld` appears to be running but not responding? Sometimes `mysqld` is not comatose even though you might think so. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while you run your other queries.
- Try the following:
 1. Start `mysqld` from `gdb` (or another debugger). See [MySQL Internals: Porting](#).
 2. Run your test scripts.
 3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

```
backtrace
info local
up
info local
up
info local
```

With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where `N` is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to crash or misbehave.
- Send a normal bug report. See [Section 1.7, “How to Report Bugs or Problems”](#). Be even more detailed than usual. Because MySQL works for many people, it may be that the crash results from something that exists only on your computer (for example, an error that is related to your particular system libraries).
- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

The current dynamic row code has been in use at MySQL AB for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Do not rule out your server hardware when diagnosing problems. Defective hardware can be the cause of data corruption. Particular attention should be paid to both RAMS and hard-drives when troubleshooting hardware.

B.1.4.3. How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, you can take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- To abort the thread, you must use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition allows the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA INFILE` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

MySQL Enterprise

For early notification of possible problems with your MySQL configuration subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

B.1.4.4. Where MySQL Stores Temporary Files

MySQL uses the value of the `TMPDIR` environment variable as the pathname of the directory in which to store temporary files. If you don't have `TMPDIR` set, MySQL uses the system default, which is normally `/tmp`, `/var/tmp`, or `/usr/tmp`. If the filesystem containing your temporary file directory is too small, you can use the `--tmpdir` option to `mysqld` to specify a directory in a filesystem where you have enough space.

In MySQL 5.0, the `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (“:”) on Unix and semicolon characters (“;”) on Windows, NetWare, and OS/2.

Note

To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you should not set `--tmpdir` to point to a directory on a memory-based filesystem or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or `LOAD DATA INFILE` operations. If files in the temporary file directory are lost when the server restarts, replication fails.

MySQL creates all temporary files as hidden files. This ensures that the temporary files are removed if `mysqld` is terminated. The disadvantage of using hidden files is that you do not see a big temporary file that fills up the filesystem in which the temporary file directory is located.

MySQL Enterprise

Advisors provided by the MySQL Enterprise Monitor automatically detect excessive temporary table storage to disk. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some `SELECT` queries, MySQL also creates temporary SQL tables. These are not hidden and have names of the form `SQL_*`.

`ALTER TABLE` creates a temporary table in the same directory as the original table.

B.1.4.5. How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

```
[mysqld]
socket=/path/to/socket

[client]
socket=/path/to/socket
```

See Section 4.2.3.2, “Using Option Files”.

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.
- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `--with-unix-socket-path` option when you run `configure`. See Section 2.4.15.2, “Typical configure Options”.

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

B.1.4.6. Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs; for example, in `mysqld_safe` or `mysql.server`. See Section 2.4.20, “Environment Variables”.

You can set the time zone for the server with the `--timezone=timezone_name` option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The allowable values for `--timezone` or `TZ` are system-dependent. Consult your operating system documentation to see what values are acceptable.

B.1.5. Query-Related Issues

B.1.5.1. Case Sensitivity in String Searches

For non-binary strings (`CHAR`, `VARCHAR`, `TEXT`), string searches use the collation of the comparison operands. For binary strings (`BINARY`, `VARBINARY`, `BLOB`), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons will be case sensitive.

A comparison between a non-binary string and binary string is treated as a comparison of binary strings.

Simple comparison operations (`>=`, `>`, `=`, `<`, `<=`, sorting, and grouping) are based on each character's "sort value." Characters with the same sort value are treated as the same character. For example, if "e" and "é" have the same sort value in a given collation, they compare as equal.

The default character set and collation are `latin1` and `latin1_swedish_ci`, so non-binary string comparisons are case insensitive by default. This means that if you search with `col_name LIKE 'a%'`, you get all column values that start with `A` or `a`. To make this search case sensitive, make sure that one of the operands has a case sensitive or binary collation. For example, if you are comparing a column and a string that both have the `latin1` character set, you can use the `COLLATE` operator to cause either operand to have the `latin1_general_cs` or `latin1_bin` collation:

```
col_name COLLATE latin1_general_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_general_cs
col_name COLLATE latin1_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case sensitive or binary collation. See [Section 12.1.9, "CREATE TABLE Syntax"](#).

To cause a case-sensitive comparison of non-binary strings to be case insensitive, use `COLLATE` to name a case-insensitive collation. The strings in the following example normally are case sensitive, but `COLLATE` changes the comparison to be case insensitive:

```
mysql> SET @s1 = 'MySQL' COLLATE latin1_bin,
->      @s2 = 'mysql' COLLATE latin1_bin;
mysql> SELECT @s1 = @s2;
+-----+
| @s1 = @s2 |
+-----+
|          0 |
+-----+
mysql> SELECT @s1 COLLATE latin1_swedish_ci = @s2;
+-----+
| @s1 COLLATE latin1_swedish_ci = @s2 |
+-----+
|                                  1 |
+-----+
```

A binary string is case sensitive in comparisons. To compare the string as case insensitive, convert it to a non-binary string and use `COLLATE` to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
+-----+
| @s = 'mysql' |
+-----+
|          0 |
+-----+
mysql> SELECT CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql';
+-----+
| CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql' |
+-----+
|                                  1 |
+-----+
```

To determine whether a value will compare as a non-binary or binary string, use the `COLLATION()` function. This example shows that `VERSION()` returns a string that has a case-insensitive collation, so comparisons are case insensitive:

```
mysql> SELECT COLLATION(VERSION());
+-----+
| COLLATION(VERSION()) |
+-----+
| utf8_general_ci     |
+-----+
```

For binary strings, the collation value is `binary`, so comparisons will be case sensitive. One context in which you will see `binary` is for compression and encryption functions, which return binary strings as a general rule: string:

```
mysql> SELECT COLLATION(ENCRYPT('x')), COLLATION(SHA1('x'));
```

COLLATION(ENCRYPT('x'))	COLLATION(SHA1('x'))
binary	binary

B.1.5.2. Problems Using DATE Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is allowed. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
mysql> SELECT * FROM tbl_name WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context (and vice versa). It is also smart enough to allow a “relaxed” string form when updating and in a `WHERE` clause that compares a date to a `TIMESTAMP`, `DATE`, or `DATETIME` column. (“Relaxed form” means that any punctuation character may be used as the separator between parts. For example, `'2004-08-15'` and `'2004#08#15'` are equivalent.) MySQL can also convert a string containing no separators (such as `'20040815'`), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any other comparison method than those just listed, such as `IN` or `STRCMP()`.

For these exceptional cases, the comparison is done by converting the objects to strings and performing a string comparison.

To keep things safe, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special date `'0000-00-00'` can be stored and retrieved as `'0000-00-00'`. When using a `'0000-00-00'` date through MyODBC, it is automatically converted to `NULL` in MyODBC 2.50.12 and above, because ODBC can't handle this kind of date.

Because MySQL performs the conversions described above, the following statements work:

```
mysql> INSERT INTO tbl_name (idate) VALUES (19970505);
mysql> INSERT INTO tbl_name (idate) VALUES ('19970505');
mysql> INSERT INTO tbl_name (idate) VALUES ('97-05-05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997.05.05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997 05 05');
mysql> INSERT INTO tbl_name (idate) VALUES ('0000-00-00');

mysql> SELECT idate FROM tbl_name WHERE idate >= '1997-05-05';
mysql> SELECT idate FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT MOD(idate,100) FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT idate FROM tbl_name WHERE idate >= '19970505';
```

However, the following does not work:

```
mysql> SELECT idate FROM tbl_name WHERE STRCMP(idate,'20030505')=0;
```

`STRCMP()` is a string function, so it converts `idate` to a string in `'YYYY-MM-DD'` format and performs a string comparison. It does not convert `'20030505'` to the date `'2003-05-05'` and perform a date comparison.

If you are using the `ALLOW_INVALID_DATES` SQL mode, MySQL allows you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12.

This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

If you are not using the `NO_ZERO_IN_DATE` SQL mode, the day or month part can be zero. This is convenient if you want to store a birthdate in a `DATE` column and you know only part of the date.

If you are not using the `NO_ZERO_DATE` SQL mode, MySQL also allows you to store `'0000-00-00'` as a “dummy date.” This is in some cases more convenient than using `NULL` values.

If the date cannot be converted to any reasonable value, a 0 is stored in the `DATE` column, which is retrieved as `'0000-00-00'`. This is both a speed and a convenience issue. We believe that the database server's responsibility is to retrieve the same date you

stored (even if the data was not logically correct in all cases). We think it is up to the application and not the server to check the dates.

If you want MySQL to check all dates and accept only legal dates (unless overridden by IGNORE), you should set `sql_mode` to `"NO_ZERO_IN_DATE,NO_ZERO_DATE"`.

Date handling in MySQL 5.0.1 and earlier works like MySQL 5.0.2 with the `ALLOW_INVALID_DATES` SQL mode enabled.

B.1.5.3. Problems with NULL Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string `' '`. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with `NULL` handling, you can use the `IS NULL` and `IS NOT NULL` operators and the `IFNULL()` function.

In SQL, the `NULL` value is never true in comparison to any other value, even `NULL`. An expression that contains `NULL` always produces a `NULL` value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return `NULL`:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

If you want to search for column values that are `NULL`, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for `NULL` values, you must use the `IS NULL` test. The following statements show how to find the `NULL` phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See Section 3.3.4.6, “Working with NULL Values”, for additional information and examples.

You can add an index on a column that can have `NULL` values if you are using the `MyISAM`, `InnoDB`, or `BDB`, or `MEMORY` storage engine. Otherwise, you must declare an indexed column `NOT NULL`, and you cannot insert `NULL` into the column.

When reading data with `LOAD DATA INFILE`, empty or missing columns are updated with `' '`. If you want a `NULL` value in a column, you should use `\N` in the data file. The literal word “NULL” may also be used under some circumstances. See Section 12.2.6, “LOAD DATA INFILE Syntax”.

When using `DISTINCT`, `GROUP BY`, or `ORDER BY`, all `NULL` values are regarded as equal.

When using `ORDER BY`, `NULL` values are presented first, or last if you specify `DESC` to sort in descending order.

Aggregate (summary) functions such as `COUNT()`, `MIN()`, and `SUM()` ignore `NULL` values. The exception to this is `COUNT(*)`, which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-`NULL` values in the `age` column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles `NULL` values specially. If you insert `NULL` into a `TIMESTAMP` column, the current date and time is inserted. If you insert `NULL` into an integer or floating-point column that has the `AUTO_INCREMENT` attribute, the next number in the sequence is inserted.

B.1.5.4. Problems with Column Aliases

You can use an alias to refer to a column in `GROUP BY`, `ORDER BY`, or `HAVING` clauses. Aliases can also be used to give columns better names:

```
SELECT SQRT(a*b) AS root FROM tbl_name GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL doesn't allow you to refer to a column alias in a `WHERE` clause. This restriction is imposed because when the `WHERE` code is executed, the column value may not yet be determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name WHERE cnt > 0 GROUP BY id;
```

The `WHERE` statement is executed to determine which rows should be included in the `GROUP BY` part, whereas `HAVING` is used to decide which rows from the result set should be used.

B.1.5.5. Rollback Failure for Non-Transactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These non-transactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and non-transactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` doesn't support a storage engine, it instead creates the table as a `MyISAM` table, which is non-transactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See [Section 12.5.5.29, “SHOW TABLE STATUS Syntax”](#), and [Section 12.5.5.8, “SHOW CREATE TABLE Syntax”](#).

You can check which storage engines your `mysqld` server supports by using this statement:

```
SHOW ENGINES;
```

You can also use the following statement, and check the value of the variable that is associated with the storage engine in which you are interested:

```
SHOW VARIABLES LIKE 'have_%';
```

For example, to determine whether the `InnoDB` storage engine is available, check the value of the `have_innodb` variable.

See [Section 12.5.5.12, “SHOW ENGINES Syntax”](#), and [Section 12.5.5.32, “SHOW VARIABLES Syntax”](#).

MySQL Enterprise

Ensure that your data is adequately protected by subscribing to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

B.1.5.6. Deleting Rows from Related Tables

If the total length of the `DELETE` statement for `related_table` is more than 1MB (the default value of the `max_allowed_packet` system variable), you should split it into smaller parts and execute multiple `DELETE` statements. You probably get the fastest `DELETE` by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` isn't indexed, the speed is independent of the number of arguments in the `IN` clause.

B.1.5.7. Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that doesn't return any rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See [Section 12.3.2, “EXPLAIN Syntax”](#).
2. Select only those columns that are used in the `WHERE` clause.
3. Remove one table at a time from the query until it returns some rows. If the tables are large, it's a good idea to use `LIMIT 10` with the query.

- Issue a `SELECT` for the column that should have matched a row against the table that was last removed from the query.
- If you are comparing `FLOAT` or `DOUBLE` columns with numbers that have decimals, you can't use equality (`=`) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the `FLOAT` to a `DOUBLE` fixes this. See [Section B.1.5.8, "Problems with Floating-Point Comparisons"](#).

Similar problems may be encountered when comparing `DECIMAL` values prior to MySQL 5.0.3.

- If you still can't figure out what's wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

Verify that the test file demonstrates the problem by executing these commands:

```
shell> mysqladmin create test2
shell> mysql test2 < query.sql
```

Attach the test file to a bug report, which you can file using the instructions in [Section 1.7, "How to Report Bugs or Problems"](#).

B.1.5.8. Problems with Floating-Point Comparisons

Floating-point numbers sometimes cause confusion because they are approximate. That is, they are not stored as exact values inside computer architecture. What you can see on the screen usually is not the exact value of the number. The `FLOAT` and `DOUBLE` data types are such, and `DECIMAL` operations before MySQL 5.0.3 are approximate as well.

Prior to MySQL 5.0.3, `DECIMAL` columns store values with exact precision because they are represented as strings, but calculations on `DECIMAL` values are done using floating-point operations. As of 5.0.6, MySQL performs `DECIMAL` operations with a precision of 65 decimal digits (64 digits from 5.0.3 to 5.0.5), which should solve most common inaccuracy problems when it comes to `DECIMAL` columns. (If your server is from MySQL 5.0.3 or higher, but you have `DECIMAL` columns in tables that were created before 5.0.3, the old behavior still applies to those columns. To convert the tables to the newer `DECIMAL` format, dump them with `mysqldump` and reload them.)

The following example (for versions of MySQL older than 5.0.3) demonstrates the problem. It shows that even for older `DECIMAL` columns, calculations that are done using floating-point operations are subject to floating-point error. (Were you to replace the `DECIMAL` columns with `FLOAT`, similar problems would occur for all versions of MySQL.)

```
mysql> CREATE TABLE t1 (i INT, d1 DECIMAL(9,2), d2 DECIMAL(9,2));
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
-> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
-> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
-> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
-> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
-> (6, 0.00, 0.00), (6, -51.40, 0.00);

mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
```

i	a	b
1	21.40	21.40
2	76.80	76.80
3	7.40	7.40
4	15.40	15.40
5	7.20	7.20
6	-51.40	0.00

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

As of MySQL 5.0.3, you will get only the last row in the above result.

The problem cannot be solved by using `ROUND()` or similar functions, because the result is still a floating-point number:

```
mysql> SELECT i, ROUND(SUM(d1), 2) AS a, ROUND(SUM(d2), 2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
```

i	a	b
1	21.40	21.40
2	76.80	76.80

3	7.40	7.40
4	15.40	15.40
5	7.20	7.20
6	-51.40	0.00

This is what the numbers in column `a` look like when displayed with more decimal places:

```
mysql> SELECT i, ROUND(SUM(d1), 2)*1.0000000000000000 AS a,
-> ROUND(SUM(d2), 2) AS b FROM t1 GROUP BY i HAVING a <> b;
```

i	a	b
1	21.3999999999999986	21.40
2	76.7999999999999972	76.80
3	7.4000000000000004	7.40
4	15.4000000000000004	15.40
5	7.2000000000000002	7.20
6	-51.399999999999986	0.00

Depending on your computer architecture, you may or may not see similar results. For example, on some machines you may get the “correct” results by multiplying both arguments by 1, as the following example shows.

Warning

Never use this method in your applications. It is not an example of a trustworthy method!

```
mysql> SELECT i, ROUND(SUM(d1), 2)*1 AS a, ROUND(SUM(d2), 2)*1 AS b
-> FROM t1 GROUP BY i HAVING a <> b;
```

i	a	b
6	-51.40	0.00

The reason that the preceding example seems to work is that on the particular machine where the test was done, CPU floating-point arithmetic happens to round the numbers to the same value. However, there is no rule that any CPU should do so, so this method cannot be trusted.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) > 0.0001;
```

i	a	b
6	-51.40	0.00

1 row in set (0.00 sec)

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) <= 0.0001;
```

i	a	b
1	21.40	21.40
2	76.80	76.80
3	7.40	7.40
4	15.40	15.40
5	7.20	7.20

B.1.6. Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL doesn't have enough information about the data at hand and has to make “educated” guesses about the data.

For the cases when MySQL does not do the “right” thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

```
mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
```

`EXPLAIN` is discussed in more detail in [Section 12.3.2, “EXPLAIN Syntax”](#).

- Use `ANALYZE TABLE tbl_name` to update the key distributions for the scanned table. See [Section 12.5.2.1, “ANALYZE TABLE Syntax”](#).
- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

```
SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
WHERE t1.col_name=t2.col_name;
```

`USE INDEX` and `IGNORE INDEX` may also be useful. See [Section 12.2.8.2, “Index Hint Syntax”](#).

- Global and table-level `STRAIGHT_JOIN`. See [Section 12.2.8, “SELECT Syntax”](#).
- You can tune global or thread-specific system variables. For example, Start `mysqld` with the `-max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See [Section 5.1.3, “System Variables”](#).

MySQL Enterprise

For expert advice on configuring MySQL servers for optimal performance, subscribe to the MySQL Enterprise Monitor. For more information, see <http://www.mysql.com/products/enterprise/advisors.html>.

B.1.7. Table Definition-Related Issues

B.1.7.1. Problems with `ALTER TABLE`

`ALTER TABLE` changes a table to the current character set. If you get a duplicate-key error during `ALTER TABLE`, the cause is either that the new character sets maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table.

If `ALTER TABLE` dies with the following error, the problem may be that MySQL crashed during an earlier `ALTER TABLE` operation and there is an old table named `A-xxx` or `B-xxx` lying around:

```
Error on rename of './database/name.frm'
to './database/B-xxx.frm' (Errcode: 17)
```

In this case, go to the MySQL data directory and delete all files that have names starting with `A-` or `B-`. (You may want to move them elsewhere instead of deleting them.)

`ALTER TABLE` works in the following way:

- Create a new table named `A-xxx` with the requested structural changes.
- Copy all rows from the original table to `A-xxx`.
- Rename the original table to `B-xxx`.
- Rename `A-xxx` to your original table name.
- Delete `B-xxx`.

If something goes wrong with the renaming operation, MySQL tries to undo the changes. If something goes seriously wrong (although this shouldn't happen), MySQL may leave the old table as `B-xxx`. A simple rename of the table files at the system level should get your data back.

If you use `ALTER TABLE` on a transactional table or if you are using Windows or OS/2, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

B.1.7.2. How to Change the Order of Columns in a Table

First, consider whether you really need to change the column order in a table. The whole point of SQL is to abstract the application from the data storage format. You should always specify the order in which you wish to retrieve your data. The first of the follow-

ing statements returns columns in the order `col_name1, col_name2, col_name3`, whereas the second returns them in the order `col_name1, col_name3, col_name2`:

```
mysql> SELECT col_name1, col_name2, col_name3 FROM tbl_name;
mysql> SELECT col_name1, col_name3, col_name2 FROM tbl_name;
```

If you decide to change the order of table columns anyway, you can do so as follows:

1. Create a new table with the columns in the new order.
2. Execute this statement:

```
mysql> INSERT INTO new_table
-> SELECT columns-in-new-order FROM old_table;
```

3. Drop or rename `old_table`.
4. Rename the new table to the original name:

```
mysql> ALTER TABLE new_table RENAME old_table;
```

`SELECT *` is quite suitable for testing queries. However, in an application, you should *never* rely on using `SELECT *` and retrieving the columns based on their position. The order and position in which columns are returned does not remain the same if you add, move, or delete columns. A simple change to your table structure could cause your application to fail.

B.1.7.3. TEMPORARY TABLE Problems

The following list indicates limitations on the use of `TEMPORARY` tables:

- A `TEMPORARY` table can only be of type `MEMORY`, `MyISAM`, `MERGE`, or `InnoDB`.

Temporary tables are not supported for MySQL Cluster.

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

This error also occurs if you refer to a temporary table multiple times in a stored function under different aliases, even if the references occur in different statements within the function.

- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- You cannot use `RENAME` to rename a `TEMPORARY` table. However, you can use `ALTER TABLE` instead:

```
mysql> ALTER TABLE orig_name RENAME new_name;
```

- There are known issues in using temporary tables with replication. See [Section 18.3.1, “Replication Features and Issues”](#), for more information.

B.1.8. Known Issues in MySQL

This section is a list of the known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in [Section 2.4.19, “Operating System-Specific Notes”](#), and [MySQL Internals: Porting](#).

B.1.8.1. Open Issues in MySQL

The following problems are known and fixing them is a high priority:

- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table

names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).

- Dropping a `FOREIGN KEY` constraint doesn't work in replication because the constraint may have another name on the slave.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` doesn't work inside `GROUP_CONCAT()` if you don't use all and only those columns that are in the `DISTINCT` list.
- If one user has a long-running transaction and another user drops a table that is updated in the transaction, there is small chance that the binary log may contain the `DROP TABLE` command before the table is used in the transaction itself. We plan to fix this by having the `DROP TABLE` command wait until the table is not being used in any transaction.
- When inserting a big integer value (between 2^{63} and $2^{64}-1$) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.
- `FLUSH TABLES WITH READ LOCK` does not block `COMMIT` if the server is running without binary logging, which may cause a problem (of consistency between tables) when doing a full backup.
- `ANALYZE TABLE` on a `BDB` table may in some cases make the table unusable until you restart `mysqld`. If this happens, look for errors of the following form in the MySQL error file:

```
001207 22:07:56 bdb: log_flush: LSN past current end-of-log
```

- Don't execute `ALTER TABLE` on a `BDB` table on which you are running multiple-statement transactions until all those transactions complete. (The transaction might be ignored.)
- `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` may cause problems on tables for which you are using `INSERT DELAYED`.
- Performing `LOCK TABLE ...` and `FLUSH TABLES ...` doesn't guarantee that there isn't a half-finished transaction in progress on the table.
- `BDB` tables are relatively slow to open. If you have many `BDB` tables in a database, it takes a long time to use the `mysql` client on the database if you are not using the `-A` option or if you are using `rehash`. This is especially noticeable when you have a large table cache.
- Replication uses query-level logging: The master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases.

It is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is non-deterministic (generally not a recommended practice, even outside of replication).

For example:

- `CREATE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
- `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
- `REPLACE ... SELECT`, `INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.

For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the master and slave.

A query is optimized differently on the master and slave only if:

- The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use `InnoDB` on the master, but `MyISAM` on the slave if the slave has less available disk space.)
- MySQL buffer sizes (`key_buffer_size`, and so on) are different on the master and slave.
- The master and slave run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using `mysqlbinlog|mysql`.

The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned non-deterministic queries to ensure that the rows are always stored or modified in the same order.

In future MySQL versions, we will automatically add an `ORDER BY` clause when needed.

The following issues are known and will be fixed in due time:

- Log filenames are based on the server hostname (if you don't specify a filename with the startup option). You have to use options such as `--log-bin=old_host_name-bin` if you change your hostname to something else. Another option is to rename the old files to reflect your hostname change (if these are binary logs, you need to edit the binary log index file and fix the binlog names there as well). See [Section 5.1.2, “Command Options”](#).
- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA INFILE` command. See [Section 4.6.7, “mysqlbinlog — Utility for Processing Binary Log Files”](#).
- `RENAME` doesn't work with `TEMPORARY` tables or tables used in a `MERGE` table.
- Due to the way table format (`.frm`) files are stored, you cannot use character 255 (`CHAR(255)`) in table names, column names, or enumerations. This is scheduled to be fixed in version 5.1 when we implement new table definition format files.
- When using `SET CHARACTER SET`, you can't use translated characters in database, table, and column names.
- You can't use “_” or “%” with `ESCAPE` in `LIKE ... ESCAPE`.
- You cannot build the server in another directory when using MIT-pthreads. Because this requires changes to MIT-pthreads, we are not likely to fix this. See [Section 2.4.15.5, “MIT-pthreads Notes”](#).
- `BLOB` and `TEXT` values can't reliably be used in `GROUP BY`, `ORDER BY` or `DISTINCT`. Only the first `max_sort_length` bytes are used when comparing `BLOB` values in these cases. The default value of `max_sort_length` is 1024 and can be changed at server startup time or at runtime.
- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF` and `ELT()` with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.
- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- `mysqld_safe` redirects all messages from `mysqld` to the `mysqld` log. One problem with this is that if you execute `mysqladmin refresh` to close and reopen the log, `stdout` and `stderr` are still redirected to the old log. If you use `-log` extensively, you should edit `mysqld_safe` to log to `host_name.err` instead of `host_name.log` so that you can easily reclaim the space for the old log by deleting it and executing `mysqladmin refresh`.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by 2, **not** 1:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following doesn't work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns don't participate in the `DISTINCT` comparison. We will probably change this in the future to never compare the hidden columns when executing `DISTINCT`.

An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads
WHERE userid = 9 ORDER BY id DESC;
```

and

```
SELECT DISTINCT band_downloads.mp3id
FROM band_downloads,band_mp3
WHERE band_downloads.userid = 9
AND band_mp3.id = band_downloads.mp3id
ORDER BY band_downloads.id DESC;
```

In the second case, using MySQL Server 3.23.x, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

Note that this happens only for queries where that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` doesn't check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

B.2. Server Error Codes and Messages

MySQL programs have access to several types of error information when the server returns an error. For example, the `mysql` client program displays errors using the following format:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

The message displayed contains three types of information:

- A numeric error value (`1146`). This number is MySQL-specific and is not portable to other database systems.
- A five-character SQLSTATE value (`'42S02'`). The values are specified by ANSI SQL and ODBC and are more standardized. Not all MySQL error numbers are mapped to SQLSTATE error codes. The value `'HY000'` (general error) is used for unmapped errors.
- A string that provides a textual description of the error.

Server error information comes from the following source files. For details about the way that error information is defined, see the MySQL Internals manual, available at <http://dev.mysql.com/doc/>.

- Error message information is listed in the `share/errmsg.txt` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the Message values when they are displayed.
- The Error values listed in `share/errmsg.txt` are used to generate the definitions in the `include/mysqld_error.h` and `include/mysqld_ename.h` MySQL source files.
- The SQLSTATE values listed in `share/errmsg.txt` are used to generate the definitions in the `include/sql_state.h` MySQL source file.

MySQL Enterprise

MySQL Enterprise subscribers will find numerous articles about server error messages at, [Error Messages](#). For information about subscribing to MySQL Enterprise see <http://www.mysql.com/products/enterprise/advisors.html>.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: `1000` SQLSTATE: `HY000` (`ER_HASHCHK`)
Message: hashchk
- Error: `1001` SQLSTATE: `HY000` (`ER_NISAMCHK`)

Message: isamchk

- Error: 1002 SQLSTATE: HY000 (ER_NO)

Message: NO

- Error: 1003 SQLSTATE: HY000 (ER_YES)

Message: YES

- Error: 1004 SQLSTATE: HY000 (ER_CANT_CREATE_FILE)

Message: Can't create file '%s' (errno: %d)

- Error: 1005 SQLSTATE: HY000 (ER_CANT_CREATE_TABLE)

Message: Can't create table '%s' (errno: %d)

- Error: 1006 SQLSTATE: HY000 (ER_CANT_CREATE_DB)

Message: Can't create database '%s' (errno: %d)

- Error: 1007 SQLSTATE: HY000 (ER_DB_CREATE_EXISTS)

Message: Can't create database '%s'; database exists

- Error: 1008 SQLSTATE: HY000 (ER_DB_DROP_EXISTS)

Message: Can't drop database '%s'; database doesn't exist

- Error: 1009 SQLSTATE: HY000 (ER_DB_DROP_DELETE)

Message: Error dropping database (can't delete '%s', errno: %d)

- Error: 1010 SQLSTATE: HY000 (ER_DB_DROP_RMDIR)

Message: Error dropping database (can't rmdir '%s', errno: %d)

- Error: 1011 SQLSTATE: HY000 (ER_CANT_DELETE_FILE)

Message: Error on delete of '%s' (errno: %d)

- Error: 1012 SQLSTATE: HY000 (ER_CANT_FIND_SYSTEM_REC)

Message: Can't read record in system table

- Error: 1013 SQLSTATE: HY000 (ER_CANT_GET_STAT)

Message: Can't get status of '%s' (errno: %d)

- Error: 1014 SQLSTATE: HY000 (ER_CANT_GET_WD)

Message: Can't get working directory (errno: %d)

- Error: 1015 SQLSTATE: HY000 (ER_CANT_LOCK)

Message: Can't lock file (errno: %d)

- Error: 1016 SQLSTATE: HY000 (ER_CANT_OPEN_FILE)

Message: Can't open file: '%s' (errno: %d)

- Error: 1017 SQLSTATE: HY000 (ER_FILE_NOT_FOUND)

Message: Can't find file: '%s' (errno: %d)

- Error: 1018 SQLSTATE: HY000 (ER_CANT_READ_DIR)

Message: Can't read dir of '%s' (errno: %d)

- Error: 1019 SQLSTATE: HY000 (ER_CANT_SET_WD)

- Message: Can't change dir to '%s' (errno: %d)

 - Error: 1020 SQLSTATE: HY000 ([ER_CHECKREAD](#))

Message: Record has changed since last read in table '%s'

 - Error: 1021 SQLSTATE: HY000 ([ER_DISK_FULL](#))

Message: Disk full (%s); waiting for someone to free some space...

 - Error: 1022 SQLSTATE: 23000 ([ER_DUP_KEY](#))

Message: Can't write; duplicate key in table '%s'

 - Error: 1023 SQLSTATE: HY000 ([ER_ERROR_ON_CLOSE](#))

Message: Error on close of '%s' (errno: %d)

 - Error: 1024 SQLSTATE: HY000 ([ER_ERROR_ON_READ](#))

Message: Error reading file '%s' (errno: %d)

 - Error: 1025 SQLSTATE: HY000 ([ER_ERROR_ON_RENAME](#))

Message: Error on rename of '%s' to '%s' (errno: %d)

 - Error: 1026 SQLSTATE: HY000 ([ER_ERROR_ON_WRITE](#))

Message: Error writing file '%s' (errno: %d)

 - Error: 1027 SQLSTATE: HY000 ([ER_FILE_USED](#))

Message: '%s' is locked against change

 - Error: 1028 SQLSTATE: HY000 ([ER_FILSORT_ABORT](#))

Message: Sort aborted

 - Error: 1029 SQLSTATE: HY000 ([ER_FORM_NOT_FOUND](#))

Message: View '%s' doesn't exist for '%s'

 - Error: 1030 SQLSTATE: HY000 ([ER_GET_ERRNO](#))

Message: Got error %d from storage engine

 - Error: 1031 SQLSTATE: HY000 ([ER_ILLEGAL HA](#))

Message: Table storage engine for '%s' doesn't have this option

 - Error: 1032 SQLSTATE: HY000 ([ER_KEY_NOT_FOUND](#))

Message: Can't find record in '%s'

 - Error: 1033 SQLSTATE: HY000 ([ER_NOT_FORM_FILE](#))

Message: Incorrect information in file: '%s'

 - Error: 1034 SQLSTATE: HY000 ([ER_NOT_KEYFILE](#))

Message: Incorrect key file for table '%s'; try to repair it

 - Error: 1035 SQLSTATE: HY000 ([ER_OLD_KEYFILE](#))

Message: Old key file for table '%s'; repair it!

 - Error: 1036 SQLSTATE: HY000 ([ER_OPEN_AS_READONLY](#))

Message: Table '%s' is read only

 - Error: 1037 SQLSTATE: HY001 ([ER_OUTOFMEMORY](#))

Message: Out of memory; restart server and try again (needed %d bytes)

- Error: 1038 SQLSTATE: HY001 ([ER_OUT_OF_SORTMEMORY](#))

Message: Out of sort memory; increase server sort buffer size

- Error: 1039 SQLSTATE: HY000 ([ER_UNEXPECTED_EOF](#))

Message: Unexpected EOF found when reading file '%s' (errno: %d)

- Error: 1040 SQLSTATE: 08004 ([ER_CON_COUNT_ERROR](#))

Message: Too many connections

- Error: 1041 SQLSTATE: HY000 ([ER_OUT_OF_RESOURCES](#))

Message: Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use 'ulimit' to allow mysqld to use more memory or you can add more swap space

- Error: 1042 SQLSTATE: 08S01 ([ER_BAD_HOST_ERROR](#))

Message: Can't get hostname for your address

- Error: 1043 SQLSTATE: 08S01 ([ER_HANDSHAKE_ERROR](#))

Message: Bad handshake

- Error: 1044 SQLSTATE: 42000 ([ER_DBACCESS_DENIED_ERROR](#))

Message: Access denied for user '%s'@'%s' to database '%s'

- Error: 1045 SQLSTATE: 28000 ([ER_ACCESS_DENIED_ERROR](#))

Message: Access denied for user '%s'@'%s' (using password: %s)

- Error: 1046 SQLSTATE: 3D000 ([ER_NO_DB_ERROR](#))

Message: No database selected

- Error: 1047 SQLSTATE: 08S01 ([ER_UNKNOWN_COM_ERROR](#))

Message: Unknown command

- Error: 1048 SQLSTATE: 23000 ([ER_BAD_NULL_ERROR](#))

Message: Column '%s' cannot be null

- Error: 1049 SQLSTATE: 42000 ([ER_BAD_DB_ERROR](#))

Message: Unknown database '%s'

- Error: 1050 SQLSTATE: 42S01 ([ER_TABLE_EXISTS_ERROR](#))

Message: Table '%s' already exists

- Error: 1051 SQLSTATE: 42S02 ([ER_BAD_TABLE_ERROR](#))

Message: Unknown table '%s'

- Error: 1052 SQLSTATE: 23000 ([ER_NON_UNIQ_ERROR](#))

Message: Column '%s' in %s is ambiguous

- Error: 1053 SQLSTATE: 08S01 ([ER_SERVER_SHUTDOWN](#))

Message: Server shutdown in progress

- Error: 1054 SQLSTATE: 42S22 ([ER_BAD_FIELD_ERROR](#))

Message: Unknown column '%s' in '%s'

- Error: 1055 SQLSTATE: 42000 ([ER_WRONG_FIELD_WITH_GROUP](#))
Message: '%s' isn't in GROUP BY
- Error: 1056 SQLSTATE: 42000 ([ER_WRONG_GROUP_FIELD](#))
Message: Can't group on '%s'
- Error: 1057 SQLSTATE: 42000 ([ER_WRONG_SUM_SELECT](#))
Message: Statement has sum functions and columns in same statement
- Error: 1058 SQLSTATE: 21S01 ([ER_WRONG_VALUE_COUNT](#))
Message: Column count doesn't match value count
- Error: 1059 SQLSTATE: 42000 ([ER_TOO_LONG_IDENT](#))
Message: Identifier name '%s' is too long
- Error: 1060 SQLSTATE: 42S21 ([ER_DUP_FIELDNAME](#))
Message: Duplicate column name '%s'
- Error: 1061 SQLSTATE: 42000 ([ER_DUP_KEYNAME](#))
Message: Duplicate key name '%s'
- Error: 1062 SQLSTATE: 23000 ([ER_DUP_ENTRY](#))
Message: Duplicate entry '%s' for key %d
- Error: 1063 SQLSTATE: 42000 ([ER_WRONG_FIELD_SPEC](#))
Message: Incorrect column specifier for column '%s'
- Error: 1064 SQLSTATE: 42000 ([ER_PARSE_ERROR](#))
Message: %s near '%s' at line %d
- Error: 1065 SQLSTATE: 42000 ([ER_EMPTY_QUERY](#))
Message: Query was empty
- Error: 1066 SQLSTATE: 42000 ([ER_NONUNIQ_TABLE](#))
Message: Not unique table/alias: '%s'
- Error: 1067 SQLSTATE: 42000 ([ER_INVALID_DEFAULT](#))
Message: Invalid default value for '%s'
- Error: 1068 SQLSTATE: 42000 ([ER_MULTIPLE_PRI_KEY](#))
Message: Multiple primary key defined
- Error: 1069 SQLSTATE: 42000 ([ER_TOO_MANY_KEYS](#))
Message: Too many keys specified; max %d keys allowed
- Error: 1070 SQLSTATE: 42000 ([ER_TOO_MANY_KEY_PARTS](#))
Message: Too many key parts specified; max %d parts allowed
- Error: 1071 SQLSTATE: 42000 ([ER_TOO_LONG_KEY](#))
Message: Specified key was too long; max key length is %d bytes
- Error: 1072 SQLSTATE: 42000 ([ER_KEY_COLUMN_DOES_NOT_EXISTS](#))
Message: Key column '%s' doesn't exist in table

- Error: [1073](#) SQLSTATE: [42000](#) ([ER_BLOB_USED_AS_KEY](#))
Message: BLOB column '%s' can't be used in key specification with the used table type
- Error: [1074](#) SQLSTATE: [42000](#) ([ER_TOO_BIG_FIELDLENGTH](#))
Message: Column length too big for column '%s' (max = %lu); use BLOB or TEXT instead
- Error: [1075](#) SQLSTATE: [42000](#) ([ER_WRONG_AUTO_KEY](#))
Message: Incorrect table definition; there can be only one auto column and it must be defined as a key
- Error: [1076](#) SQLSTATE: [HY000](#) ([ER_READY](#))
Message: %s: ready for connections. Version: '%s' socket: '%s' port: %d
- Error: [1077](#) SQLSTATE: [HY000](#) ([ER_NORMAL_SHUTDOWN](#))
Message: %s: Normal shutdown
- Error: [1078](#) SQLSTATE: [HY000](#) ([ER_GOT_SIGNAL](#))
Message: %s: Got signal %d. Aborting!
- Error: [1079](#) SQLSTATE: [HY000](#) ([ER_SHUTDOWN_COMPLETE](#))
Message: %s: Shutdown complete
- Error: [1080](#) SQLSTATE: [08S01](#) ([ER_FORCING_CLOSE](#))
Message: %s: Forcing close of thread %ld user: '%s'
- Error: [1081](#) SQLSTATE: [08S01](#) ([ER_IPSOCK_ERROR](#))
Message: Can't create IP socket
- Error: [1082](#) SQLSTATE: [42S12](#) ([ER_NO_SUCH_INDEX](#))
Message: Table '%s' has no index like the one used in CREATE INDEX; recreate the table
- Error: [1083](#) SQLSTATE: [42000](#) ([ER_WRONG_FIELD_TERMINATORS](#))
Message: Field separator argument is not what is expected; check the manual
- Error: [1084](#) SQLSTATE: [42000](#) ([ER_BLOBS_AND_NO_TERMINATED](#))
Message: You can't use fixed rowlength with BLOBs; please use 'fields terminated by'
- Error: [1085](#) SQLSTATE: [HY000](#) ([ER_TEXTFILE_NOT_READABLE](#))
Message: The file '%s' must be in the database directory or be readable by all
- Error: [1086](#) SQLSTATE: [HY000](#) ([ER_FILE_EXISTS_ERROR](#))
Message: File '%s' already exists
- Error: [1087](#) SQLSTATE: [HY000](#) ([ER_LOAD_INFO](#))

B.3. Client Error Codes and Messages

Client error information comes from the following source files:

- The Error values and the symbols in parentheses correspond to definitions in the `include/errmsg.h` MySQL source file.
- The Message values correspond to the error messages that are listed in the `libmysql/errmsg.c` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: 2000 ([CR_UNKNOWN_ERROR](#))
Message: Unknown MySQL error

- Error: 2001 (CR_SOCKET_CREATE_ERROR)
Message: Can't create UNIX socket (%d)
- Error: 2002 (CR_CONNECTION_ERROR)
Message: Can't connect to local MySQL server through socket '%s' (%d)
- Error: 2003 (CR_CONN_HOST_ERROR)
Message: Can't connect to MySQL server on '%s' (%d)
- Error: 2004 (CR_IPSOCK_ERROR)
Message: Can't create TCP/IP socket (%d)
- Error: 2005 (CR_UNKNOWN_HOST)
Message: Unknown MySQL server host '%s' (%d)
- Error: 2006 (CR_SERVER_GONE_ERROR)
Message: MySQL server has gone away
- Error: 2007 (CR_VERSION_ERROR)
Message: Protocol mismatch; server version = %d, client version = %d
- Error: 2008 (CR_OUT_OF_MEMORY)
Message: MySQL client ran out of memory
- Error: 2009 (CR_WRONG_HOST_INFO)
Message: Wrong host info
- Error: 2010 (CR_LOCALHOST_CONNECTION)
Message: Localhost via UNIX socket
- Error: 2011 (CR_TCP_CONNECTION)
Message: %s via TCP/IP
- Error: 2012 (CR_SERVER_HANDSHAKE_ERR)
Message: Error in server handshake
- Error: 2013 (CR_SERVER_LOST)
Message: Lost connection to MySQL server during query
- Error: 2014 (CR_COMMANDS_OUT_OF_SYNC)
Message: Commands out of sync; you can't run this command now
- Error: 2015 (CR_NAMEDPIPE_CONNECTION)
Message: Named pipe: %s
- Error: 2016 (CR_NAMEDPIPEWAIT_ERROR)
Message: Can't wait for named pipe to host: %s pipe: %s (%lu)
- Error: 2017 (CR_NAMEDPIPEOPEN_ERROR)
Message: Can't open named pipe to host: %s pipe: %s (%lu)
- Error: 2018 (CR_NAMEDPIPESETSTATE_ERROR)
Message: Can't set state of named pipe to host: %s pipe: %s (%lu)

- Error: 2019 (CR_CANT_READ_CHARSET)
Message: Can't initialize character set %s (path: %s)
- Error: 2020 (CR_NET_PACKET_TOO_LARGE)
Message: Got packet bigger than 'max_allowed_packet' bytes
- Error: 2021 (CR_EMBEDDED_CONNECTION)
Message: Embedded server
- Error: 2022 (CR_PROBE_SLAVE_STATUS)
Message: Error on SHOW SLAVE STATUS:
- Error: 2023 (CR_PROBE_SLAVE_HOSTS)
Message: Error on SHOW SLAVE HOSTS:
- Error: 2024 (CR_PROBE_SLAVE_CONNECT)
Message: Error connecting to slave:
- Error: 2025 (CR_PROBE_MASTER_CONNECT)
Message: Error connecting to master:
- Error: 2026 (CR_SSL_CONNECTION_ERROR)
Message: SSL connection error
- Error: 2027 (CR_MALFORMED_PACKET)
Message: Malformed packet
- Error: 2028 (CR_WRONG_LICENSE)
Message: This client library is licensed only for use with MySQL servers having '%s' license
- Error: 2029 (CR_NULL_POINTER)
Message: Invalid use of null pointer
- Error: 2030 (CR_NO_PREPARE_STMT)
Message: Statement not prepared
- Error: 2031 (CR_PARAMS_NOT_BOUND)
Message: No data supplied for parameters in prepared statement
- Error: 2032 (CR_DATA_TRUNCATED)
Message: Data truncated
- Error: 2033 (CR_NO_PARAMETERS_EXISTS)
Message: No parameters exist in the statement
- Error: 2034 (CR_INVALID_PARAMETER_NO)
Message: Invalid parameter number
- Error: 2035 (CR_INVALID_BUFFER_USE)
Message: Can't send long data for non-string/non-binary data types (parameter: %d)
- Error: 2036 (CR_UNSUPPORTED_PARAM_TYPE)
Message: Using unsupported buffer type: %d (parameter: %d)

- Error: [2037 \(CR_SHARED_MEMORY_CONNECTION\)](#)
Message: Shared memory: %s
- Error: [2038 \(CR_SHARED_MEMORY_CONNECT_REQUEST_ERROR\)](#)
Message: Can't open shared memory; client could not create request event (%lu)
- Error: [2039 \(CR_SHARED_MEMORY_CONNECT_ANSWER_ERROR\)](#)
Message: Can't open shared memory; no answer event received from server (%lu)
- Error: [2040 \(CR_SHARED_MEMORY_CONNECT_FILE_MAP_ERROR\)](#)
Message: Can't open shared memory; server could not allocate file mapping (%lu)
- Error: [2041 \(CR_SHARED_MEMORY_CONNECT_MAP_ERROR\)](#)
Message: Can't open shared memory; server could not get pointer to file mapping (%lu)
- Error: [2042 \(CR_SHARED_MEMORY_FILE_MAP_ERROR\)](#)
Message: Can't open shared memory; client could not allocate file mapping (%lu)
- Error: [2043 \(CR_SHARED_MEMORY_MAP_ERROR\)](#)
Message: Can't open shared memory; client could not get pointer to file mapping (%lu)
- Error: [2044 \(CR_SHARED_MEMORY_EVENT_ERROR\)](#)
Message: Can't open shared memory; client could not create %s event (%lu)
- Error: [2045 \(CR_SHARED_MEMORY_CONNECT_ABANDONED_ERROR\)](#)
Message: Can't open shared memory; no answer from server (%lu)
- Error: [2046 \(CR_SHARED_MEMORY_CONNECT_SET_ERROR\)](#)
Message: Can't open shared memory; cannot send request event to server (%lu)
- Error: [2047 \(CR_CONN_UNKNOW_PROTOCOL\)](#)
Message: Wrong or unknown protocol
- Error: [2048 \(CR_INVALID_CONN_HANDLE\)](#)
Message: Invalid connection handle
- Error: [2049 \(CR_SECURE_AUTH\)](#)
Message: Connection using old (pre-4.1.1) authentication protocol refused (client option 'secure_auth' enabled)
- Error: [2050 \(CR_FETCH_CANCELED\)](#)
Message: Row retrieval was canceled by mysql_stmt_close() call
- Error: [2051 \(CR_NO_DATA\)](#)
Message: Attempt to read column without prior row fetch
- Error: [2052 \(CR_NO_STMT_METADATA\)](#)
Message: Prepared statement contains no metadata
- Error: [2053 \(CR_NO_RESULT_SET\)](#)
Message: Attempt to read a row while there is no result set associated with the statement
- Error: [2054 \(CR_NOT_IMPLEMENTED\)](#)
Message: This feature is not implemented yet

- Error: 2055 (CR_SERVER_LOST_EXTENDED)

Message: Lost connection to MySQL server at '%s', system error: %d

Appendix C. MySQL Enterprise Release Notes

This appendix lists the changes from version to version in MySQL Enterprise, including MySQL Enterprise Server. Releases in MySQL Enterprise Server are divided into the following release packs:

- *Rapid Update Service Packs* are issued once a month and incorporate all the bug fixes and security updates introduced since the previous MySQL Enterprise Server release. A single Service Pack can be used to update MySQL Enterprise Server; it is not necessary to install intervening service packs to bring your system up to date.
- *Quarterly Service Packs* are issued each quarter and incorporate all the bug fixes and security updates introduced since the previous MySQL Enterprise Server release. A single Service Pack can be used to update MySQL Enterprise Server; it is not necessary to install intervening service packs to bring your system up to date.
- *Hot-fix releases* incorporate fixes for bugs that caused significant issues that are not released as part of a Service Pack.

The Release Notes are updated as bugs are fixed and features are incorporated, so that everybody can follow the development process.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (<http://dev.mysql.com/downloads/>), it means that the version has not yet been released (and will normally be marked so in the appropriate Release Note section).

The date mentioned with a release version is the date of the last change done internally at MySQL AB (the Bazaar commit) on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

For information on how to determine your current version and release type, see [Section 2.2, “Determining your current MySQL version”](#).

C.1. MySQL Enterprise 5.0 Release Notes

This section documents all changes and bug fixes, beginning with the first MySQL Enterprise Server release (5.0.28), that are made available through hot-fixes, and through service packs.

For a full list of changes, please refer to the changelog sections for each individual 5.0.x release.

C.1.1. Release Notes for MySQL Enterprise 5.0.70 (Not released yet)

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.68). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Functionality added or changed:

- **Security Enhancement:** To enable stricter control over the location from which user-defined functions can be loaded, the `plugin_dir` system variable has been backported from MySQL 5.1. If the value is non-empty, user-defined function object files can be loaded only from the directory named by this variable. If the value is empty, the behavior that is used before 5.0.67 applies: The UDF object files must be located in a directory that is searched by your system's dynamic linker. ([Bug#37428](#))

Bugs fixed:

- **Important Change: Security Fix:** It was possible to circumvent privileges through the creation of `MyISAM` tables employing the `DATA DIRECTORY` and `INDEX DIRECTORY` options to overwrite existing table files in the MySQL data directory. Use of the MySQL data directory in `DATA DIRECTORY` and `INDEX DIRECTORY` pathname is now disallowed. ([Bug#32167](#), [CVE-2008-2079](#))
- Queries of the form `SELECT ... REGEXP BINARY NULL` could lead to a hung or crashed server. ([Bug#39021](#))
- Statements of the form `INSERT ... SELECT .. ON DUPLICATE KEY UPDATE col_name = DEFAULT` could result in a server crash. ([Bug#39002](#))
- Repeated `CREATE TABLE ... SELECT` statements, where the created table contained an `AUTO_INCREMENT` column, could lead to an assertion failure. ([Bug#38821](#))

- A server crash or Valgrind warnings could result when a stored procedure selected from a view that referenced a function. (Bug#38291)
- Incorrect handling of aggregate functions when loose index scan was used caused a server crash. (Bug#38195)
- The `<=>` operator could return incorrect results when comparing `NULL` to `DATE`, `TIME`, or `DATETIME` values. (Bug#37526)
- For a `MyISAM` table with `CHECKSUM = 1` and `ROW_FORMAT = DYNAMIC` table options, a data consistency check (maximum record length) could fail and cause the table to be marked as corrupted. (Bug#37310)
- Dumping information about locks in use by sending a `SIGHUP` signal to the server or by invoking the `mysqladmin debug` command could lead to a server crash in debug builds or to undefined behavior in production builds. (Bug#36579)

C.1.2. Release Notes for MySQL Enterprise 5.0.68 (13 August 2008)

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.66a). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Bugs fixed:

- **Security Enhancement:** The server consumed excess memory while parsing statements with hundreds or thousands of nested boolean conditions (such as `OR (OR ... (OR ...))`). This could lead to a server crash or incorrect statement execution, or cause other client statements to fail due to lack of memory. The latter result constitutes a denial of service. (Bug#38296)
- **Incompatible Change:** `SHOW STATUS` took a lot of CPU time for calculating the value of the `InnoDB_buffer_pool_pages_latched` status variable. Now this variable is calculated and included in the output of `SHOW STATUS` only when the `UNIV_DEBUG` symbol is defined at server build time. (Bug#36600)
- Server-side cursors were not initialized properly, which could cause a server crash. (Bug#38486)
- For `InnoDB` tables, `ORDER BY ... DESC` sometimes returned results in ascending order. (Bug#37830)
- Nesting of `IF()` inside of `SUM()` could cause an extreme server slowdown. (Bug#37662)
- If the server failed to expire binary log files at startup, it could crash. (Bug#37027)
- The `UUID()` function returned UUIDs with the wrong time; this was because the offset for the time part in UUIDs was miscalculated. (Bug#35848)
- Freeing of an internal parser stack during parsing of complex stored programs caused a server crash. (Bug#35577, Bug#37269, Bug#37228)
- Index scans performed with the `sort_union()` access method returned wrong results, caused memory to be leaked, and caused temporary files to be deleted when the limit set by `sort_buffer_size` was reached. (Bug#35477, Bug#35478)
- If the server crashed with an `InnoDB` error due to unavailability of undo slots, errors could persist during rollback when the server was restarted: There are two `UNDO` slot caches (for `INSERT` and `UPDATE`). If all slots end up in one of the slot caches, a request for a slot from the other slot cache would fail. This can happen if the request is for an `UPDATE` slot and all slots are in the `INSERT` slot cache, or vice versa. (Bug#35352)
- For `InnoDB` tables, `ALTER TABLE DROP` failed if the name of the column to be dropped began with “foreign”. (Bug#35220)
- Using `OPTIMIZE TABLE` as the first statement on an `InnoDB` table with an `AUTO_INCREMENT` column could cause a server crash. (Bug#34286)
- `mysql_install_db` failed if the server was running with an SQL mode of `TRADITIONAL`. This program now resets the SQL mode internally to avoid this problem. (Bug#34159)
- Cached queries that used 256 or more tables were not properly cached, so that later query invalidation due to a `TRUNCATE TABLE` for one of the tables caused the server to hang. (Bug#33362)
- `mysql_upgrade` attempted to use the `/proc` filesystem even on systems that do not have it. (Bug#31605)
- The Serbian translation for the `ER_INCORRECT_GLOBAL_LOCAL_VAR` error was corrected. (Bug#29738)
- In some cases, the parser interpreted the `;` character as the end of input and misinterpreted stored program definitions. (Bug#26030)

- The `FLUSH PRIVILEGES` statement did not produce an error when it failed. (Bug#21226)

C.1.3. Release Notes for MySQL Enterprise 5.0.66a [MRU] (16 July 2008)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This is a bugfix release that replaces MySQL 5.0.66.

Bugs fixed:

- The fix for Bug#20748 caused a problem such that on Unix, MySQL programs looked for options in `~/my.cnf` rather than the standard location of `~/my.cnf`. (Bug#38180)

C.1.4. Release Notes for MySQL Enterprise 5.0.66 [MRU] (09 July 2008)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

Important

This release was withdrawn from production due to the side effect produced by Bug#20748. It has been replaced by MySQL 5.0.66a, which should be used instead.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.64). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Functionality added or changed:

- `mysql-test-run.pl` now supports `--client-bindir` and `--client-libdir` options for specifying the directory where client binaries and libraries are located. (Bug#34995)

Bugs fixed:

- **Incompatible Change:** An additional correction to the original MySQL 5.0.64 fix was made to normalize directory names before adding them to the list of directories. This prevents `/etc/` and `/etc` from being considered different, for example. (Bug#20748)

See also Bug#38180

- **Replication:** Some kinds of internal errors, such as `OUT OF MEMORY` errors, could cause the server to crash when replicating statements with user variables.
certain internal errors. (Bug#37150)
- Some binary distributions had a duplicate “-64bit” suffix in the filename. (Bug#37623)
- The `mysql` client failed to recognize comment lines consisting of `--` followed by a newline. (Bug#36244)
- An empty bit-string literal (`b' '`) caused a server crash. Now the value is parsed as an empty bit value (which is treated as an empty string in string context or 0 in numeric context). (Bug#35658)
- `mysqlbinlog` left temporary files on the disk after shutdown, leading to the pollution of the temporary directory, which eventually caused `mysqlbinlog` to fail. This caused problems in testing and other situations where `mysqlbinlog` might be invoked many times in a relatively short period of time. (Bug#35543)
- The code for detecting a byte order mark (BOM) caused `mysql` to crash for empty input. (Bug#35480)
- The `mysql` client incorrectly parsed statements containing the word “delimiter” in mid-statement.

The fix for this bug had the side effect of causing the problem reported in Bug#38158, so it was reverted in MySQL 5.0.67. (Bug#33812)

C.1.5. Release Notes for MySQL Enterprise 5.0.64 [MRU] (10 June 2008)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.62). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Functionality added or changed:

- **Important Change: Incompatible Change:** The `FEDERATED` storage engine is now disabled by default in the `.cnf` files shipped with MySQL distributions (`my-huge.cnf`, `my-medium.cnf`, and so forth). This affects server behavior only if you install one of these files. (Bug#37069)

Bugs fixed:

- **Replication:** `CREATE PROCEDURE` and `CREATE FUNCTION` statements containing extended comments were not written to the binary log correctly, causing parse errors on the slave. (Bug#36570)

See also [Bug#32575](#)

- On Windows 64-bit systems, temporary variables of `long` types were used to store `ulong` values, causing key cache initialization to receive distorted parameters. The effect was that setting `key_buffer_size` to values of 2GB or more caused memory exhaustion to due allocation of too much memory. (Bug#36705)
- Multiple-table `UPDATE` statements that used a temporary table could fail to update all qualifying rows or fail with a spurious duplicate-key error. (Bug#36676)
- A `REGEXP` match could return incorrect rows when the previous row matched the expression and used `CONCAT()` with an empty string. (Bug#36488)
- For `EXPLAIN EXTENDED`, execution of an uncorrelated `IN` subquery caused a crash if the subquery required a temporary table for its execution. (Bug#36011)

C.1.6. Release Notes for MySQL Enterprise 5.0.62 [MRU] (12 May 2008)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.60). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Functionality added or changed:

- **Important Change:** Some changes were made to `CHECK TABLE ... FOR UPGRADE` and `REPAIR TABLE` with respect to detection and handling of tables with incompatible `.frm` files (files created with a different version of the MySQL server). These changes also affect `mysqlcheck` because that program uses `CHECK TABLE` and `REPAIR table`, and thus also `mysql_upgrade` because that program invokes `mysqlcheck`.
 - If your table was created by a different version of the MySQL server than the one you are currently running, `CHECK TABLE ... FOR UPGRADE` indicates that the table has an `.frm` file with an incompatible version. In this case, the result set returned by `CHECK TABLE` contains a line with a `Msg_type` value of `error` and a `Msg_text` value of `Table upgrade required. Please do "REPAIR TABLE `tbl_name`" to fix it!`
 - `REPAIR TABLE` without `USE_FRM` upgrades the `.frm` file to the current version.
 - If you use `REPAIR TABLE ... USE_FRM` and your table was created by a different version of the MySQL server than the one you are currently running, `REPAIR TABLE` will not attempt to repair the table. In this case, the result set returned by `REPAIR TABLE` contains a line with a `Msg_type` value of `error` and a `Msg_text` value of `Failed repairing incompatible .FRM file.`

Previously, use of `REPAIR TABLE ... USE_FRM` with a table created by a different version of the MySQL server risked the loss of all rows in the table.

(Bug#36055)

- `mysql_upgrade` now has a `--tmpdir` option to enable the location of temporary files to be specified. (Bug#36469)

Bugs fixed:

- **Important Change:** The server no longer issues warnings for truncation of excess spaces for values inserted into `CHAR` columns. This reverts a change in the previous release that caused warnings to be issued. (Bug#30059)
- **Replication:** `CREATE VIEW` statements containing extended comments were not written to the binary log correctly, causing parse errors on the slave. Now, all comments are stripped from such statements before being written to the binary log. (Bug#32575)

See also Bug#36570

- `mysqltest` ignored the value of `--tmpdir` in one place. (Bug#36465)
- Conversion of a `FLOAT ZEROFILL` value to string could cause a server crash if the value was `NULL`. (Bug#36139)
- An error in calculation of the precision of zero-length items (such as `NULL`) caused a server crash for queries that employed temporary tables. (Bug#36023)
- The server crashed inside `NOT IN` subqueries with an impossible `WHERE` or `HAVING` clause, such as `NOT IN (SELECT ... FROM t1, t2, ... WHERE 0)`. (Bug#36005)
- Grouping or ordering of long values in unindexed `BLOB` or `TEXT` columns with the `gbk` or `big5` character set crashed the server. (Bug#35993)
- `SET GLOBAL debug=''` resulted in a Valgrind warning in `DbugParse()`, which was reading beyond the end of the control string. (Bug#35986)
- The combination of `GROUP_CONCAT()`, `DISTINCT`, and `LEFT JOIN` could crash the server when the right table is empty. (Bug#35298)
- Several additional configuration scripts in the `BUILD` directory now are included in source distributions. These may be useful for users who wish to build MySQL from source. (See Section 2.4.15.3, “Installing from the Development Source Tree”, for information about what they do.) (Bug#34291)
- The internal `init_time()` library function was renamed to `my_init_time()` to avoid conflicts with external libraries. (Bug#26294)
- The parser used signed rather than unsigned values in some cases that caused legal lengths in column declarations to be rejected. (Bug#15776)

C.1.7. Release Notes for MySQL Enterprise 5.0.60sp1 [QSP] (27 June 2008)

This is a *Service Pack* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.60). For this release, there are no such changes or fixes.

If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

C.1.8. Release Notes for MySQL Enterprise 5.0.60 [MRU] (28 April 2008)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.58). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Functionality added or changed:

- For binary `.tar.gz` packages, `mysqld` and other binaries now are compiled with debugging symbols included to enable easier use with a debugger. If you do not need debugging symbols and are short on disk space, you can use `strip` to remove the symbols from the binaries. (Bug#33252)

Bugs fixed:

- **Important Change: Security Fix:** It was possible to circumvent privileges through the creation of `MyISAM` tables employing the `DATA DIRECTORY` and `INDEX DIRECTORY` options to overwrite existing table files in the MySQL data directory. Use of the MySQL data directory in `DATA DIRECTORY` and `INDEX DIRECTORY` pathname is now disallowed. (Bug#32167, CVE-2008-2079)
- **Important Change:** It was possible to use `FRAC_SECOND` as a synonym for `MICROSECOND` with `DATE_ADD()`, `DATE_SUB()`, and `INTERVAL`; now, using `FRAC_SECOND` with anything other than `TIMESTAMPADD()` or `TIMESTAMPDIFF()` produces a syntax error.

It is now possible (and preferable) to use `MICROSECOND` with `TIMESTAMPADD()` and `TIMESTAMPDIFF()`, and `FRAC_SECOND` is now deprecated. (Bug#33834)

- **Important Change:** The server handled truncation of values having excess trailing spaces into `CHAR`, `VARCHAR`, and `TEXT` columns in different ways. This behavior has now been made consistent for columns of all three of these types, and now follows the existing behavior of `VARCHAR` columns in this regard; that is, a `Note` is always issued whenever such truncation occurs.

This change does not affect columns of these three types when using a binary encoding; `BLOB` columns are also unaffected by the change, since they always use a binary encoding. (Bug#30059)

- **Replication:** `INSERT_ID` was not written to the binary log for inserts into `BLACKHOLE` tables. (Bug#35178)
- **Replication:** The character sets and collations used for constant identifiers in stored procedures were not replicated correctly. (Bug#34289)
- **Replication:** An extraneous `ROLLBACK` statement was written to the binary log by a connection that did not use any transactional tables. (Bug#33329)
- **Replication:** When a stored routine or trigger, running on a master that used MySQL 5.0 or MySQL 5.1.11 or earlier, performed an insert on an `AUTO_INCREMENT` column, the `INSERT_ID` value was not replicated correctly to a slave running MySQL 5.1.12 or later (including any MySQL 6.0 release). (Bug#33029)

See also Bug#19630

- **Replication:** `STOP SLAVE` did not stop connection attempts properly. If the IO slave thread was attempting to connect, `STOP SLAVE` waited for the attempt to finish, sometimes for a long period of time, rather than stopping the slave immediately. (Bug#31024)

See also Bug#30932

- **Replication:** `MASTER_POS_WAIT()` did not return `NULL` when the server was not a slave. (Bug#26622)
- **Replication:** The inspecific error message `WRONG PARAMETERS TO FUNCTION REGISTER_SLAVE` resulted when `START SLAVE` failed to register on the master due to excess length of any the slave server options `--report-host`, `--report-user`, or `--report-password`. An error message specific to each of these options is now returned in such cases. The new error messages are:

- `FAILED TO REGISTER SLAVE: TOO LONG 'REPORT-HOST'`
 - `FAILED TO REGISTER SLAVE: TOO LONG 'REPORT-USER'`
 - `FAILED TO REGISTER SLAVE; TOO LONG 'REPORT-PASSWORD'`
- (Bug#22989)

See also Bug#19328

- **Replication:** `START SLAVE UNTIL MASTER_LOG_POS=position` issued on a slave that was using `-log-slave-updates` and that was involved in circular replication would cause the slave to run and stop one event later than that specified by the value of `position`. (Bug#13861)
- **Replication:** `PURGE BINARY LOGS TO` and `PURGE BINARY LOGS BEFORE` did not handle missing binary log files correctly or in the same way. Now for both of these statements, if any files listed in the `.index` file are missing from the filesystem, the statement fails with an error.

- On Windows, the installer attempted to use JScript to determine whether the target data directory already existed. On Windows Vista x64, this resulted in an error because the installer was attempting to run the JScript in a 32-bit engine, which wasn't registered on Vista. The installer no longer uses JScript but instead relies on a native WiX command. (Bug#36103)
- There was a memory leak when connecting to a `FEDERATED` table using a connection string that had a host value of `local-host` or omitted the host and a port value of `0` or omitted the port. (Bug#35509)
- Using `LOAD DATA INFILE` with a view could crash the server. (Bug#35469)
- When a view containing a reference to `DUAL` was created, the reference was removed when the definition was stored, causing some queries against the view to fail with invalid SQL syntax errors. (Bug#35193)
- Debugging symbols were missing for some executables in Windows binary distributions. (Bug#35104)
- A query that performed a `ref_or_null` join where the second table used a key having one or columns that could be `NULL` and had a column value that was `NULL` caused the server to crash. (Bug#34945)

This regression was introduced by Bug#12144

- Some binaries produced stack corruption messages due to being built with versions of `bison` older than 2.1. Builds are now created using `bison` 2.3. (Bug#34926)
- `mysqldump` failed to return an error code when using the `--master-data` option without binary logging being enabled on the server. (Bug#34909)
- Under some circumstances, the value of `mysql_insert_id()` following a `SELECT ... INSERT` statement could return an incorrect value. This could happen when the last `SELECT ... INSERT` did not involve an `AUTO_INCREMENT` column, but the value of `mysql_insert_id()` was changed by some previous statements. (Bug#34889)
- Table and database names were mixed up in some places of the subquery transformation procedure. This could affect debugging trace output and further extensions of that procedure. (Bug#34830)
- A malformed URL used for a `FEDERATED` table's `CONNECTION` option value in a `CREATE TABLE` statement was not handled correctly and could crash the server. (Bug#34788)
- Queries such as `SELECT ROW(1, 2) IN (SELECT t1.a, 2) FROM t1 GROUP BY t1.a` (combining row constructors and subqueries in the `FROM` clause) could lead to assertion failure or unexpected error messages. (Bug#34763)
- Using `NAME_CONST()` with a negative number and an aggregate function caused MySQL to crash. This could also have a negative impact on replication. (Bug#34749)
- A memory-handling error associated with use of `GROUP_CONCAT()` in subqueries could result in a server crash. (Bug#34747)
- For an indexed integer column `col_name` and a value `N` that is one greater than the maximum value allowed for the data type of `col_name`, conditions of the form `WHERE col_name < N` failed to return rows where the value of `col_name` is `N - 1`. (Bug#34731)
- Executing a `TRUNCATE` statement on a table having both a foreign key reference and a `DELETE` trigger crashed the server. (Bug#34643)
- Some subqueries using an expression that included an aggregate function could fail or in some cases lead to a crash of the server. (Bug#34620)
- A server crash could occur if `INFORMATION_SCHEMA` tables built in memory were swapped out to disk during query execution. (Bug#34529)
- `CAST(AVG(arg) AS DECIMAL)` produced incorrect results for non-`DECIMAL` arguments. (Bug#34512)
- Under some conditions, a `SET GLOBAL innodb_commit_concurrency` or `SET GLOBAL innodb_autoextend_increment` statement could fail. (Bug#34223)
- `mysqldump` attempts to set the `character_set_results` system variable after connecting to the server. This failed for pre-4.1 servers that have no such variable, but `mysqldump` did not account for this and 1) failed to dump database contents; 2) failed to produce any error message alerting the user to the problem. (Bug#34192)
- For a `FEDERATED` table with an index on a nullable column, accessing the table could crash a server, return an incorrect result set, or return `ERROR 1030 (HY000): Got error 1430 from storage engine`. (Bug#33946)
- A query using `WHERE (column1='string1' AND column2=constant1) OR (column1='string2' AND column2=constant2)`, where `col1` used a binary collation and `string1` matched `string2` except for case, failed to match any records even when matches were found by a query using the equivalent clause `WHERE column2=constant1`

`OR column2=constant2`. (Bug#33833)

- Reuse of prepared statements could cause a memory leak in the embedded server. (Bug#33796)
- Some queries using a combination of `IN`, `CONCAT()`, and an implicit type conversion could return an incorrect result. (Bug#33764)
- In some cases a query that produced a result set when using `ORDER BY ASC` did not return any results when this was changed to `ORDER BY DESC`. (Bug#33758)
- Disabling concurrent inserts caused some cacheable queries not to be saved in the query cache. (Bug#33756)
- Certain combinations of views, subselects with outer references and stored routines or triggers could cause the server to crash. (Bug#33389)
- `SLEEP(0)` failed to return on 64-bit Mac OS X due to a bug in `pthread_cond_timedwait()`. (Bug#33304)
- Granting the `UPDATE` privilege on one column of a view caused the server to crash. (Bug#33201)
- Under some circumstances a combination of aggregate functions and `GROUP BY` in a `SELECT` query over a view could lead to incorrect calculation of the result type of the aggregate function. This in turn could lead to incorrect results, or to crashes on debug builds of the server. (Bug#33049)
- For `DISTINCT` queries, 4.0 and 4.1 stopped reading joined tables as soon as the first matching row was found. However, this optimization was lost in MySQL 5.0, which instead read all matching rows. This fix for this regression may result in a major improvement in performance for `DISTINCT` queries in cases where many rows match. (Bug#32942)
- Incorrect assertions could cause a server crash for `DELETE` triggers for transactional tables. (Bug#32790)
- Inserting strings with a common prefix into a table that used the `ucs2` character set corrupted the table. (Bug#32705)
- Queries using `LIKE` on tables having indexed `CHAR` columns using either of the `euc_jpms` or `ujis` character sets did not return correct results. (Bug#32510)
- Queries testing numeric constants containing leading zeroes against `ZEROFILL` columns were not evaluated correctly. (Bug#31887)
- If an error occurred during file creation, the server sometimes did not remove the file, resulting in an unused file in the filesystem. (Bug#31781)
- The server returned the error message `OUT OF MEMORY; RESTART SERVER AND TRY AGAIN` when the actual problem was that the sort buffer was too small. Now an appropriate error message is returned in such cases. (Bug#31590)
- When sorting privilege table rows, the server treated escaped wildcard characters (`\%` and `_`) the same as unescaped wildcard characters (`%` and `_`), resulting in incorrect row ordering. (Bug#31194)
- On Windows, `SHOW PROCESSLIST` could display process entries with a `State` value of `*** DEAD ***`. (Bug#30960)
- If an alias was used to refer to the value returned by a stored function within a subselect, the outer select recognized the alias but failed to retrieve the value assigned to it in the subselect. (Bug#30787)
- Binary logging for a stored procedure differed depending on whether or not execution occurred in a prepared statement. (Bug#30604)
- An orphaned PID file from a no-longer-running process could cause `mysql.server` to wait for that process to exit even though it does not exist. (Bug#30378)
- The `mysql_config` command would output `CFLAGS` values that were incompatible with C++ for the HP-UX platform. (Bug#29645)
- The SQL parser did not accept an empty `UNION=()` clause. This meant that, when there were no underlying tables specified for a `MERGE` table, `SHOW CREATE TABLE` and `mysqldump` both output statements that could not be executed.

Now it is possible to execute a `CREATE TABLE` or `ALTER TABLE` statement with an empty `UNION=()` clause. However, `SHOW CREATE TABLE` and `mysqldump` do not output the `UNION=()` clause if there are no underlying tables specified for a `MERGE` table. This also means it is now possible to remove the underlying tables for a `MERGE` table using `ALTER TABLE ... UNION=()`. (Bug#28248)
- It was possible to exhaust memory by repeatedly running `index_merge` queries and never performing any `FLUSH TABLES` statements. (Bug#27732)

- When `utf8` was set as the connection character set, using `SPACE ()` with a non-Unicode column produced an error. (Bug#27580)
See also Bug#23637
- In `ORDER BY` clauses, mixing aggregate functions and non-grouping columns is not allowed if the `ONLY_FULL_GROUP_BY` SQL mode is enabled. However, in some cases, no error was thrown because of insufficient checking. (Bug#27219)
- For the `--record_log_pos` option, `mysqlhotcopy` now determines the slave status information from the result of `SHOW SLAVE STATUS` by using the `Relay_Master_Log_File` and `Exec_Master_Log_Pos` values rather than the `Master_Log_File` and `Read_Master_Log_Pos` values. This provides a more accurate indication of slave execution relative to the master. (Bug#27101)
- The MySQL Instance Configuration Wizard would not allow you to choose a service name, even though the criteria for the service name were valid. The code that checks the name has been updated to support the correct criteria of any string less than 256 character and not containing either a forward or backward slash character. (Bug#27013)
- `config-win.h` unconditionally defined `bool` as `BOOL`, causing problems on systems where `bool` is 1 byte and `BOOL` is 4 bytes. (Bug#26461)
- On Windows, for distributions built with debugging support, `mysql` could crash if the user typed Control-C. (Bug#26243)
- On Windows, an error in `configure.js` caused installation of source distributions to fail. (Bug#25340)
- Using `mysqldump` in MySQL 5.1 resulted in dump files that could not be loaded in MySQL 5.0 because `USING type_name` options in index definitions appeared after the index column list, whereas 5.0 accepted only the old syntax that has `USING` before the column list. The parser in 5.0 now accepts `USING` following the column list. (Bug#25162)
- The client library had no way to return an error if no connection had been established. This caused problems such as `mysql_library_init()` failing silently if no `errmsg.sys` file was available. (Bug#25097)
- On Mac OS X, the StartupItem for MySQL did not work. (Bug#25008)
- For Windows 64-bit builds, enabling shared-memory support caused client connections to fail. (Bug#24992)
- If a user installed MySQL Server and set a password for the `root` user, and then uninstalled and reinstalled MySQL Server to the same location, the user could not use the MySQL Instance Config wizard to configure the server because the uninstall operation left the previous data directory intact. The config wizard *assumed* that any new install (not an upgrade) would have the default data directory where the `root` user has no password. The installer now writes a registry key named `FoundExistingDataDir`. If the installer finds an existing data directory, the key will have a value of 1, otherwise it will have a value of 0. When `MySQLInstanceConfig.exe` is run, it will attempt to read the key. If it can read the key, and the value is 1 and there is no existing instance of the server (indicating a new installation), the Config Wizard will allow the user to input the old password so the server can be configured. (Bug#24215)
- The MySQL header files contained some duplicate macro definitions that could cause compilation problems. (Bug#23839)
- `SHOW COLUMNS` on a `TEMPORARY` table caused locking issues. (Bug#23588)
- For distributions compiled with the bundled `libedit` library, there were difficulties using the `mysql` client to enter input for non-ASCII or multi-byte characters. (Bug#23097)
- On Mac OS X, `mysqld` did not react to Ctrl-C when run under `gdb`, even when run with the `--gdb` option. (Bug#21567)
- `mysql-stress-test.pl` and `mysqld_multi.server.sh` were missing from some binary distributions. (Bug#21023, Bug#25486)
- A `SET` column whose definition specified 64 elements could not be updated using integer values. (Bug#15409)
- `MySQLInstanceConfig.exe` did not save the `innodb_data_home_dir` value to the `my.ini` file under certain circumstances. (Bug#6627)

C.1.9. Release Notes for MySQL Enterprise 5.0.58 [MRU] (05 March 2008)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.56). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Functionality added or changed:

- **Cluster API: Important Change:** Because `NDB_LE_MemoryUsage.page_size_kb` shows memory page sizes in bytes rather than kilobytes, it has been renamed to `page_size_bytes`. The name `page_size_kb` is now deprecated and thus subject to removal in a future release, although it currently remains supported for reasons of backward compatibility. See [The `Ndb_logevent_type` Type](#), for more information about `NDB_LE_MemoryUsage`. (Bug#30271)
- The `ndbd` and `ndb_mgmd` man pages have been reclassified from volume 1 to volume 8. (Bug#34642)
- `mysqltest` now has `mkdir` and `rmdir` commands for creating and removing directories. (Bug#31004)

Bugs fixed:

- **MySQL Cluster:** When configured with `NDB` support, MySQL failed to compile using `gcc` 4.3 on 64bit FreeBSD systems. (Bug#34169)
- **MySQL Cluster:** The failure of a DDL statement could sometimes lead to node failures when attempting to execute subsequent DDL statements. (Bug#34160)
- **MySQL Cluster:** Extremely long `SELECT` statements (where the text of the statement was in excess of 50000 characters) against `NDB` tables returned empty results. (Bug#34107)
- **MySQL Cluster:** A periodic failure to flush the send buffer by the `NDB` TCP transporter could cause a unnecessary delay of 10 ms between operations. (Bug#34005)
- **MySQL Cluster:** When all data and SQL nodes in the cluster were shut down abnormally (that is, other than by using `STOP` in the cluster management client), `ndb_mgm` used excessive amounts of CPU. (Bug#33237)
- **MySQL Cluster:** Transaction atomicity was sometimes not preserved between reads and inserts under high loads. (Bug#31477)
- **MySQL Cluster:** Numerous `NDBCLUSTER` test failures occurred in builds compiled using `icc` on IA64 platforms. (Bug#31239)
- **MySQL Cluster:** Having tables with a great many columns could cause Cluster backups to fail. (Bug#30172)
- **MySQL Cluster:** Issuing an `INSERT ... ON DUPLICATE KEY UPDATE` concurrently with or following a `TRUNCATE` statement on an `NDB` table failed with `NDB` error 4350 `TRANSACTION ALREADY ABORTED`. (Bug#29851)
- **MySQL Cluster:** It was possible in `config.ini` to define cluster nodes having node IDs greater than the maximum allowed value. (Bug#28298)
- **Cluster API:** When reading a `BIT(64)` value using `NdbOperation::getValue()`, 12 bytes were written to the buffer rather than the expected 8 bytes. (Bug#33750)
- `mysql_explain_log` concatenated multiple-line statements, causing malformed results for statements that contained SQL comments beginning with `--`. (Bug#34339)
- Executing an `ALTER VIEW` statement on a table crashed the server. (Bug#34337)
- Passing anything other than a integer to a `LIMIT` clause in a prepared statement would fail. (This limitation was introduced to avoid replication problems; for example, replicating the statement with a string argument would cause a parse failure in the slave). Now, arguments to the `LIMIT` clause are converted to integer values, and these converted values are used when logging the statement. (Bug#33851)
- An internal buffer in `mysql` was too short. Overextending it could cause stack problems or segmentation violations on some architectures. (This is not a problem that could be exploited to run arbitrary code.) (Bug#33841)
- Large unsigned integers were improperly handled for prepared statements, resulting in truncation or conversion to negative numbers. (Bug#33798)
- `make_binary_distribution` passed the `--print-libgcc-file` option to the C compiler, but this does not work with the `ICC` compiler. (Bug#33536)
- When MySQL was built with OpenSSL, the SSL library was not properly initialized with information of which endpoint it was (server or client), causing connection failures. (Bug#33050)
- Repeated creation and deletion of views within prepared statements could eventually crash the server. (Bug#32890)

See also [Bug#34587](#)

- Executing a prepared statement associated with a materialized cursor sent to the client a metadata packet with incorrect table and database names. The problem occurred because the server sent the name of the temporary table used by the cursor instead of the table name of the original table.

The same problem occurred when selecting from a view, in which case the name of the table name was sent, rather than the name of the view. ([Bug#32265](#))

- **InnoDB** adaptive hash latches could be held too long, resulting in a server crash. This fix may also provide significant performance improvements on systems on which many queries using filesorts with temporary tables are being performed. ([Bug#32149](#))
- `SHOW STATUS` caused a server crash if **InnoDB** had not been initialized. ([Bug#32083](#))
- The `mysqld` crash handler failed on Windows. ([Bug#31745](#))
- The MySQL preferences pane did not work to start or stop MySQL on Mac OS X 10.5 (Leopard). ([Bug#28854](#))
- For upgrading to a new major version using RPM packages (such as 4.1 to 5.0), if the installation procedure found an existing MySQL server running, it could fail to shut down the old server, but also erroneously removed the server's socket file. Now the procedure checks for an existing server package from a different vendor or major MySQL version. In such case, it refuses to install the server and recommends how to safely remove the old packages before installing the new ones. ([Bug#28555](#))
- `mysqlhotcopy` silently skipped databases with names consisting of two alphanumeric characters. ([Bug#28460](#))
- `mysql` did not use its completion table. Also, the table contained few entries. ([Bug#24624](#))
- `mysql_config` output did not include `-lmygcc` on some platforms when it was needed. ([Bug#21158](#))

C.1.10. Release Notes for MySQL Enterprise 5.0.56sp1 [QSP] (30 March 2008)

This is a *Service Pack* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bugfixes that have been applied in MySQL 5.0.56sp1 since the previous MySQL Enterprise Server Quarterly Service Pack release (5.0.50sp1a). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Functionality added or changed:

- `mysqldump` produces a `-- Dump completed on DATE` comment at the end of the dump if `--comments` is given. The date causes dump files for identical data take at different times to appear to be different. The new options `--dump-date` and `--skip-dump-date` control whether the date is added to the comment. `--skip-dump-date` suppresses date printing. The default is `--dump-date` (include the date in the comment). ([Bug#31077](#))
- The `mysql_odbc_escape_string()` C API function has been removed. It has multi-byte character escaping issues, doesn't honor the `NO_BACKSLASH_ESCAPES` SQL mode and is not needed anymore by Connector/ODBC as of 3.51.17. ([Bug#29592](#))
- The default value of the `connect_timeout` system variable was increased from 5 to 10 seconds. This might help in cases where clients frequently encounter errors of the form `Lost connection to MySQL server at 'XXX', system error: errno`. ([Bug#28359](#))
- The use of **InnoDB** hash indexes now can be controlled by setting the new `innodb_adaptive_hash_index` system variable at server startup. By default, this variable is enabled. See [Section 13.2.13.3, "Adaptive Hash Indexes"](#).
- The argument for the `mysql-test-run.pl --do-test` and `--skip-test` options is now interpreted as a Perl regular expression if there is a pattern metacharacter in the argument value. This allows more flexible specification of which tests to perform or skip.

Bugs fixed:

- **Security Fix:** Using `RENAME TABLE` against a table with explicit `DATA DIRECTORY` and `INDEX DIRECTORY` options can be used to overwrite system table information by replacing the symbolic link points. the file to which the symlink points.

MySQL will now return an error when the file to which the symlink points already exists. (Bug#32111, CVE-2007-5969)

- **Security Fix:** `ALTER VIEW` retained the original `DEFINER` value, even when altered by another user, which could allow that user to gain the access rights of the view. Now `ALTER VIEW` is allowed only to the original definer or users with the `SUPER` privilege. (Bug#29908)
- **Security Fix:** When using a `FEDERATED` table, the local server could be forced to crash if the remote server returned a result with fewer columns than expected. (Bug#29801)
- **Security Enhancement:** It was possible to force an error message of excessive length which could lead to a buffer overflow. This has been made no longer possible as a security precaution. (Bug#32707)
- **Incompatible Change:** With `ONLY_FULL_GROUP_BY` SQL mode enabled, queries such as `SELECT a FROM t1 HAVING COUNT(*) > 2` were not being rejected as they should have been.

This fix results in the following behavior:

- There is a check against mixing group and non-group columns *only* when `ONLY_FULL_GROUP_BY` is enabled.
- This check is done both for the select list and for the `HAVING` clause if there is one.

This behavior differs from previous versions as follows:

- Previously, the `HAVING` clause was not checked when `ONLY_FULL_GROUP_BY` was enabled; now it is checked.
- Previously, the select list was checked even when `ONLY_FULL_GROUP_BY` was not enabled; now it is checked only when `ONLY_FULL_GROUP_BY` is enabled.

(Bug#31794)

- **Incompatible Change:** The MySQL 5.0.50 patch for this bug was reverted because it changed the behavior of a General Availability MySQL release. (Bug#30234)

See also Bug#27525

- **Incompatible Change:** Several type-preserving functions and operators returned an incorrect result type that does not match their argument types: `COALESCE()`, `IF()`, `IFNULL()`, `LEAST()`, `GREATEST()`, `CASE`. These now aggregate using the precise SQL types of their arguments rather than the internal type. In addition, the result type of the `STR_TO_DATE()` function is now `DATETIME` by default. (Bug#27216)
- **Incompatible Change:** It was possible for option files to be read twice at program startup, if some of the standard option file locations turned out to be the same directory. Now duplicates are removed from the list of files to be read.

Also, users could not override system-wide settings using `~/my.cnf` because `SYSCONFDIR/my.cnf` was read last. The latter file now is read earlier so that `~/my.cnf` can override system-wide settings.

The fix for this problem had a side effect such that on Unix, MySQL programs looked for options in `~/my.cnf` rather than the standard location of `~/my.cnf`. That problem was addressed as Bug#38180. (Bug#20748)

- **Important Change: MySQL Cluster:** `AUTO_INCREMENT` columns had the following problems when used in `NDB` tables:
 - The `AUTO_INCREMENT` counter was not updated correctly when such a column was updated.
 - `AUTO_INCREMENT` values were not prefetched beyond statement boundaries.
 - `AUTO_INCREMENT` values were not handled correctly with `INSERT IGNORE` statements.
 - After being set, `ndb_autoincrement_prefetch_sz` showed a value of 1, regardless of the value it had actually been set to.

As part of this fix, the behavior of `ndb_autoincrement_prefetch_sz` has changed. Setting this to less than 32 no longer has any effect on prefetching within statements (where IDs are now always obtained in batches of 32 or more), but only between statements. The default value for this variable has also changed, and is now 1. (Bug#25176, Bug#31956, Bug#32055)

- **Important Change: Replication:** When the master crashed during an update on a transactional table while in `AUTOCOMMIT` mode, the slave failed. This fix causes every transaction (including `AUTOCOMMIT` transactions) to be recorded in the binlog as starting with a `BEGIN` and ending with a `COMMIT` or `ROLLBACK`. (Bug#26395)
- **Replication: Important Note:** Network timeouts between the master and the slave could result in corruption of the relay log. This fix rectifies a long-standing replication issue when using unreliable networks, including replication over wide area networks such as the Internet. If you experience reliability issues and see many `YOU HAVE AN ERROR IN YOUR SQL SYNTAX er-`

rors on replication slaves, we strongly recommend that you upgrade to a MySQL version which includes this fix. ([Bug#26489](#))

- **MySQL Cluster:** An improperly reset internal signal was observed as a hang when using events in the `NDB` API but could result in various errors. ([Bug#33206](#))
- **MySQL Cluster:** Incorrectly handled parameters could lead to a crash in the Transaction Coordinator during a node failure, causing other data nodes to fail. ([Bug#33168](#))
- **MySQL Cluster:** The failure of a master node could lead to subsequent failures in local checkpointing. ([Bug#32160](#))
- **MySQL Cluster:** An uninitialized variable in the `NDB` storage engine code led to `AUTO_INCREMENT` failures when the server was compiled with `gcc` 4.2.1. ([Bug#31848](#))

This regression was introduced by [Bug#27437](#)

- **MySQL Cluster:** An error with an `if` statement in `sql/ha_ndbcluster.cc` could potentially lead to an infinite loop in case of failure when working with `AUTO_INCREMENT` columns in `NDB` tables. ([Bug#31810](#))
- **MySQL Cluster:** The `NDB` storage engine code was not safe for strict-alias optimization in `gcc` 4.2.1. ([Bug#31761](#))
- **MySQL Cluster:** Primary keys on variable-length columns (such as `VARCHAR`) did not work correctly. ([Bug#31635](#))
- **MySQL Cluster:** Transaction timeouts were not handled well in some circumstances, leading to excessive number of transactions being aborted unnecessarily. ([Bug#30379](#))
- **MySQL Cluster:** In some cases, the cluster management server logged entries multiple times following a restart of `mgmd`. ([Bug#29565](#))
- **MySQL Cluster:** An interpreted program of sufficient size and complexity could cause all cluster data nodes to shut down due to buffer overruns. ([Bug#29390](#))
- **MySQL Cluster:** `UPDATE IGNORE` could sometimes fail on `NDB` tables due to the use of uninitialized data when checking for duplicate keys to be ignored. ([Bug#25817](#))
- **MySQL Cluster:** When inserting a row into an `NDB` table with a duplicate value for a non-primary unique key, the error issued would reference the wrong key.

This improves on an initial fix for this issue made in MySQL 5.0.30 and MySQL 5.0.33 ([Bug#21072](#))

- **Replication:** A `CREATE USER`, `DROP USER`, or `RENAME USER` statement that fails on the master, or that is a duplicate of any of these statements, is no longer written to the binlog; previously, either of these occurrences could cause the slave to fail. ([Bug#33862](#))

See also [Bug#29749](#)

- **Replication:** `SHOW BINLOG EVENTS` could fail when the binlog contained one or more events whose size was close to the value of `max_allowed_packet`. ([Bug#33413](#))
- **Replication:** SQL statements containing comments using `--` syntax were not replayable by `mysqlbinlog`, even though such statements replicated correctly. ([Bug#32205](#))
- **Replication:** It was possible for the name of the relay log file to exceed the amount of memory reserved for it, possibly leading to a crash of the server. ([Bug#31836](#))

See also [Bug#28597](#)

- **Replication:** Corruption of log events caused the server to crash on 64-bit Linux systems having 4 GB of memory or more. ([Bug#31793](#))
- **Replication:** Issuing a `DROP VIEW` statement caused replication to fail if the view did not actually exist. ([Bug#30998](#))
- **Replication:** One thread could read uninitialized memory from the stack of another thread. This issue was only known to occur in a `mysqld` process acting as both a master and a slave. ([Bug#30752](#))
- **Replication:** Setting `server_id` did not update its value for the current session. ([Bug#28908](#))
- **Replication:** Due a previous change in how the default name and location of the binlog file were determined, replication failed following some upgrades. ([Bug#28597](#), [Bug#28603](#))

See also [Bug#31836](#)

This regression was introduced by [Bug#20166](#)

- **Replication:** Stored procedures having `BIT` parameters were not replicated correctly. ([Bug#26199](#))
- **Replication:** Issuing `SHOW SLAVE STATUS` as `mysqld` was shutting down could cause a crash. ([Bug#26000](#))
- **Replication:** An `UPDATE` statement using a stored function that modified a non-transactional table was not logged if it failed. This caused the copy of the non-transactional table on the master have a row that the copy on the slave did not.

In addition, when an `INSERT ... ON DUPLICATE KEY UPDATE` statement encountered a duplicate key constraint, but the `UPDATE` did not actually change any data, the statement was not logged. As a result of this fix, such statements are now treated the same for logging purposes as other `UPDATE` statements, and so are written to the binary log. ([Bug#23333](#))

See also [Bug#12713](#)

- **Replication:** A replication slave sometimes failed to reconnect because it was unable to run `SHOW SLAVE HOSTS`. It was not necessary to run this statement on slaves (since the master should track connection IDs), and the execution of this statement by slaves was removed. ([Bug#21132](#))

See also [Bug#13963](#), [Bug#21869](#)

- The server crashed when executing a query that had a subquery containing an equality `X=Y` where `Y` referred to a named select list expression from the parent select. The server crashed when trying to use the `X=Y` equality for `ref`-based access. ([Bug#33794](#))
- Use of uninitialized memory for `filesort` in a subquery caused a server crash. ([Bug#33675](#))
- The server could crash when `REPEAT` or another control instruction was used in conjunction with labels and a `LEAVE` instruction. ([Bug#33618](#))
- The parser allowed control structures in compound statements to have mismatched beginning and ending labels. ([Bug#33618](#))
- `SET GLOBAL myisam_max_sort_file_size=DEFAULT` set `myisam_max_sort_file_size` to an incorrect value. ([Bug#33382](#))

See also [Bug#31177](#)

- `CREATE TABLE ... SELECT` created tables that for date columns used the obsolete `Field_date` type instead of `Field_newdate`. ([Bug#33256](#))
- For `DECIMAL` columns used with the `ROUND(X,D)` or `TRUNCATE(X,D)` function with a non-constant value of `D`, adding an `ORDER BY` for the function result produced misordered output. ([Bug#33143](#))

See also [Bug#33402](#), [Bug#30617](#)

- Some valid `SELECT` statements could not be used as views due to incorrect column reference resolution. ([Bug#33133](#))
- The fix for [Bug#11230](#) and [Bug#26215](#) introduced a significant input-parsing slowdown for the `mysql` client. This has been corrected. ([Bug#33057](#))
- `UNION` constructs cannot contain `SELECT ... INTO` except in the final `SELECT`. However, if a `UNION` was used in a subquery and an `INTO` clause appeared in the top-level query, the parser interpreted it as having appeared in the `UNION` and raised an error. ([Bug#32858](#))
- The correct data type for a `NULL` column resulting from a `UNION` could be determined incorrectly in some cases: 1) Not correctly inferred as `NULL` depending on the number of selects; 2) Not inferred correctly as `NULL` if one select used a subquery. ([Bug#32848](#))
- An `ORDER BY` query using `IS NULL` in the `WHERE` clause did not return correct results. ([Bug#32815](#))
- For queries containing `GROUP_CONCAT(DISTINCT col_list ORDER BY col_list)`, there was a limitation that the `DISTINCT` columns had to be the same as `ORDER BY` columns. Incorrect results could be returned if this was not true. ([Bug#32798](#))

- Use of the `cp932` character set with `CAST()` in an `ORDER BY` clause could cause a server crash. ([Bug#32726](#))
- A subquery using an `IS NULL` check of a column defined as `NOT NULL` in a table used in the `FROM` clause of the outer query produced an invalid result. ([Bug#32694](#))
- Specifying a non-existent column for an `INSERT DELAYED` statement caused a server crash rather than producing an error.

[Bug#32676](#)

- Use of `CLIENT_MULTI_QUERIES` caused `libmysqld` to crash. ([Bug#32624](#))
- The `INTERVAL()` function incorrectly handled `NULL` values in the value list. ([Bug#32560](#))
- Use of a `NULL`-returning `GROUP BY` expression in conjunction with `WITH ROLLUP` could cause a server crash. ([Bug#32558](#))
See also [Bug#31095](#)
- A `SELECT ... GROUP BY bit_column` query failed with an assertion if the length of the `BIT` column used for the `GROUP BY` was not an integer multiple of 8. ([Bug#32556](#))
- Using `SELECT INTO OUTFILE` with 8-bit `ENCLOSED BY` characters led to corrupted data when the data was reloaded using `LOAD DATA INFILE`. This was because `SELECT INTO OUTFILE` failed to escape the 8-bit characters. ([Bug#32533](#))
- For `FLUSH TABLES WITH READ LOCK`, the server failed to properly detect write-locked tables when running with low-priority updates, resulting in a crash or deadlock. ([Bug#32528](#))
- A build problem introduced in MySQL 5.0.52 was resolved: The x86 32-bit Intel `icc`-compiled server binary had unwanted dependences on Intel `icc` runtime libraries. ([Bug#32514](#))
- The rules for valid column names were being applied differently for base tables and views. ([Bug#32496](#))
- Sending several `KILL QUERY` statements to target a connection running `SELECT SLEEP()` could freeze the server. ([Bug#32436](#))
- `ssl-cipher` values in option files were not being read by `libmysqlclient`. ([Bug#32429](#))
- Repeated execution of a query containing a `CASE` expression and numerous `AND` and `OR` relations could crash the server. The root cause of the issue was determined to be that the internal `SEL_ARG` structure was not properly initialized when created. ([Bug#32403](#))
- Referencing within a subquery an alias used in the `SELECT` list of the outer query was incorrectly permitted. ([Bug#32400](#))
- An `ORDER BY` query on a view created using a `FEDERATED` table as a base table caused the server to crash. ([Bug#32374](#))
- Comparison of a `BIGINT NOT NULL` column with a constant arithmetic expression that evaluated to `NULL` mistakenly caused the error `COLUMN '...' CANNOT BE NULL` (error 1048). ([Bug#32335](#))
- Assigning a 65,536-byte string to a `TEXT` column (which can hold a maximum of 65,535 bytes) resulted in truncation without a warning. Now a truncation warning is generated. ([Bug#32282](#))
- The `LAST_DAY()` function returns a `DATE` value, but internally the value did not have the time fields zeroed and calculations involving the value could return incorrect results. ([Bug#32270](#))
- `MIN()` and `MAX()` could return incorrect results when an index was present if a loose index scan was used. ([Bug#32268](#))
- Memory corruption could occur due to large index map in `Range checked for each record` status reported by `EXPLAIN SELECT`. The problem was based in an incorrectly calculated length of the buffer used to store a hexadecimal representation of an index map, which could result in buffer overrun and stack corruption under some circumstances. ([Bug#32241](#))
- Various test program cleanups were made: 1) `mytest` and `libmysqltest` were removed. 2) `bug25714` displays an error message when invoked with incorrect arguments or the `--help` option. 3) `mysql_client_test` exits cleanly with a proper error status. ([Bug#32221](#))
- The default grant tables on Windows contained information for host `production.mysql.com`, which should not be there. ([Bug#32219](#))
- Under certain conditions, the presence of a `GROUP BY` clause could cause an `ORDER BY` clause to be ignored. ([Bug#32202](#))
- For comparisons of the form `date_col OP datetime_const` (where `OP` is `=`, `<`, `>`, `<=`, or `>=`), the comparison is done using `DATETIME` values, per the fix for [Bug#27590](#). However that fix caused any index on `date_col` not to be used and compromised performance. Now the index is used again. ([Bug#32198](#))
- `DATETIME` arguments specified in numeric form were treated by `DATE_ADD()` as `DATE` values. ([Bug#32180](#))
- `InnoDB` does not support `SPATIAL` indexes, but could crash when asked to handle one. Now an error is returned. ([Bug#32125](#))
- The server crashed on optimizations involving a join of `INT` and `MEDIUMINT` columns and a system variable in the `WHERE`

- clause. (Bug#32103)
- With `lower_case_table_names` set, `CREATE TABLE LIKE` was treated differently by `libmysqld` than by the non-embedded server. (Bug#32063)
 - Within a subquery, `UNION` was handled differently than at the top level, which could result in incorrect results or a server crash. (Bug#32036, Bug#32051)
 - User-defined functions are not loaded if the server is started with the `--skip-grant-tables` option, but the server did not properly handle this case and issued an `OUT OF MEMORY` error message instead. (Bug#32020)
 - `HOUR()`, `MINUTE()`, and `SECOND()` could return non-zero values for `DATE` arguments. (Bug#31990)
 - A column with malformed multi-byte characters could cause the full-text parser to go into an infinite loop. (Bug#31950)
 - Changing the SQL mode to cause dates with “zero” parts to be considered invalid (such as `'1000-00-00'`) could result in indexed and non-indexed searches returning different results for a column that contained such dates. (Bug#31928)
 - In debug builds, testing the result of an `IN` subquery against `NULL` caused an assertion failure. (Bug#31884)
 - `mysql-test-run.pl` sometimes set up test scenarios in which the same port number was passed to multiple servers, causing one of them to be unable to start. (Bug#31880)
 - Comparison results for `BETWEEN` were different from those for operators like `<` and `>` for `DATETIME`-like values with trailing extra characters such as `'2007-10-01 00:00:00 GMT-6'`. `BETWEEN` treated the values as `DATETIME`, whereas the other operators performed a binary-string comparison. Now they all uniformly use a `DATETIME` comparison, but generate warnings for values with trailing garbage. (Bug#31800)
 - Name resolution for correlated subqueries and `HAVING` clauses failed to distinguish which of two was being performed when there was a reference to an outer aliased field. This could result in error messages about a `HAVING` clause for queries that had no such clause. (Bug#31797)
 - The server could crash during `filesort` for `ORDER BY` based on expressions with `INET_NTOA()` or `OCT()` if those functions returned `NULL`. (Bug#31758)
 - For a fatal error during a `filesort` in `find_all_keys()`, the error was returned without the necessary handler uninitialization, causing an assertion failure. (Bug#31742)
 - The examined-rows count was not incremented for `const` queries. (Bug#31700)
 - The `mysql_change_user()` C API function was subject to buffer overflow. (Bug#31669)
 - For `SELECT ... INTO outfile`, if the `ENCLOSED BY` string is empty and the `FIELDS TERMINATED BY` string started with a special character (one of `n`, `t`, `r`, `b`, `0`, `Z`, or `N`), every occurrence of the character within field values would be duplicated. (Bug#31663)
 - `SHOW COLUMNS` and `DESCRIBE` displayed `null` as the column type for a view with no valid definer. This caused `mysql-dump` to produce a non-reloadable dump file for the view. (Bug#31662)
 - The `mysqlbug` script did not include the correct values of `CFLAGS` and `CXXFLAGS` that were used to configure the distribution. (Bug#31644)
 - `ucs2` does not work as a client character set, but attempts to use it as such were not rejected. Now `character_set_client` cannot be set to `ucs2`. This also affects statements such as `SET NAMES` and `SET CHARACTER SET`. (Bug#31615)
 - A buffer used when setting variables was not dimensioned to accommodate the trailing `'\0'` byte, so a single-byte buffer overrun was possible. (Bug#31588)
 - `HAVING` could treat lettercase of table aliases incorrectly if `lower_case_table_names` was enabled. (Bug#31562)
 - The fix for Bug#24989 introduced a problem such that a `NULL` thread handler could be used during a rollback operation. This problem is unlikely to be seen in practice. (Bug#31517)
 - Killing a `CREATE TABLE ... LIKE` statement that was waiting for a name lock caused a server crash. When the statement was killed, the server attempted to release locks that were not held. (Bug#31479)
 - The length of the result from `IFNULL()` could be calculated incorrectly because the sign of the result was not taken into account. (Bug#31471)
 - Queries that used the `ref` access method or index-based subquery execution over indexes that have `DECIMAL` columns could

fail with an error `Column col_name cannot be null.` (Bug#31450)

- `SELECT 1 REGEX NULL` caused an assertion failure for debug servers. (Bug#31440)
- Executing `RENAME` while tables were open for use with `HANDLER` statements could cause a server crash. (Bug#31409)
- `mysql-test-run.pl` tried to create files in a directory where it could not be expected to have write permission. `mysqltest` created `.reject` files in a directory other than the one where test results go. (Bug#31398)
- `DROP USER` caused an increase in memory usage. (Bug#31347)
- For an almost-full `MyISAM` table, an insert that failed could leave the table in a corrupt state. (Bug#31305)
- `myisamchk --unpack` could corrupt a table that when unpacked has static (fixed-length) row format. (Bug#31277)
- `CONVERT(val, DATETIME)` would fail on invalid input, but processing was not aborted for the `WHERE` clause, leading to a server crash. (Bug#31253)
- Allocation of an insufficiently large group-by buffer following creation of a temporary table could lead to a server crash. (Bug#31249)
- Use of `DECIMAL(n, n) ZEROFILL` in `GROUP_CONCAT()` could cause a server crash. (Bug#31227)
- Server variables could not be set to their current values on Linux platforms. (Bug#31177)

See also Bug#6958

- With small values of `myisam_sort_buffer_size`, `REPAIR TABLE` for `MyISAM` tables could cause a server crash. (Bug#31174)
- Use of the `@hostname` system variable in inserts in `mysql_system_tables_data.sql` did not replicate. The workaround is to select its value into a user variable (which does replicate) and insert that. (Bug#31167)
- If `MAKETIME()` returned `NULL` when used in an `ORDER BY` that was evaluated using `filesort`, a server crash could result. (Bug#31160)
- Full-text searches on `ucs2` columns caused a server crash. (`FULLTEXT` indexes on `ucs2` columns cannot be used, but it should be possible to perform `IN BOOLEAN MODE` searches on `ucs2` columns without a crash.) (Bug#31159)
- Data in `BLOB` or `GEOMETRY` columns could be cropped when performing a `UNION` query. (Bug#31158)
- An assertion designed to detect a bug in the `ROLLUP` implementation would incorrectly be triggered when used in a subquery context with non-cacheable statements. (Bug#31156)
- Selecting spatial types in a `UNION` could cause a server crash. (Bug#31155)
- Use of `GROUP_CONCAT(DISTINCT bit_column)` caused an assertion failure. (Bug#31154)
- The server crashed in the parser when running out of memory. Memory handling in the parser has been improved to gracefully return an error when out-of-memory conditions occur in the parser. (Bug#31153)
- MySQL declares a `UNIQUE` key as a `PRIMARY` key if it doesn't have `NULL` columns and is not a partial key, and the `PRIMARY` key must always be the first key. However, in some cases, a non-first key could be reported as `PRIMARY`, leading to an assert failure by `InnoDB`. This is fixed by correcting the key sort order. (Bug#31137)
- `GROUP BY NULL WITH ROLLUP` could cause a server crash. (Bug#31095)

See also Bug#32558

- `REGEXP` operations could cause a server crash for character sets such as `ucs2`. Now the arguments are converted to `utf8` if possible, to allow correct results to be produced if the resulting strings contain only 8-bit characters. (Bug#31081)
- Internal conversion routines could fail for several multi-byte character sets (`big5`, `cp932`, `euckr`, `gb2312`, `sjis`) for empty strings or during evaluation of `SOUNDS LIKE`. (Bug#31069, Bug#31070)
- Many nested subqueries in a single query could lead to excessive memory consumption and possibly a crash of the server. (Bug#31048)
- The `MOD()` function and the `%` operator crashed the server for a divisor less than 1 with a very long fractional part. (Bug#31019)
- On Windows, the `pthread_mutex_trylock()` implementation was incorrect. (Bug#30992)

- A character set introducer followed by a hexadecimal or bit-value literal did not check its argument and could return an ill-formed result for invalid input. (Bug#30986)
- `CHAR(str USING charset)` did not check its argument and could return an ill-formed result for invalid input. (Bug#30982)
- The result from `CHAR(str USING ucs2)` did not add a leading 0x00 byte for input strings with an odd number of bytes. (Bug#30981)
- The `GeomFromText()` function could cause a server crash if the first argument was `NULL` or the empty string. (Bug#30955)
- `MAKEDATE()` incorrectly moved year values in the 100-200 range into the 1970-2069 range. (This is legitimate for 00-99, but three-digit years should be used unchanged.) (Bug#30951)
- When invoked with constant arguments, `STR_TO_DATE()` could use a cached value for the format string and return incorrect results. (Bug#30942)
- `GROUP_CONCAT()` returned `' '` rather than an empty string when the argument column contained only empty strings. (Bug#30897)
- `ROUND(X,D)` or `TRUNCATE(X,D)` for non-constant values of `D` could crash the server if these functions were used in an `ORDER BY` that was resolved using `filesort`. (Bug#30889)
- For `MEMORY` tables, lookups for `NULL` values in `BTREE` indexes could return incorrect results. (Bug#30885)
- Calling `NAME_CONST()` with non-constant arguments triggered an assertion failure. Non-constant arguments are now disallowed. (Bug#30832)
- For a spatial column with a regular (non-`SPATIAL`) index, queries failed if the optimizer tried to use the index. (Bug#30825)
- Values for the `--tc-heuristic-recover` option incorrectly were treated as values for the `--myisam-stats-method` option. (Bug#30821)
- The optimizer incorrectly optimized conditions out of the `WHERE` clause in some queries involving subqueries and indexed columns. (Bug#30788)
- Improper calculation of `CASE` expression results could lead to value truncation. (Bug#30782)
- On Windows, the `pthread_mutex_trylock()` implementation was incorrect. One symptom was that invalidating the query cache could cause a server crash. (Bug#30768)
- A multiple-table `UPDATE` involving transactional and non-transactional tables caused an assertion failure. (Bug#30763)
- Under some circumstances, `CREATE TABLE ... SELECT` could crash the server or incorrectly report that the table row size was too large. (Bug#30736)
- Using the `MIN()` or `MAX()` function to select one part of a multi-part key could cause a crash when the function result was `NULL`. (Bug#30715)
- The optimizer could ignore `ORDER BY` in cases when the result set is ordered by `filesort`, resulting in rows being returned in incorrect order. (Bug#30666)
- `MyISAM` tables could not exceed 4294967295 ($2^{32} - 1$) rows on Windows. (Bug#30638)
- `mysql-test-run.pl` could not run `mysqld` with `root` privileges. (Bug#30630)
- For `MEMORY` tables, `DELETE` statements that remove rows based on an index read could fail to remove all matching rows. (Bug#30590)
- Using `GROUP BY` on an expression of the form `timestamp_col DIV number` caused a server crash due to incorrect calculation of number of decimals. (Bug#30587)
- The options available to the `CHECK TABLE` statement were also allowed in `OPTIMIZE TABLE` and `ANALYZE TABLE` statements, but caused corruption during their execution. These options were never supported for these statements, and an error is now raised if you try to apply these options to these statements. (Bug#30495)
- When expanding a `*` in a `USING` or `NATURAL` join, the check for table access for both tables in the join was done using only the grant information of the first table. (Bug#30468)
- When casting a string value to an integer, cases where the input string contained a decimal point and was long enough to overrun the `unsigned long long` type were not handled correctly. The position of the decimal point was not taken into ac-

- count which resulted in miscalculated numbers and incorrect truncation to appropriate SQL data type limits. (Bug#30453)
- Versions of `mysqldump` from MySQL 4.1 or higher tried to use `START TRANSACTION WITH CONSISTENT SNAPSHOT` if the `--single-transaction` and `--master-data` options were given, even with servers older than 4.1 that do not support consistent snapshots. (Bug#30444)
 - Replication of `LOAD DATA INFILE` could fail when `read_buffer_size` was larger than `max_allowed_packet`. (Bug#30435)
 - For `CREATE ... SELECT ... FROM`, where the resulting table contained indexes, adding `SQL_BUFFER_RESULT` to the `SELECT` part caused index corruption in the table. (Bug#30384)
 - The optimizer made incorrect assumptions about the value of the `is_member` value for user-defined functions, sometimes resulting in incorrect ordering of UDF results. (Bug#30355)
 - Some valid `euc-kr` characters having the second byte in the ranges `[0x41..0x5A]` and `[0x61..0x7A]` were rejected. (Bug#30315)
 - Simultaneous `ALTER TABLE` statements for `BLACKHOLE` tables caused 100% CPU use due to locking problems. (Bug#30294)
 - Setting certain values on a table using a spatial index could cause the server to crash. (Bug#30286)
 - Tables with a `GEOMETRY` column could be marked as corrupt if you added a non-`SPATIAL` index on a `GEOMETRY` column. (Bug#30284)
 - Some `INFORMATION_SCHEMA` tables are intended for internal use, but could be accessed by using `SHOW` statements. (Bug#30079)
 - On some 64-bit systems, inserting the largest negative value into a `BIGINT` column resulted in incorrect data. (Bug#30069)
 - Specifying the `--without-geometry` option for `configure` caused server compilation to fail. (Bug#29972)
 - Under some circumstances, a UDF initialization function could be passed incorrect argument lengths. (Bug#29804)
 - `configure` did not find `nss` on some Linux platforms. (Bug#29658)
 - `InnoDB` had a race condition for an adaptive hash rw-lock waiting for an X-lock. This fix may also provide significant speed improvements on systems experiencing problems with contention for the adaptive hash index. (Bug#29560)
 - Views were treated as insertable even if some base table columns with no default value were omitted from the view definition. (This is contrary to the condition for insertability that a view must contain all columns in the base table that do not have a default value.) (Bug#29477)
 - The `mysql` client program now ignores Unicode byte order mark (BOM) characters at the beginning of input files. Previously, it read them and sent them to the server, resulting in a syntax error.
Presence of a BOM does not cause `mysql` to change its default character set. To do that, invoke `mysql` with an option such as `--default-character-set=utf8`. (Bug#29323)
 - For transactional tables, an error during a multiple-table `DELETE` statement did not roll back the statement. (Bug#29136)
 - The `log` and `log_slow_queries` system variables were displayed by `SHOW VARIABLES` but could not be accessed in expressions as `@@log` and `@@log_slow_queries`. Also, attempting to set them with `SET` produced an incorrect `Unknown system variable` message. Now these variables can be accessed in expressions and attempting to set their values produces an error message that the variable is read only. (Bug#29131)
 - Denormalized double-precision numbers cannot be handled properly by old MIPS processors. For IRIX, this is now handled by enabling a mode to use a software workaround. (Bug#29085)
 - `SHOW VARIABLES` did not display the `relay_log`, `relay_log_index`, or `relay_log_info_file` system variables. (Bug#28893)
 - When doing a `DELETE` on table that involved a `JOIN` with `MyISAM` or `MERGE` tables and the `JOIN` referred to the same table, the operation could fail reporting `ERROR 1030 (HY000): Got error 134 from storage engine`. This was because scans on the table contents would change because of rows that had already been deleted. (Bug#28837)
 - On Windows, `mysql_upgrade` created temporary files in `C:\` and did not clean them up. (Bug#28774)
 - Index hints specified in view definitions were ignored when using the view to select from the base table. (Bug#28702)

- Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is now disallowed. (Bug#28701)
- After changing the SQL mode to a restrictive value that would make already-inserted dates in a column be considered invalid, searches returned different results depending on whether the column was indexed. (Bug#28687)
- The result from `CHAR ()` was incorrectly assumed in some contexts to return a single-byte result. (Bug#28550)
- The parser confused user-defined function (UDF) and stored function creation for `CREATE FUNCTION` and required that there be a default database when creating UDFs, although there is no such requirement. (Bug#28318, Bug#29816)
- The result of a comparison between `VARBINARY` and `BINARY` columns differed depending on whether the `VARBINARY` column was indexed. (Bug#28076)
- The metadata in some `MYSQL_FIELD` members could be incorrect when a temporary table was used to evaluate a query. (Bug#27990)
- An `ORDER BY` at the end of a `UNION` affected individual `SELECT` statements rather than the overall query result. (Bug#27848)
- `comp_err` created files with permissions such that they might be inaccessible during `make install` operations. (Bug#27789)
- It was possible to create a view having a column whose name consisted of an empty string or space characters only. (Bug#27695)

See also [Bug#31202](#)

- The anonymous accounts were not being created during MySQL installation. (Bug#27692)
- A race condition between killing a statement and the thread executing the statement could lead to a situation such that the binary log contained an event indicating that the statement was killed, whereas the statement actually executed to completion. (Bug#27571)
- Some queries using the `NAME_CONST ()` function failed to return either a result or an error to the client, causing it to hang. This was due to the fact that there was no check to insure that both arguments to this function were constant expressions. (Bug#27545, Bug#32559)
- With the `read_only` system variable enabled, `CREATE DATABASE` and `DROP DATABASE` were allowed to users who did not have the `SUPER` privilege. (Bug#27440)
- `resolveip` failed to produce correct results for hostnames that begin with a digit. (Bug#27427)
- `mysqld` sometimes miscalculated the number of digits required when storing a floating-point number in a `CHAR` column. This caused the value to be truncated, or (when using a debug build) caused the server to crash. (Bug#26788)

See also [Bug#12860](#)

- `mysqlcheck -A -r` did not correctly identify all tables that needed repairing. (Bug#25347)
- If the expected precision of an arithmetic expression exceeded the maximum precision supported by MySQL, the precision of the result was reduced by an unpredictable or arbitrary amount, rather than to the maximum precision. In some cases, exceeding the maximum supported precision could also lead to a crash of the server. (Bug#24907)
- For Windows Vista, `MySQLInstanceConfig.exe` did not include a proper manifest enabling it to run with administrative privileges. (Bug#22563)

See also [Bug#24732](#)

- `mysqldumpslow` returned a confusing error message when no configuration file was found. (Bug#20455)
- Hostnames sometimes were treated as case sensitive in account-management statements (`CREATE USER`, `GRANT`, `REVOKE`, and so forth). (Bug#19828)
- The `readline` library has been updated to version 5.2. This addresses issues in the `mysql` client where history and editing within the client would fail to work as expected. (Bug#18431)
- The `Aborted_clients` status variable was incremented twice if a client exited without calling `mysql_close ()`. (Bug#16918)
- Clients were ignoring the TCP/IP port number specified as the default port via the `--with-tcp-port` configuration option.

[Bug#15327](#))

- Zero-padding of exponent values was not the same across platforms. ([Bug#12860](#))
- Values of types `REAL ZEROFILL`, `DOUBLE ZEROFILL`, `FLOAT ZEROFILL`, were not zero-filled when converted to a character representation in the C prepared statement API. ([Bug#11589](#))
- `mysql` stripped comments from statements sent to the server. Now the `--comments` or `--skip-comments` option can be used to control whether to retain or strip comments. The default is `--skip-comments`. ([Bug#11230](#), [Bug#26215](#))
- If an `INSERT ... SELECT` statement is executed, and no automatically generated value is successfully inserted, then `mysql_insert_id()` returns the ID of the last inserted row.
If no automatically generated value is successfully inserted, then `mysql_insert_id()` returns 0. ([Bug#9481](#))
- Several buffer-size system variables were either being handled incorrectly for large values (for settings larger than 4GB, they were truncated to values less than 4GB without a warning), or were limited unnecessarily to 4GB even on 64-bit systems. The following changes were made:
 - For `key_buffer_size`, values larger than 4GB are allowed on 64-bit platforms (except Windows, for which large values are truncated to 4GB with a warning).
 - For `join_buffer_size`, `sort_buffer_size`, and `myisam_sort_buffer_size`, values are limited to 4GB on all platforms. Larger values are truncated to 4GB with a warning.

In addition, settings for `read_buffer_size` and `read_rnd_buffer_size` are limited to 2GB on all platforms. Larger values are truncated to 2GB with a warning. ([Bug#5731](#), [Bug#29419](#), [Bug#29446](#))
- Executing `DISABLE KEYS` and `ENABLE KEYS` on a non-empty table would cause the size of the index file for the table to grow considerable. This was because the `DISABLE KEYS` operation would only mark the existing index, without deleting the index blocks. The `ENABLE KEYS` operation would re-create the index, adding new blocks, while the previous index blocks would remain. Existing indexes are now dropped and recreated when the `ENABLE KEYS` statement is executed. ([Bug#4692](#))

C.1.11. Release Notes for MySQL Enterprise 5.0.56 [MRU] (06 February 2008)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.54). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Bugs fixed:

- **Important Change: MySQL Cluster:** `AUTO_INCREMENT` columns had the following problems when used in `NDB` tables:
 - The `AUTO_INCREMENT` counter was not updated correctly when such a column was updated.
 - `AUTO_INCREMENT` values were not prefetched beyond statement boundaries.
 - `AUTO_INCREMENT` values were not handled correctly with `INSERT IGNORE` statements.
 - After being set, `ndb_autoincrement_prefetch_sz` showed a value of 1, regardless of the value it had actually been set to.
As part of this fix, the behavior of `ndb_autoincrement_prefetch_sz` has changed. Setting this to less than 32 no longer has any effect on prefetching within statements (where IDs are now always obtained in batches of 32 or more), but only between statements. The default value for this variable has also changed, and is now 1. ([Bug#25176](#), [Bug#31956](#), [Bug#32055](#))
- **Important Change: Replication:** When the master crashed during an update on a transactional table while in `AUTOCOMMIT` mode, the slave failed. This fix causes every transaction (including `AUTOCOMMIT` transactions) to be recorded in the binlog as starting with a `BEGIN` and ending with a `COMMIT` or `ROLLBACK`. ([Bug#26395](#))
- **Replication: Important Note:** Network timeouts between the master and the slave could result in corruption of the relay log. This fix rectifies a long-standing replication issue when using unreliable networks, including replication over wide area networks such as the Internet. If you experience reliability issues and see many `YOU HAVE AN ERROR IN YOUR SQL SYNTAX` errors on replication slaves, we strongly recommend that you upgrade to a MySQL version which includes this fix. ([Bug#26489](#))
- **MySQL Cluster:** An improperly reset internal signal was observed as a hang when using events in the `NDB` API but could result in various errors. ([Bug#33206](#))

- **MySQL Cluster:** Incorrectly handled parameters could lead to a crash in the Transaction Coordinator during a node failure, causing other data nodes to fail. ([Bug#33168](#))
- **MySQL Cluster:** The failure of a master node could lead to subsequent failures in local checkpointing. ([Bug#32160](#))
- **MySQL Cluster:** Primary keys on variable-length columns (such as `VARCHAR`) did not work correctly. ([Bug#31635](#))
- **MySQL Cluster:** When inserting a row into an `NDB` table with a duplicate value for a non-primary unique key, the error issued would reference the wrong key.

This improves on an initial fix for this issue made in MySQL 5.0.30 and MySQL 5.0.33 ([Bug#21072](#))

- **Replication:** A `CREATE USER`, `DROP USER`, or `RENAME USER` statement that fails on the master, or that is a duplicate of any of these statements, is no longer written to the binlog; previously, either of these occurrences could cause the slave to fail. ([Bug#33862](#))

See also [Bug#29749](#)

- **Replication:** `SHOW BINLOG EVENTS` could fail when the binlog contained one or more events whose size was close to the value of `max_allowed_packet`. ([Bug#33413](#))
- **Replication:** SQL statements containing comments using `--` syntax were not replayable by `mysqlbinlog`, even though such statements replicated correctly. ([Bug#32205](#))
- **Replication:** Issuing a `DROP VIEW` statement caused replication to fail if the view did not actually exist. ([Bug#30998](#))
- **Replication:** Setting `server_id` did not update its value for the current session. ([Bug#28908](#))
- The server crashed when executing a query that had a subquery containing an equality `X=Y` where `Y` referred to a named select list expression from the parent select. The server crashed when trying to use the `X=Y` equality for `ref`-based access. ([Bug#33794](#))
- Use of uninitialized memory for `filesort` in a subquery caused a server crash. ([Bug#33675](#))
- The server could crash when `REPEAT` or another control instruction was used in conjunction with labels and a `LEAVE` instruction. ([Bug#33618](#))
- The parser allowed control structures in compound statements to have mismatched beginning and ending labels. ([Bug#33618](#))
- `SET GLOBAL myisam_max_sort_file_size=DEFAULT` set `myisam_max_sort_file_size` to an incorrect value. ([Bug#33382](#))

See also [Bug#31177](#)

- `CREATE TABLE ... SELECT` created tables that for date columns used the obsolete `Field_date` type instead of `Field_newdate`. ([Bug#33256](#))
- For `DECIMAL` columns used with the `ROUND(X,D)` or `TRUNCATE(X,D)` function with a non-constant value of `D`, adding an `ORDER BY` for the function result produced misordered output. ([Bug#33143](#))

See also [Bug#33402](#), [Bug#30617](#)

- Some valid `SELECT` statements could not be used as views due to incorrect column reference resolution. ([Bug#33133](#))
- The fix for [Bug#11230](#) and [Bug#26215](#) introduced a significant input-parsing slowdown for the `mysql` client. This has been corrected. ([Bug#33057](#))
- `UNION` constructs cannot contain `SELECT ... INTO` except in the final `SELECT`. However, if a `UNION` was used in a subquery and an `INTO` clause appeared in the top-level query, the parser interpreted it as having appeared in the `UNION` and raised an error. ([Bug#32858](#))
- The correct data type for a `NULL` column resulting from a `UNION` could be determined incorrectly in some cases: 1) Not correctly inferred as `NULL` depending on the number of selects; 2) Not inferred correctly as `NULL` if one select used a subquery. ([Bug#32848](#))
- For queries containing `GROUP_CONCAT(DISTINCT col_list ORDER BY col_list)`, there was a limitation that the `DISTINCT` columns had to be the same as `ORDER BY` columns. Incorrect results could be returned if this was not true. ([Bug#32798](#))
- `HOUR()`, `MINUTE()`, and `SECOND()` could return non-zero values for `DATE` arguments. ([Bug#31990](#))

- `mysql-test-run.pl` sometimes set up test scenarios in which the same port number was passed to multiple servers, causing one of them to be unable to start. (Bug#31880)
 - Name resolution for correlated subqueries and `HAVING` clauses failed to distinguish which of two was being performed when there was a reference to an outer aliased field. This could result in error messages about a `HAVING` clause for queries that had no such clause. (Bug#31797)
 - `ROUND(X,D)` or `TRUNCATE(X,D)` for non-constant values of `D` could crash the server if these functions were used in an `ORDER BY` that was resolved using `filesort`. (Bug#30889)
 - Replication of `LOAD DATA INFILE` could fail when `read_buffer_size` was larger than `max_allowed_packet`. (Bug#30435)
 - Views were treated as insertable even if some base table columns with no default value were omitted from the view definition. (This is contrary to the condition for insertability that a view must contain all columns in the base table that do not have a default value.) (Bug#29477)
 - An `ORDER BY` at the end of a `UNION` affected individual `SELECT` statements rather than the overall query result. (Bug#27848)
 - With the `read_only` system variable enabled, `CREATE DATABASE` and `DROP DATABASE` were allowed to users who did not have the `SUPER` privilege. (Bug#27440)
 - `resolveip` failed to produce correct results for hostnames that begin with a digit. (Bug#27427)
 - `mysqlcheck -A -r` did not correctly identify all tables that needed repairing. (Bug#25347)
 - For Windows Vista, `MySQLInstanceConfig.exe` did not include a proper manifest enabling it to run with administrative privileges. (Bug#22563)
- See also Bug#24732
- `mysqldumpslow` returned a confusing error message when no configuration file was found. (Bug#20455)

C.1.12. Release Notes for MySQL Enterprise 5.0.54a [MRU] (11 January 2008)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This is a bugfix release that replaces MySQL 5.0.54.

Bugs fixed:

- **Security Fix:** Three vulnerabilities in yaSSL versions 1.7.5 and earlier were discovered that could lead to a server crash or execution of unauthorized code. The exploit requires a server with yaSSL enabled and TCP/IP connections enabled, but does not require valid MySQL account credentials. The exploit does not apply to OpenSSL.

Note

The proof-of-concept exploit is freely available on the Internet. Everyone with a vulnerable MySQL configuration is advised to upgrade *immediately*.

(Bug#33814, CVE-2008-0226, CVE-2008-0227)

C.1.13. Release Notes for MySQL Enterprise 5.0.54 [MRU] (14 December 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.52). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Functionality added or changed:

- The `mysql_odbc_escape_string()` C API function has been removed. It has multi-byte character escaping issues, doesn't honor the `NO_BACKSLASH_ESCAPES` SQL mode and is not needed anymore by Connector/ODBC as of 3.51.17.

[Bug#29592](#)

- The argument for the `mysql-test-run.pl --do-test` and `--skip-test` options is now interpreted as a Perl regular expression if there is a pattern metacharacter in the argument value. This allows more flexible specification of which tests to perform or skip.

Bugs fixed:

- **Security Enhancement:** It was possible to force an error message of excessive length which could lead to a buffer overflow. This has been made no longer possible as a security precaution. ([Bug#32707](#))
- **Incompatible Change:** The MySQL 5.0.50 patch for this bug was reverted because it changed the behavior of a General Availability MySQL release. ([Bug#30234](#))

See also [Bug#27525](#)

- **Incompatible Change:** It was possible for option files to be read twice at program startup, if some of the standard option file locations turned out to be the same directory. Now duplicates are removed from the list of files to be read.

Also, users could not override system-wide settings using `~/my.cnf` because `SYSCONFDIR/my.cnf` was read last. The latter file now is read earlier so that `~/my.cnf` can override system-wide settings.

The fix for this problem had a side effect such that on Unix, MySQL programs looked for options in `~/my.cnf` rather than the standard location of `~/my.cnf`. That problem was addressed as [Bug#38180](#). ([Bug#20748](#))

- **Replication:** It was possible for the name of the relay log file to exceed the amount of memory reserved for it, possibly leading to a crash of the server. ([Bug#31836](#))

See also [Bug#28597](#)

- **Replication:** Corruption of log events caused the server to crash on 64-bit Linux systems having 4 GB of memory or more. ([Bug#31793](#))
- **Replication:** One thread could read uninitialized memory from the stack of another thread. This issue was only known to occur in a `mysqld` process acting as both a master and a slave. ([Bug#30752](#))
- **Replication:** Due a previous change in how the default name and location of the binlog file were determined, replication failed following some upgrades. ([Bug#28597](#), [Bug#28603](#))

See also [Bug#31836](#)

This regression was introduced by [Bug#20166](#)

- **Replication:** Stored procedures having `BIT` parameters were not replicated correctly. ([Bug#26199](#))
- **Replication:** Issuing `SHOW SLAVE STATUS` as `mysqld` was shutting down could cause a crash. ([Bug#26000](#))
- **Replication:** An `UPDATE` statement using a stored function that modified a non-transactional table was not logged if it failed. This caused the copy of the non-transactional table on the master have a row that the copy on the slave did not.

In addition, when an `INSERT ... ON DUPLICATE KEY UPDATE` statement encountered a duplicate key constraint, but the `UPDATE` did not actually change any data, the statement was not logged. As a result of this fix, such statements are now treated the same for logging purposes as other `UPDATE` statements, and so are written to the binary log. ([Bug#23333](#))

See also [Bug#12713](#)

- **Replication:** A replication slave sometimes failed to reconnect because it was unable to run `SHOW SLAVE HOSTS`. It was not necessary to run this statement on slaves (since the master should track connection IDs), and the execution of this statement by slaves was removed. ([Bug#21132](#))

See also [Bug#13963](#), [Bug#21869](#)

- An `ORDER BY` query using `IS NULL` in the `WHERE` clause did not return correct results. ([Bug#32815](#))
- Use of the `cp932` character set with `CAST()` in an `ORDER BY` clause could cause a server crash. ([Bug#32726](#))
- A subquery using an `IS NULL` check of a column defined as `NOT NULL` in a table used in the `FROM` clause of the outer query produced an invalid result. ([Bug#32694](#))
- Specifying a non-existent column for an `INSERT DELAYED` statement caused a server crash rather than producing an error.

[Bug#32676](#)

- Use of `CLIENT_MULTI_QUERIES` caused `libmysqld` to crash. ([Bug#32624](#))
- The `INTERVAL()` function incorrectly handled `NULL` values in the value list. ([Bug#32560](#))
- Use of a `NULL`-returning `GROUP BY` expression in conjunction with `WITH ROLLUP` could cause a server crash. ([Bug#32558](#))
See also [Bug#31095](#)
- A `SELECT ... GROUP BY bit_column` query failed with an assertion if the length of the `BIT` column used for the `GROUP BY` was not an integer multiple of 8. ([Bug#32556](#))
- Using `SELECT INTO OUTFILE` with 8-bit `ENCLOSED BY` characters led to corrupted data when the data was reloaded using `LOAD DATA INFILE`. This was because `SELECT INTO OUTFILE` failed to escape the 8-bit characters. ([Bug#32533](#))
- For `FLUSH TABLES WITH READ LOCK`, the server failed to properly detect write-locked tables when running with low-priority updates, resulting in a crash or deadlock. ([Bug#32528](#))
- Sending several `KILL QUERY` statements to target a connection running `SELECT SLEEP()` could freeze the server. ([Bug#32436](#))
- `ssl-cipher` values in option files were not being read by `libmysqlclient`. ([Bug#32429](#))
- Repeated execution of a query containing a `CASE` expression and numerous `AND` and `OR` relations could crash the server. The root cause of the issue was determined to be that the internal `SEL_ARG` structure was not properly initialized when created. ([Bug#32403](#))
- Referencing within a subquery an alias used in the `SELECT` list of the outer query was incorrectly permitted. ([Bug#32400](#))
- An `ORDER BY` query on a view created using a `FEDERATED` table as a base table caused the server to crash. ([Bug#32374](#))
- Comparison of a `BIGINT NOT NULL` column with a constant arithmetic expression that evaluated to `NULL` mistakenly caused the error `COLUMN '...' CANNOT BE NULL` (error 1048). ([Bug#32335](#))
- Assigning a 65,536-byte string to a `TEXT` column (which can hold a maximum of 65,535 bytes) resulted in truncation without a warning. Now a truncation warning is generated. ([Bug#32282](#))
- The `LAST_DAY()` function returns a `DATE` value, but internally the value did not have the time fields zeroed and calculations involving the value could return incorrect results. ([Bug#32270](#))
- `MIN()` and `MAX()` could return incorrect results when an index was present if a loose index scan was used. ([Bug#32268](#))
- Memory corruption could occur due to large index map in `Range checked for each record` status reported by `EXPLAIN SELECT`. The problem was based in an incorrectly calculated length of the buffer used to store a hexadecimal representation of an index map, which could result in buffer overrun and stack corruption under some circumstances. ([Bug#32241](#))
- Various test program cleanups were made: 1) `mytest` and `libmysqltest` were removed. 2) `bug25714` displays an error message when invoked with incorrect arguments or the `--help` option. 3) `mysql_client_test` exits cleanly with a proper error status. ([Bug#32221](#))
- For comparisons of the form `date_col OP datetime_const` (where `OP` is `=`, `<`, `>`, `<=`, or `>=`), the comparison is done using `DATETIME` values, per the fix for [Bug#27590](#). However that fix caused any index on `date_col` not to be used and compromised performance. Now the index is used again. ([Bug#32198](#))
- `DATETIME` arguments specified in numeric form were treated by `DATE_ADD()` as `DATE` values. ([Bug#32180](#))
- `InnoDB` does not support `SPATIAL` indexes, but could crash when asked to handle one. Now an error is returned. ([Bug#32125](#))
- With `lower_case_table_names` set, `CREATE TABLE LIKE` was treated differently by `libmysqld` than by the non-embedded server. ([Bug#32063](#))
- Within a subquery, `UNION` was handled differently than at the top level, which could result in incorrect results or a server crash. ([Bug#32036](#), [Bug#32051](#))
- Changing the SQL mode to cause dates with “zero” parts to be considered invalid (such as `'1000-00-00'`) could result in indexed and non-indexed searches returning different results for a column that contained such dates. ([Bug#31928](#))
- `ucs2` does not work as a client character set, but attempts to use it as such were not rejected. Now `character_set_client` cannot be set to `ucs2`. This also affects statements such as `SET NAMES` and `SET CHARACTER SET`.

[Bug#31615](#))

- Killing a `CREATE TABLE ... LIKE` statement that was waiting for a name lock caused a server crash. When the statement was killed, the server attempted to release locks that were not held. ([Bug#31479](#))
- `myisamchk --unpack` could corrupt a table that when unpacked has static (fixed-length) row format. ([Bug#31277](#))
- Server variables could not be set to their current values on Linux platforms. ([Bug#31177](#))

See also [Bug#6958](#)

- Data in `BLOB` or `GEOMETRY` columns could be cropped when performing a `UNION` query. ([Bug#31158](#))
- The server crashed in the parser when running out of memory. Memory handling in the parser has been improved to gracefully return an error when out-of-memory conditions occur in the parser. ([Bug#31153](#))
- MySQL declares a `UNIQUE` key as a `PRIMARY` key if it doesn't have `NULL` columns and is not a partial key, and the `PRIMARY` key must always be the first key. However, in some cases, a non-first key could be reported as `PRIMARY`, leading to an assert failure by `InnoDB`. This is fixed by correcting the key sort order. ([Bug#31137](#))
- `REGEXP` operations could cause a server crash for character sets such as `ucs2`. Now the arguments are converted to `utf8` if possible, to allow correct results to be produced if the resulting strings contain only 8-bit characters. ([Bug#31081](#))
- Many nested subqueries in a single query could lead to excessive memory consumption and possibly a crash of the server. ([Bug#31048](#))
- The optimizer incorrectly optimized conditions out of the `WHERE` clause in some queries involving subqueries and indexed columns. ([Bug#30788](#))
- Improper calculation of `CASE` expression results could lead to value truncation. ([Bug#30782](#))
- A multiple-table `UPDATE` involving transactional and non-transactional tables caused an assertion failure. ([Bug#30763](#))
- `mysql-test-run.pl` could not run `mysqld` with `root` privileges. ([Bug#30630](#))
- The options available to the `CHECK TABLE` statement were also allowed in `OPTIMIZE TABLE` and `ANALYZE TABLE` statements, but caused corruption during their execution. These options were never supported for these statements, and an error is now raised if you try to apply these options to these statements. ([Bug#30495](#))
- When casting a string value to an integer, cases where the input string contained a decimal point and was long enough to overrun the `unsigned long long` type were not handled correctly. The position of the decimal point was not taken into account which resulted in miscalculated numbers and incorrect truncation to appropriate SQL data type limits. ([Bug#30453](#))
- For `CREATE ... SELECT ... FROM`, where the resulting table contained indexes, adding `SQL_BUFFER_RESULT` to the `SELECT` part caused index corruption in the table. ([Bug#30384](#))
- The optimizer made incorrect assumptions about the value of the `is_member` value for user-defined functions, sometimes resulting in incorrect ordering of UDF results. ([Bug#30355](#))
- Some valid `eur-kr` characters having the second byte in the ranges `[0x41..0x5A]` and `[0x61..0x7A]` were rejected. ([Bug#30315](#))
- Simultaneous `ALTER TABLE` statements for `BLACKHOLE` tables caused 100% CPU use due to locking problems. ([Bug#30294](#))
- Tables with a `GEOMETRY` column could be marked as corrupt if you added a non-`SPATIAL` index on a `GEOMETRY` column. ([Bug#30284](#))
- On some 64-bit systems, inserting the largest negative value into a `BIGINT` column resulted in incorrect data. ([Bug#30069](#))
- `InnoDB` had a race condition for an adaptive hash rw-lock waiting for an X-lock. This fix may also provide significant speed improvements on systems experiencing problems with contention for the adaptive hash index. ([Bug#29560](#))
- The `mysql` client program now ignores Unicode byte order mark (BOM) characters at the beginning of input files. Previously, it read them and sent them to the server, resulting in a syntax error.

Presence of a BOM does not cause `mysql` to change its default character set. To do that, invoke `mysql` with an option such as `--default-character-set=utf8`. ([Bug#29323](#))

- For transactional tables, an error during a multiple-table `DELETE` statement did not roll back the statement. ([Bug#29136](#))

- Denormalized double-precision numbers cannot be handled properly by old MIPS processors. For IRIX, this is now handled by enabling a mode to use a software workaround. (Bug#29085)
- When doing a `DELETE` on table that involved a `JOIN` with `MyISAM` or `MERGE` tables and the `JOIN` referred to the same table, the operation could fail reporting `ERROR 1030 (HY000): Got error 134 from storage engine`. This was because scans on the table contents would change because of rows that had already been deleted. (Bug#28837)
- A race condition between killing a statement and the thread executing the statement could lead to a situation such that the binary log contained an event indicating that the statement was killed, whereas the statement actually executed to completion. (Bug#27571)
- Some queries using the `NAME_CONST()` function failed to return either a result or an error to the client, causing it to hang. This was due to the fact that there was no check to insure that both arguments to this function were constant expressions. (Bug#27545, Bug#32559)
- `mysqld` sometimes miscalculated the number of digits required when storing a floating-point number in a `CHAR` column. This caused the value to be truncated, or (when using a debug build) caused the server to crash. (Bug#26788)

See also Bug#12860

- If the expected precision of an arithmetic expression exceeded the maximum precision supported by MySQL, the precision of the result was reduced by an unpredictable or arbitrary amount, rather than to the maximum precision. In some cases, exceeding the maximum supported precision could also lead to a crash of the server. (Bug#24907)
- Zero-padding of exponent values was not the same across platforms. (Bug#12860)
- If an `INSERT ... SELECT` statement is executed, and no automatically generated value is successfully inserted, then `mysql_insert_id()` returns the ID of the last inserted row.

If no automatically generated value is successfully inserted, then `mysql_insert_id()` returns 0. (Bug#9481)

C.1.14. Release Notes for MySQL Enterprise 5.0.52 [MRU] (30 November 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.50). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Functionality added or changed:

- `mysqldump` produces a `-- Dump completed on DATE` comment at the end of the dump if `--comments` is given. The date causes dump files for identical data take at different times to appear to be different. The new options `--dump-date` and `--skip-dump-date` control whether the date is added to the comment. `--skip-dump-date` suppresses date printing. The default is `--dump-date` (include the date in the comment). (Bug#31077)
- The default value of the `connect_timeout` system variable was increased from 5 to 10 seconds. This might help in cases where clients frequently encounter errors of the form `Lost connection to MySQL server at 'XXX', system error: errno`. (Bug#28359)
- The use of `InnoDB` hash indexes now can be controlled by setting the new `innodb_adaptive_hash_index` system variable at server startup. By default, this variable is enabled. See Section 13.2.13.3, “Adaptive Hash Indexes”.

Bugs fixed:

- **Security Fix:** Using `RENAME TABLE` against a table with explicit `DATA DIRECTORY` and `INDEX DIRECTORY` options can be used to overwrite system table information by replacing the symbolic link points. the file to which the symlink points.

MySQL will now return an error when the file to which the symlink points already exists. (Bug#32111, CVE-2007-5969)

- **Security Fix:** `ALTER VIEW` retained the original `DEFINER` value, even when altered by another user, which could allow that user to gain the access rights of the view. Now `ALTER VIEW` is allowed only to the original definer or users with the `SUPER` privilege. (Bug#29908)
- **Security Fix:** When using a `FEDERATED` table, the local server could be forced to crash if the remote server returned a result with fewer columns than expected. (Bug#29801)

- **Incompatible Change:** With `ONLY_FULL_GROUP_BY` SQL mode enabled, queries such as `SELECT a FROM t1 HAVING COUNT(*) > 2` were not being rejected as they should have been.

This fix results in the following behavior:

- There is a check against mixing group and non-group columns *only* when `ONLY_FULL_GROUP_BY` is enabled.
- This check is done both for the select list and for the `HAVING` clause if there is one.

This behavior differs from previous versions as follows:

- Previously, the `HAVING` clause was not checked when `ONLY_FULL_GROUP_BY` was enabled; now it is checked.
- Previously, the select list was checked even when `ONLY_FULL_GROUP_BY` was not enabled; now it is checked only when `ONLY_FULL_GROUP_BY` is enabled.

(Bug#31794)

- **Incompatible Change:** Several type-preserving functions and operators returned an incorrect result type that does not match their argument types: `COALESCE()`, `IF()`, `IFNULL()`, `LEAST()`, `GREATEST()`, `CASE`. These now aggregate using the precise SQL types of their arguments rather than the internal type. In addition, the result type of the `STR_TO_DATE()` function is now `DATETIME` by default. (Bug#27216)
- **MySQL Cluster:** An uninitialized variable in the `NDB` storage engine code led to `AUTO_INCREMENT` failures when the server was compiled with `gcc` 4.2.1. (Bug#31848)

This regression was introduced by Bug#27437

- **MySQL Cluster:** An error with an `if` statement in `sql/ha_ndbcluster.cc` could potentially lead to an infinite loop in case of failure when working with `AUTO_INCREMENT` columns in `NDB` tables. (Bug#31810)
- **MySQL Cluster:** The `NDB` storage engine code was not safe for strict-alias optimization in `gcc` 4.2.1. (Bug#31761)
- **MySQL Cluster:** Transaction timeouts were not handled well in some circumstances, leading to excessive number of transactions being aborted unnecessarily. (Bug#30379)
- **MySQL Cluster:** In some cases, the cluster management server logged entries multiple times following a restart of `mgmd`. (Bug#29565)
- **MySQL Cluster:** An interpreted program of sufficient size and complexity could cause all cluster data nodes to shut down due to buffer overruns. (Bug#29390)
- **MySQL Cluster:** `UPDATE IGNORE` could sometimes fail on `NDB` tables due to the use of uninitialized data when checking for duplicate keys to be ignored. (Bug#25817)
- A build problem introduced in MySQL 5.0.52 was resolved: The x86 32-bit Intel `icc`-compiled server binary had unwanted dependences on Intel `icc` runtime libraries. (Bug#32514)
- The rules for valid column names were being applied differently for base tables and views. (Bug#32496)
- The default grant tables on Windows contained information for host `production.mysql.com`, which should not be there. (Bug#32219)
- Under certain conditions, the presence of a `GROUP BY` clause could cause an `ORDER BY` clause to be ignored. (Bug#32202)
- The server crashed on optimizations involving a join of `INT` and `MEDIUMINT` columns and a system variable in the `WHERE` clause. (Bug#32103)
- User-defined functions are not loaded if the server is started with the `--skip-grant-tables` option, but the server did not properly handle this case and issued an `OUT OF MEMORY` error message instead. (Bug#32020)
- A column with malformed multi-byte characters could cause the full-text parser to go into an infinite loop. (Bug#31950)
- In debug builds, testing the result of an `IN` subquery against `NULL` caused an assertion failure. (Bug#31884)
- Comparison results for `BETWEEN` were different from those for operators like `<` and `>` for `DATETIME`-like values with trailing extra characters such as `'2007-10-01 00:00:00 GMT-6'`. `BETWEEN` treated the values as `DATETIME`, whereas the other operators performed a binary-string comparison. Now they all uniformly use a `DATETIME` comparison, but generate warnings for values with trailing garbage. (Bug#31800)
- The server could crash during `filesort` for `ORDER BY` based on expressions with `INET_NTOA()` or `OCT()` if those func-

- tions returned `NULL`. (Bug#31758)
- For a fatal error during a filesort in `find_all_keys()`, the error was returned without the necessary handler uninitialization, causing an assertion failure. (Bug#31742)
 - The examined-rows count was not incremented for `const` queries. (Bug#31700)
 - The `mysql_change_user()` C API function was subject to buffer overflow. (Bug#31669)
 - For `SELECT ... INTO OUTFILE`, if the `ENCLOSED BY` string is empty and the `FIELDS TERMINATED BY` string started with a special character (one of `n`, `t`, `r`, `b`, `0`, `Z`, or `N`), every occurrence of the character within field values would be duplicated. (Bug#31663)
 - `SHOW COLUMNS` and `DESCRIBE` displayed `null` as the column type for a view with no valid definer. This caused `mysql-dump` to produce a non-reloadable dump file for the view. (Bug#31662)
 - The `mysqlbug` script did not include the correct values of `CFLAGS` and `CXXFLAGS` that were used to configure the distribution. (Bug#31644)
 - A buffer used when setting variables was not dimensioned to accommodate the trailing `'\0'` byte, so a single-byte buffer overrun was possible. (Bug#31588)
 - `HAVING` could treat lettercase of table aliases incorrectly if `lower_case_table_names` was enabled. (Bug#31562)
 - The fix for Bug#24989 introduced a problem such that a `NULL` thread handler could be used during a rollback operation. This problem is unlikely to be seen in practice. (Bug#31517)
 - The length of the result from `IFNULL()` could be calculated incorrectly because the sign of the result was not taken into account. (Bug#31471)
 - Queries that used the `ref` access method or index-based subquery execution over indexes that have `DECIMAL` columns could fail with an error `Column col_name cannot be null`. (Bug#31450)
 - `SELECT 1 REGEX NULL` caused an assertion failure for debug servers. (Bug#31440)
 - Executing `RENAME` while tables were open for use with `HANDLER` statements could cause a server crash. (Bug#31409)
 - `mysql-test-run.pl` tried to create files in a directory where it could not be expected to have write permission. `mysqltest` created `.reject` files in a directory other than the one where test results go. (Bug#31398)
 - `DROP USER` caused an increase in memory usage. (Bug#31347)
 - For an almost-full `MyISAM` table, an insert that failed could leave the table in a corrupt state. (Bug#31305)
 - `CONVERT(val, DATETIME)` would fail on invalid input, but processing was not aborted for the `WHERE` clause, leading to a server crash. (Bug#31253)
 - Allocation of an insufficiently large group-by buffer following creation of a temporary table could lead to a server crash. (Bug#31249)
 - Use of `DECIMAL(n, n) ZEROFILL` in `GROUP_CONCAT()` could cause a server crash. (Bug#31227)
 - With small values of `myisam_sort_buffer_size`, `REPAIR TABLE` for `MyISAM` tables could cause a server crash. (Bug#31174)
 - Use of the `@@hostname` system variable in inserts in `mysql_system_tables_data.sql` did not replicate. The workaround is to select its value into a user variable (which does replicate) and insert that. (Bug#31167)
 - If `MAKETIME()` returned `NULL` when used in an `ORDER BY` that was evaluated using `filesort`, a server crash could result. (Bug#31160)
 - Full-text searches on `ucs2` columns caused a server crash. (`FULLTEXT` indexes on `ucs2` columns cannot be used, but it should be possible to perform `IN BOOLEAN MODE` searches on `ucs2` columns without a crash.) (Bug#31159)
 - An assertion designed to detect a bug in the `ROLLUP` implementation would incorrectly be triggered when used in a subquery context with non-cacheable statements. (Bug#31156)
 - Selecting spatial types in a `UNION` could cause a server crash. (Bug#31155)
 - Use of `GROUP_CONCAT(DISTINCT bit_column)` caused an assertion failure. (Bug#31154)

- `GROUP BY NULL WITH ROLLUP` could cause a server crash. (Bug#31095)
See also Bug#32558
- Internal conversion routines could fail for several multi-byte character sets (`big5`, `cp932`, `euckr`, `gb2312`, `sjis`) for empty strings or during evaluation of `SOUNDS LIKE`. (Bug#31069, Bug#31070)
- The `MOD()` function and the `%` operator crashed the server for a divisor less than 1 with a very long fractional part. (Bug#31019)
- On Windows, the `pthread_mutex_trylock()` implementation was incorrect. (Bug#30992)
- A character set introducer followed by a hexadecimal or bit-value literal did not check its argument and could return an ill-formed result for invalid input. (Bug#30986)
- `CHAR(str USING charset)` did not check its argument and could return an ill-formed result for invalid input. (Bug#30982)
- The result from `CHAR(str USING ucs2)` did not add a leading 0x00 byte for input strings with an odd number of bytes. (Bug#30981)
- The `GeomFromText()` function could cause a server crash if the first argument was `NULL` or the empty string. (Bug#30955)
- `MAKEDATE()` incorrectly moved year values in the 100-200 range into the 1970-2069 range. (This is legitimate for 00-99, but three-digit years should be used unchanged.) (Bug#30951)
- When invoked with constant arguments, `STR_TO_DATE()` could use a cached value for the format string and return incorrect results. (Bug#30942)
- `GROUP_CONCAT()` returned `' '` rather than an empty string when the argument column contained only empty strings. (Bug#30897)
- For `MEMORY` tables, lookups for `NULL` values in `BTREE` indexes could return incorrect results. (Bug#30885)
- Calling `NAME_CONST()` with non-constant arguments triggered an assertion failure. Non-constant arguments are now disallowed. (Bug#30832)
- For a spatial column with a regular (non-`SPATIAL`) index, queries failed if the optimizer tried to use the index. (Bug#30825)
- Values for the `--tc-heuristic-recover` option incorrectly were treated as values for the `--myisam-stats-method` option. (Bug#30821)
- On Windows, the `pthread_mutex_trylock()` implementation was incorrect. One symptom was that invalidating the query cache could cause a server crash. (Bug#30768)
- Under some circumstances, `CREATE TABLE ... SELECT` could crash the server or incorrectly report that the table row size was too large. (Bug#30736)
- Using the `MIN()` or `MAX()` function to select one part of a multi-part key could cause a crash when the function result was `NULL`. (Bug#30715)
- The optimizer could ignore `ORDER BY` in cases when the result set is ordered by `filesort`, resulting in rows being returned in incorrect order. (Bug#30666)
- `MyISAM` tables could not exceed 4294967295 ($2^{32} - 1$) rows on Windows. (Bug#30638)
- For `MEMORY` tables, `DELETE` statements that remove rows based on an index read could fail to remove all matching rows. (Bug#30590)
- Using `GROUP BY` on an expression of the form `timestamp_col DIV number` caused a server crash due to incorrect calculation of number of decimals. (Bug#30587)
- When expanding a `*` in a `USING` or `NATURAL` join, the check for table access for both tables in the join was done using only the grant information of the first table. (Bug#30468)
- Versions of `mysqldump` from MySQL 4.1 or higher tried to use `START TRANSACTION WITH CONSISTENT SNAPSHOT` if the `--single-transaction` and `--master-data` options were given, even with servers older than 4.1 that do not support consistent snapshots. (Bug#30444)
- Setting certain values on a table using a spatial index could cause the server to crash. (Bug#30286)

- Some `INFORMATION_SCHEMA` tables are intended for internal use, but could be accessed by using `SHOW` statements. (Bug#30079)
- Specifying the `--without-geometry` option for `configure` caused server compilation to fail. (Bug#29972)
- Under some circumstances, a UDF initialization function could be passed incorrect argument lengths. (Bug#29804)
- `configure` did not find `nss` on some Linux platforms. (Bug#29658)
- The `log` and `log_slow_queries` system variables were displayed by `SHOW VARIABLES` but could not be accessed in expressions as `@@log` and `@@log_slow_queries`. Also, attempting to set them with `SET` produced an incorrect `Unknown system variable` message. Now these variables can be accessed in expressions and attempting to set their values produces an error message that the variable is read only. (Bug#29131)
- `SHOW VARIABLES` did not display the `relay_log`, `relay_log_index`, or `relay_log_info_file` system variables. (Bug#28893)
- On Windows, `mysql_upgrade` created temporary files in `C:\` and did not clean them up. (Bug#28774)
- Index hints specified in view definitions were ignored when using the view to select from the base table. (Bug#28702)
- Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is now disallowed. (Bug#28701)
- After changing the SQL mode to a restrictive value that would make already-inserted dates in a column be considered invalid, searches returned different results depending on whether the column was indexed. (Bug#28687)
- The result from `CHAR()` was incorrectly assumed in some contexts to return a single-byte result. (Bug#28550)
- The parser confused user-defined function (UDF) and stored function creation for `CREATE FUNCTION` and required that there be a default database when creating UDFs, although there is no such requirement. (Bug#28318, Bug#29816)
- The result of a comparison between `VARBINARY` and `BINARY` columns differed depending on whether the `VARBINARY` column was indexed. (Bug#28076)
- The metadata in some `MYSQL_FIELD` members could be incorrect when a temporary table was used to evaluate a query. (Bug#27990)
- `comp_err` created files with permissions such that they might be inaccessible during `make install` operations. (Bug#27789)
- It was possible to create a view having a column whose name consisted of an empty string or space characters only. (Bug#27695)

See also Bug#31202

- The anonymous accounts were not being created during MySQL installation. (Bug#27692)
- Hostnames sometimes were treated as case sensitive in account-management statements (`CREATE USER`, `GRANT`, `REVOKE`, and so forth). (Bug#19828)
- The `readline` library has been updated to version 5.2. This addresses issues in the `mysql` client where history and editing within the client would fail to work as expected. (Bug#18431)
- The `Aborted_clients` status variable was incremented twice if a client exited without calling `mysql_close()`. (Bug#16918)
- Clients were ignoring the TCP/IP port number specified as the default port via the `--with-tcp-port` configuration option. (Bug#15327)
- Values of types `REAL ZEROFILL`, `DOUBLE ZEROFILL`, `FLOAT ZEROFILL`, were not zero-filled when converted to a character representation in the C prepared statement API. (Bug#11589)
- `mysql` stripped comments from statements sent to the server. Now the `--comments` or `--skip-comments` option can be used to control whether to retain or strip comments. The default is `--skip-comments`. (Bug#11230, Bug#26215)
- Several buffer-size system variables were either being handled incorrectly for large values (for settings larger than 4GB, they were truncated to values less than 4GB without a warning), or were limited unnecessarily to 4GB even on 64-bit systems. The following changes were made:
 - For `key_buffer_size`, values larger than 4GB are allowed on 64-bit platforms (except Windows, for which large val-

ues are truncated to 4GB with a warning).

- For `join_buffer_size`, `sort_buffer_size`, and `myisam_sort_buffer_size`, values are limited to 4GB on all platforms. Larger values are truncated to 4GB with a warning.

In addition, settings for `read_buffer_size` and `read_rnd_buffer_size` are limited to 2GB on all platforms. Larger values are truncated to 2GB with a warning. ([Bug#5731](#), [Bug#29419](#), [Bug#29446](#))

- Executing `DISABLE KEYS` and `ENABLE KEYS` on a non-empty table would cause the size of the index file for the table to grow considerable. This was because the `DISABLE KEYS` operation would only mark the existing index, without deleting the index blocks. The `ENABLE KEYS` operation would re-create the index, adding new blocks, while the previous index blocks would remain. Existing indexes are now dropped and recreated when the `ENABLE KEYS` statement is executed. ([Bug#4692](#))

C.1.15. Release Notes for MySQL Enterprise 5.0.50sp1a [QSP] (11 January 2008)

This is a *Service Pack* release of the MySQL Enterprise Server 5.0.

This is a bugfix release that replaces MySQL 5.0.50sp1.

Bugs fixed:

- **Security Fix:** Three vulnerabilities in yaSSL versions 1.7.5 and earlier were discovered that could lead to a server crash or execution of unauthorized code. The exploit requires a server with yaSSL enabled and TCP/IP connections enabled, but does not require valid MySQL account credentials. The exploit does not apply to OpenSSL.

Note

The proof-of-concept exploit is freely available on the Internet. Everyone with a vulnerable MySQL configuration is advised to upgrade *immediately*.

([Bug#33814](#), [CVE-2008-0226](#), [CVE-2008-0227](#))

C.1.16. Release Notes for MySQL Enterprise 5.0.50sp1 [QSP] (12 December 2007)

This is a *Service Pack* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.50). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Bugs fixed:

- **Security Fix:** Using `RENAME TABLE` against a table with explicit `DATA DIRECTORY` and `INDEX DIRECTORY` options can be used to overwrite system table information by replacing the symbolic link points. the file to which the symlink points.

MySQL will now return an error when the file to which the symlink points already exists. ([Bug#32111](#), [CVE-2007-5969](#))

- **Security Fix:** `ALTER VIEW` retained the original `DEFINER` value, even when altered by another user, which could allow that user to gain the access rights of the view. Now `ALTER VIEW` is allowed only to the original definer or users with the `SUPER` privilege. ([Bug#29908](#))
- **Security Fix:** When using a `FEDERATED` table, the local server could be forced to crash if the remote server returned a result with fewer columns than expected. ([Bug#29801](#))
- A build problem introduced in MySQL 5.0.52 was resolved: The x86 32-bit Intel `icc`-compiled server binary had unwanted dependences on Intel `icc` runtime libraries. ([Bug#32514](#))
- `InnoDB` does not support `SPATIAL` indexes, but could crash when asked to handle one. Now an error is returned. ([Bug#32125](#))
- `mysql-test-run.pl` could not run `mysqld` with `root` privileges. ([Bug#30630](#))

- **InnoDB** had a race condition for an adaptive hash rw-lock waiting for an X-lock. This fix may also provide significant speed improvements on systems experiencing problems with contention for the adaptive hash index. ([Bug#29560](#))

C.1.17. Release Notes for MySQL Enterprise 5.0.50 [MRU] (19 October 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.48). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Functionality added or changed:

- **Incompatible Change:** The parser accepted statements that contained `/* ... */` that were not properly closed with `*/`, such as `SELECT 1 /* + 2`. Statements that contain unclosed `/*`-comments now are rejected with a syntax error.

This fix has the potential to cause incompatibilities. Because of [Bug#26302](#), which caused the trailing `*/` to be truncated from comments in views, stored routines, triggers, and events, it is possible that objects of those types may have been stored with definitions that now will be rejected as syntactically invalid. Such objects should be dropped and re-created so that their definitions do not contain truncated comments. If a stored object definition contains only a single statement (does not use a `BEGIN ... END` block) and contains a comment within the statement, the comment should be moved to follow the statement or the object should be rewritten to use a `BEGIN ... END` block. For example, this statement:

```
CREATE PROCEDURE p() SELECT 1 /* my comment */ ;
```

Can be rewritten in either of these ways:

```
CREATE PROCEDURE p() SELECT 1; /* my comment */
CREATE PROCEDURE p() BEGIN SELECT 1 /* my comment */ ; END;
```

([Bug#28779](#))

- **MySQL Cluster:** Mapping of **NDB** error codes to MySQL storage engine error codes has been improved. ([Bug#28423](#))
- **MySQL Cluster:** The output from the cluster management client showing the progress of data node starts has been improved. ([Bug#23354](#))
- Server parser performance was improved for expression parsing by lowering the number of state transitions and reductions needed. ([Bug#30625](#))
- Server parser performance was improved for boolean expressions. ([Bug#30237](#))

Bugs fixed:

- **Incompatible Change:** The file `mysqld.exe` was mistakenly included in binary distributions between MySQL 5.0.42 and 5.0.48. You should use `mysqld-nt.exe`. ([Bug#32197](#))
- **Incompatible Change:** Multiple-table `DELETE` statements containing ambiguous aliases could have unintended side effects such as deleting rows from the wrong table. Example:

```
DELETE FROM t1 AS a2 USING t1 AS a1 INNER JOIN t2 AS a2;
```

This fix enables alias declarations to be made only in the `table_references` part. Elsewhere in the statement, alias references are allowed but not alias declarations. However, this patch was reverted in MySQL 5.0.54 because it changed the behavior of a General Availability MySQL release. ([Bug#30234](#))

See also [Bug#27525](#)

- **MySQL Cluster: Packaging:** Some commercial MySQL Cluster RPM packages included support for the **InnoDB** storage engine. (**InnoDB** is not part of the standard commercial MySQL Cluster offering.) ([Bug#31989](#))
- **MySQL Cluster:** Attempting to restore a backup made on a cluster host using one endian to a machine using the other endian could cause the cluster to fail. ([Bug#29674](#))
- **MySQL Cluster:** Reads on **BLOB** columns were not locked when they needed to be to guarantee consistency. ([Bug#29102](#))

See also [Bug#31482](#)

- **MySQL Cluster:** A query using joins between several large tables and requiring unique index lookups failed to complete, eventually returning `UNKNOWN ERROR` after a very long period of time. This occurred due to inadequate handling of instances where the Transaction Coordinator ran out of `TransactionBufferMemory`, when the cluster should have returned NDB error code 4012 (`REQUEST NDBD TIME-OUT`). ([Bug#28804](#))
- **MySQL Cluster:** The description of the `--print` option provided in the output from `ndb_restore --help` was incorrect. ([Bug#27683](#))
- **MySQL Cluster:** An invalid subselect on an NDB table could cause `mysqld` to crash. ([Bug#27494](#))
- **MySQL Cluster:** An attempt to perform a `SELECT ... FROM INFORMATION_SCHEMA.TABLES` whose result included information about NDB tables for which the user had no privileges crashed the MySQL Server on which the query was performed. ([Bug#26793](#))
- When a `TIMESTAMP` with a non-zero time part was converted to a `DATE` value, no warning was generated. This caused index lookups to assume that this is a valid conversion and was returning rows that match a comparison between a `TIMESTAMP` value and a `DATE` keypart. Now a warning is generated so that `TIMESTAMP` with a non-zero time part will not match `DATE` values. ([Bug#31221](#))
- A server crash could occur when a non-`DETERMINISTIC` stored function was used in a `GROUP BY` clause. ([Bug#31035](#))
- For an InnoDB table if a `SELECT` was ordered by the primary key and also had a `WHERE field = value` clause on a different field that was indexed, a `DESC` order instruction would be ignored. ([Bug#31001](#))
- A failed `HANDLER ... READ` operation could leave the table in a locked state. ([Bug#30632](#))
- The optimization that uses a unique index to remove `GROUP BY` did not ensure that the index was actually used, thus violating the `ORDER BY` that is implied by `GROUP BY`. ([Bug#30596](#))
- `SHOW STATUS LIKE 'Ssl_cipher_list'` from a MySQL client connected via SSL returned an empty string rather than a list of available ciphers. ([Bug#30593](#))
- Issuing a `DELETE` statement having both an `ORDER BY` clause and a `LIMIT` clause could cause `mysqld` to crash. ([Bug#30385](#))
- The `Last_query_cost` status variable value can be computed accurately only for simple “flat” queries, not complex queries such as those with subqueries or `UNION`. However, the value was not consistently being set to 0 for complex queries. ([Bug#30377](#))
- Queries that had a `GROUP BY` clause and selected `COUNT(DISTINCT bit_column)` returned incorrect results. ([Bug#30324](#))
- Using `DISTINCT` or `GROUP BY` on a `BIT` column in a `SELECT` statement caused the column to be cast internally as an integer, with incorrect results being returned from the query. ([Bug#30245](#))
- Short-format `mysql` commands embedded within `/*! ... */` comments were parsed incorrectly by `mysql`, which discarded the rest of the comment including the terminating `*/` characters. The result was a malformed (unclosed) comment. Now `mysql` does not discard the `*/` characters. ([Bug#30164](#))
- When `mysqldump` wrote `DROP DATABASE` statements within version-specific comments, it included the terminating semicolon in the wrong place, causing following statements to fail when the dump file was reloaded. ([Bug#30126](#))
- If a view used a function in its `SELECT` statement, the columns from the view were not inserted into the `INFORMATION_SCHEMA.COLUMNS` table. ([Bug#29408](#))
- Killing an SSL connection on platforms where MySQL is compiled with `-DSIGNAL_WITH_VIO_CLOSE` (Windows, Mac OS X, and some others) could crash the server. ([Bug#28812](#))
- A `SELECT` in one connection could be blocked by `INSERT ... ON DUPLICATE KEY UPDATE` in another connection even when `low_priority_updates` is set. ([Bug#28587](#))
- `mysql_upgrade` could run binaries dynamically linked against incorrect versions of shared libraries. ([Bug#28560](#))
- `SHOW COLUMNS` returned `NULL` instead of the empty string for the `Default` value of columns that had no default specified. ([Bug#27747](#))
- With recent versions of `DBD::mysql`, `mysqlhotcopy` generated table names that were doubly qualified with the database name. ([Bug#27694](#))

- For InnoDB tables, `CREATE TABLE a AS SELECT * FROM A` would fail. (Bug#25164)
- Under heavy load with a large query cache, invalidating part of the cache could cause the server to freeze (that is, to be unable to service other operations until the invalidation was complete). (Bug#21074)
- Worked around an `icc` problem with an incorrect machine instruction being generated in the context of software pre-fetching after a subroutine got in-lined. (Upgrading to `icc` 10.0.026 makes the workaround unnecessary.) (Bug#20803)
- Parameters of type `DATETIME` or `DATE` in stored procedures were silently converted to `VARBINARY`. (Bug#13675)

C.1.18. Release Notes for MySQL Enterprise 5.0.48 [MRU] (27 August 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

Important

This release was withdrawn from production and is no longer available.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.46). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Functionality added or changed:

- If a `MyISAM` table is created with no `DATA DIRECTORY` option, the `.MYD` file is created in the database directory. By default, if `MyISAM` finds an existing `.MYD` file in this case, it overwrites it. The same applies to `.MYI` files for tables created with no `INDEX DIRECTORY` option. To suppress this behavior, start the server with the new `--keep_files_on_create` option, in which case `MyISAM` will not overwrite existing files and returns an error instead. (Bug#29325)
- The `EXAMPLE` storage engine is now enabled by default.

Bugs fixed:

- **MySQL Cluster:** Warnings and errors generated by `ndb_config --config-file=file` were sent to `stdout`, rather than to `stderr`. (Bug#25941)
- **MySQL Cluster:** When a cluster backup was terminated using the `ABORT BACKUP` command in the management client, a misleading error message `BACKUP ABORTED BY APPLICATION: PERMANENT ERROR: INTERNAL ERROR` was returned. The error message returned in such cases now reads `BACKUP ABORTED BY USER REQUEST`. (Bug#21052)
- **MySQL Cluster:** Large file support did not work in AIX server binaries. (Bug#10776)
- **Replication:** `SHOW SLAVE STATUS` failed when slave I/O was about to terminate. (Bug#34305)
- Memory corruption occurred for some queries with a top-level `OR` operation in the `WHERE` condition if they contained equality predicates and other sargable predicates in disjunctive parts of the condition. (Bug#30396)
- The server created temporary tables for filesort operations in the working directory, not in the directory specified by the `tmp-dir` system variable. (Bug#30287)
- The query cache does not support retrieval of statements for which column level access control applies, but the server was still caching such statements, thus wasting memory. (Bug#30269)
- `GROUP BY` on `BIT` columns produced incorrect results. (Bug#30219)
- Using `KILL QUERY` or `KILL CONNECTION` to kill a `SELECT` statement caused a server crash if the query cache was enabled. (Bug#30201)
- Prepared statements containing `CONNECTION_ID()` could be written improperly to the binary log. (Bug#30200)
- When a thread executing a `DROP TABLE` statement was killed, the table name locks that had been acquired were not released. (Bug#30193)
- Use of local variables with non-ASCII names in stored procedures crashed the server. (Bug#30120)
- On Windows, client libraries lacked symbols required for linking. (Bug#30118)

- `--myisam-recover=`' ' (empty option value) did not disable MyISAM recovery. (Bug#30088)
- The `IS_UPDATABLE` column in the `INFORMATION_SCHEMA.VIEWS` table was not always set correctly. (Bug#30020)
- Statements within stored procedures ignored the value of the `low_priority_updates` system variable. (Bug#29963)
See also Bug#26162
- For MyISAM tables on Windows, `INSERT`, `DELETE`, or `UPDATE` followed by `ALTER TABLE` within `LOCK TABLES` could cause table corruption. (Bug#29957)
- With auto-reconnect enabled, row fetching for a prepared statement could crash after reconnect occurred because loss of the statement handler was not accounted for. (Bug#29948)
- `LOCK TABLES` did not pre-lock tables used in triggers of the locked tables. Unexpected locking behavior and statement failures similar to `FAILED: 1100: TABLE 'xx' WAS NOT LOCKED WITH LOCK TABLES` could result. (Bug#29929)
- `INSERT ... VALUES(CONNECTION_ID(), ...)` statements were written to the binary log in such a way that they could not be properly restored. (Bug#29928)
- Adding `DISTINCT` could cause incorrect rows to appear in a query result. (Bug#29911)
- Using the `DATE()` function in a `WHERE` clause did not return any records after encountering `NULL`. However, using `TRIM` or `CAST` produced the correct results. (Bug#29898)
- Very long prepared statements in stored procedures could cause a server crash. (Bug#29856)
- If query execution involved a temporary table, `GROUP_CONCAT()` could return a result with an incorrect character set. (Bug#29850)
- If one thread was performing concurrent inserts, other threads reading from the same table using equality key searches could see the index values for new rows before the data values had been written, leading to reports of table corruption. (Bug#29838)
- Repeatedly accessing a view in a stored procedure (for example, in a loop) caused a small amount of memory to be allocated per access. Although this memory is deallocated on disconnect, it could be a problem for a long running stored procedures that make repeated access of views. (Bug#29834)
- `mysqldump` produced output that incorrectly discarded the `NO_AUTO_VALUE_ON_ZERO` value of the `SQL_MODE` variable after dumping triggers. (Bug#29788)
- An assertion failure occurred within yaSSL for very long keys. (Bug#29784)
- For `MEMORY` tables, the `index_merge` union access method could return incorrect results. (Bug#29740)
- Comparison of `TIME` values using the `BETWEEN` operator led to string comparison, producing incorrect results in some cases. Now the values are compared as integers. (Bug#29739)
- The thread ID was not reset properly after execution of `mysql_change_user()`, which could cause replication failure when replicating temporary tables. (Bug#29734)
- For a table with a `DATE` column `date_col` such that selecting rows with `WHERE date_col = 'date_val 00:00:00'` yielded a non-empty result, adding `GROUP BY date_col` caused the result to be empty. (Bug#29729)
- In some cases, `INSERT INTO ... SELECT ... GROUP BY` could insert rows even if the `SELECT` by itself produced an empty result. (Bug#29717)
- For the embedded server, the `mysql_stmt_store_result()` C API function caused a memory leak for empty result sets. (Bug#29687)
- `EXPLAIN` produced `Impossible where` for statements of the form `SELECT ... FROM t WHERE c=0`, where `c` was an `ENUM` column defined as a primary key. (Bug#29661)
- On Windows, `ALTER TABLE` hung if records were locked in share mode by a long-running transaction. (Bug#29644)
- A left join between two views could produce incorrect results. (Bug#29604)
- Certain statements with unions, subqueries, and joins could result in huge memory consumption. (Bug#29582)
- Clients using SSL could hang the server. (Bug#29579)
- A slave running with `--log-slave-updates` would fail to write `INSERT DELAY IGNORE` statements to its binary log,

resulting in different binary log contents on the master and slave. (Bug#29571)

- An incorrect result was returned when comparing string values that were converted to `TIME` values with `CAST()`. (Bug#29555)
- Operations that used the time zone replicated the time zone only for successful operations, but did not replicate the time zone for errors that need to know it. (Bug#29536)
- Conversion of ASCII DEL (`0x7F`) to Unicode incorrectly resulted in QUESTION MARK (`0x3F`) rather than DEL. (Bug#29499)
- A field packet with `NULL` fields caused a `libmysqlclient` crash. (Bug#29494)
- When using a combination of `HANDLER... READ` and `DELETE` on a table, MySQL continued to open new copies of the table every time, leading to an exhaustion of file descriptors. (Bug#29474)

This regression was introduced by Bug#21587

- On Windows, the `mysql` client died if the user entered a statement and Return after entering Control-C. (Bug#29469)
- Failure to consider collation when comparing space characters could lead to incorrect index entry order, making it impossible to find some index values. (Bug#29461)
- Killing an `INSERT DELAYED` thread caused a server crash. (Bug#29431)
- The special “zero” `ENUM` value was coerced to the normal empty string `ENUM` value during a column-to-column copy. This affected `CREATE... SELECT` statements and `SELECT` statements with aggregate functions on `ENUM` columns in the `GROUP BY` clause. (Bug#29360)
- Optimization of queries with `DETERMINISTIC` stored functions in the `WHERE` clause was ineffective: A sequential scan was always used. (Bug#29338)
- `MyISAM` corruption could occur with the `cp932_japanese_ci` collation for the `cp932` character set due to incorrect comparison for trailing space. (Bug#29333)
- The `mysql_list_fields()` C API function incorrectly set `MYSQL_FIELD::decimals` for some view columns. (Bug#29306)
- `InnoDB` refused to start on some versions of FreeBSD with LinuxThreads. This is fixed by enabling file locking on FreeBSD. (Bug#29155)
- `INSERT DELAYED` statements on a master server are replicated as non-`DELAYED` inserts on slaves (which is normal, to preserve serialization), but the inserts on the slave did not use concurrent inserts. Now `INSERT DELAYED` on a slave is converted to a concurrent insert when possible, and to a normal insert otherwise. (Bug#29152)
- A maximum of 4TB `InnoDB` free space was reported by `SHOW TABLE STATUS`, which is incorrect on systems with more than 4TB space. (Bug#29097)
- A byte-order issue in writing a spatial index to disk caused bad index files on some systems. (Bug#29070)
- Creation of a legal stored procedure could fail if no default database had been selected. (Bug#29050)
- Coercion of ASCII values to character sets that are a superset of ASCII sometimes was not done, resulting in `ILLEGAL MIX OF COLLATIONS` errors. These cases now are resolved using repertoire, a new string expression attribute (see Section 9.1.6, “String Repertoire”). (Bug#28875)
- Fast `ALTER TABLE` (that works without rebuilding the table) acquired duplicate locks in the storage engine. In `MyISAM`, if `ALTER TABLE` was issued under `LOCK TABLE`, it caused all data inserted after `LOCK TABLE` to disappear. (Bug#28838)
- Tables using the `InnoDB` storage engine incremented `AUTO_INCREMENT` values incorrectly with `ON DUPLICATE KEY UPDATE`. (Bug#28781)
- Starting the server with an `innodb_force_recovery` value of 4 did not work. (Bug#28604)
- For `InnoDB` tables, MySQL unnecessarily sorted records in certain cases when the records were retrieved by `InnoDB` in the proper order already. (Bug#28591)
- `mysql_install_db` could fail to find script files that it needs. (Bug#28585)
- If a stored procedure was created and invoked prior to selecting a default database with `USE`, a `NO DATABASE SELECTED` error occurred. (Bug#28551)

- On Mac OS X, shared-library installation pathnames were incorrect. (Bug#28544)
 - Using the `--skip-add-drop-table` option with `mysqldump` generated incorrect SQL if the database included any views. The recreation of views requires the creation and removal of temporary tables. This option suppressed the removal of those temporary tables. The same applied to `--compact` since this option also invokes `--skip-add-drop-table`. (Bug#28524)
 - A race condition in the interaction between `MyISAM` and the query cache code caused the query cache not to invalidate itself for concurrently inserted data. (Bug#28249)
 - Indexing column prefixes in `InnoDB` tables could cause table corruption. (Bug#28138)
 - Index creation could fail due to truncation of key values to the maximum key length rather than to a multiple of the maximum character length. (Bug#28125)
 - On Windows, symbols for `yaSSL` and `taocrypt` were missing from `mysqlclient.lib`, resulting in unresolved symbol errors for clients linked against that library. (Bug#27861)
 - Some `SHOW` statements and `INFORMATION_SCHEMA` queries could expose information not allowed by the user's access privileges. (Bug#27629)
 - Some character mappings in the `ascii.xml` file were incorrect. (Bug#27562)
 - An error that happened inside `INSERT`, `UPDATE`, or `DELETE` statements performed from within a stored function or trigger could cause inconsistency between master and slave servers. (Bug#27417)
 - A `SELECT` with more than 31 nested dependent subqueries returned an incorrect result. (Bug#27352)
 - `INSERT INTO ... SELECT` caused a crash if `innodb_locks_unsafe_for_binlog` was enabled. (Bug#27294)
 - `FEDERATED` tables had an artificially low maximum of key length. (Bug#26909)
 - After the first read of a `TEMPORARY` table, `CHECK TABLE` could report the table as being corrupt. (Bug#26325)
 - If an operation had an `InnoDB` table, and two triggers, `AFTER UPDATE` and `AFTER INSERT`, competing for different resources (such as two distinct `MyISAM` tables), the triggers were unable to execute concurrently. In addition, `INSERT` and `UPDATE` statements for the `InnoDB` table were unable to run concurrently. (Bug#26141)
 - `ALTER DATABASE` did not require at least one option. (Bug#25859)
 - Using `HANDLER` to open a table having a storage engine not supported by `HANDLER` properly returned an error, but also improperly prevented the table from being dropped by other connections. (Bug#25856)
 - When using a `FEDERATED` table, the value of `last_insert_id()` would not correctly update the C API interface, which would affect the autogenerated ID returned both through the C API and the MySQL protocol, affecting Connectors that used the protocol and/or C API. (Bug#25714)
 - The server was blocked from opening other tables while the `FEDERATED` engine was attempting to open a remote table. Now the server does not check the correctness of a `FEDERATED` table at `CREATE TABLE` time, but waits until the table actually is accessed. (Bug#25679)
 - Several `InnoDB` assertion failures were corrected. (Bug#25645)
 - In a stored function or trigger, when `InnoDB` detected deadlock, it attempted rollback and displayed an incorrect error message (`EXPLICIT OR IMPLICIT COMMIT IS NOT ALLOWED IN STORED FUNCTION OR TRIGGER`). Now `InnoDB` returns an error under these conditions and does not attempt rollback. Rollback is handled outside of `InnoDB` above the function/trigger level. (Bug#24989)
 - Dropping a temporary `InnoDB` table that had been locked with `LOCK TABLES` caused a server crash. (Bug#24918)
 - On Windows, executables did not include Vista manifests. (Bug#24732)
- See also [Bug#22563](#)
- Slave servers could incorrectly interpret an out-of-memory error from the master and reconnect using the wrong binary log position. (Bug#24192)
 - If MySQL/`InnoDB` crashed very quickly after starting up, it would not force a checkpoint. In this case, `InnoDB` would skip crash recovery at next startup, and the database would become corrupt. Now, if the redo log scan at `InnoDB` startup goes past the last checkpoint, crash recovery is forced. (Bug#23710)

- `SHOW INNODB STATUS` caused an assertion failure under high load. (Bug#22819)
- A statement of the form `CREATE TABLE IF NOT EXISTS t1 SELECT f1() AS i` failed with a deadlock error if the stored function `f1()` referred to a table with the same name as the to-be-created table. Now it correctly produces a message that the table already exists. (Bug#22427)
- Read lock requests that were blocked by a pending write lock request were not allowed to proceed if the statement requesting the write lock was killed. (Bug#21281)
- On Windows, the server used 10MB of memory for each connection thread, resulting in memory exhaustion. Now each thread uses 1MB. (Bug#20815)
- InnoDB produced an unnecessary (and harmless) warning: `InnoDB: Error: trying to declare trx to enter InnoDB, but InnoDB: it already is declared.` (Bug#20090)
- `SQL_BIG_RESULT` had no effect for `CREATE TABLE ... SELECT SQL_BIG_RESULT ...` statements. (Bug#15130)
- `mysql_setpermission` tried to grant global-only privileges at the database level. (Bug#14618)
- For the general query log, logging of prepared statements executed via the C API differed from logging of prepared statements performed with `PREPARE` and `EXECUTE`. Logging for the latter was missing the `Prepare` and `Execute` lines. (Bug#13326)
- Backup software can cause `ERROR_SHARING_VIOLATION` or `ERROR_LOCK_VIOLATION` conditions during file operations. InnoDB now retries forever until the condition goes away. (Bug#9709)

C.1.19. Release Notes for MySQL Enterprise 5.0.46 [MRU] (13 July 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bugfixes that have been applied since the last MySQL Enterprise Server release (5.0.44). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise/advisors.html>.

Functionality added or changed:

- **MySQL Cluster:** `auto_increment_increment` and `auto_increment_offset` are now supported for NDB tables. (Bug#26342)
- If a `MERGE` table cannot be opened or used because of a problem with an underlying table, `CHECK TABLE` now displays information about which table caused the problem. (Bug#26976)
- The `SQL_MODE`, `FOREIGN_KEY_CHECKS`, `UNIQUE_CHECKS`, character set/collations, and `SQL_AUTO_IS_NULL` session variables are written to the binary log and honoured during replication. See Section 5.2.3, “The Binary Log”.

Bugs fixed:

- **MySQL Cluster:** When restarting a data node, queries could hang during that node's start phase 5, and continue only after the node had entered phase 6. (Bug#29364)
- **MySQL Cluster:** Replica redo logs were inconsistently handled during a system restart. (Bug#29354)
- **MySQL Cluster:** The management client's response to `START BACKUP WAIT COMPLETED` did not include the backup ID. (Bug#27640)
- On the IBM i5 platform, the installation script in the `.savf` binaries unconditionally executed the `mysql_install_db` script. (Bug#30084)
- `gcov` coverage-testing information was not written if the server crashed. (Bug#29543)
- Corrupt data resulted from use of `SELECT ... INTO OUTFILE 'file_name' FIELDS ENCLOSED BY 'c'`, where `c` is a digit or minus sign, followed by `LOAD DATA INFILE 'file_name' FIELDS ENCLOSED BY 'c'`. (Bug#29442)
- Use of `SHOW BINLOG EVENTS` for a non-existent log file followed by `PURGE MASTER LOGS` caused a server crash. (Bug#29420)

- Assertion failure could occur for grouping queries that employed `DECIMAL` user variables with assignments to them. (Bug#29417)
- For `CAST(expr AS DECIMAL(M,D))`, the limits of 65 and 30 on the precision (*M*) and scale (*D*) were not enforced. (Bug#29415)
- Results for a select query that aliases the column names against a view could duplicate one column while omitting another. This bug could occur for a query over a multiple-table view that includes an `ORDER BY` clause in its definition. (Bug#29392)
- `mysqldump` created a stray file when a given a too-long filename argument. (Bug#29361)
- `FULLTEXT` indexes could be corrupted by certain `gbk` characters. (Bug#29299)
- `SELECT ... INTO OUTFILE` followed by `LOAD DATA` could result in garbled characters when the `FIELDS ENCLOSED BY` clause named a delimiter of `'0'`, `'b'`, `'n'`, `'r'`, `'t'`, `'N'`, or `'Z'` due to an interaction of character encoding and doubling for data values containing the enclosed-by character. (Bug#29294)
- Sort order of the collation wasn't used when comparing trailing spaces. This could lead to incorrect comparison results, incorrectly created indexes, or incorrect result set order for queries that include an `ORDER BY` clause. (Bug#29261)
- If an `ENUM` column contained `' '` as one of its members (represented with numeric value greater than 0), and the column contained error values (represented as 0 and displayed as `' '`), using `ALTER TABLE` to modify the column definition caused the 0 values to be given the numeric value of the non-zero `' '` member. (Bug#29251)
- Calling `mysql_options()` after `mysql_real_connect()` could cause clients to crash. (Bug#29247)
- `CHECK TABLE` for `ARCHIVE` tables could falsely report table corruption or cause a server crash. (Bug#29207)
- Mixing binary and `utf8` columns in a union caused field lengths to be calculated incorrectly, resulting in truncation. (Bug#29205)
- `AsText()` could fail with a buffer overrun. (Bug#29166)
- `LOCK TABLES` was not atomic when more than one `InnoDB` tables were locked. (Bug#29154)
- A network structure was initialized incorrectly, leading to embedded server crashes. (Bug#29117)
- An assertion failure occurred if a query contained a conjunctive predicate of the form `view_column = constant` in the `WHERE` clause and the `GROUP BY` clause contained a reference to a different view column. The fix also enables application of an optimization that was being skipped if a query contained a conjunctive predicate of the form `view_column = constant` in the `WHERE` clause and the `GROUP BY` clause contained a reference to the same view column. (Bug#29104)
- If an `INSERT INTO ... SELECT` statement inserted into the same table that the `SELECT` retrieved from, and the `SELECT` included `ORDER BY` and `LIMIT` clauses, different data was inserted than the data produced by the `SELECT` executed by itself. (Bug#29095)
- Queries that performed a lookup into a `BINARY` index containing key values ending with spaces caused an assertion failure for debug builds and incorrect results for non-debug builds. (Bug#29087)
- The semantics of `BIGINT` depended on platform-specific characteristics. (Bug#29079)
- If one of the queries in a `UNION` used the `SQL_CACHE` option and another query in the `UNION` contained a nondeterministic function, the result was still cached. For example, this query was incorrectly cached:

```
SELECT NOW() FROM t1 UNION SELECT SQL_CACHE 1 FROM t1;
```

(Bug#29053)
- `DROP USER` statements that named multiple users, only some of which could be dropped, were replicated incorrectly. (Bug#29030)
- `REPLACE`, `INSERT IGNORE`, and `UPDATE IGNORE` did not work for `FEDERATED` tables. (Bug#29019)
- Inserting into `InnoDB` tables and executing `RESET MASTER` in multiple threads cause assertion failure in debug server binaries. (Bug#28983)
- For a `ucs2` column, `GROUP_CONCAT()` did not convert separators to the result character set before inserting them, producing a result containing a mixture of two different character sets. (Bug#28925)
- Queries using UDFs or stored functions were cached. (Bug#28921)

- For a join with `GROUP BY` and/or `ORDER BY` and a view reference in the `FROM` list, the query metadata erroneously showed empty table aliases and database names for the view columns. (Bug#28898)
- Non-`utf8` characters could get mangled when stored in `CSV` tables. (Bug#28862)
- `ALTER VIEW` is not supported as a prepared statement but was not being rejected. `ALTER VIEW` is now prohibited as a prepared statement or when called within stored routines. (Bug#28846)
- In strict SQL mode, errors silently stopped the SQL thread even for errors named using the `--slave-skip-errors` option. (Bug#28839)
- Runtime changes to the `log_queries_not_using_indexes` system variable were ignored. (Bug#28808)
- Selecting a column not present in the selected-from table caused an extra error to be produced by `SHOW ERRORS`. (Bug#28677)
- For a statement of the form `CREATE t1 SELECT integer_constant`, the server created the column using the `DECIMAL` data type for large negative values that are within the range of `BIGINT`. (Bug#28625)
- When one thread attempts to lock two (or more) tables and another thread executes a statement that aborts these locks (such as `REPAIR TABLE`, `OPTIMIZE TABLE`, or `CHECK TABLE`), the thread might get a table object with an incorrect lock type in the table cache. The result is table corruption or a server crash. (Bug#28574)
- `mysqlbinlog --hexdump` generated incorrect output due to omission of the “#” comment character for some comment lines. (Bug#28293)
- The `LOCATE()` function returned `NULL` if any of its arguments evaluated to `NULL`. Likewise, the predicate, `LOCATE(str, NULL) IS NULL`, erroneously evaluated to `FALSE`. (Bug#27932)
- The modification of a table by a partially completed multi-column update was not recorded in the binlog, rather than being marked by an event and a corresponding error code. (Bug#27716)
- A stack overrun could occur when storing `DATETIME` values using repeated prepared statements. (Bug#27592)
- Dropping a user-defined function could cause a server crash if the function was still in use by another thread. (Bug#27564)
- Unsafe aliasing in the source caused a client library crash when compiled with `gcc 4` at high optimization levels. (Bug#27383)
- Index-based range reads could fail for comparisons that involved contraction characters (such as `ch` in Czech or `ll` in Spanish). (Bug#27345)
- Aggregations in subqueries that refer to outer query columns were not always correctly referenced to the proper outer query. (Bug#27333)
- Error returns from the `time()` system call were ignored. (Bug#27198)
- Phantom reads could occur under `InnoDB` serializable isolation level. (Bug#27197)
- The `SUBSTRING()` function returned the entire string instead of an empty string when it was called from a stored procedure and when the length parameter was specified by a variable with the value “0”. (Bug#27130)
- `ALTER TABLE ... ENABLE KEYS` could cause `mysqld` to crash when executed on a table containing on a `MyISAM` table containing billions of rows. (Bug#27029)
- Binary content `0x00` in a `BLOB` column sometimes became `0x5C 0x00` following a dump and reload, which could cause problems with data using multi-byte character sets such as `GBK` (Chinese). This was due to a problem with `SELECT INTO OUTFILE` whereby `LOAD DATA` later incorrectly interpreted `0x5C` as the second byte of a multi-byte sequence rather than as the `SOLIDUS` (“\”) character, used by MySQL as the escape character. (Bug#26711)
- Index creation could corrupt the table definition in the `.frm` file: 1) A table with the maximum number of key segments and maximum length key name would have a corrupted `.frm` file, due to incorrect calculation of the total key length. 2) `MyISAM` would reject a table with the maximum number of keys and the maximum number of key segments in all keys. (It would allow one less than this total maximum.) Now `MyISAM` accepts a table defined with the maximum. (Bug#26642)
- The index merge union access algorithm could produce incorrect results with `InnoDB` tables. The problem could also occur for queries that used `DISTINCT`. (Bug#25798)
- Under ActiveState Perl, `mysql-test-run.pl` could kill itself when attempting to kill other processes. (Bug#25657)
- A query with `DISTINCT` in the select list to which the loose-scan optimization for grouping queries was applied returned an incorrect result set when the query was used with the `SQL_BIG_RESULT` option. (Bug#25602)

- For a multiple-row insert into a `FEDERATED` table that refers to a remote transactional table, if the insert failed for a row due to constraint failure, the remote table would contain a partial commit (the rows preceding the failed one) instead of rolling back the statement completely. This occurred because the rows were treated as individual inserts.

Now `FEDERATED` performs bulk-insert handling such that multiple rows are sent to the remote table in a batch. This provides a performance improvement and enables the remote table to perform statement rollback properly should an error occur. This capability has the following limitations:

- The size of the insert cannot exceed the maximum packet size between servers. If the insert exceeds this size, it is broken into multiple packets and the rollback problem can occur.
- Bulk-insert handling does not occur for `INSERT ... ON DUPLICATE KEY UPDATE`.

([Bug#25513](#))

- The `FEDERATED` storage engine failed silently for `INSERT ... ON DUPLICATE KEY UPDATE` if a duplicate key violation occurred. `FEDERATED` does not support `ON DUPLICATE KEY UPDATE`, so now it correctly returns an `ER_DUP_KEY` error if a duplicate key violation occurs. ([Bug#25511](#))
- A too-long `shared-memory-base-name` value could cause a buffer overflow and crash the server or clients. ([Bug#24924](#))
- The server deducted some bytes from the `key_cache_block_size` option value and reduced it to the next lower 512 byte boundary. The resulting block size was not a power of two. Setting the `key_cache_block_size` system variable to a value that is not a power of two resulted in `MyISAM` table corruption. ([Bug#23068](#), [Bug#28478](#), [Bug#25853](#))
- `SHOW BINLOG EVENTS` displayed incorrect values of `End_log_pos` for events associated with transactional storage engines. ([Bug#22540](#))
- Under ActiveState Perl, `mysql-test-run.pl` would not run. ([Bug#18415](#))
- The server crashed when the size of an `ARCHIVE` table grew larger than 2GB. ([Bug#15787](#))
- On 64-bit Windows systems, the Config Wizard failed to complete the setup because 64-bit Windows does not resolve dynamic linking of the 64-bit `libmysql.dll` to a 32-bit application like the Config Wizard. ([Bug#14649](#))
- The server returned data from `SHOW CREATE TABLE` statement or a `SELECT` statement on an `INFORMATION_SCHEMA` table using the `binary` character set. ([Bug#10491](#))
- Bulk-insert handling does not occur for `INSERT ... ON DUPLICATE KEY UPDATE`.
- The size of the insert cannot exceed the maximum packet size between servers. If the insert exceeds this size, it is broken into multiple packets and the rollback problem can occur.

C.1.20. Release Notes for MySQL Enterprise 5.0.44sp1 [QSP] (01 August 2007)

This is a *Service Pack* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.44).

Bugs fixed:

- Using the `DATE()` function in a `WHERE` clause did not return any records after encountering `NULL`. However, using `TRIM` or `CAST` produced the correct results. ([Bug#29898](#))
- For a table with a `DATE` column `date_col` such that selecting rows with `WHERE date_col = 'date_val 00:00:00'` yielded a non-empty result, adding `GROUP BY date_col` caused the result to be empty. ([Bug#29729](#))
- Optimization of queries with `DETERMINISTIC` stored functions in the `WHERE` clause was ineffective: A sequential scan was always used. ([Bug#29338](#))
- Creation of a legal stored procedure could fail if no default database had been selected. ([Bug#29050](#))
- If a stored procedure was created and invoked prior to selecting a default database with `USE`, a `NO DATABASE SELECTED` error occurred. ([Bug#28551](#))

C.1.21. Release Notes for MySQL Enterprise 5.0.44 [MRU] (21 June 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.42).

Functionality added or changed:

- **MySQL Cluster:** The server source tree now includes scripts to simplify building MySQL with SCI support. For more information about SCI interconnects and these build scripts, see [Section 19.11.1, “Configuring MySQL Cluster to use SCI Sockets”](#). ([Bug#25470](#))
- Enterprise builds did not include the `CSV` storage engine. `CSV` is now included in Enterprise builds for all platforms except Windows, QNX, and NetWare. ([Bug#28844](#))
- `INSERT DELAYED` statements on `BLACKHOLE` tables are now rejected, due to the fact that the `BLACKHOLE` storage engine does not support them. ([Bug#27998](#))
- A new status variable, `Com_call_procedure`, indicates the number of calls to stored procedures. ([Bug#27994](#))

Bugs fixed:

- **Security Fix:** A malformed password packet in the connection protocol could cause the server to crash. Thanks for Dormando for reporting this bug, and for providing details and a proof of concept. ([Bug#28984](#), [CVE-2007-3780](#))
- **Security Fix:** `CREATE TABLE LIKE` did not require any privileges on the source table. Now it requires the `SELECT` privilege.

In addition, `CREATE TABLE LIKE` was not isolated from alteration by other connections, which resulted in various errors and incorrect binary log order when trying to execute concurrently a `CREATE TABLE LIKE` statement and either DDL statements on the source table or DML or DDL statements on the target table. ([Bug#23667](#), [Bug#25578](#), [CVE-2007-3781](#))

- **Incompatible Change:** When `mysqldump` was run with the `--delete-master-logs` option, binary log files were deleted before it was known that the dump had succeeded, not after. (The method for removing log files used `RESET MASTER` prior to the dump. This also reset the binary log sequence numbering to `.000001`.) Now `mysqldump` flushes the logs (which creates a new binary log number with the next sequence number), performs the dump, and then uses `PURGE MASTER LOGS` to remove the log files older than the new one. This also preserves log numbering because the new log with the next number is generated and only the preceding logs are removed. However, this may affect applications if they rely on the log numbering sequence being reset. ([Bug#24733](#))
- **Incompatible Change:** The use of an `ORDER BY` or `DISTINCT` clause with a query containing a call to the `GROUP_CONCAT()` function caused results from previous queries to be redisplayed in the current result. The fix for this includes replacing a `BLOB` value used internally for sorting with a `VARCHAR`. This means that for long results (more than 65,535 bytes), it is possible for truncation to occur; if so, an appropriate warning is issued. ([Bug#23856](#), [Bug#28273](#))
- **MySQL Cluster:** A corrupt schema file could cause a `FILE ALREADY OPEN` error. ([Bug#28770](#))
- **MySQL Cluster:** Setting `InitialNoOpenFiles` equal to `MaxNoOfOpenFiles` caused an error. This was due to the fact that the actual value of `MaxNoOfOpenFiles` as used by the cluster was offset by 1 from the value set in `config.ini`. ([Bug#28749](#))
- **MySQL Cluster:** `UPDATE IGNORE` statements involving the primary keys of multiple tables could result in data corruption. ([Bug#28719](#))
- **MySQL Cluster:** A race condition could result when non-master nodes (in addition to the master node) tried to update active status due to a local checkpoint (that is, between `NODE_FAILREP` and `COPY_GCIREQ` events). Now only the master updates the active status. ([Bug#28717](#))
- **MySQL Cluster:** A fast global checkpoint under high load with high usage of the redo buffer caused data nodes to fail. ([Bug#28653](#))
- **MySQL Cluster:** When an API node sent more than 1024 signals in a single batch, `NDB` would process only the first 1024 of these, and then hang. ([Bug#28443](#))
- **MySQL Cluster:** A delay in obtaining `AUTO_INCREMENT` IDs could lead to excess temporary errors. ([Bug#28410](#))
- **MySQL Cluster:** A failure to release internal resources following an error could lead to problems with single user mode. ([Bug#25818](#))
- On the IBM i5 platform, the installation script in the `.savf` binaries unconditionally executed the `mysql_install_db`

script. This problem was fixed in a repackaged distribution numbered 5.0.44b. (Bug#30084)

- Long pathnames for internal temporary tables could cause stack overflows. (Bug#29015)
- Using an `INTEGER` column from a table to `ROUND()` a number produced different results than using a constant with the same value as the `INTEGER` column. (Bug#28980)
- If a program binds a given number of parameters to a prepared statement handle and then somehow changes `stmt->param_count` to a different number, `mysql_stmt_execute()` could crash the client or server. (Bug#28934)
- `INSERT .. ON DUPLICATE KEY UPDATE` could under some circumstances silently update rows when it should not have. (Bug#28904)
- Queries that used `UUID()` were incorrectly allowed into the query cache. (This should not happen because `UUID()` is non-deterministic.) (Bug#28897)
- Using a `VIEW` created with a non-existing `DEFINER` could lead to incorrect results under some circumstances. (Bug#28895)
- For `InnoDB` tables that use the `utf8` character set, incorrect results could occur for DML statements such as `DELETE` or `UPDATE` that use an index on character-based columns. (Bug#28878)

See also [Bug#29449](#), [Bug#30485](#), [Bug#31395](#)

This regression was introduced by [Bug#13195](#)

- On Windows, `USE_TLS` was not defined for `mysqlclient.lib`. (Bug#28860)
- A subquery with `ORDER BY` and `LIMIT 1` could cause a server crash. (Bug#28811)
- Using `BETWEEN` with non-indexed date columns and short formats of the date string could return incorrect results. (Bug#28778)
- Selecting `GEOMETRY` columns in a `UNION` caused a server crash. (Bug#28763)
- When constructing the path to the original `.frm` file, `ALTER .. RENAME` was unnecessarily (and incorrectly) lowercasing the entire path when not on a case-insensitive filesystem, causing the statement to fail. (Bug#28754)
- Searches on indexed and non-indexed `ENUM` columns could return different results for empty strings. (Bug#28729)
- Executing `EXPLAIN EXTENDED` on a query using a derived table over a grouping subselect could lead to a server crash. This occurred only when materialization of the derived tables required creation of an auxiliary temporary table, an example being when a grouping operation was carried out with usage of a temporary table. (Bug#28728)
- The result of evaluation for a view's `CHECK OPTION` option over an updated record and records of merged tables was arbitrary and dependant on the order of records in the merged tables during the execution of the `SELECT` statement. (Bug#28716)
- The “manager thread” of the LinuxThreads implementation was unintentionally started before `mysqld` had dropped privileges (to run as an unprivileged user). This caused signaling between threads in `mysqld` to fail when the privileges were finally dropped. (Bug#28690)
- For debug builds, `ALTER TABLE` could trigger an assertion failure due to occurrence of a deadlock when committing changes. (Bug#28652)
- After an upgrade, the names of stored routines referenced by views were no longer displayed by `SHOW CREATE VIEW`. (Bug#28605)

This regression was introduced by [Bug#23491](#)

- Killing from one connection a long-running `EXPLAIN QUERY` started from another connection caused `mysqld` to crash. (Bug#28598)
- Outer join queries with `ON` conditions over constant outer tables did not return `NULL`-complemented rows when conditions were evaluated to `FALSE`. (Bug#28571)
- An update on a multiple-table view with the `CHECK OPTION` clause and a subquery in the `WHERE` condition could cause an assertion failure. (Bug#28561)
- `PURGE MASTER LOGS BEFORE (subquery)` caused a server crash. Subqueries are forbidden in the `BEFORE` clause now. (Bug#28553)
- `mysqldump` calculated the required memory for a hex-blob string incorrectly causing a buffer overrun. This in turn caused

`mysqldump` to crash silently and produce incomplete output. (Bug#28522)

- Passing a `DECIMAL` value as a parameter of a statement prepared with `PREPARE` resulted in an error. (Bug#28509)
- `mysql_affected_rows()` could return an incorrect result for `INSERT ... ON DUPLICATE KEY UPDATE` if the `CLIENT_FOUND_ROWS` flag was set. (Bug#28505)
- A query that grouped by the result of an expression returned a different result when the expression was assigned to a user variable. (Bug#28494)
- Subselects returning `LONG` values in MySQL versions later than 5.0.24a returned `LONGLONG` prior to this. The previous behavior was restored. (Bug#28492)

This regression was introduced by Bug#19714

- Forcing the use of an index on a `SELECT` query when the index had been disabled would raise an error without running the query. The query now executes, with a warning generated noting that the use of a disabled index has been ignored. (Bug#28476)
- The result of executing of a prepared statement created with `PREPARE s FROM "SELECT 1 LIMIT ?"` was not replicated correctly. (Bug#28464)
- The query `SELECT '2007-01-01' + INTERVAL column_name DAY FROM table_name` caused `mysqld` to fail. (Bug#28450)
- A server crash could happen under rare conditions such that a temporary table outgrew heap memory reserved for it and the remaining disk space was not big enough to store the table as a `MyISAM` table. (Bug#28449)
- `mysql_upgrade` failed if certain SQL modes were set. Now it sets the mode itself to avoid this problem. (Bug#28401)
- The test case for `mysqldump` failed with `bin-log` disabled. (Bug#28372)
- Attempting to `LOAD_FILE` from an empty floppy drive under Windows, caused the server to hang. For example, if you opened a connection to the server and then issued the command `SELECT LOAD_FILE('a:test');`, with no floppy in the drive, the server was inaccessible until the modal pop-up dialog box was dismissed. (Bug#28366)
- A buffer overflow could occur when using `DECIMAL` columns on Windows operating systems. (Bug#28361)
- `libmysql.dll` could not be dynamically loaded on Windows. (Bug#28358)
- Grouping queries with correlated subqueries in `WHERE` conditions could produce incorrect results. (Bug#28337)
- `mysqltest` used a too-large stack size on PPC/Debian Linux, causing thread-creation failure for tests that use many threads. (Bug#28333)
- `EXPLAIN` for a query on an empty table immediately after its creation could result in a server crash. (Bug#28272)
- The `IS_UPDATABLE` column in the `INFORMATION_SCHEMA.VIEWS` table was not always set correctly. (Bug#28266)
- Comparing a `DATETIME` column value with a user variable yielded incorrect results. (Bug#28261)
- For `CAST()` of a `NULL` value with type `DECIMAL`, the return value was incorrectly initialized, producing a runtime error for binaries built using Visual C++ 2005. (Bug#28250)
- Recreating a view that already exists on the master would cause a replicating slave to terminate replication with a 'different error message on slave and master' error. (Bug#28244)
- Portability problems caused by use of `isinf()` were corrected. (Bug#28240)
- When dumping procedures, `mysqldump --compact` generated output that restored the session variable `SQL_MODE` without first capturing it. When dumping routines, `mysqldump --compact` neither set nor retrieved the value of `SQL_MODE`. (Bug#28223)
- Comparison of the string value of a date showed as unequal to `CURTIME()`. Similar behavior was exhibited for `DATETIME` values. (Bug#28208)
- The `Bytes_received` and `Bytes_sent` status variables could hold only 32-bit values (not 64-bit values) on some platforms. (Bug#28149)
- Storing a large number into a `FLOAT` or `DOUBLE` column with a fixed length could result in incorrect truncation of the number if the column's length was greater than 31. (Bug#28121)

- `DECIMAL` values beginning with nine 9 digits could be incorrectly rounded. (Bug#27984)
- The second execution of a prepared statement from a `UNION` query with `ORDER BY RAND()` caused the server to crash. This problem could also occur when invoking a stored procedure containing such a query. (Bug#27937)
- For attempts to open a non-existent table, the server should report `ER_NO_SUCH_TABLE` but sometimes reported `ER_TABLE_NOT_LOCKED`. (Bug#27907)
- A stored program that uses a variable name containing multibyte characters could fail to execute. (Bug#27876)
- `ON` conditions from `JOIN` expressions were ignored when checking the `CHECK OPTION` clause while updating a multiple-table view that included such a clause. (Bug#27827)
- On some systems, `udf_example.c` returned an incorrect result length. Also on some systems, `mysql-test-run.pl` could not find the shared object built from `udf_example.c`. (Bug#27741)
- `HASH` indexes on `VARCHAR` columns with binary collations did not ignore trailing spaces from strings before comparisons. This could result in duplicate records being successfully inserted into a `MEMORY` table with unique key constraints. A consequence was that internal `MEMORY` tables used for `GROUP BY` calculation contained duplicate rows that resulted in duplicate-key errors when converting those temporary tables to `MyISAM`, and that error was incorrectly reported as a `table is full` error. (Bug#27643)
- An error occurred trying to connect to `mysqld-debug.exe`. (Bug#27597)
- Selecting `MIN()` on an indexed column that contained only `NULL` values caused `NULL` to be returned for other result columns. (Bug#27573)
- If a stored function or trigger was killed, it aborted but no error was thrown, allowing the calling statement to continue without noticing the problem. This could lead to incorrect results. (Bug#27563)
- When `ALTER TABLE` was used to add a new `DATE` column with no explicit default value, `'0000-00-00'` was used as the default even if the SQL mode included the `NO_ZERO_DATE` mode to prohibit that value. A similar problem occurred for `DATETIME` columns. (Bug#27507)
- Using a `TEXT` local variable in a stored routine in an expression such as `SET var = SUBSTRING(var, 3)` produced an incorrect result. (Bug#27415)
- The error message for error number 137 did not report which database/table combination reported the problem. (Bug#27173)
- A large filesort could result in a division by zero error and a server crash. (Bug#27119)
- Binary logging of prepared statements could produce syntactically incorrect queries in the binary log, replacing some parameters with variable names rather than variable values. This could lead to incorrect results on replication slaves. (Bug#26842, Bug#12826)
- Connections from one `mysqld` server to another failed on Mac OS X, affecting replication and `FEDERATED` tables. (Bug#26664)
See also Bug#29083
- Some test suite files were missing from some MySQL-test packages. (Bug#26609)
- Statements within triggers ignored the value of the `low_priority_updates` system variable. (Bug#26162)
See also Bug#29963
- Running `CHECK TABLE` concurrently with a `SELECT`, `INSERT` or other statement on Windows could corrupt a `MyISAM` table. (Bug#25712)
- On Windows, connection handlers did not properly decrement the server's thread count when exiting. (Bug#25621)
- Due to a race condition, executing `FLUSH PRIVILEGES` in one thread could cause brief table unavailability in other threads. (Bug#24988)
- When `mysqld` was run as a Windows service, shared memory objects were not created in the global namespace and could not be used by clients to connect. (Bug#24731)
- On some Linux distributions where `LinuxThreads` and `NPTL glibc` versions both are available, statically built binaries can crash because the linker defaults to `LinuxThreads` when linking statically, but calls to external libraries (such as `libnss`) are resolved to `NPTL` versions. This cannot be worked around in the code, so instead if a crash occurs on such a binary/OS combination, print an error message that provides advice about how to fix the problem. (Bug#24611)

- Implicit conversion of `9912101` to `DATE` did not match `CAST(9912101 AS DATE)`. (Bug#23093)
- Conversion errors could occur when constructing the condition for an `IN` predicate. The predicate was treated as if the affected column contains `NULL`, but if the `IN` predicate is inside `NOT`, incorrect results could be returned. (Bug#22855)
- When using transactions and replication, shutting down the master in the middle of a transaction would cause all slaves to stop replicating. (Bug#22725)
- Linux binaries were unable to dump core after executing a `setuid()` call. (Bug#21723)
- Stack overflow caused server crashes. (Bug#21476)
- `CURDATE()` is less than `NOW()`, either when comparing `CURDATE()` directly (`CURDATE() < NOW()` is true) or when casting `CURDATE()` to `DATE` (`CAST(CURDATE() AS DATE) < NOW()` is true). However, storing `CURDATE()` in a `DATE` column and comparing `col_name < NOW()` incorrectly yielded false. This is fixed by comparing a `DATE` column as `DATETIME` for comparisons to a `DATETIME` constant. (Bug#21103)
- For dates with 4-digit year parts less than 200, an incorrect implicit conversion to add a century was applied for date arithmetic performed with `DATE_ADD()`, `DATE_SUB()`, `+ INTERVAL`, and `- INTERVAL`. (For example, `DATE_ADD('0050-01-01 00:00:00', INTERVAL 0 SECOND)` became `'2050-01-01 00:00:00'`.) (Bug#18997)
- Using `CREATE TABLE LIKE ...` would raise an assertion when replicated to a slave. (Bug#18950)
- Granting access privileges to an individual table where the database or table name contained an underscore would fail. (Bug#18660)
- The `-lmtmalloc` library was removed from the output of `mysql_config` on Solaris, as it caused problems when building `DBD: :mysql` (and possibly other applications) on that platform that tried to use `dlopen()` to access the client library. (Bug#18322)
- The `check-cpu` script failed to detect AMD64 Turion processors correctly. (Bug#17707)
- Trying to shut down the server following a failed `LOAD DATA INFILE` caused `mysqld` to crash. (Bug#17233)
- Using up-arrow for command-line recall in `mysql` could cause a segmentation fault. (Bug#10218)
- The result for `CAST()` when casting a value to `UNSIGNED` was limited to the maximum signed `BIGINT` value (9223372036854775808), rather than the maximum unsigned value (18446744073709551615). (Bug#8663)

C.1.22. Release Notes for MySQL Enterprise 5.0.42 [MRU] (23 May 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.40).

Functionality added or changed:

- **Incompatible Change:** Prior to this release, when `DATE` values were compared with `DATETIME` values, the time portion of the `DATETIME` value was ignored, or the comparison could be performed as a string compare. Now a `DATE` value is coerced to the `DATETIME` type by adding the time portion as `00:00:00`. To mimic the old behavior, use the `CAST()` function as shown in this example: `SELECT date_col = CAST(NOW() AS DATE) FROM table;` (Bug#28929)
- **Incompatible Change:** `INSERT DELAYED` is now downgraded to a normal `INSERT` if the statement uses functions that access tables or triggers, or that is called from a function or a trigger.

This was done to resolve the following interrelated issues:

- The server could abort or deadlock for `INSERT DELAYED` statements for which another insert was performed implicitly (for example, via a stored function that inserted a row).
- A trigger using an `INSERT DELAYED` caused the error `INSERT DELAYED CAN'T BE USED WITH TABLE ... BECAUSE IT IS LOCKED WITH LOCK TABLES` although the target table was not actually locked.
- `INSERT DELAYED` into a table with a `BEFORE INSERT` or `AFTER INSERT` trigger gave an incorrect `NEW` pseudo-column value and caused the server to deadlock or abort. (Bug#21483)

See also [Bug#20497](#), [Bug#21714](#)

- `mysqld_multi` now understands the `--no-defaults`, `--defaults-file`, and `--defaults-extra-file` options. The `--config-file` option is deprecated; if given, it is treated like `--defaults-extra-file`. (Bug#27390)

Bugs fixed:

- **Security Fix:** Use of a view could allow a user to gain update privileges for tables in other databases. (Bug#27878, CVE-2007-3782)
- **Security Fix:** The requirement of the `DROP` privilege for `RENAME TABLE` was not enforced. (Bug#27515, CVE-2007-2691)
- **Security Fix:** If a stored routine was declared using `SQL SECURITY INVOKER`, a user who invoked the routine could gain privileges. (Bug#27337, CVE-2007-2692)
- **MySQL Cluster:** The cluster waited 30 seconds instead of 30 milliseconds before reading table statistics. (Bug#28093)
- **MySQL Cluster:** `INSERT IGNORE` wrongly ignored `NULL` values in unique indexes. (Bug#27980)
- **MySQL Cluster:** The name of the month “March” was given incorrectly in the cluster error log. (Bug#27926)
- **MySQL Cluster:** It was not possible to add a unique index to an `NDB` table while in single user mode. (Bug#27710)
- **MySQL Cluster:** Repeated insertion of data generated by `mysqldump` into `NDB` tables could eventually lead to failure of the cluster. (Bug#27437)
- **MySQL Cluster:** `ndb_connectstring` did not appear in the output of `SHOW VARIABLES`. (Bug#26675)
- **Cluster API:** For `BLOB` reads on operations with lock mode `LM_CommittedRead`, the lock mode was not upgraded to `LM_Read` before the state of the `BLOB` had already been calculated. The `NDB` API methods affected by this problem included the following:
 - `NdbOperation::readTuple()`
 - `NdbScanOperation::readTuples()`
 - `NdbIndexScanOperation::readTuples()` (Bug#27320)
- On the IBM i5 platform, the installation script in the `.savf` binaries unconditionally executed the `mysql_install_db` script. This problem was fixed in a repackaged distribution numbered 5.0.42b. (Bug#30084)
- A query with a `NOT IN` subquery predicate could cause a crash when the left operand of the predicate evaluated to `NULL`. (Bug#28375)
- For `InnoDB`, in some rare cases the optimizer preferred a more expensive `ref` access to a less expensive range access. (Bug#28189)
- A performance degradation was observed for outer join queries to which a not-exists optimization was applied. (Bug#28188)
- `SELECT * INTO OUTFILE ... FROM INFORMATION_SCHEMA.SCHEMATA` failed with an `ACCESS DENIED` error, even for a user who had the `FILE` privilege. (Bug#28181)
- Comparisons of `DATE` or `DATETIME` values for the `IN()` function could yield incorrect results. (Bug#28133)
- The server could hang for `INSERT IGNORE ... ON DUPLICATE KEY UPDATE` if an update failed. (Bug#28000)
- `CAST()` to `DECIMAL` did not check for overflow. (Bug#27957)
- For `INSERT ... ON DUPLICATE KEY UPDATE` statements that affected many rows, updates could be applied to the wrong rows. (Bug#27954)
- Early `NULL`-filtering optimization did not work for `eq_ref` table access. (Bug#27939)
- Views ignored precision for `CAST()` operations. (Bug#27921)
- Non-grouped columns were allowed by `*` in `ONLY_FULL_GROUP_BY` SQL mode. (Bug#27874)
- Debug builds on Windows generated false alarms about uninitialized variables with some Visual Studio runtime libraries. (Bug#27811)
- Certain queries that used uncorrelated scalar subqueries caused `EXPLAIN` to crash. (Bug#27807)

- Changes to some system variables should invalidate statements in the query cache, but invalidation did not happen. (Bug#27792)
- Performing a `UNION` on two views that had `ORDER BY` clauses resulted in an `Unknown column` error. (Bug#27786)
- `mysql_install_db` is supposed to detect existing system tables and create only those that do not exist. Instead, it was exiting with an error if tables already existed. (Bug#27783)
- `mysqld` did not check the length of option values and could crash with a buffer overflow for long values. (Bug#27715)
- Comparisons using row constructors could fail for rows containing `NULL` values. (Bug#27704)
- `LOAD DATA` did not use `CURRENT_TIMESTAMP` as the default value for a `TIMESTAMP` column for which no value was provided. (Bug#27670)
- `mysqldump` could not connect using SSL. (Bug#27669)
- On Linux, the server could not create temporary tables if `lower_case_table_names` was set to 1 and the value of `tmpdir` was a directory name containing any uppercase letters. (Bug#27653)
- For InnoDB tables, a multiple-row `INSERT` of the form `INSERT INTO t (id...) VALUES (NULL...) ON DUPLICATE KEY UPDATE id=VALUES(id)`, where `id` is an `AUTO_INCREMENT` column, could cause `ERROR 1062 (23000): Duplicate entry...` errors or lost rows. (Bug#27650)
- The XML output representing an empty result was an empty string rather than an empty `<resultset/>` element. (Bug#27608)
- Comparison of a `DATE` with a `DATETIME` did not treat the `DATE` as having a time part of `00:00:00`. (Bug#27590)

See also Bug#32198

- The fix for Bug#17212 provided correct sort order for misordered output of certain queries, but caused significant overall query performance degradation. (Results were correct (good), but returned much more slowly (bad).) The fix also affected performance of queries for which results were correct. The performance degradation has been addressed. (Bug#27531)
- The `CRC32()` function returns an unsigned integer, but the metadata was signed, which could cause certain queries to return incorrect results. (For example, queries that selected a `CRC32()` value and used that value in the `GROUP BY` clause.) (Bug#27530)
- An interaction between `SHOW TABLE STATUS` and other concurrent statements that modify the table could result in a divide-by-zero error and a server crash. (Bug#27516)
- A race condition between `DROP TABLE` and `SHOW TABLE STATUS` could cause the latter to display incorrect information. (Bug#27499)
- Nested aggregate functions could be improperly evaluated. (Bug#27363)
- A stored function invocation in the `WHERE` clause was treated as a constant. (Bug#27354)
- Failure to allocate memory associated with `transaction_prealloc_size` could cause a server crash. (Bug#27322)
- `mysqldump` crashed if it got no data from `SHOW CREATE PROCEDURE` (for example, when trying to dump a routine defined by a different user and for which the current user had no privileges). Now it prints a comment to indicate the problem. It also returns an error, or continues if the `--force` option is given. (Bug#27293)
- `mysqlbinlog` produced different output with the `-R` option than without it. (Bug#27171)
- Flow control optimization in stored routines could cause exception handlers to never return or execute incorrect logic. (Bug#26977)
- `mysqldump` would not dump a view for which the `DEFINER` no longer exists. (Bug#26817)
- Creating a temporary table with InnoDB when using the one-file-per-table setting, and when the host filesystem for temporary tables was `tmpfs`, would cause an assertion within `mysqld`. This was due to the use of `O_DIRECT` when opening the temporary table file. (Bug#26662)
- `mysql_upgrade` did not detect failure of external commands that it runs. (Bug#26639)
- Aborting a statement on the master that applied to a non-transactional statement broke replication. The statement was written to the binary log but not completely executed on the master. Slaves receiving the statement executed it completely, resulting in loss of data synchrony. Now an error code is written to the error log so that the slaves stop without executing the aborted state-

- ment. (That is, replication stops, but synchrony to the point of the stop is preserved and you can investigate the problem.) (Bug#26551)
- Index hints (`USE INDEX`, `IGNORE INDEX`, `FORCE INDEX`) cannot be used with `FULLTEXT` indexes, but were not being ignored. (Bug#25951)
 - If `CREATE TABLE t1 LIKE t2` failed due to a full disk, an empty `t2.frm` file could be created but not removed. This file then caused subsequent attempts to create a table named `t2` to fail. This is easily corrected at the filesystem level by removing the `t2.frm` file manually, but now the server removes the file if the create operation does not complete successfully. (Bug#25761)
 - `mysql_upgrade` did not pass a password to `mysqlcheck` if one was given. (Bug#25452)
 - On Windows, `mysql_upgrade` was sensitive to lettercase of the names of some required components. (Bug#25405)
 - For storage engines that allow the current auto-increment value to be set, using `ALTER TABLE ... ENGINE` to convert a table from one such storage engine to another caused loss of the current value. (For storage engines that do not support setting the value, it cannot be retained anyway when changing the storage engine.) (Bug#25262)
 - Restoration of the default database after stored routine or trigger execution on a slave could cause replication to stop if the database no longer existed. (Bug#25082)
 - Several math functions produced incorrect results for large unsigned values. `ROUND()` produced incorrect results or a crash for a large number-of-decimals argument. (Bug#24912)
 - The result set of a query that used `WITH ROLLUP` and `DISTINCT` could lack some rollup rows (rows with `NULL` values for grouping attributes) if the `GROUP BY` list contained constant expressions. (Bug#24856)
 - For queries that used `ORDER BY` with `InnoDB` tables, if the optimizer chose an index for accessing the table but found a covering index that enabled the `ORDER BY` to be skipped, no results were returned. (Bug#24778)
 - Concurrent execution of `CREATE TABLE ... SELECT` and other statements involving the target table suffered from various race conditions, some of which might have led to deadlocks. (Bug#24738)
 - An attempt to execute `CREATE TABLE ... SELECT` when a temporary table with the same name already existed led to the insertion of data into the temporary table and creation of an empty non-temporary table. (Bug#24508)
 - The `MERGE` storage engine could return incorrect results when several index values that compare equality were present in an index (for example, `'gross'` and `'gross '`, which are considered equal but have different lengths). (Bug#24342)
 - Some upgrade problems are detected and better error messages suggesting that `mysql_upgrade` be run are produced. (Bug#24248)
 - Some views could not be created even when the user had the requisite privileges. (Bug#24040)
 - Using `CAST()` to convert `DATETIME` values to numeric values did not work. (Bug#23656)
 - The `AUTO_INCREMENT` value would not be correctly reported for `InnoDB` tables when using `SHOW CREATE TABLE` statement or `mysqldump` command. (Bug#23313)
 - `SELECT COUNT(*)` from a table containing a `DATETIME NOT NULL` column could produce spurious warnings with the `NO_ZERO_DATE` SQL mode enabled. (Bug#22824)
 - Using `SET GLOBAL` to change the `lc_time_names` system variable had no effect on new connections. (Bug#22648)
 - A multiple-table `UPDATE` could return an incorrect rows-matched value if, during insertion of rows into a temporary table, the table had to be converted from a `MEMORY` table to a `MyISAM` table. (Bug#22364)
 - `yaSSL` crashed on pre-Pentium Intel CPUs. (Bug#21765)
 - A slave that used `--master-ssl-cipher` could not connect to the master. (Bug#21611)
 - Quoted labels in stored routines were mishandled, rendering the routines unusable. (Bug#21513)
 - `CREATE TABLE IF NOT EXISTS ... SELECT` caused a server crash if the target table already existed and had a `BEFORE INSERT` trigger. (Bug#20903)
 - Deadlock occurred for attempts to execute `CREATE TABLE IF NOT EXISTS ... SELECT` when `LOCK TABLES` had been used to acquire a read lock on the target table. (Bug#20662, Bug#15522)
 - Changing a `utf8` column in an `InnoDB` table to a shorter length did not shorten the data values. (Bug#20095)

- The omission of leading zeros in dates could lead to erroneous results when these were compared with the output of certain date and time functions. (Bug#16377)
- `INSERT...ON DUPLICATE KEY UPDATE` could cause `Error 1032: Can't find record in ...` for inserts into an InnoDB table unique index using key column prefixes with an underlying `utf8` string column. (Bug#13191)
- Having the `EXECUTE` privilege for a routine in a database should make it possible to `USE` that database, but the server returned an error instead. This has been corrected. As a result of the change, `SHOW TABLES` for a database in which you have only the `EXECUTE` privilege returns an empty set rather than an error. (Bug#9504)

C.1.23. Release Notes for MySQL Enterprise 5.0.40 [MRU] (17 April 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.38).

Functionality added or changed:

- **MySQL Cluster:** The behavior of the `ndb_restore` utility has been changed as follows:
 - It is now possible to restore selected databases or tables using `ndb_restore`.
 - Several options have been added for use with `ndb_restore --print_data` to facilitate the creation of structured data dump files. These options can be used to make dumps made using `ndb_restore` more like those produced by `mysqldump`.
For details of these changes, see [Section 19.9.3, “ndb_restore — Restore a Cluster Backup”](#). (Bug#26899, Bug#26900)
- If a set function `S` with an outer reference `S(outer_ref)` cannot be aggregated in the outer query against which the outer reference has been resolved, MySQL interprets `S(outer_ref)` the same way that it would interpret `S(const)`. However, standard SQL requires throwing an error in this situation. An error now is thrown for such queries if the `ANSI SQL` mode is enabled. (Bug#27348)
- Added the `--service-startup-timeout` option for `mysql.server` to specify how long to wait for the server to start. If the server does not start within the timeout period, `mysql.server` exits with an error. (Bug#26952)
- Prefix lengths for columns in `SPATIAL` indexes are no longer displayed in `SHOW CREATE TABLE` output. `mysqldump` uses that statement, so if a table with `SPATIAL` indexes containing prefixed columns is dumped and reloaded, the index is created with no prefixes. (The full column width of each column is indexed.) (Bug#26794)
- The output of `mysql --xml` and `mysqldump --xml` now includes a valid XML namespace. (Bug#25946)
- If you use SSL for a client connection, you can tell the client not to authenticate the server certificate by specifying neither `--ssl-ca` nor `--ssl-capath`. The server still verifies the client according to any applicable requirements established via `GRANT` statements for the client, and it still uses any `--ssl-ca/--ssl-capath` values that were passed to server at startup time. (Bug#25309)
- The syntax for index hints has been extended to enable explicit specification that the hint applies only to join processing. See [Section 12.2.8.2, “Index Hint Syntax”](#).

This is a new fix for this issue, and replaces the fix made in MySQL 5.0.25 and reverted in 5.0.26. (Bug#21174)

- The `mysql_create_system_tables` script was removed because `mysql_install_db` no longer uses it in MySQL 5.0.

Bugs fixed:

- **Important Note:** The parser accepted invalid code in SQL condition handlers, leading to server crashes or unexpected execution behavior in stored programs. Specifically, the parser allowed a condition handler to refer to labels for blocks that enclose the handler declaration. This was incorrect because block label scope does not include the code for handlers declared within the labeled block.

The parser now rejects this invalid construct, but if you upgrade in place (without dumping and reloading your databases), existing handlers that contain the construct are still invalid — *even if they appear to function as you expect* — and should be rewritten.

To find affected handlers, use `mysqldump` to dump all stored functions and procedures, triggers, and events. Then attempt to reload them into an upgraded server. Handlers that contain illegal label references will be rejected.

For more information about condition handlers and writing them to avoid invalid jumps, see [Section 12.8.4.2, “DECLARE Handlers”](#). (Bug#26503)

- **MySQL Cluster:** NDB tables having `MEDIUMINT AUTO_INCREMENT` columns were not restored correctly by `ndb_restore`, causing spurious duplicate key errors. This issue did not affect `TINYINT`, `INT`, or `BIGINT` columns with `AUTO_INCREMENT`. (Bug#27775)
- **MySQL Cluster:** NDB tables with indexes whose names contained space characters were not restored correctly by `ndb_restore` (the index names were truncated). (Bug#27758)
- **MySQL Cluster:** Under certain rare circumstances performing a `DROP TABLE` or `TRUNCATE` on an NDB table could cause a node failure or forced cluster shutdown. (Bug#27581)
- **MySQL Cluster:** Memory usage of a `mysqld` process grew even while idle. (Bug#27560)
- **MySQL Cluster:** It was not possible to set `LockPagesInMainMemory` equal to 0. (Bug#27291)
- **MySQL Cluster:** A race condition could sometimes occur if the node acting as master failed while node IDs were still being allocated during startup. (Bug#27286)
- **MySQL Cluster:** When a data node was taking over as the master node, a race condition could sometimes occur as the node was assuming responsibility for handling of global checkpoints. (Bug#27283)
- **MySQL Cluster:** Error messages displayed when running in single user mode were inconsistent. (Bug#27021)
- **MySQL Cluster:** The failure of a data node while restarting could cause other data nodes to hang or crash. (Bug#27003)
- **MySQL Cluster:** On Solaris, the value of an NDB table column declared as `BIT(33)` was always displayed as 0. (Bug#26986)
- **MySQL Cluster:** `mysqld` processes would sometimes crash under high load. (Bug#26825)
- **MySQL Cluster:** The output from `ndb_restore --print_data` was incorrect for a backup made of a database containing tables with `TINYINT` or `SMALLINT` columns. (Bug#26740)
- **MySQL Cluster:** In some cases, `AFTER UPDATE` and `AFTER DELETE` triggers on NDB tables that referenced subject table did not see the results of operation which caused invocation of the trigger, but rather saw the row as it was prior to the update or delete operation.

This was most noticeable when an update operation used a subquery to obtain the rows to be updated. An example would be `UPDATE tbl1 SET col2 = val1 WHERE tbl1.col1 IN (SELECT col3 FROM tbl2 WHERE col4 = val2)` where there was an `AFTER UPDATE` trigger on table `tbl1`. In such cases, the trigger would fail to execute.

The problem occurred because the actual update or delete operations were deferred to be able to perform them later as one batch. The fix for this bug solves the problem by disabling this optimization for a given update or delete if the table has an `AFTER` trigger defined for this operation. (Bug#26242)

- **MySQL Cluster:** Condition pushdown did not work with prepared statements. (Bug#26225)
- **MySQL Cluster:** Joins on multiple tables containing `BLOB` columns could cause data nodes run out of memory, and to crash with the error `NDBOBJECTIDMAP: : EXPAND UNABLE TO EXPAND`. (Bug#26176)
- **MySQL Cluster:** After entering single user mode it was not possible to alter non-NDB tables on any SQL nodes other than the one having sole access to the cluster. (Bug#25275)
- **MySQL Cluster:** When a cluster data node suffered a “hard” failure (such as a power failure or loss of a network connection) TCP sockets to the missing node were maintained indefinitely. Now socket-based transporters check for a response and terminate the socket if there is no activity on the socket after 2 hours. (Bug#24793)
- **MySQL Cluster:** The management client command `node_id STATUS` displayed the message `Node node_id: not connected` when `node_id` was not the node ID of a data node.

Note

The `ALL STATUS` command in the cluster management client still displays status information for data nodes only. This is by design. See [Section 19.7.2, “Commands in the MySQL Cluster Management Client”](#), for more information.

(Bug#21715)

- **MySQL Cluster:** Some values of `MaxNoOfTables` caused the error `JOB BUFFER CONGESTION` to occur. (Bug#19378)

- **MySQL Cluster:** When trying to create tables on an SQL node not connected to the cluster, a misleading error message `TABLE 'TBL_NAME' ALREADY EXISTS` was generated. The error now generated is `COULD NOT CONNECT TO STORAGE ENGINE`. (Bug#18676)
- **Replication:** Out-of-memory errors were not reported. Now they are written to the error log. (Bug#26844)
- **Cluster Replication:** Some queries that updated multiple tables were not backed up correctly. (Bug#27748)
- **Cluster API:** Using `NdbBlob::writeData()` to write data in the middle of an existing blob value (that is, updating the value) could overwrite some data past the end of the data to be changed. (Bug#27018)
- **Cluster API:** After defining a delete operation (using `NdbOperation::deleteTuple()`) on a nonexistent primary key of a table having a `BLOB` or `TEXT` column, invoking `NdbTransaction::execute()` caused the calling application to enter an endless loop rather than raising an error.

This issue also affected `ndb_restore`; when restoring tables containing `BLOB` or `TEXT` columns, this could cause it to consume all available memory and then crash. (Bug#24028)

See also Bug#27308, Bug#30177

- Some equi-joins containing a `WHERE` clause that included a `NOT IN` subquery caused a server crash. (Bug#27870)
- `SELECT DISTINCT` could return incorrect results if the select list contained duplicated columns. (Bug#27659)
- With `NO_AUTO_VALUE_ON_ZERO` SQL mode enabled, `LOAD DATA` operations could assign incorrect `AUTO_INCREMENT` values. (Bug#27586)
- Incorrect results could be returned for some queries that contained a select list expression with `IN` or `BETWEEN` together with an `ORDER BY` or `GROUP BY` on the same expression using `NOT IN` or `NOT BETWEEN`. (Bug#27532)
- Evaluation of an `IN()` predicate containing a decimal-valued argument caused a server crash. (Bug#27513, Bug#27362, CVE-2007-2583)
- In out-of-memory conditions, the server might crash or otherwise not report an error to the Windows event log. (Bug#27490)
- Passing nested row expressions with different structures to an `IN` predicate caused a server crash. (Bug#27484)
- The `decimal.h` header file was incorrectly omitted from binary distributions. (Bug#27456)
- With `innodb_file_per_table` enabled, attempting to rename an `InnoDB` table to a non-existent database caused the server to exit. (Bug#27381)
- A subquery could get incorrect values for references to outer query columns when it contained aggregate functions that were aggregated in outer context. (Bug#27321)
- The server did not shut down cleanly. (Bug#27310)
- In a view, a column that was defined using a `GEOMETRY` function was treated as having the `LONGBLOB` data type rather than the `GEOMETRY` type. (Bug#27300)
- Queries containing subqueries with `COUNT(*)` aggregated in an outer context returned incorrect results. This happened only if the subquery did not contain any references to outer columns. (Bug#27257)
- Use of an aggregate function from an outer context as an argument to `GROUP_CONCAT()` caused a server crash. (Bug#27229)
- String truncation upon insertion into an integer or year column did not generate a warning (or an error in strict mode). (Bug#27176, Bug#26359)
- Storing `NULL` values in spatial fields caused excessive memory allocation and crashes on some systems. (Bug#27164)
- Row equalities in `WHERE` clauses could cause memory corruption. (Bug#27154)
- `GROUP BY` on a `ucs2` column caused a server crash when there was at least one empty string in the column. (Bug#27079)
- Duplicate members in `SET` or `ENUM` definitions were not detected. Now they result in a warning; if strict SQL mode is enabled, an error occurs instead. (Bug#27069)
- For `INSERT ... ON DUPLICATE KEY UPDATE` statements on tables containing `AUTO_INCREMENT` columns, `LAST_INSERT_ID()` was reset to 0 if no rows were successfully inserted or changed. “Not changed” includes the case where a row was updated to its current values, but in that case, `LAST_INSERT_ID()` should not be reset to 0. Now `LAST_INSERT_ID()` is reset to 0 only if no rows were successfully inserted or touched, whether or not touched rows were

changed. (Bug#27033)

See also [Bug#27210](#), [Bug#27006](#)

This regression was introduced by [Bug#19978](#)

- `mysql_install_db` could terminate with an error after failing to determine that a system table already existed. (Bug#27022)
- In a `MEMORY` table, using a `BTREE` index to scan for updatable rows could lead to an infinite loop. (Bug#26996)
- Invalid optimization of pushdown conditions for queries where an outer join was guaranteed to read only one row from the outer table led to results with too few rows. (Bug#26963)
- Windows binaries contained no debug symbol file. Now `.map` and `.pdb` files are included in 32-bit builds for `mysqld-nt.exe`, `mysqld-debug.exe`, and `mysqlmanager.exe`. (Bug#26893)
- Improved out-of-memory detection when sending logs from a master server to slaves, and log a message when allocation fails. (Bug#26837)
- For `InnoDB` tables having a clustered index that began with a `CHAR` or `VARCHAR` column, deleting a record and then inserting another before the deleted record was purged could result in table corruption. (Bug#26835)
- Duplicates were not properly identified among (potentially) long strings used as arguments for `GROUP_CONCAT(DISTINCT)`. (Bug#26815)
- `ALTER VIEW` requires the `CREATE VIEW` and `DROP` privileges for the view. However, if the view was created by another user, the server erroneously required the `SUPER` privilege. (Bug#26813)
- A result set column formed by concatenation of string literals was incomplete when the column was produced by a subquery in the `FROM` clause. (Bug#26738)
- When using the result of `SEC_TO_TIME()` for time value greater than 24 hours in an `ORDER BY` clause, either directly or through a column alias, the rows were sorted incorrectly as strings. (Bug#26672)
- The range optimizer could cause the server to run out of memory. (Bug#26625)
- The range optimizer could consume a combinatorial amount of memory for certain classes of `WHERE` clauses. (Bug#26624)
- `mysqldump` could crash or exhibit incorrect behavior when some options were given very long values, such as `--fields-terminated-by="some very long string"`. The code has been cleaned up to remove a number of fixed-sized buffers and to be more careful about error conditions in memory allocation. (Bug#26346)
- If the server was started with `--skip-grant-tables`, selecting from `INFORMATION_SCHEMA` tables causes a server crash. (Bug#26285)
- For an `INSERT` statement that should fail due to a column with no default value not being assigned a value, the statement succeeded with no error if the column was assigned a value in an `ON DUPLICATE KEY UPDATE` clause, even if that clause was not used. (Bug#26261)
- The temporary file-creation code was cleaned up on Windows to improve server stability. (Bug#26233)
- For `MyISAM` tables, `COUNT(*)` could return an incorrect value if the `WHERE` clause compared an indexed `TEXT` column to the empty string (`' '`). This happened if the column contained empty strings and also strings starting with control characters such as tab or newline. (Bug#26231)
- For `INSERT INTO ... SELECT` where index searches used column prefixes, insert errors could occur when key value type conversion was done. (Bug#26207)
- For `DELETE FROM tbl_name ORDER BY col_name` (with no `WHERE` or `LIMIT` clause), the server did not check whether `col_name` was a valid column in the table. (Bug#26186)
- `REPAIR TABLE ... USE_FRM` with an `ARCHIVE` table deleted all records from the table. (Bug#26138)
- `mysqldump` crashed for `MERGE` tables if the `--complete-insert (-c)` option was given. (Bug#25993)
- Setting a column to `NOT NULL` with an `ON DELETE SET NULL` clause foreign key crashes the server. (Bug#25927)
- On Windows, debug builds of `mysqld` could fail with heap assertions. (Bug#25765)
- In certain situations, `MATCH ... AGAINST` returned false hits for `NULL` values produced by `LEFT JOIN` when no full-text

index was available. (Bug#25729)

- When `RAND()` was called multiple times inside a stored procedure, the server did not write the correct random seed values to the binary log, resulting in incorrect replication. (Bug#25543)
- `OPTIMIZE TABLE` might fail on Windows when it attempts to rename a temporary file to the original name if the original file had been opened, resulting in loss of the `.MYD` file. (Bug#25521)
- For `SHOW ENGINE INNODB STATUS`, the `LATEST DEADLOCK INFORMATION` was not always cleared properly. (Bug#25494)
- `mysql_stmt_fetch()` did an invalid memory deallocation when used with the embedded server. (Bug#25492)
- `GRANT` statements were not replicated if the server was started with the `--replicate-ignore-table` or `--replicate-wild-ignore-table` option. (Bug#25482)
- Difficult repair or optimization operations could cause an assertion failure, resulting in a server crash. (Bug#25289)
- Duplicate entries were not assessed correctly in a `MEMORY` table with a `BTREE` primary key on a `utf8 ENUM` column. (Bug#24985)
- Selecting the result of `AVG()` within a `UNION` could produce incorrect values. (Bug#24791)
- `MBROverlaps()` returned incorrect values in some cases. (Bug#24563)
- Increasing the width of a `DECIMAL` column could cause column values to be changed. (Bug#24558)
- A problem in handling of aggregate functions in subqueries caused predicates containing aggregate functions to be ignored during query execution. (Bug#24484)
- The test for the `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` option for `mysql_options()` was performed incorrectly. Also changed as a result of this bugfix: The `arg` option for the `mysql_options()` C API function was changed from `char *` to `void *`. (Bug#24121)
- Replication between master and slave would infinitely retry binary log transmission where the `max_allowed_packet` on the master was larger than that on the slave if the size of the transfer was between these two values. (Bug#23775)
- On Windows, debug builds of `mysqlbinlog` could fail with a memory error. (Bug#23736)
- The values displayed for the `InnoDB_row_lock_time`, `InnoDB_row_lock_time_avg`, and `InnoDB_row_lock_time_max` status variables were incorrect. (Bug#23666)
- `SHOW CREATE VIEW` qualified references to stored functions in the view definition with the function's database name, even when the database was the default database. This affected `mysqldump` (which uses `SHOW CREATE VIEW` to dump views) because the resulting dump file could not be used to reload the database into a different database. `SHOW CREATE VIEW` now suppresses the database name for references to functions in the default database. (Bug#23491)
- An `INTO OUTFILE` clause is allowed only for the final `SELECT` of a `UNION`, but this restriction was not being enforced correctly. (Bug#23345)
- With the `NO_AUTO_VALUE_ON_ZERO` SQL mode enabled, `LAST_INSERT_ID()` could return 0 after `INSERT ... ON DUPLICATE KEY UPDATE`. Additionally, the next rows inserted (by the same `INSERT`, or the following `INSERT` with or without `ON DUPLICATE KEY UPDATE`), would insert 0 for the auto-generated value if the value for the `AUTO_INCREMENT` column was `NULL` or missing. (Bug#23233)
- `SOUNDEX()` returned an invalid string for international characters in multi-byte character sets. (Bug#22638)
- `COUNT(decimal_expr)` sometimes generated a spurious truncation warning. (Bug#21976)
- `InnoDB`: The first read statement, if served from the query cache, was not consistent with the `READ COMMITTED` isolation level. (Bug#21409)
- For a stored procedure containing a `SELECT` statement that used a complicated join with an `ON` expression, the expression could be ignored during re-execution of the procedure, yielding an incorrect result. (Bug#20492)
- In some cases, the optimizer preferred a range or full index scan access method over lookup access methods when the latter were much cheaper. (Bug#19372)
- Conversion of `DATETIME` values in numeric contexts sometimes did not produce a double (`YYYYMMDDHHMMSS.uuuuuu`) value. (Bug#16546)

C.1.24. Release Notes for MySQL Enterprise 5.0.38 [MRU] (20 March 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.36).

Functionality added or changed:

- The server now includes a timestamp in error messages that are logged as a result of unhandled signals (such as `mysqld got signal 11` messages). (Bug#24878)
- Added the `--secure-file-priv` option for `mysqld`, which limits the effect of the `LOAD_FILE()` function and the `LOAD DATA` and `SELECT ... INTO OUTFILE` statements to work only with files in a given directory. (Bug#18628)
- Added the `hostname` system variable, which the server sets at startup to the server hostname.
- To satisfy different user requirements, we provide several servers. `mysqld` is an optimized server that is a smaller, faster binary. Each package now also includes `mysqld-debug`, which is compiled with debugging support but is otherwise configured identically to the non-debug server.

Bugs fixed:

- **Incompatible Change:** `INSERT DELAYED` statements are not supported for `MERGE` tables, but the `MERGE` storage engine was not rejecting such statements, resulting in table corruption. Applications previously using `INSERT DELAYED` into `MERGE` table will break when upgrading to versions with this fix. To avoid the problem, remove `DELAYED` from such statements. (Bug#26464)
- **MySQL Cluster:** An inadvertent use of unaligned data caused `ndb_restore` to fail on some 64-bit platforms, including Sparc and Itanium-2. (Bug#26739)
- **MySQL Cluster:** An infinite loop in an internal logging function could cause trace logs to fill up with `UNKNOWN SIGNAL TYPE` error messages and thus grow to unreasonable sizes. (Bug#26720)
- **MySQL Cluster:** An invalid pointer was returned following a `FSCLOSECONF` signal when accessing the REDO logs during a node restart or system restart. (Bug#26515)
- **MySQL Cluster:** The failure of a data node when restarting it with `--initial` could lead to failures of subsequent data node restarts. (Bug#26481)
- **MySQL Cluster:** Takeover for local checkpointing due to multiple failures of master nodes was sometimes incorrectly handled. (Bug#26457)
- **MySQL Cluster:** The `LockPagesInMainMemory` parameter was not read until after distributed communication had already started between cluster nodes. When the value of this parameter was `1`, this could sometimes result in data node failure due to missed heartbeats. (Bug#26454)
- **MySQL Cluster:** Under some circumstances, following the restart of a management node, all data nodes would connect to it normally, but some of them subsequently failed to log any events to the management node. (Bug#26293)
- **MySQL Cluster:** The message `ERROR 0 IN READAUTOINCREMENTVALUE(): NO ERROR` was written to the error log whenever `SHOW TABLE STATUS` was performed on a Cluster table that did not have an `AUTO_INCREMENT` column. (Bug#21033)
- `SELECT ... INTO OUTFILE` with a long `FIELDS ENCLOSED BY` value could crash the server. (Bug#27231)
- An `INSERT ... ON DUPLICATE KEY UPDATE` statement might modify values in a table but not flush affected data from the query cache, causing subsequent selects to return stale results. This made the combination of query cache plus `ON DUPLICATE KEY UPDATE` very unreliable. (Bug#27210)

See also [Bug#27006](#), [Bug#27033](#)

This regression was introduced by [Bug#19978](#)

- For `MERGE` tables defined on underlying tables that contained a short `VARCHAR` column (shorter than four characters), using `ALTER TABLE` on at least one but not all of the underlying tables caused the table definitions to be considered different from that of the `MERGE` table, even if the `ALTER TABLE` did not change the definition. (Bug#26881)
- Use of a subquery containing `GROUP BY` and `WITH ROLLUP` caused a server crash. (Bug#26830)
- Added support for `--debugger=dbx` for `mysql-test-run.pl` and added support for `--debugger=devenv, -`

- `-debugger=DevEnv`, and `--debugger=/path/to/devenv`. (Bug#26792)
- SSL connections failed on Windows. (Bug#26678)
- Use of a subquery containing a `UNION` with an invalid `ORDER BY` clause caused a server crash. (Bug#26661)
- In some error messages, inconsistent format specifiers were used for the translations in different languages. `comp_err` (the error message compiler) now checks for mismatches. (Bug#26571)
- Views that used a scalar correlated subquery returned incorrect results. (Bug#26560)
- `UNHEX() IS NULL` comparisons failed when `UNHEX()` returned `NULL`. (Bug#26537)
- On 64-bit Windows, large timestamp values could be handled incorrectly. (Bug#26536)
- For some values of the position argument, the `INSERT()` function could insert a NUL byte into the result. (Bug#26281)
- `INSERT DELAYED` statements inserted incorrect values into `BIT` columns. (Bug#26238)
- A multiple-row delayed insert with an auto-increment column could cause duplicate entries to be created on the slave in a replication environment. (Bug#26116, Bug#25507)
- `BENCHMARK()` did not work correctly for expressions that produced a `DECIMAL` result. (Bug#26093)
- `LOAD DATA INFILE` sent an okay to the client before writing the binary log and committing the changes to the table had finished, thus violating ACID requirements. (Bug#26050)
- `X() IS NULL` and `Y() IS NULL` comparisons failed when `X()` and `Y()` returned `NULL`. (Bug#26038)
- Indexes on `TEXT` columns were ignored when `ref` accesses were evaluated. (Bug#25971)
- If a thread previously serviced a connection that was killed, excessive memory and CPU use by the thread occurred if it later serviced a connection that had to wait for a table lock. (Bug#25966)
- `VIEW` restrictions were applied to `SELECT` statements after a `CREATE VIEW` statement failed, as though the `CREATE` had succeeded. (Bug#25897)
- Several deficiencies in resolution of column names for `INSERT ... SELECT` statements were corrected. (Bug#25831)
- Inserting `utf8` data into a `TEXT` column that used a single-byte character set could result in spurious warnings about truncated data. (Bug#25815)
- In certain cases it could happen that deleting a row corrupted an `RTREE` index. This affected indexes on spatial columns. (Bug#25673)
- Expressions involving `SUM()`, when used in an `ORDER BY` clause, could lead to out-of-order results. (Bug#25376)
- Use of a `GROUP BY` clause that referred to a stored function result together with `WITH ROLLUP` caused incorrect results. (Bug#25373)
- A stored procedure that made use of cursors failed when the procedure was invoked from a stored function. (Bug#25345)
- On Windows, the server exhibited a file-handle leak after reaching the limit on the number of open file descriptors. (Bug#25222)
- The `REPEAT()` function did not allow a column name as the `count` parameter. (Bug#25197)
- Duplicating the usage of a user variable in a stored procedure or trigger would not be replicated correctly to the slave. (Bug#25167)
- A reference to a non-existent column in the `ORDER BY` clause of an `UPDATE ... ORDER BY` statement could cause a server crash. (Bug#25126)
- A view on a join is insertable for `INSERT` statements that store values into only one table of the join. However, inserts were being rejected if the inserted-into table was used in a self-join because MySQL incorrectly was considering the insert to modify multiple tables of the view. (Bug#25122)
- MySQL would not compile when configured using `--without-query-cache`. (Bug#25075)
- `IF(expr, unsigned_expr, unsigned_expr)` was evaluated to a signed result, not unsigned. This has been corrected. The fix also affects constructs of the form `IS [NOT] {TRUE|FALSE}`, which were transformed internally into `IF()` expressions that evaluated to a signed result.

For existing views that were defined using `IS [NOT] {TRUE|FALSE}` constructs, there is a related implication. The definitions of such views were stored using the `IF()` expression, not the original construct. This is manifest in that `SHOW CREATE VIEW` shows the transformed `IF()` expression, not the original one. Existing views will evaluate correctly after the fix, but if you want `SHOW CREATE VIEW` to display the original construct, you must drop the view and re-create it using its original definition. New views will retain the construct in their definition. (Bug#24532)

- `DROP TRIGGER` statements would not be filtered on the slave when using the `replication-wild-do-table` option. (Bug#24478)
- For `INSERT ... ON DUPLICATE KEY UPDATE` statements where some `AUTO_INCREMENT` values were generated automatically for inserts and some rows were updated, one auto-generated value was lost per updated row, leading to faster exhaustion of the range of the `AUTO_INCREMENT` column.

Because the original problem can affect replication (different values on master and slave), it is recommended that the master and its slaves be upgraded to the current version. (Bug#24432)
- A user-defined variable could be assigned an incorrect value if a temporary table was employed in obtaining the result of the query used to determine its value. (Bug#24010)
- Queries that used a temporary table for the outer query when evaluating a correlated subquery could return incorrect results. (Bug#23800)
- When using certain server SQL modes, the `mysql.proc` table was not created by `mysql_install_db`. (Bug#23669)
- `DOUBLE` values such as `20070202191048.000000` were being treated as illegal arguments by `WEEK()`. (Bug#23616)
- The server could crash if two or more threads initiated query cache resize operation at moments very close in time. (Bug#23527)
- `NOW()` returned the wrong value in statements executed at server startup with the `--init-file` option. (Bug#23240)
- When nesting stored procedures within a trigger on a table, a false dependency error was thrown when one of the nested procedures contained a `DROP TABLE` statement. (Bug#22580)
- Instance Manager did not remove the angel PID file on a clean shutdown. (Bug#22511)
- `EXPLAIN EXTENDED` did not show `WHERE` conditions that were optimized away. (Bug#22331)
- `IN ((subquery))`, `IN (((subquery)))`, and so forth, are equivalent to `IN (subquery)`, which is always interpreted as a table subquery (so that it is allowed to return more than one row). MySQL was treating the “over-parenthesized” subquery as a single-row subquery and rejecting it if it returned more than one row. This bug primarily affected automatically generated code (such as queries generated by Hibernate), because humans rarely write the over-parenthesized forms. (Bug#21904)
- An `INSERT` trigger invoking a stored routine that inserted into a table other than the one on which the trigger was defined would fail with a `TABLE '...' DOESN'T EXIST` referring to the second table when attempting to delete records from the first table. (Bug#21825)
- When a stored routine attempted to execute a statement accessing a nonexistent table, the error was not caught by the routine's exception handler. (Bug#20713, Bug#8407)
- The conditions checked by the optimizer to allow use of indexes in `IN` predicate calculations were unnecessarily tight and were relaxed. (Bug#20420)
- When a `TIME_FORMAT()` expression was used as a column in a `GROUP BY` clause, the expression result was truncated. (Bug#20293)
- The creation of MySQL system tables was not checked for by `mysql-test-run.pl`. (Bug#20166)
- For index reads, the `BLACKHOLE` engine did not return end-of-file (which it must because `BLACKHOLE` tables contain no rows), causing some queries to crash. (Bug#19717)
- For `expr IN(value_list)`, the result could be incorrect if `BIGINT UNSIGNED` values were used for `expr` or in the value list. (Bug#19342)
- When attempting to call a stored procedure creating a table from a trigger on a table `tbl` in a database `db`, the trigger failed with `ERROR 1146 (42S02): TABLE 'DB.TBL' DOESN'T EXIST`. However, the actual reason that such a trigger fails is due to the fact that `CREATE TABLE` causes an implicit `COMMIT`, and so a trigger cannot invoke a stored routine containing this statement. A trigger which does so now fails with `ERROR 1422 (HY000): EXPLICIT OR IMPLICIT COMMIT IS NOT ALLOWED IN STORED FUNCTION OR TRIGGER`, which makes clear the reason for the trigger's failure. (Bug#18914)

- The update columns for `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` could be assigned incorrect values if a temporary table was used to evaluate the `SELECT`. (Bug#16630)
- For `SUBSTRING()` evaluation using a temporary table, when `SUBSTRING()` was used on a `LONGTEXT` column, the `max_length` metadata value of the result was incorrectly calculated and set to 0. Consequently, an empty string was returned instead of the correct result. (Bug#15757)
- Loading data using `LOAD DATA INFILE` may not replicate correctly (due to character set incompatibilities) if the `character_set_database` variable is set before the data is loaded. (Bug#15126)
- User defined variables used within stored procedures and triggers are not replicated correctly when operating in statement-based replication mode. (Bug#14914, Bug#20141)
- Local variables in stored routines or triggers, when declared as the `BIT` type, were interpreted as strings. (Bug#12976)
- `CONNECTION` is no longer treated as a reserved word. (Bug#12204)

C.1.25. Release Notes for MySQL Enterprise 5.0.36sp1 [QSP] (12 April 2007)

This is a *Service Pack* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.36).

Bugs fixed:

- `SELECT ... INTO OUTFILE` with a long `FIELDS ENCLOSED BY` value could crash the server. (Bug#27231)
- For `MERGE` tables defined on underlying tables that contained a short `VARCHAR` column (shorter than four characters), using `ALTER TABLE` on at least one but not all of the underlying tables caused the table definitions to be considered different from that of the `MERGE` table, even if the `ALTER TABLE` did not change the definition. (Bug#26881)

C.1.26. Release Notes for MySQL Enterprise 5.0.36 [MRU] (20 February 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

Note

After release, a trigger failure problem was found to have been introduced. (Bug#27006) Users affected by this issue should upgrade to MySQL 5.0.38, which corrects the problem.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.34).

Functionality added or changed:

- **Incompatible Change: MySQL Cluster:** The `LockPagesInMainMemory` configuration parameter has changed its type and possible values. For more information, see `LockPagesInMainMemory`.

Important

The values `true` and `false` are no longer accepted for this parameter. If you were using this parameter and had it set to `false` in a previous release, you must change it to `0`. If you had this parameter set to `true`, you should instead use `1` to obtain the same behavior as previously, or `2` to take advantage of new functionality introduced with this release, as described in the section cited above.

(Bug#25686)

- **Incompatible Change:** Previously, the `DATE_FORMAT()` function returned a binary string. Now it returns a string with a character set and collation given by `character_set_connection` and `collation_connection` so that it can return month and weekday names containing non-ASCII characters. (Bug#22646)
- **Important Change:** When using `MERGE` tables the definition of the `MERGE` table and the `MyISAM` tables are checked each time the tables are opened for access (including any `SELECT` or `INSERT` statement). Each table is compared for column order, types, sizes and associated. If there is a difference in any one of the tables then the statement will fail.
- The `localhost` anonymous user account created during MySQL installation on Windows now has no global privileges. Formerly this account had all global privileges. For operations that require global privileges, the `root` account can be used in-

stead. ([Bug#24496](#))

- The bundled yaSSL library was upgraded to version 1.5.8.

Bugs fixed:

- **Security Fix:** Using an `INFORMATION_SCHEMA` table with `ORDER BY` in a subquery could cause a server crash.

We would like to thank Oren Isacson of Flowgate Security Consulting and Stefan Streichsbier of SEC Consult for informing us of this problem. ([Bug#24630](#), [Bug#26556](#), [CVE-2007-1420](#))

- **Incompatible Change:** For `ENUM` columns that had enumeration values containing commas, the commas were mapped to `0xff` internally. However, this rendered the commas indistinguishable from true `0xff` characters in the values. This no longer occurs. However, the fix requires that you dump and reload any tables that have `ENUM` columns containing any true `0xff` values. Dump the tables using `mysqldump` with the current server before upgrading from a version of MySQL 5.0 older than 5.0.36 to version 5.0.36 or newer. ([Bug#24660](#))
- **Partitioning: MySQL Cluster:** A query with an `IN` clause against an `NDB` table employing explicit user-defined partitioning did not always return all matching rows. ([Bug#25821](#))
- **MySQL Cluster:** It was not possible to create an `NDB` table with a key on two `VARCHAR` columns where both columns had a storage length in excess of 256. ([Bug#25746](#))
- **MySQL Cluster:** In some circumstances, shutting down the cluster could cause connected `mysqld` processes to crash. ([Bug#25668](#))
- **MySQL Cluster:** Memory allocations for `TEXT` columns were calculated incorrectly, resulting in space being wasted and other issues. ([Bug#25562](#))
- **MySQL Cluster:** The failure of a master node during a node restart could lead to a resource leak, causing later node failures. ([Bug#25554](#))
- **MySQL Cluster:** An `UPDATE` using an `IN` clause on an `NDB` table on which there was a trigger caused `mysqld` to crash. ([Bug#25522](#))
- **MySQL Cluster:** A node shutdown occurred if the master failed during a commit. ([Bug#25364](#))
- **MySQL Cluster:** Creating a non-unique index with the `USING HASH` clause silently created an ordered index instead of issuing a warning. ([Bug#24820](#))
- **MySQL Cluster:** The `ndb_size.tmp1` file (necessary for using the `ndb_size.pl` script) was missing from binary distributions. ([Bug#24191](#))
- **MySQL Cluster:** The management server did not handle logging of node shutdown events correctly in certain cases. ([Bug#22013](#))
- **MySQL Cluster:** `SELECT` statements with a `BLOB` or `TEXT` column in the selected column list and a `WHERE` condition including a primary key lookup on a `VARCHAR` primary key produced empty result sets. ([Bug#19956](#))
- **MySQL Cluster:** The loss of one or more data nodes could sometimes cause `ndb_mgmd` to use a high amount of CPU (15 percent or more, as opposed to 1 to 2 percent normally).
- **Cluster API:** Deletion of an `Ndb_cluster_connection` object took a very long time. ([Bug#25487](#))
- **Cluster API:** `libndbclient.so` was not versioned. ([Bug#13522](#))
- Using `ORDER BY` or `GROUP BY` could yield different results when selecting from a view and selecting from the underlying table. ([Bug#26209](#))
- `DISTINCT` queries that were executed using a loose scan for an `InnoDB` table that had been emptied caused a server crash. ([Bug#26159](#))
- A `WHERE` clause that used `BETWEEN` for `DATETIME` values could be treated differently for a `SELECT` and a view defined as that `SELECT`. ([Bug#26124](#))
- Collation for `LEFT JOIN` comparisons could be evaluated incorrectly, leading to improper query results. ([Bug#26017](#))
- The `WITH CHECK OPTION` clause for views was ignored for updates of multiple-table views when the updates could not be performed on fly and the rows to update had to be put into temporary tables first. ([Bug#25931](#))

- `LOAD DATA INFILE` did not work with pipes. (Bug#25807)
- The `SEC_TO_TIME()` and `QUARTER()` functions sometimes did not handle `NULL` values correctly. (Bug#25643)
- The `InnoDB` parser sometimes did not account for null bytes, causing spurious failure of some queries. (Bug#25596)
- View definitions that used the `!` operator were treated as containing the `NOT` operator, which has a different precedence and can produce different results. (Bug#25580)
- An error in the name resolution of nested `JOIN ... USING` constructs was corrected. (Bug#25575)
- `GROUP BY` and `DISTINCT` did not group `NULL` values for columns that have a `UNIQUE` index. (Bug#25551)
- The `--with-readline` option for `configure` did not work for commercial source packages, but no error message was printed to that effect. Now a message is printed. (Bug#25530)
- A `yaSSL` program named `test` was installed, causing conflicts with the `test` system utility. It is no longer installed. (Bug#25417)
- For a `UNIQUE` index containing many `NULL` values, the optimizer would prefer the index for `col IS NULL` conditions over other more selective indexes. (Bug#25407)
- An `AFTER UPDATE` trigger on an `InnoDB` table with a composite primary key caused the server to crash. (Bug#25398)
- Passing a `NULL` value to a user-defined function from within a stored procedure crashes the server. (Bug#25382)
- `pererror` crashed on some platforms due to failure to handle a `NULL` pointer. (Bug#25344)
- `mysql.server stop` timed out too quickly (35 seconds) waiting for the server to exit. Now it waits up to 15 minutes, to ensure that the server exits. (Bug#25341)
- A query that contained an `EXIST` subquery with a `UNION` over correlated and uncorrelated `SELECT` queries could cause the server to crash. (Bug#25219)
- `mysql_kill()` caused a server crash when used on an SSL connection. (Bug#25203)
- `yaSSL` was sensitive to the presence of whitespace at the ends of lines in PEM-encoded certificates, causing a server crash. (Bug#25189)
- A query with `ORDER BY` and `GROUP BY` clauses where the `ORDER BY` clause had more elements than the `GROUP BY` clause caused a memory overrun leading to a crash of the server. (Bug#25172)
- Use of `ON DUPLICATE KEY UPDATE` defeated the usual restriction against inserting into a join-based view unless only one of the underlying tables is used. (Bug#25123)
- `ALTER TABLE ... ENABLE KEYS` acquired a global lock, preventing concurrent execution of other statements that use tables. (Bug#25044)
- A return value of `-1` from user-defined handlers was not handled well and could result in conflicts with server code. (Bug#24987)
- Accessing a fixed record format table with a crashed key definition results in server/`myisamchk` segmentation fault. (Bug#24855)
- `mysqld_multi` and `mysqlaccess` looked for option files in `/etc` even if the `--sysconfdir` option for `configure` had been given to specify a different directory. (Bug#24780)
- If there was insufficient memory available to `mysqld`, this could sometimes cause the server to hang during startup. (Bug#24751)
- If an `ORDER BY` or `GROUP BY` list included a constant expression being optimized away and, at the same time, containing single-row subselects that returned more than one row, no error was reported. If a query required sorting by expressions containing single-row subselects that returned more than one row, execution of the query could cause a server crash. (Bug#24653)
- For `ALTER TABLE`, using `ORDER BY expression` could cause a server crash. Now the `ORDER BY` clause allows only column names to be specified as sort criteria (which was the only documented syntax, anyway). (Bug#24562)
- A workaround was implemented to avoid a race condition in the NPTL `pthread_exit()` implementation. (Bug#24507)
- `mysqltest` crashed with a stack overflow. (Bug#24498)

- Within stored routines or prepared statements, inconsistent results occurred with multiple use of `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` when the `ON DUPLICATE KEY UPDATE` clause erroneously tried to assign a value to a column mentioned only in its `SELECT` part. (Bug#24491)
- Expressions of the form `(a, b) IN (SELECT a, MIN(b) FROM t GROUP BY a)` could produce incorrect results when column `a` of table `t` contained `NULL` values while column `b` did not. (Bug#24420)
- If a prepared statement accessed a view, access to the tables listed in the query after that view was checked in the security context of the view. (Bug#24404)
- Attempts to access a `MyISAM` table with a corrupt column definition caused a server crash. (Bug#24401)
- When opening a corrupted `.frm` file during a query, the server crashes. (Bug#24358)
- A query using `WHERE unsigned_column NOT IN ('negative_value')` could cause the server to crash. (Bug#24261)
- When `SET PASSWORD` was written to the binary log double quotes were included in the statement. If the slave was running in with the server SQL mode set to `ANSI_QUOTES`, then the event failed, which halted the replication process. (Bug#24158)
- Expressions of the form `(a, b) IN (SELECT c, d ...)` could produce incorrect results if `a`, `b`, or both were `NULL`. (Bug#24127)
- A `FETCH` statement using a cursor on a table which was not in the table cache could sometimes cause the server to crash. (Bug#24117)
- Queries that evaluate `NULL IN (SELECT ... UNION SELECT ...)` could produce an incorrect result (`FALSE` instead of `NULL`). (Bug#24085)
- Hebrew-to-Unicode conversion failed for some characters. Definitions for the following Hebrew characters (as specified by the ISO/IEC 8859-8:1999) were added: LEFT-TO-RIGHT MARK (LRM), RIGHT-TO-LEFT MARK (RLM) (Bug#24037)
- Some `UPDATE` statements were slower than in previous versions when the search key could not be converted to a valid value for the type of the search column. (Bug#24035)
- `ISNULL(DATE(NULL))` and `ISNULL(CAST(NULL AS DATE))` erroneously returned false. (Bug#23938)
- Within a stored routine, accessing a declared routine variable with `PROCEDURE ANALYSE()` caused a server crash. (Bug#23782)
- When reading from the standard input on Windows, `mysqlbinlog` opened the input in text mode rather than binary mode and consequently misinterpreted some characters such as Control-Z. (Bug#23735)
- A stored procedure, executed from a connection using a binary character set, and which wrote multibyte data, would write incorrectly escaped entries to the binary log. This caused syntax errors, and caused replication to fail. (Bug#23619, Bug#24492)
- For an `InnoDB` table with any `ON DELETE` trigger, `TRUNCATE TABLE` mapped to `DELETE` and activated triggers. Now a fast truncation occurs and triggers are not activated. (Bug#23556)
- The row count for `MyISAM` tables was not updated properly, causing `SHOW TABLE STATUS` to report incorrect values. (Bug#23526)
- With `ONLY_FULL_GROUP_BY` enables, the server was too strict: Some expressions involving only aggregate values were rejected as non-aggregate (for example, `MAX(a) - MIN(a)`). (Bug#23417)
- The arguments to the `ENCODE()` and the `DECODE()` functions were not printed correctly, causing problems in the output of `EXPLAIN EXTENDED` and in view definitions. (Bug#23409)
- Some queries against `INFORMATION_SCHEMA` that used subqueries failed. (Bug#23299)
- `readline` detection did not work correctly on NetBSD. (Bug#23293)
- If there was insufficient memory to store or update a blob record in a `MyISAM` table then the table will marked as crashed. (Bug#23196)
- `LAST_INSERT_ID()` was not reset to 0 if `INSERT ... SELECT` inserted no rows. (Bug#23170)
- The number of `setsockopt()` calls performed for reads and writes to the network socket was reduced to decrease system call overhead. (Bug#22943)
- `mysql_upgrade` failed when called with a `basedir` pathname containing spaces. (Bug#22801)

- `SET lc_time_names = value` allowed only exact literal values, not expression values. (Bug#22647)
- Changes to the `lc_time_names` system variable were not replicated. (Bug#22645)
- The `STDDEV()` function returned a positive value for data sets consisting of a single value. (Bug#22555)
- Storing values specified as hexadecimal values 64 or more bits long in `BIT(64)`, `BIGINT`, or `BIGINT UNSIGNED` columns did not raise any warning or error if the value was out of range. (Bug#22533)
- `SHOW COLUMNS` reported some `NOT NULL` columns as `NULL`. (Bug#22377)
- Type conversion errors during formation of index search conditions were not correctly checked, leading to incorrect query results. (Bug#22344)
- The code for generating `USE` statements for binary logging of `CREATE PROCEDURE` statements resulted in confusing output from `mysqlbinlog` for `DROP PROCEDURE` statements. (Bug#22043)
- For the `IF()` and `COALESCE()` function and `CASE` expressions, large unsigned integer values could be mishandled and result in warnings. (Bug#22026)
- SSL connections could hang at connection shutdown. (Bug#21781, Bug#24148)
- When updating a table that used a `JOIN` of the table itself (for example, when building trees) and the table was modified on one side of the expression, the table would either be reported as crashed or the wrong rows in the table would be updated. (Bug#21310)
- Inserting `DEFAULT` into a column with no default value could result in garbage in the column. Now the same result occurs as when inserting `NULL` into a `NOT NULL` column. (Bug#20691)
- A stored routine containing semicolon in its body could not be reloaded from a dump of a binary log. (Bug#20396)
- `SELECT ... FOR UPDATE`, `SELECT ... LOCK IN SHARE MODE`, `DELETE`, and `UPDATE` statements executed using a full table scan were not releasing locks on rows that did not satisfy the `WHERE` condition. (Bug#20390)
- On Windows, if the server was installed as a service, it did not auto-detect the location of the data directory. (Bug#20376)
- The `BUILD/check-cpu` script did not recognize Celeron processors. (Bug#20061)
- If a duplicate key value was present in the table, `INSERT ... ON DUPLICATE KEY UPDATE` reported a row count indicating that a record was updated, even when no record actually changed due to the old and new values being the same. Now it reports a row count of zero. (Bug#19978)

See also [Bug#27006](#), [Bug#27033](#), [Bug#27210](#)

- For `SET`, `SELECT`, and `DO` statements that invoked a stored function from a database other than the default database, the function invocation could fail to be replicated. (Bug#19725)
- `ORDER BY` values of the `DOUBLE` or `DECIMAL` types could change the result returned by a query. (Bug#19690)
- The `readline` library wrote to uninitialized memory, causing `mysql` to crash. (Bug#19474)
- `mysqltest` incorrectly tried to retrieve result sets for some queries where no result set was available. (Bug#19410)
- Use of already freed memory caused SSL connections to hang forever. (Bug#19209)
- The server might fail to use an appropriate index for `DELETE` when `ORDER BY`, `LIMIT`, and a non-restricting `WHERE` are present. (Bug#17711)
- No warning was issued for use of the `DATA DIRECTORY` or `INDEX DIRECTORY` table options on a platform that does not support them. (Bug#17498)
- When a prepared statement failed during the prepare operation, the error code was not cleared when it was reused, even if the subsequent use was successful. (Bug#15518)
- On Windows, the `SLEEP()` function could sleep too long, especially after a change to the system clock. (Bug#14094, Bug#24686, Bug#17635)
- `mysqldump --order-by-primary` failed if the primary key name was an identifier that required quoting. (Bug#13926)
- To enable installation of MySQL RPMs on Linux systems running RHEL 4 (which includes SE-Linux) additional information was provided to specify some actions that are allowed to the MySQL binaries. (Bug#12676)

- The presence of `ORDER BY` in a view definition prevented the `MERGE` algorithm from being used to resolve the view even if nothing else in the definition required the `TEMPTABLE` algorithm. (Bug#12122)
- If a slave server closed its relay log (for example, due to an error during log rotation), the I/O thread did not recognize this and still tried to write to the log, causing a server crash. (Bug#10798)

C.1.27. Release Notes for MySQL Enterprise 5.0.34 [MRU] (17 January 2007)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.32).

Functionality added or changed:

- The `--skip-thread-priority` option now is enabled by default for binary Mac OS X distributions. Use of thread priorities degrades performance on Mac OS X. (Bug#18526)
- Added the `--disable-grant-options` option to `configure`. If `configure` is run with this option, the `--bootstrap`, `--skip-grant-tables`, and `--init-file` options for `mysqld` are disabled and cannot be used. For Windows, the `configure.js` script recognizes the `DISABLE_GRANT_OPTIONS` flag, which has the same effect.

Bugs fixed:

- **MySQL Cluster:** Hosts in clusters with large numbers of nodes could experience excessive CPU usage while obtaining configuration data. (Bug#25711)
- **MySQL Cluster:** When a data node was shut down using the management client `STOP` command, a connection event (`NDB_LE_Connected`) was logged instead of a disconnection event (`NDB_LE_Disconnected`). (Bug#22773)
- **Cluster API:** Invoking the `NdbTransaction::execute()` method using execution type `Commit` and abort option `AO_IgnoreError` could lead to a crash of the transaction coordinator (DBTC). (Bug#25090)
- **Cluster API:** A unique index lookup on a non-existent tuple could lead to a data node timeout (error 4012). (Bug#25059)
- Referencing an ambiguous column alias in an expression in the `ORDER BY` clause of a query caused the server to crash. (Bug#25427)
- Using a view in combination with a `USING` clause caused column aliases to be ignored. (Bug#25106)
- A multiple-table `DELETE QUICK` could sometimes cause one of the affected tables to become corrupted. (Bug#25048)
- An assertion failed incorrectly for prepared statements that contained a single-row uncorrelated subquery that was used as an argument of the `IS NULL` predicate. (Bug#25027)
- Optimizations that are legal only for subqueries without tables and `WHERE` conditions were applied for any subquery without tables. (Bug#24670)
- Some joins in which one of the joined tables was a view could return erroneous results or crash the server. (Bug#24345)
- A view was not handled correctly if the `SELECT` part contained “\z”. (Bug#24293)
- The server was built even when `configure` was run with the `--without-server` option. (Bug#23973)

See also Bug#32898

- `OPTIMIZE TABLE` tried to sort R-tree indexes such as spatial indexes, although this is not possible (see Section 12.5.2.5, “`OPTIMIZE TABLE Syntax`”). (Bug#23578)
- User-defined variables could consume excess memory, leading to a crash caused by the exhaustion of resources available to the `MEMORY` storage engine, due to the fact that this engine is used by MySQL for variable storage and intermediate results of `GROUP BY` queries. Where `SET` had been used, such a condition could instead give rise to the misleading error message `YOU MAY ONLY USE CONSTANT EXPRESSIONS WITH SET`, rather than `OUT OF MEMORY (NEEDED NNNNNN BYTES)`. (Bug#23443)
- A table created with the `ROW_FORMAT = FIXED` table option lost the option if an index was added or dropped with `CREATE INDEX` or `DROP INDEX`. (Bug#23404)
- A deadlock could occur, with the server hanging on `Closing tables`, with a sufficient number of concurrent `INSERT`

`DELAYED`, `FLUSH TABLES`, and `ALTER TABLE` operations. (Bug#23312)

- A compressed `MyISAM` table that became corrupted could crash `myisamchk` and possibly the MySQL Server. (Bug#23139)
- Changing the value of `MI_KEY_BLOCK_LENGTH` in `myisam.h` and recompiling MySQL resulted in a `myisamchk` that saw existing `MyISAM` tables as corrupt. (Bug#22119)
- A crash of the MySQL Server could occur when unpacking a `BLOB` column from a row in a corrupted `MyISAM` table. This could happen when trying to repair a table using either `REPAIR TABLE` or `myisamchk`; it could also happen when trying to access such a “broken” row using statements like `SELECT` if the table was not marked as crashed. (Bug#22053)
- The `FEDERATED` storage engine did not support the `euckr` character set. (Bug#21556)
- `mysqld_error.h` was not installed when only the client libraries were built. (Bug#21265)
- `InnoDB`: During a restart of the MySQL Server that followed the creation of a temporary table using the `InnoDB` storage engine, MySQL failed to clean up in such a way that `InnoDB` still attempted to find the files associated with such tables. (Bug#20867)
- Some `CASE` statements inside stored routines could lead to excessive resource usage or a crash of the server. (Bug#19194, Bug#24854)
- Instance Manager could crash during shutdown. (Bug#19044)
- The `FEDERATED` storage engine did not support the `utf8` character set. (Bug#17044)
- The optimizer removes expressions from `GROUP BY` and `DISTINCT` clauses if they happen to participate in `expression = constant` predicates of the `WHERE` clause, the idea being that, if the expression is equal to a constant, then it cannot take on multiple values. However, for predicates where the expression and the constant item are of different result types (for example, when a string column is compared to 0), this is not valid, and can lead to invalid results in such cases. The optimizer now performs an additional check of the result types of the expression and the constant; if their types differ, then the expression is not removed from the `GROUP BY` list. (Bug#15881)
- Dropping a user-defined function sometimes did not remove the UDF entry from the `mysql.proc` table. (Bug#15439)
- Inserting a row into a table without specifying a value for a `BINARY(N) NOT NULL` column caused the column to be set to spaces, not zeroes. (Bug#14171)

C.1.28. Release Notes for MySQL Enterprise 5.0.32 [MRU] (20 December 2006)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.30).

Functionality added or changed:

- **Incompatible Change:** `InnoDB` rolls back only the last statement on a transaction timeout. A new option, `-innodb_rollback_on_timeout`, causes `InnoDB` to abort and roll back the entire transaction if a transaction timeout occurs (the same behavior as in MySQL 5.0.13 and earlier). (Bug#24200)
- **Incompatible Change:** The `prepared_stmt_count` system variable has been converted to the `Prepared_stmt_count` global status variable (viewable with the `SHOW GLOBAL STATUS` statement). (Bug#23159)
- **MySQL Cluster:** Setting the configuration parameter `LockPagesInMainMemory` had no effect. (Bug#24461)
- **MySQL Cluster:** It is now possible to create a unique hashed index on a column that is not defined as `NOT NULL`.

Note

This change applies only to tables using the `NDB` storage engine.

Unique indexes on columns in `NDB` tables do not store null values because they are mapped to primary keys in an internal index table (and primary keys cannot contain nulls).

Normally, an additional ordered index is created when one creates unique indexes on `NDB` table columns; this can be used to search for `NULL` values. However, if `USING HASH` is specified when such an index is created, no ordered index is created.

The reason for permitting unique hash indexes with null values is that, in some cases, the user wants to save space if a large number of records are pre-allocated but not fully initialized. This also assumes that the user will *not* try to search for null val-

ues. Since MySQL does not support indexes that are not allowed to be searched in some cases, the `NDB` storage engine uses a full table scan with pushed conditions for the referenced index columns to return the correct result.

A warning is returned if one creates a unique nullable hash index, since the query optimizer should be provided a hint not to use it with `NULL` values if this can be avoided. (Bug#21507)

- `DROP TRIGGER` now supports an `IF EXISTS` clause. (Bug#23703)
- The `Com_create_user` status variable was added (for counting `CREATE USER` statements). (Bug#22958)
- The `--memlock` option relies on system calls that are unreliable on some operating systems. If a crash occurs, the server now checks whether `--memlock` was specified and if so issues some information about possible workarounds. (Bug#22860)
- `mysqldump` now accepts the `--debug-info` option, which displays debugging information and memory and CPU usage statistics at program exit.
- The bundled yaSSL library was upgraded to version 1.5.0.

Bugs fixed:

- **MySQL Cluster:** The failure of a data node failure during a schema operation could lead to additional node failures. (Bug#24752)
- **MySQL Cluster:** A committed read could be attempted before a data node had time to connect, causing a timeout error. (Bug#24717)
- **MySQL Cluster:** Sudden disconnection of an SQL or data node could lead to shutdown of data nodes with the error `FAILED NDBREQUIRE`. (Bug#24447)
- **MySQL Cluster:** `ndb_config` failed when trying to use 2 management servers and node IDs. (Bug#23887)
- **MySQL Cluster:** If the value set for `MaxNoOfAttributes` is excessive, a suitable error message is now returned. (Bug#19352)
- **MySQL Cluster:** A unique constraint violation was not ignored by an `UPDATE IGNORE` statement when the constraint violation occurred on a non-primary key. (Bug#18487, Bug#24303)
- **Cluster API:** Using `BIT` values with any of the comparison methods of the `NdbScanFilter` class caused data nodes to fail. (Bug#24503)
- **Cluster API:** Some MGM API function calls could yield incorrect return values in certain cases where the cluster was operating under a very high load, or experienced timeouts in inter-node communications. (Bug#24011)
- The `REPEAT()` function could return `NULL` when passed a column for the count argument. (Bug#24947)
- `mysql_upgrade` failed if the `--password` (or `-p`) option was given. (Bug#24896)
- With `innodb_file_per_table` enabled, `InnoDB` displayed incorrect file times in the output from `SHOW TABLE STATUS`. (Bug#24712)
- `ALTER ENABLE KEYS` or `ALTER TABLE DISABLE KEYS` combined with another `ALTER TABLE` option other than `RENAME TO` did nothing. In addition, if `ALTER TABLE` was used on a table having disabled keys, the keys of the resulting table were enabled. (Bug#24395)
- The `InnoDB` mutex structure was simplified to reduce memory load. (Bug#24386)
- The `--extern` option for `mysql-test-run.pl` did not function correctly. (Bug#24354)
- Foreign key identifiers for `InnoDB` tables could not contain certain characters. (Bug#24299)
- The `mysql.server` script used the `source` command, which is less portable than the `.` command; it now uses `.` instead. (Bug#24294)
- `ALTER TABLE` statements that performed both `RENAME TO` and `{ENABLE|DISABLE} KEYS` operations caused a server crash. (Bug#24219)
- The loose index scan optimization for `GROUP BY` with `MIN` or `MAX` was not applied within other queries, such as `CREATE TABLE ... SELECT ..., INSERT ... SELECT ...`, or in the `FROM` clauses of subqueries. (Bug#24156)
- Subqueries for which a pushed-down condition did not produce exactly one key field could cause a server crash. (Bug#24056)

- The size of `MEMORY` tables and internal temporary tables was limited to 4GB on 64-bit Windows systems. (Bug#24052)
- `ROW_COUNT()` did not work properly as an argument to a stored procedure. (Bug#23760)
- `LAST_DAY('0000-00-00')` could cause a server crash. (Bug#23653)
- A trigger that invoked a stored function could cause a server crash when activated by different client connections. (Bug#23651)
- The stack size for NetWare binaries was increased to 128KB to prevent problems caused by insufficient stack size. (Bug#23504)
- If elements in a non-top-level `IN` subquery were accessed by an index and the subquery result set included a `NULL` value, the quantified predicate that contained the subquery was evaluated to `NULL` when it should return a non-`NULL` value. (Bug#23478)
- When applying the `group_concat_max_len` limit, `GROUP_CONCAT()` could truncate multi-byte characters in the middle. (Bug#23451)
- `mysql_affected_rows()` could return values different from `mysql_stmt_affected_rows()` for the same sequence of statements. (Bug#23383)
- Accuracy was improved for comparisons between `DECIMAL` columns and numbers represented as strings. (Bug#23260)
- Calculation of `COUNT(DISTINCT)`, `AVG(DISTINCT)`, or `SUM(DISTINCT)` when they are referenced more than once in a single query with `GROUP BY` could cause a server crash. (Bug#23184)
- Changes to character set variables prior to an action on a replication-ignored table were forgotten by slave servers. (Bug#22877)
- Queries using a column alias in an expression as part of an `ORDER BY` clause failed, an example of such a query being `SELECT mycol + 1 AS mynum FROM mytable ORDER BY 30 - mynum`. (Bug#22457)
- Using `EXPLAIN` caused a server crash for queries that selected from `INFORMATION_SCHEMA` in a subquery in the `FROM` clause. (Bug#22413)
- A server crash occurred when using `LOAD DATA` to load a table containing a `NOT NULL` spatial column, when the statement did not load the spatial column. Now a `NULL supplied to NOT NULL column` error occurs. (Bug#22372)
- `DATE_ADD()` requires complete dates with no “zero” parts, but sometimes did not return `NULL` when given such a date. (Bug#22229)
- Some small double precision numbers (such as `1.00000001e-300`) that should have been accepted were truncated to zero. (Bug#22129)
- For a nonexistent table, `DROP TEMPORARY TABLE` failed with an incorrect error message if `read_only` was enabled. (Bug#22077)
- Trailing spaces were not removed from Unicode `CHAR` column values when used in indexes. This resulted in excessive usage of storage space, and could affect the results of some `ORDER BY` queries that made use of such indexes.

Note

When upgrading, it is necessary to re-create any existing indexes on Unicode `CHAR` columns in order to take advantage of the fix. This can be done by using a `REPAIR TABLE` statement on each affected table.

(Bug#22052)

- `STR_TO_DATE()` returned `NULL` if the format string contained a space following a non-format character. (Bug#22029)
- In some cases, the parser failed to distinguish a user-defined function from a stored function. (Bug#21809)
- Inserting a default or invalid value into a spatial column could fail with `Unknown error` rather than a more appropriate error. (Bug#21790)
- It was possible to use `DATETIME` values whose year, month, and day parts were all zeroes but whose hour, minute, and second parts contained nonzero values, an example of such an illegal `DATETIME` being `'0000-00-00 11:23:45'`.

Note

This fix was reverted in MySQL 5.0.40.

(Bug#21789)

See also [Bug#25301](#)

- yaSSL crashed on pre-Pentium Intel CPUs. ([Bug#21765](#))
- Evaluation of subqueries that require the filesort algorithm were allocating and freeing the `sort_buffer_size` buffer many times, resulting in slow performance. Now the buffer is allocated once and reused. ([Bug#21727](#))
- Through the C API, the member strings in `MYSQL_FIELD` for a query that contains expressions may return incorrect results. ([Bug#21635](#))
- Using `FLUSH TABLES` in one connection while another connection is using `HANDLER` statements caused a server crash.

Note

This fix was reverted in MySQL 5.0.48

([Bug#21587](#))

See also [Bug#29474](#)

- View columns were always handled as having implicit derivation, leading to `illegal mix of collation errors` for some views in `UNION` operations. Now view column derivation comes from the original expression given in the view definition. ([Bug#21505](#))
- InnoDB crashed while performing XA recovery of prepared transactions. ([Bug#21468](#))
- `INET_ATON()` returned a signed `BIGINT` value, not an unsigned value. ([Bug#21466](#))
- It was possible to set the backslash character (“\”) as the delimiter character using `DELIMITER`, but not actually possible to use it as the delimiter. ([Bug#21412](#))
- Selecting into variables sometimes returned incorrect wrong results. ([Bug#20836](#))
- On slave servers, transactions that exceeded the lock wait timeout failed to roll back properly. ([Bug#20697](#))
- `CONCURRENT` did not work correctly for `LOAD DATA INFILE`. ([Bug#20637](#))
- `mysql_fix_privilege_tables.sql` altered the `table_privs.table_priv` column to contain too few privileges, causing loss of the `CREATE VIEW` and `SHOW VIEW` privileges. ([Bug#20589](#))
- With `lower_case_table_names` set to 1, `SHOW CREATE TABLE` printed incorrect output for table names containing Turkish I (LATIN CAPITAL LETTER I WITH DOT ABOVE). ([Bug#20404](#))
- A query with a subquery that references columns of a view from the outer `SELECT` could return an incorrect result if used from a prepared statement. ([Bug#20327](#))
- For queries that select from a view, the server was returning `MYSQL_FIELD` metadata inconsistently for view names and table names. For view columns, the server now returns the view name in the `table` field and, if the column selects from an underlying table, the table name in the `org_table` field. ([Bug#20191](#))
- Invalidating the query cache caused a server crash for `INSERT INTO ... SELECT` statements that selected from a view. ([Bug#20045](#))
- Unsigned `BIGINT` values treated as signed values by the `MOD()` function. ([Bug#19955](#))
- Compiling PHP 5.1 with the MySQL static libraries failed on some versions of Linux. ([Bug#19817](#))
- The `DELIMITER` statement did not work correctly when used in an SQL file run using the `SOURCE` statement. ([Bug#19799](#))
- For a cast of a `DATETIME` value containing microseconds to `DECIMAL`, the microseconds part was truncated without generating a warning. Now the microseconds part is preserved. ([Bug#19491](#))
- SQL statements close to the size of `max_allowed_packet` could produce binary log events larger than `max_allowed_packet` that could not be read by slave servers. ([Bug#19402](#))
- `VARBINARY` column values inserted on a MySQL 4.1 server had trailing zeroes following upgrade to MySQL 5.0 or later. ([Bug#19371](#))
- The server could send incorrect column count information to the client for queries that produce a larger number of columns than can fit in a two-byte number. ([Bug#19216](#))

- For some problems relating to character set conversion or incorrect string values for `INSERT` or `UPDATE`, the server was reporting truncation or length errors instead. (Bug#18908)
- Constant expressions and some numeric constants used as input parameters to user-defined functions were not treated as constants. (Bug#18761)
- `myisampack` wrote to unallocated memory, causing a crash. (Bug#17951)
- `FLUSH LOGS` or `mysqladmin flush-logs` caused a server crash if the binary log was not open. (Bug#17733)
- `mysql_fix_privilege_tables` did not accept a password containing embedded space or apostrophe characters. (Bug#17700)
- Attempting to use a view containing `DEFINER` information for a non-existent user resulted in an error message that revealed the definer account. Now the definer is revealed only to superusers. Other users receive only an `access denied` message. (Bug#17254)
- `IN()` and `CHAR()` can return `NULL`, but did not signal that to the query processor, causing incorrect results for `IS NULL` operations. (Bug#17047)
- Slave servers would retry the execution of an SQL statement an infinite number of times, ignoring the value `SLAVE_TRANSACTION_RETRIES` when using the NDB engine. (Bug#16228)
- Warnings were generated when explicitly casting a character to a number (for example, `CAST('x' AS SIGNED)`), but not for implicit conversions in simple arithmetic operations (such as `'x' + 0`). Now warnings are generated in all cases. (Bug#11927)
- Metadata for columns calculated from scalar subqueries was limited to integer, double, or string, even if the actual type of the column was different. (Bug#11032)
- Subqueries of the form `NULL IN (SELECT ...)` returned invalid results. (Bug#8804, Bug#23485)

C.1.29. Release Notes for MySQL Enterprise 5.0.30sp1 [QSP] (19 January 2007)

This is a *Service Pack* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.30).

Functionality added or changed:

- **Incompatible Change:** `InnoDB` rolls back only the last statement on a transaction timeout. A new option, `-innodb_rollback_on_timeout`, causes `InnoDB` to abort and roll back the entire transaction if a transaction timeout occurs (the same behavior as in MySQL 5.0.13 and earlier). (Bug#24200)

Bugs fixed:

- The loose index scan optimization for `GROUP BY` with `MIN` or `MAX` was not applied within other queries, such as `CREATE TABLE ... SELECT ...`, `INSERT ... SELECT ...`, or in the `FROM` clauses of subqueries. (Bug#24156)
- The size of `MEMORY` tables and internal temporary tables was limited to 4GB on 64-bit Windows systems. (Bug#24052)
- A stored procedure, executed from a connection using a binary character set, and which wrote multibyte data, would write incorrectly escaped entries to the binary log. This caused syntax errors, and caused replication to fail. (Bug#23619, Bug#24492)
- Accuracy was improved for comparisons between `DECIMAL` columns and numbers represented as strings. (Bug#23260)
- Calculation of `COUNT(DISTINCT)`, `AVG(DISTINCT)`, or `SUM(DISTINCT)` when they are referenced more than once in a single query with `GROUP BY` could cause a server crash. (Bug#23184)
- Evaluation of subqueries that require the filesort algorithm were allocating and freeing the `sort_buffer_size` buffer many times, resulting in slow performance. Now the buffer is allocated once and reused. (Bug#21727)
- `InnoDB` crashed while performing XA recovery of prepared transactions. (Bug#21468)
- Certain malformed `INSERT` statements could crash the `mysql` client. (Bug#21142)

- `CONCURRENT` did not work correctly for `LOAD DATA INFILE`. (Bug#20637)
- Several string functions could return incorrect results when given very large length arguments. (Bug#10963)

C.1.30. Release Notes for MySQL Enterprise 5.0.30 [MRU] (14 November 2006)

This is a *Monthly Rapid Update* release of the MySQL Enterprise Server 5.0.

This section documents all changes and bug fixes that have been applied since the last MySQL Enterprise Server release (5.0.28).

Functionality added or changed:

- **MySQL Cluster:** The `ndb_config` utility now accepts `-c` as a short form of the `--ndb-connectstring` option. (Bug#22295)
- **MySQL Cluster:** Added the `--bind-address` option for `ndbd`. This allows a data node process to be bound to a specific network interface. (Bug#22195)
- **MySQL Cluster:** The NDB storage engine could leak memory during file operations. (Bug#21858)
- **MySQL Cluster:** The `Ndb_number_of_storage_nodes` system variable was renamed to `Ndb_number_of_data_nodes`. (Bug#20848)
- **MySQL Cluster:** The `HELP` command in the Cluster management client now provides command-specific help. For example, `HELP RESTART` in `ndb_mgm` provides detailed information about the `RESTART` command. (Bug#19620)
- If the user specified the server options `--max-connections=N` or `--table-open-cache=M`, a warning would be given in some cases that some values were recalculated, with the result that `--table-open-cache` could be assigned greater value.

In such cases, both the warning and the increase in the `--table-open-cache` value were completely harmless. Note also that it is not possible for the MySQL Server to predict or to control limitations on the maximum number of open files, since this is determined by the operating system.

The value of `--table-open-cache` is no longer increased automatically, and a warning is now given only if some values had to be decreased due to operating system limits. (Bug#21915)

- For the `CALL` statement, stored procedures that take no arguments now can be invoked without parentheses. That is, `CALL p()` and `CALL p` are equivalent. (Bug#21462)
- `mysql_upgrade` now passes all the parameters specified on the command line to both `mysqlcheck` and `mysql` using the `upgrade_defaults` file. (Bug#20100)
- `SHOW STATUS` is no longer logged to the slow query log. (Bug#19764)
- `mysqldump --single-transaction` now uses `START TRANSACTION /*!40100 WITH CONSISTENT SNAPSHOT */` rather than `BEGIN` to start a transaction, so that a consistent snapshot will be used on those servers that support it. (Bug#19660)

Bugs fixed:

- **MySQL Cluster:** Backup of a cluster failed if there were any tables with 128 or more columns. (Bug#23502)
- **MySQL Cluster:** Cluster backups failed when there were more than 2048 schema objects in the cluster. (Bug#23499)
- **MySQL Cluster:** The management client command `ALL DUMP 1000` would cause the cluster to crash if data nodes were connected to the cluster but not yet fully started. (Bug#23203)
- **MySQL Cluster:** `INSERT ... ON DUPLICATE KEY UPDATE` on an NDB table could lead to deadlocks and memory leaks. (Bug#23200)
- **MySQL Cluster:** (NDB API): Inactivity timeouts for scans were not correctly handled. (Bug#23107)
- **MySQL Cluster:** If a node restart could not be performed from the REDO log, no node takeover took place. This could cause partitions to be left empty during a system restart. (Bug#22893)
- **MySQL Cluster:** Multiple node restarts in rapid succession could cause a system restart to fail, or induce a race condition.

[Bug#22892](#), [Bug#23210](#))

- **MySQL Cluster:** (NDB API): Attempting to read a nonexistent tuple using `Commit` mode for `NdbTransaction::execute()` caused node failures. ([Bug#22672](#))
- **MySQL Cluster:** The `--help` output from NDB binaries did not include file-related options. ([Bug#21994](#))
- **MySQL Cluster:** (NDB API): Scans closed before being executed were still placed in the send queue. ([Bug#21941](#))
- **MySQL Cluster:** A scan timeout returned Error 4028 (NODE FAILURE CAUSED ABORT OF TRANSACTION) instead of Error 4008 (NODE FAILURE CAUSED ABORT OF TRANSACTION...). ([Bug#21799](#))
- **MySQL Cluster:** The node recovery algorithm was missing a version check for tables in the `ALTER_TABLE_COMMITTED` state (as opposed to the `TABLE_ADD_COMMITTED` state, which has the version check). This could cause inconsistent schemas across nodes following node recovery. ([Bug#21756](#))
- **MySQL Cluster:** Partition distribution keys were updated only for the primary and starting replicas during node recovery. This could lead to node failure recovery for clusters having an odd number of replicas.

Note

We recommend values for `NumberOfReplicas` that are even powers of 2, for best results.

([Bug#21535](#))

- **MySQL Cluster:** The `ndb_mgm` management client did not set the exit status on errors, always returning 0 instead. ([Bug#21530](#))
- **MySQL Cluster:** Attempting to create an NDB table on a MySQL with an existing non-Cluster table with the same name in the same database could result in data loss or corruption. MySQL now issues a warning when a `SHOW TABLES` or other statement causing table discovery finds such a table. ([Bug#21378](#))
- **MySQL Cluster:** Cluster logs were not rotated following the first rotation cycle. ([Bug#21345](#))
- **MySQL Cluster:** When inserting a row into an NDB table with a duplicate value for a non-primary unique key, the error issued would reference the wrong key. ([Bug#21072](#))
- **MySQL Cluster:** Condition pushdown did not work correctly with `DATETIME` columns. ([Bug#21056](#))
- **MySQL Cluster:** Under some circumstances, local checkpointing would hang, keeping any unstarted nodes from being started. ([Bug#20895](#))
- **MySQL Cluster:** Using an invalid node ID with the management client `STOP` command could cause `ndb_mgm` to hang. ([Bug#20575](#))
- **MySQL Cluster:** Data nodes added while the cluster was running in single user mode were all assigned node ID 0, which could later cause multiple node failures. Adding nodes while in single user mode is no longer possible. ([Bug#20395](#))
- **MySQL Cluster:** In some cases where `SELECT COUNT(*)` from an NDB table should have yielded an error, `MAX_INT` was returned instead. ([Bug#19914](#))
- **MySQL Cluster:** Following the restart of a management node, the Cluster management client did not automatically reconnect. ([Bug#19873](#))
- **MySQL Cluster:** Error messages given when trying to make online changes to parameters such as `NoOfReplicas` that can only be changed via a complete shutdown and restart of the cluster did not indicate the true nature of the problem. ([Bug#19787](#))
- **MySQL Cluster:** `ndb_restore` did not always make clear that it had recovered successfully from temporary errors while restoring a cluster backup. ([Bug#19651](#))
- **MySQL Cluster:** In rare situations with resource shortages, a crash could result from insufficient `IndexScanOperations`. ([Bug#19198](#))
- **MySQL Cluster:** `ndb_mgm -e show | head` would hang after displaying the first 10 lines of output. ([Bug#19047](#))
- **MySQL Cluster:** The error returned by the cluster when too many nodes were defined did not make clear the nature of the problem. ([Bug#19045](#))
- **MySQL Cluster:** The `ndb_config` utility did not perform host lookups correctly when using the `--host` option ([Bug#17582](#))

- **MySQL Cluster:** A problem with takeover during a system restart caused ordered indexes to be rebuilt incorrectly. (Bug#15303)
- **Cluster API:** The `NdbOperation::getBlobHandle()` method, when called with the name of a nonexistent column, caused a segmentation fault. (Bug#21036)
- **Cluster API:** When multiple processes or threads in parallel performed the same ordered scan with exclusive lock and updated the retrieved records, the scan could skip some records, which as a result were not updated. (Bug#20446)
- There was a race condition in the `InnoDB fil_flush_file_spaces()` function. (Bug#24089)
This regression was introduced by Bug#15653
- yaSSL-related memory leaks were detected by Valgrind. (Bug#23981)
- The internal SQL interpreter of `InnoDB` placed an unnecessary lock on the supremum record when `innodb_locks_unsafe_for_binlog=1`. This caused an assertion failure when `InnoDB` was built with debugging enabled. (Bug#23769)
- `M % 0` returns `NULL`, but `(M % 0) IS NULL` evaluated to false. (Bug#23411)
- For not-yet-authenticated connections, the `Time` column in `SHOW PROCESSLIST` was a random value rather than `NULL`. (Bug#23379)
- MySQL failed to build on Linux/Alpha. (Bug#23256)
This regression was introduced by Bug#21250
- If `COMPRESS()` returned `NULL`, subsequent invocations of `COMPRESS()` within a result set or within a trigger also returned `NULL`. (Bug#23254)
- Insufficient memory (`myisam_sort_buffer_size`) could cause a server crash for several operations on `MyISAM` tables: repair table, create index by sort, repair by sort, parallel repair, bulk insert. (Bug#23175)
- The column default value in the output from `SHOW COLUMNS` or `SELECT FROM INFORMATION_SCHEMA.COLUMNS` was truncated to 64 characters. (Bug#23037)
- `mysql` did not check for errors when fetching data during result set printing. (Bug#22913)
- `InnoDB` exhibited thread thrashing with more than 50 concurrent connections under an update-intensive workload. (Bug#22868)
- The return value from `my_seek()` was ignored. (Bug#22828)
- The optimizer failed to use equality propagation for `BETWEEN` and `IN` predicates with string arguments. (Bug#22753)
- The `Handler_rollback` status variable sometimes was incremented when no rollback had taken place. (Bug#22728)
- The `Host` column in `SHOW PROCESSLIST` output was blank when the server was started with the `--skip-grant-tables` option. (Bug#22723)
- If a table contains an `AUTO_INCREMENT` column, inserting into an insertable view on the table that does not include the `AUTO_INCREMENT` column should not change the value of `LAST_INSERT_ID()`, because the side effects of inserting default values into columns not part of the view should not be visible. MySQL was incorrectly setting `LAST_INSERT_ID()` to zero. (Bug#22584)
- Instance Manager had a race condition involving `mysqld` PID file removal. (Bug#22379)
- The optimizer used the `ref` join type rather than `eq_ref` for a simple join on strings. (Bug#22367)
- Some queries that used `MAX()` and `GROUP BY` could incorrectly return an empty result. (Bug#22342)
- If an `init_connect` SQL statement produced an error, the connection was silently terminated with no error message. Now the server writes a warning to the error log. (Bug#22158)
- Use of a DES-encrypted SSL certificate file caused a server crash. (Bug#21868)
- Use of `PREPARE` with a `CREATE PROCEDURE` statement that contained a syntax error caused a server crash. (Bug#21856)
- Adding a day, month, or year interval to a `DATE` value produced a `DATE`, but adding a week interval produced a `DATETIME` value. Now all produce a `DATE` value. (Bug#21811)

- Use of a subquery that invoked a function in the column list of the outer query resulted in a memory leak. (Bug#21798)
- Selecting from a `MERGE` table could result in a server crash if the underlying tables had fewer indexes than the `MERGE` table itself. (Bug#21617, Bug#22937)
- After `FLUSH TABLES WITH READ LOCK` followed by `UNLOCK TABLES`, attempts to drop or alter a stored routine failed with an error that the routine did not exist, and attempts to execute the routine failed with a lock conflict error. (Bug#21414)
- For multiple-table `UPDATE` statements, storage engines were not notified of duplicate-key errors. (Bug#21381)
- Within a prepared statement, `SELECT (COUNT(*) = 1)` (or similar use of other aggregate functions) did not return the correct result for statement re-execution. (Bug#21354)
- It was possible for a stored routine with a non-`latin1` name to cause a stack overrun. (Bug#21311)
- Creating a `TEMPORARY` table with the same name as an existing table that was locked by another client could result in a lock conflict for `DROP TEMPORARY TABLE` because the server unnecessarily tried to acquire a name lock. (Bug#21096)
- Incorrect results could be obtained from re-execution of a parametrized prepared statement or a stored routine with a `SELECT` that uses `LEFT JOIN` with a second table having only one row. (Bug#21081)
- Within a stored routine, a view definition cannot refer to routine parameters or local variables. However, an error did not occur until the routine was called. Now it occurs during parsing of the routine creation statement.

Note

A side effect of this fix is that if you have already created such routines, an error will occur if you execute `SHOW CREATE PROCEDURE` or `SHOW CREATE FUNCTION`. You should drop these routines because they are erroneous.

(Bug#20953)

- In `mysql`, invoking `connect` or `\r` with very long `db_name` or `host_name` parameters caused buffer overflow. (Bug#20894)
- `SHOW VARIABLES` truncated the `Value` field to 256 characters. (Bug#20862)
- `WITH ROLLUP` could group unequal values. (Bug#20825)
- Range searches on columns with an index prefix could miss records. (Bug#20732)
- An `UPDATE` that referred to a key column in the `WHERE` clause and activated a trigger that modified the column resulted in a loop. (Bug#20670)
- `LIKE` searches failed for indexed `utf8` character columns. (Bug#20471)
- With `SQL_MODE=TRADITIONAL`, MySQL incorrectly aborted on warnings within stored routines and triggers. (Bug#20028)
- `mysqldump --xml` produced invalid XML for `BLOB` data. (Bug#19745)
- Column names were not quoted properly for replicated views. (Bug#19736)
- `FLUSH INSTANCES` in Instance Manager triggered an assertion failure. (Bug#19368)
- For a debug server, a reference to an undefined user variable in a prepared statement executed with `EXECUTE` caused an assertion failure. (Bug#19356)
- Within a trigger for a base table, selecting from a view on that base table failed. (Bug#19111)
- The value of the `warning_count` system variable was not being calculated correctly (also affecting `SHOW COUNT(*) WARNINGS`). (Bug#19024)
- `DELETE IGNORE` could hang for foreign key parent deletes. (Bug#18819)
- `InnoDB` used table locks (not row locks) within stored functions. (Bug#18077)
- `mysql` would lose its connection to the server if its standard output was not writable. (Bug#17583)
- `mysql-test-run` did not work correctly for RPM-based installations. (Bug#17194)
- A client library crash was caused by executing a statement such as `SELECT * FROM t1 PROCEDURE ANALYSE()` using a server side cursor on a table `t1` that does not have the same number of columns as the output from `PROCEDURE ANA-`

`LYSE()`. ([Bug#17039](#))

- The `WITH CHECK OPTION` for a view failed to prevent storing invalid column values for `UPDATE` statements. ([Bug#16813](#))
- `InnoDB` showed substandard performance with multiple queries running concurrently. ([Bug#15815](#))
- `ALTER TABLE` was not able to rename a view. ([Bug#14959](#))
- Statements such as `DROP PROCEDURE` and `DROP VIEW` were written to the binary log too late due to a race condition. ([Bug#14262](#))
- A literal string in a `GROUP BY` clause could be interpreted as a column name. ([Bug#14019](#))
- Instance Manager didn't close the client socket file when starting a new `mysqld` instance. `mysqld` inherited the socket, causing clients connected to Instance Manager to hang. ([Bug#12751](#))
- Entries in the slow query log could have an incorrect `Rows_examined` value. ([Bug#12240](#))
- Lack of validation for input and output `TIME` values resulted in several problems: `SEC_TO_TIME()` in some cases did not clip large values to the `TIME` range appropriately; `SEC_TO_TIME()` treated `BIGINT UNSIGNED` values as signed; only truncation warnings were produced when both truncation and out-of-range `TIME` values occurred. ([Bug#11655](#), [Bug#20927](#))
- A locking safety check in `InnoDB` reported a spurious error `STORED_SELECT_LOCK_TYPE IS 0 INSIDE ::START_STMT()` for `INSERT ... SELECT` statements in `innodb_locks_unsafe_for_binlog` mode. The safety check was removed. ([Bug#10746](#))
- `FROM_UNIXTIME()` did not accept arguments up to `POWER(2, 31)-1`, which it had previously. ([Bug#9191](#))
- `OPTIMIZE TABLE` with `myisam_repair_threads > 1` could result in `MyISAM` table corruption. ([Bug#8283](#))
- Transient errors in replication from master to slave may trigger multiple `Got fatal error 1236: 'binlog truncated in the middle of event'` errors on the slave. ([Bug#4053](#))

C.1.31. Release Notes for MySQL Enterprise 5.0.28 (24 October 2006)

This is the first *MySQL Enterprise Server* release, following the last Community Server release (5.0.27).

Functionality added or changed:

- Binary MySQL distributions no longer include a `mysqld-max` server, except for RPM distributions. Instead, distributions contain a `mysqld` binary that includes the features previously included in the `mysqld-max` binary.

Bugs fixed:

- MySQL 5.0.26 introduced an ABI incompatibility, which this release reverts. Programs compiled against 5.0.26 are not compatible with any other version and must be recompiled. ([Bug#23427](#))
- `InnoDB`: Reduced optimization level for Windows 64 builds to handle possible memory overrun. ([Bug#19424](#))

Appendix D. MySQL Community Server Enhancements and Release Notes

This appendix lists the enhancements and changes from version to version in MySQL Community Server. This information is updated as bugs are fixed and features are incorporated, so that everybody can follow the development process.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (<http://dev.mysql.com/downloads/>), it means that the version has not yet been released (and will normally be marked so in the appropriate Release Note section).

The date mentioned with a release version is the date of the last change done internally at MySQL AB (the Bazaar commit) on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

For information on how to determine your current version and release type, see [Section 2.2, "Determining your current MySQL version"](#).

D.1. MySQL Community Server 5.0 Enhancements and Release Notes

This section documents all enhancements, changes, and bug fixes made to MySQL Community Server from 5.0.27 on. For changes and bug fixes to earlier versions, see [Appendix E, MySQL Change History](#).

D.1.1. Release Notes for MySQL Community Server 5.0.67 (04 August 2008)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.51b.

Functionality added or changed:

- **Security Enhancement:** To enable stricter control over the location from which user-defined functions can be loaded, the `plugin_dir` system variable has been backported from MySQL 5.1. If the value is non-empty, user-defined function object files can be loaded only from the directory named by this variable. If the value is empty, the behavior that is used before 5.0.67 applies: The UDF object files must be located in a directory that is searched by your system's dynamic linker. ([Bug#37428](#))
- **Important Change: Incompatible Change:** The `FEDERATED` storage engine is now disabled by default in the `.cnf` files shipped with MySQL distributions (`my-huge.cnf`, `my-medium.cnf`, and so forth). This affects server behavior only if you install one of these files. ([Bug#37069](#))
- **Cluster API: Important Change:** Because `NDB_LE_MemoryUsage.page_size_kb` shows memory page sizes in bytes rather than kilobytes, it has been renamed to `page_size_bytes`. The name `page_size_kb` is now deprecated and thus subject to removal in a future release, although it currently remains supported for reasons of backward compatibility. See [The Ndb_logevent_type Type](#), for more information about `NDB_LE_MemoryUsage`. ([Bug#30271](#))
- **Important Change:** Some changes were made to `CHECK TABLE ... FOR UPGRADE` and `REPAIR TABLE` with respect to detection and handling of tables with incompatible `.frm` files (files created with a different version of the MySQL server). These changes also affect `mysqlcheck` because that program uses `CHECK TABLE` and `REPAIR table`, and thus also `mysql_upgrade` because that program invokes `mysqlcheck`.
 - If your table was created by a different version of the MySQL server than the one you are currently running, `CHECK TABLE ... FOR UPGRADE` indicates that the table has an `.frm` file with an incompatible version. In this case, the result set returned by `CHECK TABLE` contains a line with a `Msg_type` value of `error` and a `Msg_text` value of `Table upgrade required. Please do "REPAIR TABLE `tbl_name`" to fix it!`
 - `REPAIR TABLE` without `USE_FRM` upgrades the `.frm` file to the current version.
