- The default value of the `connect_timeout` system variable was increased from 5 to 10 seconds. This might help in cases where clients frequently encounter errors of the form `Lost connection to MySQL server at 'XXX', system error: errno`. (Bug#28359)
- The use of InnoDB hash indexes now can be controlled by setting the new `innodb_adaptive_hash_index` system variable at server startup. By default, this variable is enabled. See Section 13.2.13.3, “Adaptive Hash Indexes”.
- The argument for the `mysql-test-run.pl --do-test` and `--skip-test` options is now interpreted as a Perl regular expression if there is a pattern metacharacter in the argument value. This allows more flexible specification of which tests to perform or skip.

Bugs fixed:

- **Important Change: Security Fix:** It was possible to circumvent privileges through the creation of `MyISAM` tables employing the `DATA DIRECTORY` and `INDEX DIRECTORY` options to overwrite existing table files in the MySQL data directory. Use of the MySQL data directory in `DATA DIRECTORY` and `INDEX DIRECTORY` pathname is now disallowed. (Bug#32167, CVE-2008-2079)
- **Security Fix:** Three vulnerabilities in yaSSL versions 1.7.5 and earlier were discovered that could lead to a server crash or execution of unauthorized code. The exploit requires a server with yaSSL enabled and TCP/IP connections enabled, but does not require valid MySQL account credentials. The exploit does not apply to OpenSSL.

Note

The proof-of-concept exploit is freely available on the Internet. Everyone with a vulnerable MySQL configuration is advised to upgrade *immediately*.

(Bug#33814, CVE-2008-0226, CVE-2008-0227)

- **Security Fix:** Using `RENAME TABLE` against a table with explicit `DATA DIRECTORY` and `INDEX DIRECTORY` options can be used to overwrite system table information by replacing the symbolic link points. the file to which the symlink points. MySQL will now return an error when the file to which the symlink points already exists. (Bug#32111, CVE-2007-5969)
- **Security Fix:** `ALTER VIEW` retained the original `DEFINER` value, even when altered by another user, which could allow that user to gain the access rights of the view. Now `ALTER VIEW` is allowed only to the original definer or users with the `SUPER` privilege. (Bug#29908)
- **Security Fix:** When using a `FEDERATED` table, the local server could be forced to crash if the remote server returned a result with fewer columns than expected. (Bug#29801)
- **Security Enhancement:** It was possible to force an error message of excessive length which could lead to a buffer overflow. This has been made no longer possible as a security precaution. (Bug#32707)
- **Incompatible Change:** With `ONLY_FULL_GROUP_BY` SQL mode enabled, queries such as `SELECT a FROM t1 HAVING COUNT(*) > 2` were not being rejected as they should have been.

This fix results in the following behavior:

- There is a check against mixing group and non-group columns *only* when `ONLY_FULL_GROUP_BY` is enabled.
- This check is done both for the select list and for the `HAVING` clause if there is one.

This behavior differs from previous versions as follows:

- Previously, the `HAVING` clause was not checked when `ONLY_FULL_GROUP_BY` was enabled; now it is checked.
- Previously, the select list was checked even when `ONLY_FULL_GROUP_BY` was not enabled; now it is checked only when `ONLY_FULL_GROUP_BY` is enabled.

([Bug#31794](#))

- **Incompatible Change:** The MySQL 5.0.50 patch for this bug was reverted because it changed the behavior of a General Availability MySQL release. ([Bug#30234](#))

See also [Bug#27525](#)

- **Incompatible Change:** Several type-preserving functions and operators returned an incorrect result type that does not match their argument types: `COALESCE()`, `IF()`, `IFNULL()`, `LEAST()`, `GREATEST()`, `CASE`. These now aggregate using the precise SQL types of their arguments rather than the internal type. In addition, the result type of the `STR_TO_DATE()` function is now `DATETIME` by default. ([Bug#27216](#))
- **Incompatible Change:** It was possible for option files to be read twice at program startup, if some of the standard option file locations turned out to be the same directory. Now duplicates are removed from the list of files to be read.

Also, users could not override system-wide settings using `~/my.cnf` because `SYSCONFDIR/my.cnf` was read last. The latter file now is read earlier so that `~/my.cnf` can override system-wide settings.

The fix for this problem had a side effect such that on Unix, MySQL programs looked for options in `~/my.cnf` rather than the standard location of `~/my.cnf`. That problem was addressed as [Bug#38180](#). ([Bug#20748](#))

- **Important Change: MySQL Cluster:** `AUTO_INCREMENT` columns had the following problems when used in `NDB` tables:
 - The `AUTO_INCREMENT` counter was not updated correctly when such a column was updated.
 - `AUTO_INCREMENT` values were not prefetched beyond statement boundaries.
 - `AUTO_INCREMENT` values were not handled correctly with `INSERT IGNORE` statements.
 - After being set, `ndb_autoincrement_prefetch_sz` showed a value of 1, regardless of the value it had actually been set to.

As part of this fix, the behavior of `ndb_autoincrement_prefetch_sz` has changed. Setting this to less than 32 no longer has any effect on prefetching within statements (where IDs are now always obtained in batches of 32 or more), but only between statements. The default value for this variable has also changed, and is now 1. ([Bug#25176](#), [Bug#31956](#), [Bug#32055](#))

- **Important Change: Replication:** When the master crashed during an update on a transactional table while in `AUTOCOMMIT` mode, the slave failed. This fix causes every transaction (including `AUTOCOMMIT` transactions) to be recorded in the binlog as starting with a `BEGIN` and ending with a `COMMIT` or `ROLLBACK`. ([Bug#26395](#))
- **Important Change:** It was possible to use `FRAC_SECOND` as a synonym for `MICROSECOND` with `DATE_ADD()`, `DATE_SUB()`, and `INTERVAL`; now, using `FRAC_SECOND` with anything other than `TIMESTAMPADD()` or `TIMESTAMPDIFF()` produces a syntax error.

It is now possible (and preferable) to use `MICROSECOND` with `TIMESTAMPADD()` and `TIMESTAMPDIFF()`, and `FRAC_SECOND` is now deprecated. ([Bug#33834](#))

- **Important Change:** The server no longer issues warnings for truncation of excess spaces for values inserted into `CHAR` columns. This reverts a change in the previous release that caused warnings to be issued. ([Bug#30059](#))
- **Replication: Important Note:** Network timeouts between the master and the slave could result in corruption of the relay log. This fix rectifies a long-standing replication issue when using unreliable networks, including replication over wide area networks such as the Internet. If you experience reliability issues and see many `YOU HAVE AN ERROR IN YOUR SQL SYNTAX errors` on replication slaves, we strongly recommend that you upgrade to a MySQL version which includes this fix. ([Bug#26489](#))
- **MySQL Cluster:** When configured with `NDB` support, MySQL failed to compile using `gcc` 4.3 on 64bit FreeBSD systems. ([Bug#34169](#))

- **MySQL Cluster:** The failure of a DDL statement could sometimes lead to node failures when attempting to execute subsequent DDL statements. ([Bug#34160](#))
- **MySQL Cluster:** Extremely long `SELECT` statements (where the text of the statement was in excess of 50000 characters) against `NDB` tables returned empty results. ([Bug#34107](#))
- **MySQL Cluster:** A periodic failure to flush the send buffer by the `NDB` TCP transporter could cause a unnecessary delay of 10 ms between operations. ([Bug#34005](#))
- **MySQL Cluster:** When all data and SQL nodes in the cluster were shut down abnormally (that is, other than by using `STOP` in the cluster management client), `ndb_mgm` used excessive amounts of CPU. ([Bug#33237](#))
- **MySQL Cluster:** An improperly reset internal signal was observed as a hang when using events in the `NDB` API but could result in various errors. ([Bug#33206](#))
- **MySQL Cluster:** Incorrectly handled parameters could lead to a crash in the Transaction Coordinator during a node failure, causing other data nodes to fail. ([Bug#33168](#))
- **MySQL Cluster:** The failure of a master node could lead to subsequent failures in local checkpointing. ([Bug#32160](#))
- **MySQL Cluster:** An uninitialized variable in the `NDB` storage engine code led to `AUTO_INCREMENT` failures when the server was compiled with `gcc` 4.2.1. ([Bug#31848](#))

This regression was introduced by [Bug#27437](#)

- **MySQL Cluster:** An error with an `if` statement in `sql/ha_ndbcluster.cc` could potentially lead to an infinite loop in case of failure when working with `AUTO_INCREMENT` columns in `NDB` tables. ([Bug#31810](#))
- **MySQL Cluster:** The `NDB` storage engine code was not safe for strict-alias optimization in `gcc` 4.2.1. ([Bug#31761](#))
- **MySQL Cluster:** Primary keys on variable-length columns (such as `VARCHAR`) did not work correctly. ([Bug#31635](#))
- **MySQL Cluster:** Transaction atomicity was sometimes not preserved between reads and inserts under high loads. ([Bug#31477](#))
- **MySQL Cluster:** Numerous `NDBCLUSTER` test failures occurred in builds compiled using `icc` on IA64 platforms. ([Bug#31239](#))
- **MySQL Cluster:** Transaction timeouts were not handled well in some circumstances, leading to excessive number of transactions being aborted unnecessarily. ([Bug#30379](#))
- **MySQL Cluster:** Having tables with a great many columns could cause Cluster backups to fail. ([Bug#30172](#))
- **MySQL Cluster:** Issuing an `INSERT ... ON DUPLICATE KEY UPDATE` concurrently with or following a `TRUNCATE` statement on an `NDB` table failed with `NDB` error 4350 `TRANSACTION ALREADY ABORTED`. ([Bug#29851](#))
- **MySQL Cluster:** In some cases, the cluster management server logged entries multiple times following a restart of `mgmd`. ([Bug#29565](#))
- **MySQL Cluster:** An interpreted program of sufficient size and complexity could cause all cluster data nodes to shut down due to buffer overruns. ([Bug#29390](#))
- **MySQL Cluster:** It was possible in `config.ini` to define cluster nodes having node IDs greater than the maximum allowed value. ([Bug#28298](#))
- **MySQL Cluster:** `UPDATE IGNORE` could sometimes fail on `NDB` tables due to the use of uninitialized data when checking for duplicate keys to be ignored. ([Bug#25817](#))
- **MySQL Cluster:** When inserting a row into an `NDB` table with a duplicate value for a non-primary unique key, the error issued would reference the wrong key.

This improves on an initial fix for this issue made in MySQL 5.0.30 and MySQL 5.0.33 ([Bug#21072](#))

- **Replication:** Some kinds of internal errors, such as `OUT OF MEMORY` errors, could cause the server to crash when replicating statements with user variables.
certain internal errors. ([Bug#37150](#))
- **Replication:** `CREATE PROCEDURE` and `CREATE FUNCTION` statements containing extended comments were not written to the binary log correctly, causing parse errors on the slave. ([Bug#36570](#))

See also [Bug#32575](#)

- **Replication:** `INSERT_ID` was not written to the binary log for inserts into `BLACKHOLE` tables. ([Bug#35178](#))
- **Replication:** The character sets and collations used for constant identifiers in stored procedures were not replicated correctly. ([Bug#34289](#))
- **Replication:** A `CREATE USER`, `DROP USER`, or `RENAME USER` statement that fails on the master, or that is a duplicate of any of these statements, is no longer written to the binlog; previously, either of these occurrences could cause the slave to fail. ([Bug#33862](#))

See also [Bug#29749](#)

- **Replication:** `SHOW BINLOG EVENTS` could fail when the binlog contained one or more events whose size was close to the value of `max_allowed_packet`. ([Bug#33413](#))
- **Replication:** An extraneous `ROLLBACK` statement was written to the binary log by a connection that did not use any transactional tables. ([Bug#33329](#))
- **Replication:** When a stored routine or trigger, running on a master that used MySQL 5.0 or MySQL 5.1.11 or earlier, performed an insert on an `AUTO_INCREMENT` column, the `INSERT_ID` value was not replicated correctly to a slave running MySQL 5.1.12 or later (including any MySQL 6.0 release). ([Bug#33029](#))

See also [Bug#19630](#)

- **Replication:** `CREATE VIEW` statements containing extended comments were not written to the binary log correctly, causing parse errors on the slave. Now, all comments are stripped from such statements before being written to the binary log. ([Bug#32575](#))

See also [Bug#36570](#)

- **Replication:** SQL statements containing comments using `--` syntax were not replayable by `mysqlbinlog`, even though such statements replicated correctly. ([Bug#32205](#))
- **Replication:** It was possible for the name of the relay log file to exceed the amount of memory reserved for it, possibly leading to a crash of the server. ([Bug#31836](#))

See also [Bug#28597](#)

- **Replication:** Corruption of log events caused the server to crash on 64-bit Linux systems having 4 GB of memory or more. ([Bug#31793](#))
- **Replication:** `STOP SLAVE` did not stop connection attempts properly. If the IO slave thread was attempting to connect, `STOP SLAVE` waited for the attempt to finish, sometimes for a long period of time, rather than stopping the slave immediately. ([Bug#31024](#))

See also [Bug#30932](#)

- **Replication:** Issuing a `DROP VIEW` statement caused replication to fail if the view did not actually exist. ([Bug#30998](#))
- **Replication:** One thread could read uninitialized memory from the stack of another thread. This issue was only known to occur in a `mysqld` process acting as both a master and a slave. ([Bug#30752](#))
- **Replication:** Setting `server_id` did not update its value for the current session. ([Bug#28908](#))
- **Replication:** Due a previous change in how the default name and location of the binlog file were determined, replication failed following some upgrades. ([Bug#28597](#), [Bug#28603](#))

See also [Bug#31836](#)

This regression was introduced by [Bug#20166](#)

- **Replication:** `MASTER_POS_WAIT()` did not return `NULL` when the server was not a slave. ([Bug#26622](#))
- **Replication:** Stored procedures having `BIT` parameters were not replicated correctly. ([Bug#26199](#))
- **Replication:** Issuing `SHOW SLAVE STATUS` as `mysqld` was shutting down could cause a crash. ([Bug#26000](#))
- **Replication:** An `UPDATE` statement using a stored function that modified a non-transactional table was not logged if it failed. This caused the copy of the non-transactional table on the master have a row that the copy on the slave did not.

In addition, when an `INSERT ... ON DUPLICATE KEY UPDATE` statement encountered a duplicate key constraint, but the `UPDATE` did not actually change any data, the statement was not logged. As a result of this fix, such statements are now treated the same for logging purposes as other `UPDATE` statements, and so are written to the binary log. (Bug#23333)

See also [Bug#12713](#)

- **Replication:** The inspecific error message `WRONG PARAMETERS TO FUNCTION REGISTER_SLAVE` resulted when `START SLAVE` failed to register on the master due to excess length of any the slave server options `--report-host`, `--report-user`, or `--report-password`. An error message specific to each of these options is now returned in such cases. The new error messages are:

- `FAILED TO REGISTER SLAVE: TOO LONG 'REPORT-HOST'`
- `FAILED TO REGISTER SLAVE: TOO LONG 'REPORT-USER'`
- `FAILED TO REGISTER SLAVE; TOO LONG 'REPORT-PASSWORD'`

(Bug#22989)

See also [Bug#19328](#)

- **Replication:** A replication slave sometimes failed to reconnect because it was unable to run `SHOW SLAVE HOSTS`. It was not necessary to run this statement on slaves (since the master should track connection IDs), and the execution of this statement by slaves was removed. (Bug#21132)

See also [Bug#13963](#), [Bug#21869](#)

- **Replication:** `START SLAVE UNTIL MASTER_LOG_POS=position` issued on a slave that was using `-log-slave-updates` and that was involved in circular replication would cause the slave to run and stop one event later than that specified by the value of `position`. (Bug#13861)
- **Replication:** `PURGE BINARY LOGS TO` and `PURGE BINARY LOGS BEFORE` did not handle missing binary log files correctly or in the same way. Now for both of these statements, if any files listed in the `.index` file are missing from the filesystem, the statement fails with an error.
- **Cluster API:** When reading a `BIT(64)` value using `NdbOperation::getValue()`, 12 bytes were written to the buffer rather than the expected 8 bytes. (Bug#33750)
- The fix for [Bug#20748](#) caused a problem such that on Unix, MySQL programs looked for options in `~/my.cnf` rather than the standard location of `~/my.cnf`. (Bug#38180)
- The fix for [Bug#33812](#) had the side effect of causing the `mysql` client not to be able to read some dump files produced with `mysqldump`. To address this, that fix was reverted. (Bug#38158)
- Some binary distributions had a duplicate “-64bit” suffix in the filename. (Bug#37623)
- On Windows 64-bit systems, temporary variables of `long` types were used to store `ulong` values, causing key cache initialization to receive distorted parameters. The effect was that setting `key_buffer_size` to values of 2GB or more caused memory exhaustion to due allocation of too much memory. (Bug#36705)
- Multiple-table `UPDATE` statements that used a temporary table could fail to update all qualifying rows or fail with a spurious duplicate-key error. (Bug#36676)
- A `REGEXP` match could return incorrect rows when the previous row matched the expression and used `CONCAT()` with an empty string. (Bug#36488)
- `mysqltest` ignored the value of `--tmpdir` in one place. (Bug#36465)
- The `mysql` client failed to recognize comment lines consisting of `--` followed by a newline. (Bug#36244)
- Conversion of a `FLOAT ZEROFILL` value to string could cause a server crash if the value was `NULL`. (Bug#36139)
- On Windows, the installer attempted to use JScript to determine whether the target data directory already existed. On Windows Vista x64, this resulted in an error because the installer was attempting to run the JScript in a 32-bit engine, which wasn't registered on Vista. The installer no longer uses JScript but instead relies on a native WiX command. (Bug#36103)
- An error in calculation of the precision of zero-length items (such as `NULL`) caused a server crash for queries that employed temporary tables. (Bug#36023)
- For `EXPLAIN EXTENDED`, execution of an uncorrelated `IN` subquery caused a crash if the subquery required a temporary table for its execution. (Bug#36011)

- The server crashed inside `NOT IN` subqueries with an impossible `WHERE` or `HAVING` clause, such as `NOT IN (SELECT ... FROM t1, t2, ... WHERE 0)`. (Bug#36005)
- Grouping or ordering of long values in unindexed `BLOB` or `TEXT` columns with the `gbk` or `big5` character set crashed the server. (Bug#35993)
- `SET GLOBAL debug= ' '` resulted in a Valgrind warning in `DbugParse()`, which was reading beyond the end of the control string. (Bug#35986)
- An empty bit-string literal (`b' '`) caused a server crash. Now the value is parsed as an empty bit value (which is treated as an empty string in string context or 0 in numeric context). (Bug#35658)
- `mysqlbinlog` left temporary files on the disk after shutdown, leading to the pollution of the temporary directory, which eventually caused `mysqlbinlog` to fail. This caused problems in testing and other situations where `mysqlbinlog` might be invoked many times in a relatively short period of time. (Bug#35543)
- There was a memory leak when connecting to a `FEDERATED` table using a connection string that had a host value of `localhost` or omitted the host and a port value of 0 or omitted the port. (Bug#35509)
- The code for detecting a byte order mark (BOM) caused `mysql` to crash for empty input. (Bug#35480)
- Using `LOAD DATA INFILE` with a view could crash the server. (Bug#35469)
- The combination of `GROUP_CONCAT()`, `DISTINCT`, and `LEFT JOIN` could crash the server when the right table is empty. (Bug#35298)
- When a view containing a reference to `DUAL` was created, the reference was removed when the definition was stored, causing some queries against the view to fail with invalid SQL syntax errors. (Bug#35193)
- Debugging symbols were missing for some executables in Windows binary distributions. (Bug#35104)
- A query that performed a `ref_or_null` join where the second table used a key having one or columns that could be `NULL` and had a column value that was `NULL` caused the server to crash. (Bug#34945)

This regression was introduced by Bug#12144

- Some binaries produced stack corruption messages due to being built with versions of `bison` older than 2.1. Builds are now created using `bison` 2.3. (Bug#34926)
- `mysqldump` failed to return an error code when using the `--master-data` option without binary logging being enabled on the server. (Bug#34909)
- Under some circumstances, the value of `mysql_insert_id()` following a `SELECT ... INSERT` statement could return an incorrect value. This could happen when the last `SELECT ... INSERT` did not involve an `AUTO_INCREMENT` column, but the value of `mysql_insert_id()` was changed by some previous statements. (Bug#34889)
- Table and database names were mixed up in some places of the subquery transformation procedure. This could affect debugging trace output and further extensions of that procedure. (Bug#34830)
- A malformed URL used for a `FEDERATED` table's `CONNECTION` option value in a `CREATE TABLE` statement was not handled correctly and could crash the server. (Bug#34788)
- Queries such as `SELECT ROW(1, 2) IN (SELECT t1.a, 2) FROM t1 GROUP BY t1.a` (combining row constructors and subqueries in the `FROM` clause) could lead to assertion failure or unexpected error messages. (Bug#34763)
- Using `NAME_CONST()` with a negative number and an aggregate function caused MySQL to crash. This could also have a negative impact on replication. (Bug#34749)
- A memory-handling error associated with use of `GROUP_CONCAT()` in subqueries could result in a server crash. (Bug#34747)
- For an indexed integer column `col_name` and a value `N` that is one greater than the maximum value allowed for the data type of `col_name`, conditions of the form `WHERE col_name < N` failed to return rows where the value of `col_name` is `N - 1`. (Bug#34731)
- Executing a `TRUNCATE` statement on a table having both a foreign key reference and a `DELETE` trigger crashed the server. (Bug#34643)
- Some subqueries using an expression that included an aggregate function could fail or in some cases lead to a crash of the server. (Bug#34620)
- A server crash could occur if `INFORMATION_SCHEMA` tables built in memory were swapped out to disk during query execu-

tion. ([Bug#34529](#))

- `CAST(AVG(arg) AS DECIMAL)` produced incorrect results for non-`DECIMAL` arguments. ([Bug#34512](#))
- `mysql_explain_log` concatenated multiple-line statements, causing malformed results for statements that contained SQL comments beginning with `--`. ([Bug#34339](#))
- Executing an `ALTER VIEW` statement on a table crashed the server. ([Bug#34337](#))
- Several additional configuration scripts in the `BUILD` directory now are included in source distributions. These may be useful for users who wish to build MySQL from source. (See [Section 2.4.15.3](#), “Installing from the Development Source Tree”, for information about what they do.) ([Bug#34291](#))
- Under some conditions, a `SET GLOBAL innodb_commit_concurrency` or `SET GLOBAL innodb_autoextend_increment` statement could fail. ([Bug#34223](#))
- `mysqldump` attempts to set the `character_set_results` system variable after connecting to the server. This failed for pre-4.1 servers that have no such variable, but `mysqldump` did not account for this and 1) failed to dump database contents; 2) failed to produce any error message alerting the user to the problem. ([Bug#34192](#))
- `mysql_install_db` failed if the server was running with an SQL mode of `TRADITIONAL`. This program now resets the SQL mode internally to avoid this problem. ([Bug#34159](#))
- For a `FEDERATED` table with an index on a nullable column, accessing the table could crash a server, return an incorrect result set, or return `ERROR 1030 (HY000): Got error 1430 from storage engine`. ([Bug#33946](#))
- Passing anything other than a integer to a `LIMIT` clause in a prepared statement would fail. (This limitation was introduced to avoid replication problems; for example, replicating the statement with a string argument would cause a parse failure in the slave). Now, arguments to the `LIMIT` clause are converted to integer values, and these converted values are used when logging the statement. ([Bug#33851](#))
- An internal buffer in `mysql` was too short. Overextending it could cause stack problems or segmentation violations on some architectures. (This is not a problem that could be exploited to run arbitrary code.) ([Bug#33841](#))
- A query using `WHERE (column1='string1' AND column2=constant1) OR (column1='string2' AND column2=constant2)`, where `col1` used a binary collation and `string1` matched `string2` except for case, failed to match any records even when matches were found by a query using the equivalent clause `WHERE column2=constant1 OR column2=constant2`. ([Bug#33833](#))
- The `mysql` client incorrectly parsed statements containing the word “delimiter” in mid-statement.

The fix for this bug had the side effect of causing the problem reported in [Bug#38158](#), so it was reverted in MySQL 5.0.67. ([Bug#33812](#))

- Large unsigned integers were improperly handled for prepared statements, resulting in truncation or conversion to negative numbers. ([Bug#33798](#))
- Reuse of prepared statements could cause a memory leak in the embedded server. ([Bug#33796](#))
- The server crashed when executing a query that had a subquery containing an equality `X=Y` where `Y` referred to a named select list expression from the parent select. The server crashed when trying to use the `X=Y` equality for `ref`-based access. ([Bug#33794](#))
- Some queries using a combination of `IN`, `CONCAT()`, and an implicit type conversion could return an incorrect result. ([Bug#33764](#))
- In some cases a query that produced a result set when using `ORDER BY ASC` did not return any results when this was changed to `ORDER BY DESC`. ([Bug#33758](#))
- Disabling concurrent inserts caused some cacheable queries not to be saved in the query cache. ([Bug#33756](#))
- Use of uninitialized memory for `filesort` in a subquery caused a server crash. ([Bug#33675](#))
- The server could crash when `REPEAT` or another control instruction was used in conjunction with labels and a `LEAVE` instruction. ([Bug#33618](#))
- The parser allowed control structures in compound statements to have mismatched beginning and ending labels. ([Bug#33618](#))
- `make_binary_distribution` passed the `--print-libgcc-file` option to the C compiler, but this does not work with the `ICC` compiler. ([Bug#33536](#))

- Certain combinations of views, subselects with outer references and stored routines or triggers could cause the server to crash. (Bug#33389)
- `SET GLOBAL myisam_max_sort_file_size=DEFAULT` set `myisam_max_sort_file_size` to an incorrect value. (Bug#33382)
See also Bug#31177
- `SLEEP(0)` failed to return on 64-bit Mac OS X due to a bug in `pthread_cond_timedwait()`. (Bug#33304)
- `CREATE TABLE ... SELECT` created tables that for date columns used the obsolete `Field_date` type instead of `Field_newdate`. (Bug#33256)
- Granting the `UPDATE` privilege on one column of a view caused the server to crash. (Bug#33201)
- For `DECIMAL` columns used with the `ROUND(X,D)` or `TRUNCATE(X,D)` function with a non-constant value of `D`, adding an `ORDER BY` for the function result produced misordered output. (Bug#33143)
See also Bug#33402, Bug#30617
- Some valid `SELECT` statements could not be used as views due to incorrect column reference resolution. (Bug#33133)
- The fix for Bug#11230 and Bug#26215 introduced a significant input-parsing slowdown for the `mysql` client. This has been corrected. (Bug#33057)
- When MySQL was built with OpenSSL, the SSL library was not properly initialized with information of which endpoint it was (server or client), causing connection failures. (Bug#33050)
- Under some circumstances a combination of aggregate functions and `GROUP BY` in a `SELECT` query over a view could lead to incorrect calculation of the result type of the aggregate function. This in turn could lead to incorrect results, or to crashes on debug builds of the server. (Bug#33049)
- For `DISTINCT` queries, 4.0 and 4.1 stopped reading joined tables as soon as the first matching row was found. However, this optimization was lost in MySQL 5.0, which instead read all matching rows. This fix for this regression may result in a major improvement in performance for `DISTINCT` queries in cases where many rows match. (Bug#32942)
- The server was built even when `configure` was run with the `--without-server` option. (Bug#32898)
See also Bug#23973
- Repeated creation and deletion of views within prepared statements could eventually crash the server. (Bug#32890)
See also Bug#34587
- `UNION` constructs cannot contain `SELECT ... INTO` except in the final `SELECT`. However, if a `UNION` was used in a subquery and an `INTO` clause appeared in the top-level query, the parser interpreted it as having appeared in the `UNION` and raised an error. (Bug#32858)
- The correct data type for a `NULL` column resulting from a `UNION` could be determined incorrectly in some cases: 1) Not correctly inferred as `NULL` depending on the number of selects; 2) Not inferred correctly as `NULL` if one select used a subquery. (Bug#32848)
- An `ORDER BY` query using `IS NULL` in the `WHERE` clause did not return correct results. (Bug#32815)
- For queries containing `GROUP_CONCAT(DISTINCT col_list ORDER BY col_list)`, there was a limitation that the `DISTINCT` columns had to be the same as `ORDER BY` columns. Incorrect results could be returned if this was not true. (Bug#32798)
- Incorrect assertions could cause a server crash for `DELETE` triggers for transactional tables. (Bug#32790)
- Use of the `cp932` character set with `CAST()` in an `ORDER BY` clause could cause a server crash. (Bug#32726)
- Inserting strings with a common prefix into a table that used the `ucs2` character set corrupted the table. (Bug#32705)
- A subquery using an `IS NULL` check of a column defined as `NOT NULL` in a table used in the `FROM` clause of the outer query produced an invalid result. (Bug#32694)
- Specifying a non-existent column for an `INSERT DELAYED` statement caused a server crash rather than producing an error. (Bug#32676)
- Use of `CLIENT_MULTI_QUERIES` caused `libmysqld` to crash. (Bug#32624)

- The `INTERVAL()` function incorrectly handled `NULL` values in the value list. (Bug#32560)
- Use of a `NULL`-returning `GROUP BY` expression in conjunction with `WITH ROLLUP` could cause a server crash. (Bug#32558)
See also Bug#31095
- A `SELECT ... GROUP BY bit_column` query failed with an assertion if the length of the `BIT` column used for the `GROUP BY` was not an integer multiple of 8. (Bug#32556)
- Using `SELECT INTO outfile` with 8-bit `ENCLOSED BY` characters led to corrupted data when the data was reloaded using `LOAD DATA INFILE`. This was because `SELECT INTO outfile` failed to escape the 8-bit characters. (Bug#32533)
- For `FLUSH TABLES WITH READ LOCK`, the server failed to properly detect write-locked tables when running with low-priority updates, resulting in a crash or deadlock. (Bug#32528)
- A build problem introduced in MySQL 5.0.52 was resolved: The x86 32-bit Intel `icc`-compiled server binary had unwanted dependences on Intel `icc` runtime libraries. (Bug#32514)
- Queries using `LIKE` on tables having indexed `CHAR` columns using either of the `euojpms` or `ujis` character sets did not return correct results. (Bug#32510)
- The rules for valid column names were being applied differently for base tables and views. (Bug#32496)
- Sending several `KILL QUERY` statements to target a connection running `SELECT SLEEP()` could freeze the server. (Bug#32436)
- `ssl-cipher` values in option files were not being read by `libmysqlclient`. (Bug#32429)
- Repeated execution of a query containing a `CASE` expression and numerous `AND` and `OR` relations could crash the server. The root cause of the issue was determined to be that the internal `SEL_ARG` structure was not properly initialized when created. (Bug#32403)
- Referencing within a subquery an alias used in the `SELECT` list of the outer query was incorrectly permitted. (Bug#32400)
- An `ORDER BY` query on a view created using a `FEDERATED` table as a base table caused the server to crash. (Bug#32374)
- Comparison of a `BIGINT NOT NULL` column with a constant arithmetic expression that evaluated to `NULL` mistakenly caused the error `COLUMN '...' CANNOT BE NULL` (error 1048). (Bug#32335)
- Assigning a 65,536-byte string to a `TEXT` column (which can hold a maximum of 65,535 bytes) resulted in truncation without a warning. Now a truncation warning is generated. (Bug#32282)
- The `LAST_DAY()` function returns a `DATE` value, but internally the value did not have the time fields zeroed and calculations involving the value could return incorrect results. (Bug#32270)
- `MIN()` and `MAX()` could return incorrect results when an index was present if a loose index scan was used. (Bug#32268)
- Executing a prepared statement associated with a materialized cursor sent to the client a metadata packet with incorrect table and database names. The problem occurred because the server sent the name of the temporary table used by the cursor instead of the table name of the original table.

The same problem occurred when selecting from a view, in which case the name of the table name was sent, rather than the name of the view. (Bug#32265)
- Memory corruption could occur due to large index map in `Range checked for each record` status reported by `EXPLAIN SELECT`. The problem was based in an incorrectly calculated length of the buffer used to store a hexadecimal representation of an index map, which could result in buffer overrun and stack corruption under some circumstances. (Bug#32241)
- Various test program cleanups were made: 1) `mytest` and `libmysqltest` were removed. 2) `bug25714` displays an error message when invoked with incorrect arguments or the `--help` option. 3) `mysql_client_test` exits cleanly with a proper error status. (Bug#32221)
- The default grant tables on Windows contained information for host `production.mysql.com`, which should not be there. (Bug#32219)
- Under certain conditions, the presence of a `GROUP BY` clause could cause an `ORDER BY` clause to be ignored. (Bug#32202)
- For comparisons of the form `date_col OP datetime_const` (where `OP` is `=`, `<`, `>`, `<=`, or `>=`), the comparison is done using `DATETIME` values, per the fix for Bug#27590. However that fix caused any index on `date_col` not to be used and compromised performance. Now the index is used again. (Bug#32198)

- `DATETIME` arguments specified in numeric form were treated by `DATE_ADD()` as `DATE` values. (Bug#32180)
- `InnoDB` adaptive hash latches could be held too long, resulting in a server crash. This fix may also provide significant performance improvements on systems on which many queries using filesorts with temporary tables are being performed. (Bug#32149)
- `InnoDB` does not support `SPATIAL` indexes, but could crash when asked to handle one. Now an error is returned. (Bug#32125)
- The server crashed on optimizations involving a join of `INT` and `MEDIUMINT` columns and a system variable in the `WHERE` clause. (Bug#32103)
- `SHOW STATUS` caused a server crash if `InnoDB` had not been initialized. (Bug#32083)
- With `lower_case_table_names` set, `CREATE TABLE LIKE` was treated differently by `libmysqld` than by the non-embedded server. (Bug#32063)
- Within a subquery, `UNION` was handled differently than at the top level, which could result in incorrect results or a server crash. (Bug#32036, Bug#32051)
- User-defined functions are not loaded if the server is started with the `--skip-grant-tables` option, but the server did not properly handle this case and issued an `OUT OF MEMORY` error message instead. (Bug#32020)
- `hour()`, `minute()`, and `second()` could return non-zero values for `DATE` arguments. (Bug#31990)
- A column with malformed multi-byte characters could cause the full-text parser to go into an infinite loop. (Bug#31950)
- Changing the SQL mode to cause dates with “zero” parts to be considered invalid (such as `'1000-00-00'`) could result in indexed and non-indexed searches returning different results for a column that contained such dates. (Bug#31928)
- Queries testing numeric constants containing leading zeroes against `ZEROFILL` columns were not evaluated correctly. (Bug#31887)
- In debug builds, testing the result of an `IN` subquery against `NULL` caused an assertion failure. (Bug#31884)
- `mysql-test-run.pl` sometimes set up test scenarios in which the same port number was passed to multiple servers, causing one of them to be unable to start. (Bug#31880)
- Comparison results for `BETWEEN` were different from those for operators like `<` and `>` for `DATETIME`-like values with trailing extra characters such as `'2007-10-01 00:00:00 GMT-6'`. `BETWEEN` treated the values as `DATETIME`, whereas the other operators performed a binary-string comparison. Now they all uniformly use a `DATETIME` comparison, but generate warnings for values with trailing garbage. (Bug#31800)
- Name resolution for correlated subqueries and `HAVING` clauses failed to distinguish which of two was being performed when there was a reference to an outer aliased field. This could result in error messages about a `HAVING` clause for queries that had no such clause. (Bug#31797)
- If an error occurred during file creation, the server sometimes did not remove the file, resulting in an unused file in the filesystem. (Bug#31781)
- The server could crash during `filesort` for `ORDER BY` based on expressions with `INET_NTOA()` or `OCT()` if those functions returned `NULL`. (Bug#31758)
- The `mysqld` crash handler failed on Windows. (Bug#31745)
- For a fatal error during a filesort in `find_all_keys()`, the error was returned without the necessary handler uninitialization, causing an assertion failure. (Bug#31742)
- The examined-rows count was not incremented for `const` queries. (Bug#31700)
- The `mysql_change_user()` C API function was subject to buffer overflow. (Bug#31669)
- For `SELECT ... INTO outfile`, if the `ENCLOSED BY` string is empty and the `FIELDS TERMINATED BY` string started with a special character (one of `n`, `t`, `r`, `b`, `0`, `Z`, or `N`), every occurrence of the character within field values would be duplicated. (Bug#31663)
- `SHOW COLUMNS` and `DESCRIBE` displayed `null` as the column type for a view with no valid definer. This caused `mysql-dump` to produce a non-reloadable dump file for the view. (Bug#31662)
- The `mysqlbug` script did not include the correct values of `CFLAGS` and `CXXFLAGS` that were used to configure the distribution. (Bug#31644)

- `ucs2` does not work as a client character set, but attempts to use it as such were not rejected. Now `character_set_client` cannot be set to `ucs2`. This also affects statements such as `SET NAMES` and `SET CHARACTER SET`. (Bug#31615)
 - The server returned the error message `OUT OF MEMORY; RESTART SERVER AND TRY AGAIN` when the actual problem was that the sort buffer was too small. Now an appropriate error message is returned in such cases. (Bug#31590)
 - A buffer used when setting variables was not dimensioned to accommodate the trailing `'\0'` byte, so a single-byte buffer overrun was possible. (Bug#31588)
 - `HAVING` could treat lettercase of table aliases incorrectly if `lower_case_table_names` was enabled. (Bug#31562)
 - The fix for Bug#24989 introduced a problem such that a `NULL` thread handler could be used during a rollback operation. This problem is unlikely to be seen in practice. (Bug#31517)
 - Killing a `CREATE TABLE ... LIKE` statement that was waiting for a name lock caused a server crash. When the statement was killed, the server attempted to release locks that were not held. (Bug#31479)
 - The length of the result from `IFNULL()` could be calculated incorrectly because the sign of the result was not taken into account. (Bug#31471)
 - Queries that used the `ref` access method or index-based subquery execution over indexes that have `DECIMAL` columns could fail with an error `Column col_name cannot be null`. (Bug#31450)
 - `SELECT 1 REGEX NULL` caused an assertion failure for debug servers. (Bug#31440)
 - Executing `RENAME` while tables were open for use with `HANDLER` statements could cause a server crash. (Bug#31409)
 - `mysql-test-run.pl` tried to create files in a directory where it could not be expected to have write permission. `mysqltest` created `.reject` files in a directory other than the one where test results go. (Bug#31398)
 - `DROP USER` caused an increase in memory usage. (Bug#31347)
 - For an almost-full `MyISAM` table, an insert that failed could leave the table in a corrupt state. (Bug#31305)
 - `myisamchk --unpack` could corrupt a table that when unpacked has static (fixed-length) row format. (Bug#31277)
 - `CONVERT(val, DATETIME)` would fail on invalid input, but processing was not aborted for the `WHERE` clause, leading to a server crash. (Bug#31253)
 - Allocation of an insufficiently large group-by buffer following creation of a temporary table could lead to a server crash. (Bug#31249)
 - Use of `DECIMAL(n, n) ZEROFILL` in `GROUP_CONCAT()` could cause a server crash. (Bug#31227)
 - When sorting privilege table rows, the server treated escaped wildcard characters (`\%` and `_`) the same as unescaped wildcard characters (`%` and `_`), resulting in incorrect row ordering. (Bug#31194)
 - Server variables could not be set to their current values on Linux platforms. (Bug#31177)
- See also [Bug#6958](#)
- With small values of `myisam_sort_buffer_size`, `REPAIR TABLE` for `MyISAM` tables could cause a server crash. (Bug#31174)
 - Use of the `@hostname` system variable in inserts in `mysql_system_tables_data.sql` did not replicate. The workaround is to select its value into a user variable (which does replicate) and insert that. (Bug#31167)
 - If `MAKETIME()` returned `NULL` when used in an `ORDER BY` that was evaluated using `filesort`, a server crash could result. (Bug#31160)
 - Full-text searches on `ucs2` columns caused a server crash. (`FULLTEXT` indexes on `ucs2` columns cannot be used, but it should be possible to perform `IN BOOLEAN MODE` searches on `ucs2` columns without a crash.) (Bug#31159)
 - Data in `BLOB` or `GEOMETRY` columns could be cropped when performing a `UNION` query. (Bug#31158)
 - An assertion designed to detect a bug in the `ROLLUP` implementation would incorrectly be triggered when used in a subquery context with non-cacheable statements. (Bug#31156)
 - Selecting spatial types in a `UNION` could cause a server crash. (Bug#31155)

- Use of `GROUP_CONCAT(DISTINCT bit_column)` caused an assertion failure. (Bug#31154)
- The server crashed in the parser when running out of memory. Memory handling in the parser has been improved to gracefully return an error when out-of-memory conditions occur in the parser. (Bug#31153)
- MySQL declares a `UNIQUE` key as a `PRIMARY` key if it doesn't have `NULL` columns and is not a partial key, and the `PRIMARY` key must always be the first key. However, in some cases, a non-first key could be reported as `PRIMARY`, leading to an assert failure by `InnoDB`. This is fixed by correcting the key sort order. (Bug#31137)
- `GROUP BY NULL WITH ROLLUP` could cause a server crash. (Bug#31095)
See also Bug#32558
- `REGEXP` operations could cause a server crash for character sets such as `ucs2`. Now the arguments are converted to `utf8` if possible, to allow correct results to be produced if the resulting strings contain only 8-bit characters. (Bug#31081)
- Internal conversion routines could fail for several multi-byte character sets (`big5`, `cp932`, `euckr`, `gb2312`, `sjis`) for empty strings or during evaluation of `SOUNDS LIKE`. (Bug#31069, Bug#31070)
- Many nested subqueries in a single query could lead to excessive memory consumption and possibly a crash of the server. (Bug#31048)
- The `MOD()` function and the `%` operator crashed the server for a divisor less than 1 with a very long fractional part. (Bug#31019)
- On Windows, the `pthread_mutex_trylock()` implementation was incorrect. (Bug#30992)
- A character set introducer followed by a hexadecimal or bit-value literal did not check its argument and could return an ill-formed result for invalid input. (Bug#30986)
- `CHAR(str USING charset)` did not check its argument and could return an ill-formed result for invalid input. (Bug#30982)
- The result from `CHAR(str USING ucs2)` did not add a leading 0x00 byte for input strings with an odd number of bytes. (Bug#30981)
- On Windows, `SHOW PROCESSLIST` could display process entries with a `State` value of `*** DEAD ***`. (Bug#30960)
- The `GeomFromText()` function could cause a server crash if the first argument was `NULL` or the empty string. (Bug#30955)
- `MAKEDATE()` incorrectly moved year values in the 100-200 range into the 1970-2069 range. (This is legitimate for 00-99, but three-digit years should be used unchanged.) (Bug#30951)
- When invoked with constant arguments, `STR_TO_DATE()` could use a cached value for the format string and return incorrect results. (Bug#30942)
- `GROUP_CONCAT()` returned `' , '` rather than an empty string when the argument column contained only empty strings. (Bug#30897)
- `ROUND(X,D)` or `TRUNCATE(X,D)` for non-constant values of `D` could crash the server if these functions were used in an `ORDER BY` that was resolved using `filesort`. (Bug#30889)
- For `MEMORY` tables, lookups for `NULL` values in `BTREE` indexes could return incorrect results. (Bug#30885)
- Calling `NAME_CONST()` with non-constant arguments triggered an assertion failure. Non-constant arguments are now disallowed. (Bug#30832)
- For a spatial column with a regular (non-`SPATIAL`) index, queries failed if the optimizer tried to use the index. (Bug#30825)
- Values for the `--tc-heuristic-recover` option incorrectly were treated as values for the `--myisam-stats-method` option. (Bug#30821)
- The optimizer incorrectly optimized conditions out of the `WHERE` clause in some queries involving subqueries and indexed columns. (Bug#30788)
- If an alias was used to refer to the value returned by a stored function within a subselect, the outer select recognized the alias but failed to retrieve the value assigned to it in the subselect. (Bug#30787)
- Improper calculation of `CASE` expression results could lead to value truncation. (Bug#30782)
- On Windows, the `pthread_mutex_trylock()` implementation was incorrect. One symptom was that invalidating the

- query cache could cause a server crash. ([Bug#30768](#))
- A multiple-table `UPDATE` involving transactional and non-transactional tables caused an assertion failure. ([Bug#30763](#))
 - Under some circumstances, `CREATE TABLE ... SELECT` could crash the server or incorrectly report that the table row size was too large. ([Bug#30736](#))
 - Using the `MIN()` or `MAX()` function to select one part of a multi-part key could cause a crash when the function result was `NULL`. ([Bug#30715](#))
 - The optimizer could ignore `ORDER BY` in cases when the result set is ordered by `filesort`, resulting in rows being returned in incorrect order. ([Bug#30666](#))
 - `MyISAM` tables could not exceed 4294967295 ($2^{32} - 1$) rows on Windows. ([Bug#30638](#))
 - `mysql-test-run.pl` could not run `mysqld` with `root` privileges. ([Bug#30630](#))
 - Binary logging for a stored procedure differed depending on whether or not execution occurred in a prepared statement. ([Bug#30604](#))
 - For `MEMORY` tables, `DELETE` statements that remove rows based on an index read could fail to remove all matching rows. ([Bug#30590](#))
 - Using `GROUP BY` on an expression of the form `timestamp_col DIV number` caused a server crash due to incorrect calculation of number of decimals. ([Bug#30587](#))
 - The options available to the `CHECK TABLE` statement were also allowed in `OPTIMIZE TABLE` and `ANALYZE TABLE` statements, but caused corruption during their execution. These options were never supported for these statements, and an error is now raised if you try to apply these options to these statements. ([Bug#30495](#))
 - When expanding a `*` in a `USING` or `NATURAL` join, the check for table access for both tables in the join was done using only the grant information of the first table. ([Bug#30468](#))
 - When casting a string value to an integer, cases where the input string contained a decimal point and was long enough to overrun the `unsigned long long` type were not handled correctly. The position of the decimal point was not taken into account which resulted in miscalculated numbers and incorrect truncation to appropriate SQL data type limits. ([Bug#30453](#))
 - Versions of `mysqldump` from MySQL 4.1 or higher tried to use `START TRANSACTION WITH CONSISTENT SNAPSHOT` if the `--single-transaction` and `--master-data` options were given, even with servers older than 4.1 that do not support consistent snapshots. ([Bug#30444](#))
 - Replication of `LOAD DATA INFILE` could fail when `read_buffer_size` was larger than `max_allowed_packet`. ([Bug#30435](#))
 - For `CREATE ... SELECT ... FROM`, where the resulting table contained indexes, adding `SQL_BUFFER_RESULT` to the `SELECT` part caused index corruption in the table. ([Bug#30384](#))
 - An orphaned PID file from a no-longer-running process could cause `mysql.server` to wait for that process to exit even though it does not exist. ([Bug#30378](#))
 - The optimizer made incorrect assumptions about the value of the `is_member` value for user-defined functions, sometimes resulting in incorrect ordering of UDF results. ([Bug#30355](#))
 - Some valid `euc-kr` characters having the second byte in the ranges `[0x41..0x5A]` and `[0x61..0x7A]` were rejected. ([Bug#30315](#))
 - Simultaneous `ALTER TABLE` statements for `BLACKHOLE` tables caused 100% CPU use due to locking problems. ([Bug#30294](#))
 - Setting certain values on a table using a spatial index could cause the server to crash. ([Bug#30286](#))
 - Tables with a `GEOMETRY` column could be marked as corrupt if you added a non-`SPATIAL` index on a `GEOMETRY` column. ([Bug#30284](#))
 - Some `INFORMATION_SCHEMA` tables are intended for internal use, but could be accessed by using `SHOW` statements. ([Bug#30079](#))
 - On some 64-bit systems, inserting the largest negative value into a `BIGINT` column resulted in incorrect data. ([Bug#30069](#))
 - Specifying the `--without-geometry` option for `configure` caused server compilation to fail. ([Bug#29972](#))

- Under some circumstances, a UDF initialization function could be passed incorrect argument lengths. (Bug#29804)
- `configure` did not find `nss` on some Linux platforms. (Bug#29658)
- The `mysql_config` command would output `CFLAGS` values that were incompatible with C++ for the HP-UX platform. (Bug#29645)
- `InnoDB` had a race condition for an adaptive hash rw-lock waiting for an X-lock. This fix may also provide significant speed improvements on systems experiencing problems with contention for the adaptive hash index. (Bug#29560)
- Views were treated as insertable even if some base table columns with no default value were omitted from the view definition. (This is contrary to the condition for insertability that a view must contain all columns in the base table that do not have a default value.) (Bug#29477)
- The `mysql` client program now ignores Unicode byte order mark (BOM) characters at the beginning of input files. Previously, it read them and sent them to the server, resulting in a syntax error.

Presence of a BOM does not cause `mysql` to change its default character set. To do that, invoke `mysql` with an option such as `--default-character-set=utf8`. (Bug#29323)
- For transactional tables, an error during a multiple-table `DELETE` statement did not roll back the statement. (Bug#29136)
- The `log` and `log_slow_queries` system variables were displayed by `SHOW VARIABLES` but could not be accessed in expressions as `@@log` and `@@log_slow_queries`. Also, attempting to set them with `SET` produced an incorrect `Unknown system variable` message. Now these variables can be accessed in expressions and attempting to set their values produces an error message that the variable is read only. (Bug#29131)
- Denormalized double-precision numbers cannot be handled properly by old MIPS processors. For IRIX, this is now handled by enabling a mode to use a software workaround. (Bug#29085)
- `SHOW VARIABLES` did not display the `relay_log`, `relay_log_index`, or `relay_log_info_file` system variables. (Bug#28893)
- The MySQL preferences pane did not work to start or stop MySQL on Mac OS X 10.5 (Leopard). (Bug#28854)
- When doing a `DELETE` on table that involved a `JOIN` with `MyISAM` or `MERGE` tables and the `JOIN` referred to the same table, the operation could fail reporting `ERROR 1030 (HY000): Got error 134 from storage engine`. This was because scans on the table contents would change because of rows that had already been deleted. (Bug#28837)
- On Windows, `mysql_upgrade` created temporary files in `C:\` and did not clean them up. (Bug#28774)
- Index hints specified in view definitions were ignored when using the view to select from the base table. (Bug#28702)
- Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is now disallowed. (Bug#28701)
- After changing the SQL mode to a restrictive value that would make already-inserted dates in a column be considered invalid, searches returned different results depending on whether the column was indexed. (Bug#28687)
- For upgrading to a new major version using RPM packages (such as 4.1 to 5.0), if the installation procedure found an existing MySQL server running, it could fail to shut down the old server, but also erroneously removed the server's socket file. Now the procedure checks for an existing server package from a different vendor or major MySQL version. In such case, it refuses to install the server and recommends how to safely remove the old packages before installing the new ones. (Bug#28555)
- The result from `CHAR ()` was incorrectly assumed in some contexts to return a single-byte result. (Bug#28550)
- `mysqlhotcopy` silently skipped databases with names consisting of two alphanumeric characters. (Bug#28460)
- The parser confused user-defined function (UDF) and stored function creation for `CREATE FUNCTION` and required that there be a default database when creating UDFs, although there is no such requirement. (Bug#28318, Bug#29816)
- The SQL parser did not accept an empty `UNION= ()` clause. This meant that, when there were no underlying tables specified for a `MERGE` table, `SHOW CREATE TABLE` and `mysqldump` both output statements that could not be executed.

Now it is possible to execute a `CREATE TABLE` or `ALTER TABLE` statement with an empty `UNION= ()` clause. However, `SHOW CREATE TABLE` and `mysqldump` do not output the `UNION= ()` clause if there are no underlying tables specified for a `MERGE` table. This also means it is now possible to remove the underlying tables for a `MERGE` table using `ALTER TABLE ... UNION= ()`. (Bug#28248)
- The result of a comparison between `VARBINARY` and `BINARY` columns differed depending on whether the `VARBINARY` column was indexed. (Bug#28076)

- The metadata in some `MYSQL_FIELD` members could be incorrect when a temporary table was used to evaluate a query. (Bug#27990)
- An `ORDER BY` at the end of a `UNION` affected individual `SELECT` statements rather than the overall query result. (Bug#27848)
- `comp_err` created files with permissions such that they might be inaccessible during `make install` operations. (Bug#27789)
- It was possible to exhaust memory by repeatedly running `index_merge` queries and never performing any `FLUSH TABLES` statements. (Bug#27732)
- It was possible to create a view having a column whose name consisted of an empty string or space characters only. (Bug#27695)

See also [Bug#31202](#)

- The anonymous accounts were not being created during MySQL installation. (Bug#27692)
 - When `utf8` was set as the connection character set, using `SPACE()` with a non-Unicode column produced an error. (Bug#27580)
- See also [Bug#23637](#)
- A race condition between killing a statement and the thread executing the statement could lead to a situation such that the binary log contained an event indicating that the statement was killed, whereas the statement actually executed to completion. (Bug#27571)
 - Some queries using the `NAME_CONST()` function failed to return either a result or an error to the client, causing it to hang. This was due to the fact that there was no check to insure that both arguments to this function were constant expressions. (Bug#27545, Bug#32559)
 - With the `read_only` system variable enabled, `CREATE DATABASE` and `DROP DATABASE` were allowed to users who did not have the `SUPER` privilege. (Bug#27440)

- `resolveip` failed to produce correct results for hostnames that begin with a digit. (Bug#27427)
- In `ORDER BY` clauses, mixing aggregate functions and non-grouping columns is not allowed if the `ONLY_FULL_GROUP_BY` SQL mode is enabled. However, in some cases, no error was thrown because of insufficient checking. (Bug#27219)
- For the `--record_log_pos` option, `mysqlhotcopy` now determines the slave status information from the result of `SHOW SLAVE STATUS` by using the `Relay_Master_Log_File` and `Exec_Master_Log_Pos` values rather than the `Master_Log_File` and `Read_Master_Log_Pos` values. This provides a more accurate indication of slave execution relative to the master. (Bug#27101)
- The MySQL Instance Configuration Wizard would not allow you to choose a service name, even though the criteria for the service name were valid. The code that checks the name has been updated to support the correct criteria of any string less than 256 character and not containing either a forward or backward slash character. (Bug#27013)
- `mysqld` sometimes miscalculated the number of digits required when storing a floating-point number in a `CHAR` column. This caused the value to be truncated, or (when using a debug build) caused the server to crash. (Bug#26788)

See also [Bug#12860](#)

- `config-win.h` unconditionally defined `bool` as `BOOL`, causing problems on systems where `bool` is 1 byte and `BOOL` is 4 bytes. (Bug#26461)
- The internal `init_time()` library function was renamed to `my_init_time()` to avoid conflicts with external libraries. (Bug#26294)
- On Windows, for distributions built with debugging support, `mysql` could crash if the user typed Control-C. (Bug#26243)
- `mysqlcheck -A -r` did not correctly identify all tables that needed repairing. (Bug#25347)
- On Windows, an error in `configure.js` caused installation of source distributions to fail. (Bug#25340)
- Using `mysqldump` in MySQL 5.1 resulted in dump files that could not be loaded in MySQL 5.0 because `USING type_name` options in index definitions appeared after the index column list, whereas 5.0 accepted only the old syntax that has `USING` before the column list. The parser in 5.0 now accepts `USING` following the column list. (Bug#25162)
- The client library had no way to return an error if no connection had been established. This caused problems such as

`mysql_library_init()` failing silently if no `errmsg.sys` file was available. (Bug#25097)

- On Mac OS X, the StartupItem for MySQL did not work. (Bug#25008)
- For Windows 64-bit builds, enabling shared-memory support caused client connections to fail. (Bug#24992)
- If the expected precision of an arithmetic expression exceeded the maximum precision supported by MySQL, the precision of the result was reduced by an unpredictable or arbitrary amount, rather than to the maximum precision. In some cases, exceeding the maximum supported precision could also lead to a crash of the server. (Bug#24907)
- `mysql` did not use its completion table. Also, the table contained few entries. (Bug#24624)
- If a user installed MySQL Server and set a password for the `root` user, and then uninstalled and reinstalled MySQL Server to the same location, the user could not use the MySQL Instance Config wizard to configure the server because the uninstall operation left the previous data directory intact. The config wizard *assumed* that any new install (not an upgrade) would have the default data directory where the `root` user has no password. The installer now writes a registry key named `FoundExistingDataDir`. If the installer finds an existing data directory, the key will have a value of 1, otherwise it will have a value of 0. When `MySQLInstanceConfig.exe` is run, it will attempt to read the key. If it can read the key, and the value is 1 and there is no existing instance of the server (indicating a new installation), the Config Wizard will allow the user to input the old password so the server can be configured. (Bug#24215)
- The MySQL header files contained some duplicate macro definitions that could cause compilation problems. (Bug#23839)
- `SHOW COLUMNS` on a `TEMPORARY` table caused locking issues. (Bug#23588)
- For distributions compiled with the bundled `libedit` library, there were difficulties using the `mysql` client to enter input for non-ASCII or multi-byte characters. (Bug#23097)
- For Windows Vista, `MySQLInstanceConfig.exe` did not include a proper manifest enabling it to run with administrative privileges. (Bug#22563)

See also [Bug#24732](#)

- On Mac OS X, `mysqld` did not react to Ctrl-C when run under `gdb`, even when run with the `--gdb` option. (Bug#21567)
- `mysql_config` output did not include `-lmygcc` on some platforms when it was needed. (Bug#21158)
- `mysql-stress-test.pl` and `mysqld_multi.server.sh` were missing from some binary distributions. (Bug#21023, Bug#25486)
- `mysqldumpslow` returned a confusing error message when no configuration file was found. (Bug#20455)
- Hostnames sometimes were treated as case sensitive in account-management statements (`CREATE USER`, `GRANT`, `REVOKE`, and so forth). (Bug#19828)
- The `readline` library has been updated to version 5.2. This addresses issues in the `mysql` client where history and editing within the client would fail to work as expected. (Bug#18431)
- The `Aborted_clients` status variable was incremented twice if a client exited without calling `mysql_close()`. (Bug#16918)
- The parser used signed rather than unsigned values in some cases that caused legal lengths in column declarations to be rejected. (Bug#15776)
- A `SET` column whose definition specified 64 elements could not be updated using integer values. (Bug#15409)
- Clients were ignoring the TCP/IP port number specified as the default port via the `--with-tcp-port` configuration option. (Bug#15327)
- Zero-padding of exponent values was not the same across platforms. (Bug#12860)
- Values of types `REAL ZEROFILL`, `DOUBLE ZEROFILL`, `FLOAT ZEROFILL`, were not zero-filled when converted to a character representation in the C prepared statement API. (Bug#11589)
- `mysql` stripped comments from statements sent to the server. Now the `--comments` or `--skip-comments` option can be used to control whether to retain or strip comments. The default is `--skip-comments`. (Bug#11230, Bug#26215)
- If an `INSERT ... SELECT` statement is executed, and no automatically generated value is successfully inserted, then `mysql_insert_id()` returns the ID of the last inserted row.

If no automatically generated value is successfully inserted, then `mysql_insert_id()` returns 0. (Bug#9481)

- `MySQLInstanceConfig.exe` did not save the `innodb_data_home_dir` value to the `my.ini` file under certain circumstances. (Bug#6627)
 - Several buffer-size system variables were either being handled incorrectly for large values (for settings larger than 4GB, they were truncated to values less than 4GB without a warning), or were limited unnecessarily to 4GB even on 64-bit systems. The following changes were made:
 - For `key_buffer_size`, values larger than 4GB are allowed on 64-bit platforms (except Windows, for which large values are truncated to 4GB with a warning).
 - For `join_buffer_size`, `sort_buffer_size`, and `myisam_sort_buffer_size`, values are limited to 4GB on all platforms. Larger values are truncated to 4GB with a warning.
- In addition, settings for `read_buffer_size` and `read_rnd_buffer_size` are limited to 2GB on all platforms. Larger values are truncated to 2GB with a warning. (Bug#5731, Bug#29419, Bug#29446)
- Executing `DISABLE KEYS` and `ENABLE KEYS` on a non-empty table would cause the size of the index file for the table to grow considerable. This was because the `DISABLE KEYS` operation would only mark the existing index, without deleting the index blocks. The `ENABLE KEYS` operation would re-create the index, adding new blocks, while the previous index blocks would remain. Existing indexes are now dropped and recreated when the `ENABLE KEYS` statement is executed. (Bug#4692)

D.1.2. Release Notes for MySQL Community Server 5.0.51b (24 April 2008)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.51.

Bugs fixed:

- On Windows, the installer attempted to use JScript to determine whether the target data directory already existed. On Windows Vista x64, this resulted in an error because the installer was attempting to run the JScript in a 32-bit engine, which wasn't registered on Vista. The installer no longer uses JScript but instead relies on a native WiX command. (Bug#36103)
- The MySQL preferences pane did not work to start or stop MySQL on Mac OS X 10.5 (Leopard). (Bug#28854)
- On Mac OS X, the StartupItem for MySQL did not work. (Bug#25008)

D.1.3. Release Notes for MySQL Community Server 5.0.51a (11 January 2008)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.51.

Bugs fixed:

- **Security Fix:** Three vulnerabilities in yaSSL versions 1.7.5 and earlier were discovered that could lead to a server crash or execution of unauthorized code. The exploit requires a server with yaSSL enabled and TCP/IP connections enabled, but does not require valid MySQL account credentials. The exploit does not apply to OpenSSL.

Note

The proof-of-concept exploit is freely available on the Internet. Everyone with a vulnerable MySQL configuration is advised to upgrade *immediately*.

(Bug#33814, CVE-2008-0226, CVE-2008-0227)

- **Security Fix:** `ALTER VIEW` retained the original `DEFINER` value, even when altered by another user, which could allow that user to gain the access rights of the view. Now `ALTER VIEW` is allowed only to the original definer or users with the `SUPER` privilege. (Bug#29908)
- **Security Fix:** When using a `FEDERATED` table, the local server could be forced to crash if the remote server returned a result with fewer columns than expected. (Bug#29801)
- When running the MySQL Instance Configuration Wizard, a race condition could exist that would fail to connect to a newly configured instance. This was because `mysqld` had not completed the startup process before the next stage of the installation process. (Bug#28628)
- For Windows Vista, `MySQLInstanceConfig.exe` did not include a proper manifest enabling it to run with administrative privileges. (Bug#22563)

See also [Bug#24732](#)

- `MySQLInstanceConfig.exe` failed to grant certain privileges to the 'root'@'%' account. ([Bug#17303](#))

D.1.4. Release Notes for MySQL Community Server 5.0.51 (15 November 2007)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.45.

Functionality added or changed:

- **Incompatible Change:** The parser accepted statements that contained `/* ... */` that were not properly closed with `*/`, such as `SELECT 1 /* + 2`. Statements that contain unclosed `/*`-comments now are rejected with a syntax error.

This fix has the potential to cause incompatibilities. Because of [Bug#26302](#), which caused the trailing `*/` to be truncated from comments in views, stored routines, triggers, and events, it is possible that objects of those types may have been stored with definitions that now will be rejected as syntactically invalid. Such objects should be dropped and re-created so that their definitions do not contain truncated comments. If a stored object definition contains only a single statement (does not use a `BEGIN ... END` block) and contains a comment within the statement, the comment should be moved to follow the statement or the object should be rewritten to use a `BEGIN ... END` block. For example, this statement:

```
CREATE PROCEDURE p() SELECT 1 /* my comment */ ;
```

Can be rewritten in either of these ways:

```
CREATE PROCEDURE p() SELECT 1; /* my comment */  
CREATE PROCEDURE p() BEGIN SELECT 1 /* my comment */ ; END;
```

([Bug#28779](#))

- **MySQL Cluster:** Mapping of `NDB` error codes to MySQL storage engine error codes has been improved. ([Bug#28423](#))
- **MySQL Cluster:** `auto_increment_increment` and `auto_increment_offset` are now supported for `NDB` tables. ([Bug#26342](#))
- **MySQL Cluster:** The output from the cluster management client showing the progress of data node starts has been improved. ([Bug#23354](#))
- Server parser performance was improved for expression parsing by lowering the number of state transitions and reductions needed. ([Bug#30625](#))
- Server parser performance was improved for boolean expressions. ([Bug#30237](#))
- If a `MyISAM` table is created with no `DATA DIRECTORY` option, the `.MYD` file is created in the database directory. By default, if `MyISAM` finds an existing `.MYD` file in this case, it overwrites it. The same applies to `.MYI` files for tables created with no `INDEX DIRECTORY` option. To suppress this behavior, start the server with the new `--keep_files_on_create` option, in which case `MyISAM` will not overwrite existing files and returns an error instead. ([Bug#29325](#))
- If a `MERGE` table cannot be opened or used because of a problem with an underlying table, `CHECK TABLE` now displays information about which table caused the problem. ([Bug#26976](#))
- The `SQL_MODE`, `FOREIGN_KEY_CHECKS`, `UNIQUE_CHECKS`, character set/collations, and `SQL_AUTO_IS_NULL` session variables are written to the binary log and honoured during replication. See [Section 5.2.3](#), “The Binary Log”.
- The `EXAMPLE` storage engine is now enabled by default.

Bugs fixed:

- **Security Fix:** Using `RENAME TABLE` against a table with explicit `DATA DIRECTORY` and `INDEX DIRECTORY` options can be used to overwrite system table information by replacing the symbolic link points. the file to which the symlink points.

MySQL will now return an error when the file to which the symlink points already exists. ([Bug#32111](#), [CVE-2007-5969](#))

- **Incompatible Change:** The file `mysqld.exe` was mistakenly included in binary distributions between MySQL 5.0.42 and 5.0.48. You should use `mysqld-nt.exe`. ([Bug#32197](#))

- **Incompatible Change:** Multiple-table `DELETE` statements containing ambiguous aliases could have unintended side effects such as deleting rows from the wrong table. Example:

```
DELETE FROM t1 AS a2 USING t1 AS a1 INNER JOIN t2 AS a2;
```

This bugfix enables alias declarations to be declared only in the `table_references` part. Elsewhere in the statement, alias references are allowed but not alias declarations. (Bug#30234)

See also [Bug#27525](#)

- **MySQL Cluster: Packaging:** Some commercial MySQL Cluster RPM packages included support for the `InnoDB` storage engine. (`InnoDB` is not part of the standard commercial MySQL Cluster offering.) (Bug#31989)
- **MySQL Cluster:** Attempting to restore a backup made on a cluster host using one endian to a machine using the other endian could cause the cluster to fail. (Bug#29674)
- **MySQL Cluster:** When restarting a data node, queries could hang during that node's start phase 5, and continue only after the node had entered phase 6. (Bug#29364)
- **MySQL Cluster:** Replica redo logs were inconsistently handled during a system restart. (Bug#29354)
- **MySQL Cluster:** Reads on `BLOB` columns were not locked when they needed to be to guarantee consistency. (Bug#29102)
- See also [Bug#31482](#)
- **MySQL Cluster:** A query using joins between several large tables and requiring unique index lookups failed to complete, eventually returning `UNKNOWN ERROR` after a very long period of time. This occurred due to inadequate handling of instances where the Transaction Coordinator ran out of `TransactionBufferMemory`, when the cluster should have returned NDB error code 4012 (`REQUEST NDBD TIME-OUT`). (Bug#28804)
- **MySQL Cluster:** The description of the `--print` option provided in the output from `ndb_restore --help` was incorrect. (Bug#27683)
- **MySQL Cluster:** The management client's response to `START BACKUP WAIT COMPLETED` did not include the backup ID. (Bug#27640)
- **MySQL Cluster:** An invalid subselect on an `NDB` table could cause `mysqld` to crash. (Bug#27494)
- **MySQL Cluster:** An attempt to perform a `SELECT ... FROM INFORMATION_SCHEMA.TABLES` whose result included information about `NDB` tables for which the user had no privileges crashed the MySQL Server on which the query was performed. (Bug#26793)
- **MySQL Cluster:** Warnings and errors generated by `ndb_config --config-file=file` were sent to `stdout`, rather than to `stderr`. (Bug#25941)
- **MySQL Cluster:** Large file support did not work in AIX server binaries. (Bug#10776)
- When a `TIMESTAMP` with a non-zero time part was converted to a `DATE` value, no warning was generated. This caused index lookups to assume that this is a valid conversion and was returning rows that match a comparison between a `TIMESTAMP` value and a `DATE` keypart. Now a warning is generated so that `TIMESTAMP` with a non-zero time part will not match `DATE` values. (Bug#31221)
- A server crash could occur when a non-`DETERMINISTIC` stored function was used in a `GROUP BY` clause. (Bug#31035)
- For an `InnoDB` table if a `SELECT` was ordered by the primary key and also had a `WHERE field = value` clause on a different field that was indexed, a `DESC` order instruction would be ignored. (Bug#31001)
- A failed `HANDLER ... READ` operation could leave the table in a locked state. (Bug#30632)
- The optimization that uses a unique index to remove `GROUP BY` did not ensure that the index was actually used, thus violating the `ORDER BY` that is implied by `GROUP BY`. (Bug#30596)
- `SHOW STATUS LIKE 'Ssl_cipher_list'` from a MySQL client connected via SSL returned an empty string rather than a list of available ciphers. (Bug#30593)
- Memory corruption occurred for some queries with a top-level `OR` operation in the `WHERE` condition if they contained equality predicates and other sargable predicates in disjunctive parts of the condition. (Bug#30396)
- Issuing a `DELETE` statement having both an `ORDER BY` clause and a `LIMIT` clause could cause `mysqld` to crash. (Bug#30385)

- The `Last_query_cost` status variable value can be computed accurately only for simple “flat” queries, not complex queries such as those with subqueries or `UNION`. However, the value was not consistently being set to 0 for complex queries. (Bug#30377)
 - Queries that had a `GROUP BY` clause and selected `COUNT(DISTINCT bit_column)` returned incorrect results. (Bug#30324)
 - The server created temporary tables for filesort operations in the working directory, not in the directory specified by the `tmp-dir` system variable. (Bug#30287)
 - The query cache does not support retrieval of statements for which column level access control applies, but the server was still caching such statements, thus wasting memory. (Bug#30269)
 - Using `DISTINCT` or `GROUP BY` on a `BIT` column in a `SELECT` statement caused the column to be cast internally as an integer, with incorrect results being returned from the query. (Bug#30245)
 - `GROUP BY` on `BIT` columns produced incorrect results. (Bug#30219)
 - Using `KILL QUERY` or `KILL CONNECTION` to kill a `SELECT` statement caused a server crash if the query cache was enabled. (Bug#30201)
 - Prepared statements containing `CONNECTION_ID()` could be written improperly to the binary log. (Bug#30200)
 - When a thread executing a `DROP TABLE` statement was killed, the table name locks that had been acquired were not released. (Bug#30193)
 - Short-format `mysql` commands embedded within `/*! ... */` comments were parsed incorrectly by `mysql`, which discarded the rest of the comment including the terminating `*/` characters. The result was a malformed (unclosed) comment. Now `mysql` does not discard the `*/` characters. (Bug#30164)
 - When `mysqldump` wrote `DROP DATABASE` statements within version-specific comments, it included the terminating semi-colon in the wrong place, causing following statements to fail when the dump file was reloaded. (Bug#30126)
 - Use of local variables with non-ASCII names in stored procedures crashed the server. (Bug#30120)
 - On Windows, client libraries lacked symbols required for linking. (Bug#30118)
 - `--myisam-recover=`' ' (empty option value) did not disable `MyISAM` recovery. (Bug#30088)
 - The `IS_UPDATABLE` column in the `INFORMATION_SCHEMA.VIEWS` table was not always set correctly. (Bug#30020)
 - Statements within stored procedures ignored the value of the `low_priority_updates` system variable. (Bug#29963)
- See also [Bug#26162](#)
- For `MyISAM` tables on Windows, `INSERT`, `DELETE`, or `UPDATE` followed by `ALTER TABLE` within `LOCK TABLES` could cause table corruption. (Bug#29957)
 - With auto-reconnect enabled, row fetching for a prepared statement could crash after reconnect occurred because loss of the statement handler was not accounted for. (Bug#29948)
 - `LOCK TABLES` did not pre-lock tables used in triggers of the locked tables. Unexpected locking behavior and statement failures similar to `FAILED: 1100: TABLE 'XX' WAS NOT LOCKED WITH LOCK TABLES` could result. (Bug#29929)
 - `INSERT ... VALUES(CONNECTION_ID(), ...)` statements were written to the binary log in such a way that they could not be properly restored. (Bug#29928)
 - Adding `DISTINCT` could cause incorrect rows to appear in a query result. (Bug#29911)
 - Using the `DATE()` function in a `WHERE` clause did not return any records after encountering `NULL`. However, using `TRIM` or `CAST` produced the correct results. (Bug#29898)
 - Very long prepared statements in stored procedures could cause a server crash. (Bug#29856)
 - If query execution involved a temporary table, `GROUP_CONCAT()` could return a result with an incorrect character set. (Bug#29850)
 - If one thread was performing concurrent inserts, other threads reading from the same table using equality key searches could see the index values for new rows before the data values had been written, leading to reports of table corruption. (Bug#29838)
 - Repeatedly accessing a view in a stored procedure (for example, in a loop) caused a small amount of memory to be allocated

per access. Although this memory is deallocated on disconnect, it could be a problem for a long running stored procedures that make repeated access of views. ([Bug#29834](#))

- `mysqldump` produced output that incorrectly discarded the `NO_AUTO_VALUE_ON_ZERO` value of the `SQL_MODE` variable after dumping triggers. ([Bug#29788](#))
- An assertion failure occurred within yaSSL for very long keys. ([Bug#29784](#))
- For `MEMORY` tables, the `index_merge` union access method could return incorrect results. ([Bug#29740](#))
- Comparison of `TIME` values using the `BETWEEN` operator led to string comparison, producing incorrect results in some cases. Now the values are compared as integers. ([Bug#29739](#))
- The thread ID was not reset properly after execution of `mysql_change_user()`, which could cause replication failure when replicating temporary tables. ([Bug#29734](#))
- For a table with a `DATE` column `date_col` such that selecting rows with `WHERE date_col = 'date_val 00:00:00'` yielded a non-empty result, adding `GROUP BY date_col` caused the result to be empty. ([Bug#29729](#))
- In some cases, `INSERT INTO ... SELECT ... GROUP BY` could insert rows even if the `SELECT` by itself produced an empty result. ([Bug#29717](#))
- For the embedded server, the `mysql_stmt_store_result()` C API function caused a memory leak for empty result sets. ([Bug#29687](#))
- `EXPLAIN` produced `Impossible where` for statements of the form `SELECT ... FROM t WHERE c=0`, where `c` was an `ENUM` column defined as a primary key. ([Bug#29661](#))
- On Windows, `ALTER TABLE` hung if records were locked in share mode by a long-running transaction. ([Bug#29644](#))
- A left join between two views could produce incorrect results. ([Bug#29604](#))
- Certain statements with unions, subqueries, and joins could result in huge memory consumption. ([Bug#29582](#))
- Clients using SSL could hang the server. ([Bug#29579](#))
- A slave running with `--log-slave-updates` would fail to write `INSERT DELAY IGNORE` statements to its binary log, resulting in different binary log contents on the master and slave. ([Bug#29571](#))
- An incorrect result was returned when comparing string values that were converted to `TIME` values with `CAST()`. ([Bug#29555](#))
- `gcov` coverage-testing information was not written if the server crashed. ([Bug#29543](#))
- Operations that used the time zone replicated the time zone only for successful operations, but did not replicate the time zone for errors that need to know it. ([Bug#29536](#))
- Conversion of ASCII DEL (`0x7F`) to Unicode incorrectly resulted in QUESTION MARK (`0x3F`) rather than DEL. ([Bug#29499](#))
- A field packet with `NULL` fields caused a `libmysqlclient` crash. ([Bug#29494](#))
- When using a combination of `HANDLER ... READ` and `DELETE` on a table, MySQL continued to open new copies of the table every time, leading to an exhaustion of file descriptors. ([Bug#29474](#))

This regression was introduced by [Bug#21587](#)
- On Windows, the `mysql` client died if the user entered a statement and Return after entering Control-C. ([Bug#29469](#))
- Failure to consider collation when comparing space characters could lead to incorrect index entry order, making it impossible to find some index values. ([Bug#29461](#))
- Corrupt data resulted from use of `SELECT ... INTO OUTFILE 'file_name' FIELDS ENCLOSED BY 'c'`, where `c` is a digit or minus sign, followed by `LOAD DATA INFILE 'file_name' FIELDS ENCLOSED BY 'c'`. ([Bug#29442](#))
- Killing an `INSERT DELAYED` thread caused a server crash. ([Bug#29431](#))
- Use of `SHOW BINLOG EVENTS` for a non-existent log file followed by `PURGE MASTER LOGS` caused a server crash. ([Bug#29420](#))

- Assertion failure could occur for grouping queries that employed `DECIMAL` user variables with assignments to them. (Bug#29417)
- For `CAST(expr AS DECIMAL(M,D))`, the limits of 65 and 30 on the precision (*M*) and scale (*D*) were not enforced. (Bug#29415)
- If a view used a function in its `SELECT` statement, the columns from the view were not inserted into the `INFORMATION_SCHEMA.COLUMNS` table. (Bug#29408)
- Results for a select query that aliases the column names against a view could duplicate one column while omitting another. This bug could occur for a query over a multiple-table view that includes an `ORDER BY` clause in its definition. (Bug#29392)
- `mysqldump` created a stray file when a given a too-long filename argument. (Bug#29361)
- The special “zero” `ENUM` value was coerced to the normal empty string `ENUM` value during a column-to-column copy. This affected `CREATE ... SELECT` statements and `SELECT` statements with aggregate functions on `ENUM` columns in the `GROUP BY` clause. (Bug#29360)
- Optimization of queries with `DETERMINISTIC` stored functions in the `WHERE` clause was ineffective: A sequential scan was always used. (Bug#29338)
- `MyISAM` corruption could occur with the `cp932_japanese_ci` collation for the `cp932` character set due to incorrect comparison for trailing space. (Bug#29333)
- The `mysql_list_fields()` C API function incorrectly set `MYSQL_FIELD::decimals` for some view columns. (Bug#29306)
- `FULLTEXT` indexes could be corrupted by certain `gbk` characters. (Bug#29299)
- `SELECT ... INTO OUTFILE` followed by `LOAD DATA` could result in garbled characters when the `FIELDS ENCLOSED BY` clause named a delimiter of `'0'`, `'b'`, `'n'`, `'r'`, `'t'`, `'N'`, or `'Z'` due to an interaction of character encoding and doubling for data values containing the enclosed-by character. (Bug#29294)
- Sort order of the collation wasn't used when comparing trailing spaces. This could lead to incorrect comparison results, incorrectly created indexes, or incorrect result set order for queries that include an `ORDER BY` clause. (Bug#29261)
- If an `ENUM` column contained `'` as one of its members (represented with numeric value greater than 0), and the column contained error values (represented as 0 and displayed as `'`), using `ALTER TABLE` to modify the column definition caused the 0 values to be given the numeric value of the non-zero `'` member. (Bug#29251)
- Calling `mysql_options()` after `mysql_real_connect()` could cause clients to crash. (Bug#29247)
- `CHECK TABLE` for `ARCHIVE` tables could falsely report table corruption or cause a server crash. (Bug#29207)
- Mixing binary and `utf8` columns in a union caused field lengths to be calculated incorrectly, resulting in truncation. (Bug#29205)
- `AsText()` could fail with a buffer overrun. (Bug#29166)
- `InnoDB` refused to start on some versions of FreeBSD with LinuxThreads. This is fixed by enabling file locking on FreeBSD. (Bug#29155)
- `LOCK TABLES` was not atomic when more than one `InnoDB` tables were locked. (Bug#29154)
- `INSERT DELAYED` statements on a master server are replicated as non-`DELAYED` inserts on slaves (which is normal, to preserve serialization), but the inserts on the slave did not use concurrent inserts. Now `INSERT DELAYED` on a slave is converted to a concurrent insert when possible, and to a normal insert otherwise. (Bug#29152)
- A network structure was initialized incorrectly, leading to embedded server crashes. (Bug#29117)
- An assertion failure occurred if a query contained a conjunctive predicate of the form `view_column = constant` in the `WHERE` clause and the `GROUP BY` clause contained a reference to a different view column. The fix also enables application of an optimization that was being skipped if a query contained a conjunctive predicate of the form `view_column = constant` in the `WHERE` clause and the `GROUP BY` clause contained a reference to the same view column. (Bug#29104)
- A maximum of 4TB `InnoDB` free space was reported by `SHOW TABLE STATUS`, which is incorrect on systems with more than 4TB space. (Bug#29097)
- If an `INSERT INTO ... SELECT` statement inserted into the same table that the `SELECT` retrieved from, and the `SELECT` included `ORDER BY` and `LIMIT` clauses, different data was inserted than the data produced by the `SELECT` executed by itself. (Bug#29095)

- Queries that performed a lookup into a `BINARY` index containing key values ending with spaces caused an assertion failure for debug builds and incorrect results for non-debug builds. (Bug#29087)
- The semantics of `BIGINT` depended on platform-specific characteristics. (Bug#29079)
- A byte-order issue in writing a spatial index to disk caused bad index files on some systems. (Bug#29070)
- If one of the queries in a `UNION` used the `SQL_CACHE` option and another query in the `UNION` contained a nondeterministic function, the result was still cached. For example, this query was incorrectly cached:

```
SELECT NOW() FROM t1 UNION SELECT SQL_CACHE 1 FROM t1;
```

(Bug#29053)

- Creation of a legal stored procedure could fail if no default database had been selected. (Bug#29050)
- `DROP USER` statements that named multiple users, only some of which could be dropped, were replicated incorrectly. (Bug#29030)
- `REPLACE`, `INSERT IGNORE`, and `UPDATE IGNORE` did not work for `FEDERATED` tables. (Bug#29019)
- Inserting into `InnoDB` tables and executing `RESET MASTER` in multiple threads cause assertion failure in debug server binaries. (Bug#28983)
- For a `ucs2` column, `GROUP_CONCAT()` did not convert separators to the result character set before inserting them, producing a result containing a mixture of two different character sets. (Bug#28925)
- Queries using UDFs or stored functions were cached. (Bug#28921)
- For a join with `GROUP BY` and/or `ORDER BY` and a view reference in the `FROM` list, the query metadata erroneously showed empty table aliases and database names for the view columns. (Bug#28898)
- Coercion of ASCII values to character sets that are a superset of ASCII sometimes was not done, resulting in `ILLEGAL MIX OF COLLATIONS` errors. These cases now are resolved using repertoire, a new string expression attribute (see Section 9.1.6, “String Repertoire”). (Bug#28875)
- Non-`utf8` characters could get mangled when stored in `CSV` tables. (Bug#28862)
- `ALTER VIEW` is not supported as a prepared statement but was not being rejected. `ALTER VIEW` is now prohibited as a prepared statement or when called within stored routines. (Bug#28846)
- In strict SQL mode, errors silently stopped the SQL thread even for errors named using the `--slave-skip-errors` option. (Bug#28839)
- Fast `ALTER TABLE` (that works without rebuilding the table) acquired duplicate locks in the storage engine. In `MyISAM`, if `ALTER TABLE` was issued under `LOCK TABLE`, it caused all data inserted after `LOCK TABLE` to disappear. (Bug#28838)
- Killing an SSL connection on platforms where MySQL is compiled with `-DSIGNAL_WITH_VIO_CLOSE` (Windows, Mac OS X, and some others) could crash the server. (Bug#28812)
- Runtime changes to the `log_queries_not_using_indexes` system variable were ignored. (Bug#28808)
- Tables using the `InnoDB` storage engine incremented `AUTO_INCREMENT` values incorrectly with `ON DUPLICATE KEY UPDATE`. (Bug#28781)
- Selecting a column not present in the selected-from table caused an extra error to be produced by `SHOW ERRORS`. (Bug#28677)
- For a statement of the form `CREATE t1 SELECT integer_constant`, the server created the column using the `DECIMAL` data type for large negative values that are within the range of `BIGINT`. (Bug#28625)
- For `InnoDB` tables, MySQL unnecessarily sorted records in certain cases when the records were retrieved by `InnoDB` in the proper order already. (Bug#28591)
- A `SELECT` in one connection could be blocked by `INSERT ... ON DUPLICATE KEY UPDATE` in another connection even when `low_priority_updates` is set. (Bug#28587)
- `mysql_install_db` could fail to find script files that it needs. (Bug#28585)
- When one thread attempts to lock two (or more) tables and another thread executes a statement that aborts these locks (such as `REPAIR TABLE`, `OPTIMIZE TABLE`, or `CHECK TABLE`), the thread might get a table object with an incorrect lock type in

- the table cache. The result is table corruption or a server crash. ([Bug#28574](#))
- `mysql_upgrade` could run binaries dynamically linked against incorrect versions of shared libraries. ([Bug#28560](#))
 - If a stored procedure was created and invoked prior to selecting a default database with `USE`, a `NO DATABASE SELECTED` error occurred. ([Bug#28551](#))
 - On Mac OS X, shared-library installation pathnames were incorrect. ([Bug#28544](#))
 - Using the `--skip-add-drop-table` option with `mysqldump` generated incorrect SQL if the database included any views. The recreation of views requires the creation and removal of temporary tables. This option suppressed the removal of those temporary tables. The same applied to `--compact` since this option also invokes `--skip-add-drop-table`. ([Bug#28524](#))
 - `mysqlbinlog --hexdump` generated incorrect output due to omission of the “#” comment character for some comment lines. ([Bug#28293](#))
 - A race condition in the interaction between `MyISAM` and the query cache code caused the query cache not to invalidate itself for concurrently inserted data. ([Bug#28249](#))
 - Indexing column prefixes in `InnoDB` tables could cause table corruption. ([Bug#28138](#))
 - Index creation could fail due to truncation of key values to the maximum key length rather than to a multiple of the maximum character length. ([Bug#28125](#))
 - The `LOCATE ()` function returned `NULL` if any of its arguments evaluated to `NULL`. Likewise, the predicate, `LOCATE (str, NULL) IS NULL`, erroneously evaluated to `FALSE`. ([Bug#27932](#))
 - On Windows, symbols for `yaSSL` and `taocrypt` were missing from `mysqlclient.lib`, resulting in unresolved symbol errors for clients linked against that library. ([Bug#27861](#))
 - `SHOW COLUMNS` returned `NULL` instead of the empty string for the `Default` value of columns that had no default specified. ([Bug#27747](#))
 - The modification of a table by a partially completed multi-column update was not recorded in the binlog, rather than being marked by an event and a corresponding error code. ([Bug#27716](#))
 - With recent versions of `DBD::mysql`, `mysqlhotcopy` generated table names that were doubly qualified with the database name. ([Bug#27694](#))
 - The anonymous accounts were not being created during MySQL installation. ([Bug#27692](#))
 - Some `SHOW` statements and `INFORMATION_SCHEMA` queries could expose information not allowed by the user's access privileges. ([Bug#27629](#))
 - A stack overrun could occur when storing `DATETIME` values using repeated prepared statements. ([Bug#27592](#))
 - Dropping a user-defined function could cause a server crash if the function was still in use by another thread. ([Bug#27564](#))
 - Some character mappings in the `ascii.xml` file were incorrect. ([Bug#27562](#))
 - The parser rules for the `SHOW PROFILE` statement were revised to work with older versions of `bison`. ([Bug#27433](#))
 - An error that happened inside `INSERT`, `UPDATE`, or `DELETE` statements performed from within a stored function or trigger could cause inconsistency between master and slave servers. ([Bug#27417](#))
 - Unsafe aliasing in the source caused a client library crash when compiled with `gcc 4` at high optimization levels. ([Bug#27383](#))
 - A `SELECT` with more than 31 nested dependent subqueries returned an incorrect result. ([Bug#27352](#))
 - Index-based range reads could fail for comparisons that involved contraction characters (such as `ch` in Czech or `ll` in Spanish). ([Bug#27345](#))
 - Aggregations in subqueries that refer to outer query columns were not always correctly referenced to the proper outer query. ([Bug#27333](#))
 - `INSERT INTO ... SELECT` caused a crash if `innodb_locks_unsafe_for_binlog` was enabled. ([Bug#27294](#))
 - Error returns from the `time ()` system call were ignored. ([Bug#27198](#))
 - Phantom reads could occur under `InnoDB` serializable isolation level. ([Bug#27197](#))

- The `SUBSTRING()` function returned the entire string instead of an empty string when it was called from a stored procedure and when the length parameter was specified by a variable with the value "0". (Bug#27130)
- `ALTER TABLE ... ENABLE KEYS` could cause `mysqld` to crash when executed on a table containing on a `MyISAM` table containing billions of rows. (Bug#27029)
- `FEDERATED` tables had an artificially low maximum of key length. (Bug#26909)
- Binary content `0x00` in a `BLOB` column sometimes became `0x5C 0x00` following a dump and reload, which could cause problems with data using multi-byte character sets such as `GBK` (Chinese). This was due to a problem with `SELECT INTO OUTFILE` whereby `LOAD DATA` later incorrectly interpreted `0x5C` as the second byte of a multi-byte sequence rather than as the `SOLIDUS` ("") character, used by MySQL as the escape character. (Bug#26711)
- Index creation could corrupt the table definition in the `.frm` file: 1) A table with the maximum number of key segments and maximum length key name would have a corrupted `.frm` file, due to incorrect calculation of the total key length. 2) `MyISAM` would reject a table with the maximum number of keys and the maximum number of key segments in all keys. (It would allow one less than this total maximum.) Now `MyISAM` accepts a table defined with the maximum. (Bug#26642)
- After the first read of a `TEMPORARY` table, `CHECK TABLE` could report the table as being corrupt. (Bug#26325)
- If an operation had an `InnoDB` table, and two triggers, `AFTER UPDATE` and `AFTER INSERT`, competing for different resources (such as two distinct `MyISAM` tables), the triggers were unable to execute concurrently. In addition, `INSERT` and `UPDATE` statements for the `InnoDB` table were unable to run concurrently. (Bug#26141)
- `ALTER DATABASE` did not require at least one option. (Bug#25859)
- Using `HANDLER` to open a table having a storage engine not supported by `HANDLER` properly returned an error, but also improperly prevented the table from being dropped by other connections. (Bug#25856)
- The index merge union access algorithm could produce incorrect results with `InnoDB` tables. The problem could also occur for queries that used `DISTINCT`. (Bug#25798)
- When using a `FEDERATED` table, the value of `last_insert_id()` would not correctly update the C API interface, which would affect the autogenerated ID returned both through the C API and the MySQL protocol, affecting Connectors that used the protocol and/or C API. (Bug#25714)
- The server was blocked from opening other tables while the `FEDERATED` engine was attempting to open a remote table. Now the server does not check the correctness of a `FEDERATED` table at `CREATE TABLE` time, but waits until the table actually is accessed. (Bug#25679)
- Under ActiveState Perl, `mysql-test-run.pl` could kill itself when attempting to kill other processes. (Bug#25657)
- Several `InnoDB` assertion failures were corrected. (Bug#25645)
- A query with `DISTINCT` in the select list to which the loose-scan optimization for grouping queries was applied returned an incorrect result set when the query was used with the `SQL_BIG_RESULT` option. (Bug#25602)
- For a multiple-row insert into a `FEDERATED` table that refers to a remote transactional table, if the insert failed for a row due to constraint failure, the remote table would contain a partial commit (the rows preceding the failed one) instead of rolling back the statement completely. This occurred because the rows were treated as individual inserts.

Now `FEDERATED` performs bulk-insert handling such that multiple rows are sent to the remote table in a batch. This provides a performance improvement and enables the remote table to perform statement rollback properly should an error occur. This capability has the following limitations:

- The size of the insert cannot exceed the maximum packet size between servers. If the insert exceeds this size, it is broken into multiple packets and the rollback problem can occur.
- Bulk-insert handling does not occur for `INSERT ... ON DUPLICATE KEY UPDATE`.

(Bug#25513)

- The `FEDERATED` storage engine failed silently for `INSERT ... ON DUPLICATE KEY UPDATE` if a duplicate key violation occurred. `FEDERATED` does not support `ON DUPLICATE KEY UPDATE`, so now it correctly returns an `ER_DUP_KEY` error if a duplicate key violation occurs. (Bug#25511)
- For `InnoDB` tables, `CREATE TABLE a AS SELECT * FROM A` would fail. (Bug#25164)
- In a stored function or trigger, when `InnoDB` detected deadlock, it attempted rollback and displayed an incorrect error message (`EXPLICIT OR IMPLICIT COMMIT IS NOT ALLOWED IN STORED FUNCTION OR TRIGGER`). Now `InnoDB` returns an error under these conditions and does not attempt rollback. Rollback is handled outside of `InnoDB` above the function/trigger level.

[Bug#24989](#))

- A too-long `shared-memory-base-name` value could cause a buffer overflow and crash the server or clients. ([Bug#24924](#))
- Dropping a temporary `InnoDB` table that had been locked with `LOCK TABLES` caused a server crash. ([Bug#24918](#))
- On Windows, executables did not include Vista manifests. ([Bug#24732](#))

See also [Bug#22563](#)

- Slave servers could incorrectly interpret an out-of-memory error from the master and reconnect using the wrong binary log position. ([Bug#24192](#))
- If MySQL/`InnoDB` crashed very quickly after starting up, it would not force a checkpoint. In this case, `InnoDB` would skip crash recovery at next startup, and the database would become corrupt. Now, if the redo log scan at `InnoDB` startup goes past the last checkpoint, crash recovery is forced. ([Bug#23710](#))
- The server deducted some bytes from the `key_cache_block_size` option value and reduced it to the next lower 512 byte boundary. The resulting block size was not a power of two. Setting the `key_cache_block_size` system variable to a value that is not a power of two resulted in `MyISAM` table corruption. ([Bug#23068](#), [Bug#28478](#), [Bug#25853](#))
- `SHOW INNODB STATUS` caused an assertion failure under high load. ([Bug#22819](#))
- `SHOW BINLOG EVENTS` displayed incorrect values of `End_log_pos` for events associated with transactional storage engines. ([Bug#22540](#))
- A statement of the form `CREATE TABLE IF NOT EXISTS t1 SELECT f1() AS i` failed with a deadlock error if the stored function `f1()` referred to a table with the same name as the to-be-created table. Now it correctly produces a message that the table already exists. ([Bug#22427](#))
- Read lock requests that were blocked by a pending write lock request were not allowed to proceed if the statement requesting the write lock was killed. ([Bug#21281](#))
- Under heavy load with a large query cache, invalidating part of the cache could cause the server to freeze (that is, to be unable to service other operations until the invalidation was complete). ([Bug#21074](#))
- `mysql-stress-test.pl` and `mysqld_multi.server.sh` were missing from some binary distributions. ([Bug#21023](#), [Bug#25486](#))
- On Windows, the server used 10MB of memory for each connection thread, resulting in memory exhaustion. Now each thread uses 1MB. ([Bug#20815](#))
- Worked around an `icc` problem with an incorrect machine instruction being generated in the context of software pre-fetching after a subroutine got in-lined. (Upgrading to `icc` 10.0.026 makes the workaround unnecessary.) ([Bug#20803](#))
- `InnoDB` produced an unnecessary (and harmless) warning: `InnoDB: Error: trying to declare trx to enter InnoDB, but InnoDB: it already is declared.` ([Bug#20090](#))
- Under ActiveState Perl, `mysql-test-run.pl` would not run. ([Bug#18415](#))
- The server crashed when the size of an `ARCHIVE` table grew larger than 2GB. ([Bug#15787](#))
- `SQL_BIG_RESULT` had no effect for `CREATE TABLE ... SELECT SQL_BIG_RESULT ...` statements. ([Bug#15130](#))
- On 64-bit Windows systems, the Config Wizard failed to complete the setup because 64-bit Windows does not resolve dynamic linking of the 64-bit `libmysql.dll` to a 32-bit application like the Config Wizard. ([Bug#14649](#))
- `mysql_setpermission` tried to grant global-only privileges at the database level. ([Bug#14618](#))
- Parameters of type `DATETIME` or `DATE` in stored procedures were silently converted to `VARBINARY`. ([Bug#13675](#))
- For the general query log, logging of prepared statements executed via the C API differed from logging of prepared statements performed with `PREPARE` and `EXECUTE`. Logging for the latter was missing the `Prepare` and `Execute` lines. ([Bug#13326](#))
- The server returned data from `SHOW CREATE TABLE` statement or a `SELECT` statement on an `INFORMATION_SCHEMA` table using the `binary` character set. ([Bug#10491](#))
- Backup software can cause `ERROR_SHARING_VIOLATION` or `ERROR_LOCK_VIOLATION` conditions during file operations. `InnoDB` now retries forever until the condition goes away. ([Bug#9709](#))
- Bulk-insert handling does not occur for `INSERT ... ON DUPLICATE KEY UPDATE`.

- The size of the insert cannot exceed the maximum packet size between servers. If the insert exceeds this size, it is broken into multiple packets and the rollback problem can occur.

D.1.5. Release Notes for MySQL Community Server 5.0.45 (04 July 2007)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.41.

Functionality added or changed:

- **Incompatible Change:** Prior to this release, when `DATE` values were compared with `DATETIME` values, the time portion of the `DATETIME` value was ignored, or the comparison could be performed as a string compare. Now a `DATE` value is coerced to the `DATETIME` type by adding the time portion as `00:00:00`. To mimic the old behavior, use the `CAST()` function as shown in this example: `SELECT date_col = CAST(NOW() AS DATE) FROM table;` (Bug#28929)
- **Incompatible Change:** `INSERT DELAYED` is now downgraded to a normal `INSERT` if the statement uses functions that access tables or triggers, or that is called from a function or a trigger.

This was done to resolve the following interrelated issues:

- The server could abort or deadlock for `INSERT DELAYED` statements for which another insert was performed implicitly (for example, via a stored function that inserted a row).
- A trigger using an `INSERT DELAYED` caused the error `INSERT DELAYED CAN'T BE USED WITH TABLE ... BECAUSE IT IS LOCKED WITH LOCK TABLES` although the target table was not actually locked.
- `INSERT DELAYED` into a table with a `BEFORE INSERT` or `AFTER INSERT` trigger gave an incorrect `NEW` pseudo-column value and caused the server to deadlock or abort. (Bug#21483)

See also [Bug#20497](#), [Bug#21714](#)

- **MySQL Cluster:** The server source tree now includes scripts to simplify building MySQL with SCI support. For more information about SCI interconnects and these build scripts, see [Section 19.11.1, “Configuring MySQL Cluster to use SCI Sockets”](#). (Bug#25470)
- Binaries for the Linux x86 statically linked `tar.gz` Community package were linked dynamically, not statically. Static linking has been re-enabled. (Bug#29617)
- `INSERT DELAYED` statements on `BLACKHOLE` tables are now rejected, due to the fact that the `BLACKHOLE` storage engine does not support them. (Bug#27998)
- A new status variable, `Com_call_procedure`, indicates the number of calls to stored procedures. (Bug#27994)
- Potential memory leaks in `SHOW PROFILE` were eliminated. (Bug#24795)

Bugs fixed:

- **Security Fix:** A malformed password packet in the connection protocol could cause the server to crash. Thanks for Dormando for reporting this bug, and for providing details and a proof of concept. (Bug#28984, CVE-2007-3780)
- **Security Fix:** Use of a view could allow a user to gain update privileges for tables in other databases. (Bug#27878, CVE-2007-3782)
- **Security Fix:** The requirement of the `DROP` privilege for `RENAME TABLE` was not enforced. (Bug#27515, CVE-2007-2691)
- **Security Fix:** If a stored routine was declared using `SQL SECURITY INVOKER`, a user who invoked the routine could gain privileges. (Bug#27337, CVE-2007-2692)
- **Security Fix:** `CREATE TABLE LIKE` did not require any privileges on the source table. Now it requires the `SELECT` privilege.

In addition, `CREATE TABLE LIKE` was not isolated from alteration by other connections, which resulted in various errors and incorrect binary log order when trying to execute concurrently a `CREATE TABLE LIKE` statement and either DDL statements on the source table or DML or DDL statements on the target table. (Bug#23667, Bug#25578, CVE-2007-3781)

- **Incompatible Change:** When `mysqldump` was run with the `--delete-master-logs` option, binary log files were deleted before it was known that the dump had succeeded, not after. (The method for removing log files used `RESET MASTER`

prior to the dump. This also reset the binary log sequence numbering to `.000001`.) Now `mysqldump` flushes the logs (which creates a new binary log number with the next sequence number), performs the dump, and then uses `PURGE MASTER LOGS` to remove the log files older than the new one. This also preserves log numbering because the new log with the next number is generated and only the preceding logs are removed. However, this may affect applications if they rely on the log numbering sequence being reset. (Bug#24733)

- **Incompatible Change:** The use of an `ORDER BY` or `DISTINCT` clause with a query containing a call to the `GROUP_CONCAT()` function caused results from previous queries to be redisplayed in the current result. The fix for this includes replacing a `BLOB` value used internally for sorting with a `VARCHAR`. This means that for long results (more than 65,535 bytes), it is possible for truncation to occur; if so, an appropriate warning is issued. (Bug#23856, Bug#28273)
- **MySQL Cluster:** A corrupt schema file could cause a `FILE ALREADY OPEN` error. (Bug#28770)
- **MySQL Cluster:** Setting `InitialNoOpenFiles` equal to `MaxNoOfOpenFiles` caused an error. This was due to the fact that the actual value of `MaxNoOfOpenFiles` as used by the cluster was offset by 1 from the value set in `config.ini`. (Bug#28749)
- **MySQL Cluster:** `UPDATE IGNORE` statements involving the primary keys of multiple tables could result in data corruption. (Bug#28719)
- **MySQL Cluster:** A race condition could result when non-master nodes (in addition to the master node) tried to update active status due to a local checkpoint (that is, between `NODE_FAILREP` and `COPY_GCIREQ` events). Now only the master updates the active status. (Bug#28717)
- **MySQL Cluster:** A fast global checkpoint under high load with high usage of the redo buffer caused data nodes to fail. (Bug#28653)
- **MySQL Cluster:** When an API node sent more than 1024 signals in a single batch, `NDB` would process only the first 1024 of these, and then hang. (Bug#28443)
- **MySQL Cluster:** A delay in obtaining `AUTO_INCREMENT` IDs could lead to excess temporary errors. (Bug#28410)
- **MySQL Cluster:** The cluster waited 30 seconds instead of 30 milliseconds before reading table statistics. (Bug#28093)
- **MySQL Cluster:** `INSERT IGNORE` wrongly ignored `NULL` values in unique indexes. (Bug#27980)
- **MySQL Cluster:** The name of the month “March” was given incorrectly in the cluster error log. (Bug#27926)
- **MySQL Cluster:** It was not possible to add a unique index to an `NDB` table while in single user mode. (Bug#27710)
- **MySQL Cluster:** Repeated insertion of data generated by `mysqldump` into `NDB` tables could eventually lead to failure of the cluster. (Bug#27437)
- **MySQL Cluster:** `ndb_connectstring` did not appear in the output of `SHOW VARIABLES`. (Bug#26675)
- **MySQL Cluster:** A failure to release internal resources following an error could lead to problems with single user mode. (Bug#25818)
- **Cluster API:** For `BLOB` reads on operations with lock mode `LM_CommittedRead`, the lock mode was not upgraded to `LM_Read` before the state of the `BLOB` had already been calculated. The `NDB` API methods affected by this problem included the following:
 - `NdbOperation::readTuple()`
 - `NdbScanOperation::readTuples()`
 - `NdbIndexScanOperation::readTuples()`(Bug#27320)
- On the IBM i5 platform, the installation script in the `.savf` binaries unconditionally executed the `mysql_install_db` script. This problem was fixed in a repackaged distribution numbered 5.0.45b. (Bug#30084)
- Long pathnames for internal temporary tables could cause stack overflows. (Bug#29015)
- Using an `INTEGER` column from a table to `ROUND()` a number produced different results than using a constant with the same value as the `INTEGER` column. (Bug#28980)
- If a program binds a given number of parameters to a prepared statement handle and then somehow changes `stmt->param_count` to a different number, `mysql_stmt_execute()` could crash the client or server. (Bug#28934)
- `INSERT .. ON DUPLICATE KEY UPDATE` could under some circumstances silently update rows when it should not

have. (Bug#28904)

- Queries that used `UUID()` were incorrectly allowed into the query cache. (This should not happen because `UUID()` is non-deterministic.) (Bug#28897)
- Using a `VIEW` created with a non-existing `DEFINER` could lead to incorrect results under some circumstances. (Bug#28895)
- On Windows, `USE_TLS` was not defined for `mysqlclient.lib`. (Bug#28860)
- A subquery with `ORDER BY` and `LIMIT 1` could cause a server crash. (Bug#28811)
- Using `BETWEEN` with non-indexed date columns and short formats of the date string could return incorrect results. (Bug#28778)
- Selecting `GEOMETRY` columns in a `UNION` caused a server crash. (Bug#28763)
- When constructing the path to the original `.frm` file, `ALTER ... RENAME` was unnecessarily (and incorrectly) lowercasing the entire path when not on a case-insensitive filesystem, causing the statement to fail. (Bug#28754)
- Searches on indexed and non-indexed `ENUM` columns could return different results for empty strings. (Bug#28729)
- Executing `EXPLAIN EXTENDED` on a query using a derived table over a grouping subselect could lead to a server crash. This occurred only when materialization of the derived tables required creation of an auxiliary temporary table, an example being when a grouping operation was carried out with usage of a temporary table. (Bug#28728)
- The result of evaluation for a view's `CHECK OPTION` option over an updated record and records of merged tables was arbitrary and dependant on the order of records in the merged tables during the execution of the `SELECT` statement. (Bug#28716)
- The “manager thread” of the LinuxThreads implementation was unintentionally started before `mysqld` had dropped privileges (to run as an unprivileged user). This caused signaling between threads in `mysqld` to fail when the privileges were finally dropped. (Bug#28690)
- For debug builds, `ALTER TABLE` could trigger an assertion failure due to occurrence of a deadlock when committing changes. (Bug#28652)
- After an upgrade, the names of stored routines referenced by views were no longer displayed by `SHOW CREATE VIEW`. (Bug#28605)

This regression was introduced by Bug#23491

- Killing from one connection a long-running `EXPLAIN QUERY` started from another connection caused `mysqld` to crash. (Bug#28598)
- Outer join queries with `ON` conditions over constant outer tables did not return `NULL`-complemented rows when conditions were evaluated to `FALSE`. (Bug#28571)
- An update on a multiple-table view with the `CHECK OPTION` clause and a subquery in the `WHERE` condition could cause an assertion failure. (Bug#28561)
- `PURGE MASTER LOGS BEFORE (subquery)` caused a server crash. Subqueries are forbidden in the `BEFORE` clause now. (Bug#28553)
- `mysqldump` calculated the required memory for a hex-blob string incorrectly causing a buffer overrun. This in turn caused `mysqldump` to crash silently and produce incomplete output. (Bug#28522)
- Passing a `DECIMAL` value as a parameter of a statement prepared with `PREPARE` resulted in an error. (Bug#28509)
- `mysql_affected_rows()` could return an incorrect result for `INSERT ... ON DUPLICATE KEY UPDATE` if the `CLIENT_FOUND_ROWS` flag was set. (Bug#28505)
- A query that grouped by the result of an expression returned a different result when the expression was assigned to a user variable. (Bug#28494)
- Subselects returning `LONG` values in MySQL versions later than 5.0.24a returned `LONGLONG` prior to this. The previous behavior was restored. (Bug#28492)

This regression was introduced by Bug#19714

- Forcing the use of an index on a `SELECT` query when the index had been disabled would raise an error without running the query. The query now executes, with a warning generated noting that the use of a disabled index has been ignored. (Bug#28476)

- The result of executing of a prepared statement created with `PREPARE s FROM "SELECT 1 LIMIT ?"` was not replicated correctly. (Bug#28464)
- The query `SELECT '2007-01-01' + INTERVAL column_name DAY FROM table_name` caused `mysqld` to fail. (Bug#28450)
- A server crash could happen under rare conditions such that a temporary table outgrew heap memory reserved for it and the remaining disk space was not big enough to store the table as a `MyISAM` table. (Bug#28449)
- `mysql_upgrade` failed if certain SQL modes were set. Now it sets the mode itself to avoid this problem. (Bug#28401)
- A query with a `NOT IN` subquery predicate could cause a crash when the left operand of the predicate evaluated to `NULL`. (Bug#28375)
- The test case for `mysqldump` failed with `bin-log` disabled. (Bug#28372)
- Attempting to `LOAD_FILE` from an empty floppy drive under Windows, caused the server to hang. For example, if you opened a connection to the server and then issued the command `SELECT LOAD_FILE('a:test');`, with no floppy in the drive, the server was inaccessible until the modal pop-up dialog box was dismissed. (Bug#28366)
- A buffer overflow could occur when using `DECIMAL` columns on Windows operating systems. (Bug#28361)
- `libmysql.dll` could not be dynamically loaded on Windows. (Bug#28358)
- Grouping queries with correlated subqueries in `WHERE` conditions could produce incorrect results. (Bug#28337)
- `mysqltest` used a too-large stack size on PPC/Debian Linux, causing thread-creation failure for tests that use many threads. (Bug#28333)
- `EXPLAIN` for a query on an empty table immediately after its creation could result in a server crash. (Bug#28272)
- The `IS_UPDATABLE` column in the `INFORMATION_SCHEMA.VIEWS` table was not always set correctly. (Bug#28266)
- Comparing a `DATETIME` column value with a user variable yielded incorrect results. (Bug#28261)
- For `CAST()` of a `NULL` value with type `DECIMAL`, the return value was incorrectly initialized, producing a runtime error for binaries built using Visual C++ 2005. (Bug#28250)
- Recreating a view that already exists on the master would cause a replicating slave to terminate replication with a 'different error message on slave and master' error. (Bug#28244)
- Portability problems caused by use of `isinf()` were corrected. (Bug#28240)
- When dumping procedures, `mysqldump --compact` generated output that restored the session variable `SQL_MODE` without first capturing it. When dumping routines, `mysqldump --compact` neither set nor retrieved the value of `SQL_MODE`. (Bug#28223)
- Comparison of the string value of a date showed as unequal to `CURTIME()`. Similar behavior was exhibited for `DATETIME` values. (Bug#28208)
- For `InnoDB`, in some rare cases the optimizer preferred a more expensive `ref` access to a less expensive range access. (Bug#28189)
- A performance degradation was observed for outer join queries to which a not-exists optimization was applied. (Bug#28188)
- `SELECT * INTO OUTFILE ... FROM INFORMATION_SCHEMA.SCHEMATA` failed with an `ACCESS DENIED` error, even for a user who had the `FILE` privilege. (Bug#28181)
- The `Bytes_received` and `Bytes_sent` status variables could hold only 32-bit values (not 64-bit values) on some platforms. (Bug#28149)
- Comparisons of `DATE` or `DATETIME` values for the `IN()` function could yield incorrect results. (Bug#28133)
- Storing a large number into a `FLOAT` or `DOUBLE` column with a fixed length could result in incorrect truncation of the number if the column's length was greater than 31. (Bug#28121)
- The server could hang for `INSERT IGNORE ... ON DUPLICATE KEY UPDATE` if an update failed. (Bug#28000)
- `DECIMAL` values beginning with nine 9 digits could be incorrectly rounded. (Bug#27984)
- `CAST()` to `DECIMAL` did not check for overflow. (Bug#27957)

- For `INSERT ... ON DUPLICATE KEY UPDATE` statements that affected many rows, updates could be applied to the wrong rows. (Bug#27954)
 - Early `NULL`-filtering optimization did not work for `eq_ref` table access. (Bug#27939)
 - The second execution of a prepared statement from a `UNION` query with `ORDER BY RAND()` caused the server to crash. This problem could also occur when invoking a stored procedure containing such a query. (Bug#27937)
 - Views ignored precision for `CAST()` operations. (Bug#27921)
 - For attempts to open a non-existent table, the server should report `ER_NO_SUCH_TABLE` but sometimes reported `ER_TABLE_NOT_LOCKED`. (Bug#27907)
 - A stored program that uses a variable name containing multibyte characters could fail to execute. (Bug#27876)
 - Non-grouped columns were allowed by `*` in `ONLY_FULL_GROUP_BY` SQL mode. (Bug#27874)
 - `ON` conditions from `JOIN` expressions were ignored when checking the `CHECK OPTION` clause while updating a multiple-table view that included such a clause. (Bug#27827)
 - Debug builds on Windows generated false alarms about uninitialized variables with some Visual Studio runtime libraries. (Bug#27811)
 - Certain queries that used uncorrelated scalar subqueries caused `EXPLAIN` to crash. (Bug#27807)
 - Changes to some system variables should invalidate statements in the query cache, but invalidation did not happen. (Bug#27792)
 - Performing a `UNION` on two views that had `ORDER BY` clauses resulted in an `Unknown column` error. (Bug#27786)
 - `mysql_install_db` is supposed to detect existing system tables and create only those that do not exist. Instead, it was exiting with an error if tables already existed. (Bug#27783)
 - On some systems, `udf_example.c` returned an incorrect result length. Also on some systems, `mysql-test-run.pl` could not find the shared object built from `udf_example.c`. (Bug#27741)
 - `mysqld` did not check the length of option values and could crash with a buffer overflow for long values. (Bug#27715)
 - Comparisons using row constructors could fail for rows containing `NULL` values. (Bug#27704)
 - `LOAD DATA` did not use `CURRENT_TIMESTAMP` as the default value for a `TIMESTAMP` column for which no value was provided. (Bug#27670)
 - `mysqldump` could not connect using SSL. (Bug#27669)
 - On Linux, the server could not create temporary tables if `lower_case_table_names` was set to 1 and the value of `tmp-dir` was a directory name containing any uppercase letters. (Bug#27653)
 - For InnoDB tables, a multiple-row `INSERT` of the form `INSERT INTO t (id...) VALUES (NULL...) ON DUPLICATE KEY UPDATE id=VALUES(id)`, where `id` is an `AUTO_INCREMENT` column, could cause `ERROR 1062 (23000): Duplicate entry...` errors or lost rows. (Bug#27650)
 - `HASH` indexes on `VARCHAR` columns with binary collations did not ignore trailing spaces from strings before comparisons. This could result in duplicate records being successfully inserted into a `MEMORY` table with unique key constraints. A consequence was that internal `MEMORY` tables used for `GROUP BY` calculation contained duplicate rows that resulted in duplicate-key errors when converting those temporary tables to `MyISAM`, and that error was incorrectly reported as a `table is full` error. (Bug#27643)
 - The XML output representing an empty result was an empty string rather than an empty `<resultset/>` element. (Bug#27608)
 - An error occurred trying to connect to `mysqld-debug.exe`. (Bug#27597)
 - Comparison of a `DATE` with a `DATETIME` did not treat the `DATE` as having a time part of `00:00:00`. (Bug#27590)
- See also Bug#32198
- Selecting `MIN()` on an indexed column that contained only `NULL` values caused `NULL` to be returned for other result columns. (Bug#27573)
 - If a stored function or trigger was killed, it aborted but no error was thrown, allowing the calling statement to continue without

noticing the problem. This could lead to incorrect results. ([Bug#27563](#))

- The fix for [Bug#17212](#) provided correct sort order for misordered output of certain queries, but caused significant overall query performance degradation. (Results were correct (good), but returned much more slowly (bad).) The fix also affected performance of queries for which results were correct. The performance degradation has been addressed. ([Bug#27531](#))
 - The `CRC32()` function returns an unsigned integer, but the metadata was signed, which could cause certain queries to return incorrect results. (For example, queries that selected a `CRC32()` value and used that value in the `GROUP BY` clause.) ([Bug#27530](#))
 - An interaction between `SHOW TABLE STATUS` and other concurrent statements that modify the table could result in a divide-by-zero error and a server crash. ([Bug#27516](#))
 - When `ALTER TABLE` was used to add a new `DATE` column with no explicit default value, `'0000-00-00'` was used as the default even if the SQL mode included the `NO_ZERO_DATE` mode to prohibit that value. A similar problem occurred for `DATETIME` columns. ([Bug#27507](#))
 - A race condition between `DROP TABLE` and `SHOW TABLE STATUS` could cause the latter to display incorrect information. ([Bug#27499](#))
 - Using a `TEXT` local variable in a stored routine in an expression such as `SET var = SUBSTRING(var, 3)` produced an incorrect result. ([Bug#27415](#))
 - Nested aggregate functions could be improperly evaluated. ([Bug#27363](#))
 - A stored function invocation in the `WHERE` clause was treated as a constant. ([Bug#27354](#))
 - Failure to allocate memory associated with `transaction_prealloc_size` could cause a server crash. ([Bug#27322](#))
 - `mysqldump` crashed if it got no data from `SHOW CREATE PROCEDURE` (for example, when trying to dump a routine defined by a different user and for which the current user had no privileges). Now it prints a comment to indicate the problem. It also returns an error, or continues if the `--force` option is given. ([Bug#27293](#))
 - The error message for error number `137` did not report which database/table combination reported the problem. ([Bug#27173](#))
 - `mysqlbinlog` produced different output with the `-R` option than without it. ([Bug#27171](#))
 - A large filesort could result in a division by zero error and a server crash. ([Bug#27119](#))
 - Times displayed by `SHOW PROFILE` were incorrectly associated with the profile entry one later than the correct one. ([Bug#27060](#))
 - Flow control optimization in stored routines could cause exception handlers to never return or execute incorrect logic. ([Bug#26977](#))
 - `SHOW PROFILE` hung if executed before enabling the `@@profiling` session variable. ([Bug#26938](#))
 - Binary logging of prepared statements could produce syntactically incorrect queries in the binary log, replacing some parameters with variable names rather than variable values. This could lead to incorrect results on replication slaves. ([Bug#26842](#), [Bug#12826](#))
 - `mysqldump` would not dump a view for which the `DEFINER` no longer exists. ([Bug#26817](#))
 - Connections from one `mysqld` server to another failed on Mac OS X, affecting replication and `FEDERATED` tables. ([Bug#26664](#))
- See also [Bug#29083](#)
- Creating a temporary table with `InnoDB` when using the one-file-per-table setting, and when the host filesystem for temporary tables was `tmpfs`, would cause an assertion within `mysqld`. This was due to the use of `O_DIRECT` when opening the temporary table file. ([Bug#26662](#))
 - `mysql_upgrade` did not detect failure of external commands that it runs. ([Bug#26639](#))
 - Some test suite files were missing from some MySQL-test packages. ([Bug#26609](#))
 - Aborting a statement on the master that applied to a non-transactional statement broke replication. The statement was written to the binary log but not completely executed on the master. Slaves receiving the statement executed it completely, resulting in loss of data synchrony. Now an error code is written to the error log so that the slaves stop without executing the aborted statement. (That is, replication stops, but synchrony to the point of the stop is preserved and you can investigate the problem.) ([Bug#26551](#))

- Statements within triggers ignored the value of the `low_priority_updates` system variable. (Bug#26162)
See also Bug#29963
- Index hints (`USE INDEX`, `IGNORE INDEX`, `FORCE INDEX`) cannot be used with `FULLTEXT` indexes, but were not being ignored. (Bug#25951)
- If `CREATE TABLE t1 LIKE t2` failed due to a full disk, an empty `t2.frm` file could be created but not removed. This file then caused subsequent attempts to create a table named `t2` to fail. This is easily corrected at the filesystem level by removing the `t2.frm` file manually, but now the server removes the file if the create operation does not complete successfully. (Bug#25761)
- Running `CHECK TABLE` concurrently with a `SELECT`, `INSERT` or other statement on Windows could corrupt a MyISAM table. (Bug#25712)
- On Windows, connection handlers did not properly decrement the server's thread count when exiting. (Bug#25621)
- `mysql_upgrade` did not pass a password to `mysqlcheck` if one was given. (Bug#25452)
- On Windows, `mysql_upgrade` was sensitive to lettercase of the names of some required components. (Bug#25405)
- For storage engines that allow the current auto-increment value to be set, using `ALTER TABLE ... ENGINE` to convert a table from one such storage engine to another caused loss of the current value. (For storage engines that do not support setting the value, it cannot be retained anyway when changing the storage engine.) (Bug#25262)
- Restoration of the default database after stored routine or trigger execution on a slave could cause replication to stop if the database no longer existed. (Bug#25082)
- Due to a race condition, executing `FLUSH PRIVILEGES` in one thread could cause brief table unavailability in other threads. (Bug#24988)
- Several math functions produced incorrect results for large unsigned values. `ROUND()` produced incorrect results or a crash for a large number-of-decimals argument. (Bug#24912)
- The result set of a query that used `WITH ROLLUP` and `DISTINCT` could lack some rollup rows (rows with `NULL` values for grouping attributes) if the `GROUP BY` list contained constant expressions. (Bug#24856)
- For queries that used `ORDER BY` with `InnoDB` tables, if the optimizer chose an index for accessing the table but found a covering index that enabled the `ORDER BY` to be skipped, no results were returned. (Bug#24778)
- Concurrent execution of `CREATE TABLE ... SELECT` and other statements involving the target table suffered from various race conditions, some of which might have led to deadlocks. (Bug#24738)
- On some Linux distributions where LinuxThreads and NPTL `glibc` versions both are available, statically built binaries can crash because the linker defaults to LinuxThreads when linking statically, but calls to external libraries (such as `libnss`) are resolved to NPTL versions. This cannot be worked around in the code, so instead if a crash occurs on such a binary/OS combination, print an error message that provides advice about how to fix the problem. (Bug#24611)
- An attempt to execute `CREATE TABLE ... SELECT` when a temporary table with the same name already existed led to the insertion of data into the temporary table and creation of an empty non-temporary table. (Bug#24508)
- The `MERGE` storage engine could return incorrect results when several index values that compare equality were present in an index (for example, `'gross'` and `'gross '`, which are considered equal but have different lengths). (Bug#24342)
- Some upgrade problems are detected and better error messages suggesting that `mysql_upgrade` be run are produced. (Bug#24248)
- Some views could not be created even when the user had the requisite privileges. (Bug#24040)
- Using `CAST()` to convert `DATETIME` values to numeric values did not work. (Bug#23656)
- The `AUTO_INCREMENT` value would not be correctly reported for `InnoDB` tables when using `SHOW CREATE TABLE` statement or `mysqldump` command. (Bug#23313)
- Implicit conversion of `9912101` to `DATE` did not match `CAST(9912101 AS DATE)`. (Bug#23093)
- Conversion errors could occur when constructing the condition for an `IN` predicate. The predicate was treated as if the affected column contains `NULL`, but if the `IN` predicate is inside `NOT`, incorrect results could be returned. (Bug#22855)
- `SELECT COUNT(*)` from a table containing a `DATETIME NOT NULL` column could produce spurious warnings with the `NO_ZERO_DATE` SQL mode enabled. (Bug#22824)

- When using transactions and replication, shutting down the master in the middle of a transaction would cause all slaves to stop replicating. ([Bug#22725](#))
- Using `SET GLOBAL` to change the `lc_time_names` system variable had no effect on new connections. ([Bug#22648](#))
- A multiple-table `UPDATE` could return an incorrect rows-matched value if, during insertion of rows into a temporary table, the table had to be converted from a `MEMORY` table to a `MyISAM` table. ([Bug#22364](#))
- `yaSSL` crashed on pre-Pentium Intel CPUs. ([Bug#21765](#))
- Linux binaries were unable to dump core after executing a `setuid()` call. ([Bug#21723](#))
- A slave that used `--master-ssl-cipher` could not connect to the master. ([Bug#21611](#))
- Quoted labels in stored routines were mishandled, rendering the routines unusable. ([Bug#21513](#))
- Stack overflow caused server crashes. ([Bug#21476](#))
- `CURDATE()` is less than `NOW()`, either when comparing `CURDATE()` directly (`CURDATE() < NOW()` is true) or when casting `CURDATE()` to `DATE` (`CAST(CURDATE() AS DATE) < NOW()` is true). However, storing `CURDATE()` in a `DATE` column and comparing `col_name < NOW()` incorrectly yielded false. This is fixed by comparing a `DATE` column as `DATETIME` for comparisons to a `DATETIME` constant. ([Bug#21103](#))
- `CREATE TABLE IF NOT EXISTS ... SELECT` caused a server crash if the target table already existed and had a `BEFORE INSERT` trigger. ([Bug#20903](#))
- Deadlock occurred for attempts to execute `CREATE TABLE IF NOT EXISTS ... SELECT` when `LOCK TABLES` had been used to acquire a read lock on the target table. ([Bug#20662](#), [Bug#15522](#))
- Changing a `utf8` column in an `InnoDB` table to a shorter length did not shorten the data values. ([Bug#20095](#))
- For dates with 4-digit year parts less than 200, an incorrect implicit conversion to add a century was applied for date arithmetic performed with `DATE_ADD()`, `DATE_SUB()`, `+ INTERVAL`, and `- INTERVAL`. (For example, `DATE_ADD('0050-01-01 00:00:00', INTERVAL 0 SECOND)` became `'2050-01-01 00:00:00'`.) ([Bug#18997](#))
- Using `CREATE TABLE LIKE ...` would raise an assertion when replicated to a slave. ([Bug#18950](#))
- Granting access privileges to an individual table where the database or table name contained an underscore would fail. ([Bug#18660](#))
- The `-lmtmalloc` library was removed from the output of `mysql_config` on Solaris, as it caused problems when building `DBD::mysql` (and possibly other applications) on that platform that tried to use `dlopen()` to access the client library. ([Bug#18322](#))
- The `check-cpu` script failed to detect AMD64 Turion processors correctly. ([Bug#17707](#))
- Trying to shut down the server following a failed `LOAD DATA INFILE` caused `mysqld` to crash. ([Bug#17233](#))
- The omission of leading zeros in dates could lead to erroneous results when these were compared with the output of certain date and time functions. ([Bug#16377](#))
- `INSERT...ON DUPLICATE KEY UPDATE` could cause `Error 1032: Can't find record in ...` for inserts into an `InnoDB` table unique index using key column prefixes with an underlying `utf8` string column. ([Bug#13191](#))
- Having the `EXECUTE` privilege for a routine in a database should make it possible to `USE` that database, but the server returned an error instead. This has been corrected. As a result of the change, `SHOW TABLES` for a database in which you have only the `EXECUTE` privilege returns an empty set rather than an error. ([Bug#9504](#))

D.1.6. Release Notes for MySQL Community Server 5.0.41 (01 May 2007)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.37.

Functionality added or changed:

- If a set function `S` with an outer reference `S(outer_ref)` cannot be aggregated in the outer query against which the outer reference has been resolved, MySQL interprets `S(outer_ref)` the same way that it would interpret `S(const)`. However, standard SQL requires throwing an error in this situation. An error now is thrown for such queries if the `ANSI SQL` mode is enabled. ([Bug#27348](#))

- Prefix lengths for columns in `SPATIAL` indexes are no longer displayed in `SHOW CREATE TABLE` output. `mysqldump` uses that statement, so if a table with `SPATIAL` indexes containing prefixed columns is dumped and reloaded, the index is created with no prefixes. (The full column width of each column is indexed.) (Bug#26794)
- The output of `mysql --xml` and `mysqldump --xml` now includes a valid XML namespace. (Bug#25946)
- If you use SSL for a client connection, you can tell the client not to authenticate the server certificate by specifying neither `--ssl-ca` nor `--ssl-capath`. The server still verifies the client according to any applicable requirements established via `GRANT` statements for the client, and it still uses any `--ssl-ca/--ssl-capath` values that were passed to server at startup time. (Bug#25309)
- The server now includes a timestamp in error messages that are logged as a result of unhandled signals (such as `mysqld got signal 11` messages). (Bug#24878)
- The syntax for index hints has been extended to enable explicit specification that the hint applies only to join processing. See Section 12.2.8.2, “Index Hint Syntax”.

This is a new fix for this issue, and replaces the fix made in MySQL 5.0.25 and reverted in 5.0.26. (Bug#21174)
- Added the `--secure-file-priv` option for `mysqld`, which limits the effect of the `LOAD_FILE()` function and the `LOAD DATA` and `SELECT ... INTO OUTFILE` statements to work only with files in a given directory. (Bug#18628)
- Binary distributions for some platforms did not include shared libraries; now shared libraries are shipped for all platforms except AIX 5.2 64-bit. *Exception:* The library for the `libmysqld` embedded server is not shared except on Windows. (Bug#16520, Bug#26767, Bug#13450)
- Added the `hostname` system variable, which the server sets at startup to the server hostname.
- The `mysql_create_system_tables` script was removed because `mysql_install_db` no longer uses it in MySQL 5.0.
- To satisfy different user requirements, we provide several servers. `mysqld` is an optimized server that is a smaller, faster binary. Each package now also includes `mysqld-debug`, which is compiled with debugging support but is otherwise configured identically to the non-debug server.

Bugs fixed:

- **Incompatible Change:** `INSERT DELAYED` statements are not supported for `MERGE` tables, but the `MERGE` storage engine was not rejecting such statements, resulting in table corruption. Applications previously using `INSERT DELAYED` into `MERGE` table will break when upgrading to versions with this fix. To avoid the problem, remove `DELAYED` from such statements. (Bug#26464)
- **MySQL Cluster:** `NDB` tables having `MEDIUMINT AUTO_INCREMENT` columns were not restored correctly by `ndb_restore`, causing spurious duplicate key errors. This issue did not affect `TINYINT`, `INT`, or `BIGINT` columns with `AUTO_INCREMENT`. (Bug#27775)
- **MySQL Cluster:** `NDB` tables with indexes whose names contained space characters were not restored correctly by `ndb_restore` (the index names were truncated). (Bug#27758)
- **MySQL Cluster:** Under certain rare circumstances performing a `DROP TABLE` or `TRUNCATE` on an `NDB` table could cause a node failure or forced cluster shutdown. (Bug#27581)
- **MySQL Cluster:** Memory usage of a `mysqld` process grew even while idle. (Bug#27560)
- **MySQL Cluster:** It was not possible to set `LockPagesInMainMemory` equal to 0. (Bug#27291)
- **MySQL Cluster:** A race condition could sometimes occur if the node acting as master failed while node IDs were still being allocated during startup. (Bug#27286)
- **MySQL Cluster:** When a data node was taking over as the master node, a race condition could sometimes occur as the node was assuming responsibility for handling of global checkpoints. (Bug#27283)
- **MySQL Cluster:** Error messages displayed when running in single user mode were inconsistent. (Bug#27021)
- **MySQL Cluster:** The failure of a data node while restarting could cause other data nodes to hang or crash. (Bug#27003)
- **MySQL Cluster:** On Solaris, the value of an `NDB` table column declared as `BIT(33)` was always displayed as 0. (Bug#26986)

- **MySQL Cluster:** `mysqld` processes would sometimes crash under high load. (Bug#26825)
- **MySQL Cluster:** The output from `ndb_restore --print_data` was incorrect for a backup made of a database containing tables with `TINYINT` or `SMALLINT` columns. (Bug#26740)
- **MySQL Cluster:** An inadvertent use of unaligned data caused `ndb_restore` to fail on some 64-bit platforms, including Sparc and Itanium-2. (Bug#26739)
- **MySQL Cluster:** An invalid pointer was returned following a `FSCLOSECONF` signal when accessing the REDO logs during a node restart or system restart. (Bug#26515)
- **MySQL Cluster:** The failure of a data node when restarting it with `--initial` could lead to failures of subsequent data node restarts. (Bug#26481)
- **MySQL Cluster:** Takeover for local checkpointing due to multiple failures of master nodes was sometimes incorrectly handled. (Bug#26457)
- **MySQL Cluster:** The `LockPagesInMainMemory` parameter was not read until after distributed communication had already started between cluster nodes. When the value of this parameter was `1`, this could sometimes result in data node failure due to missed heartbeats. (Bug#26454)
- **MySQL Cluster:** Under some circumstances, following the restart of a management node, all data nodes would connect to it normally, but some of them subsequently failed to log any events to the management node. (Bug#26293)
- **MySQL Cluster:** In some cases, `AFTER UPDATE` and `AFTER DELETE` triggers on `NDB` tables that referenced subject table did not see the results of operation which caused invocation of the trigger, but rather saw the row as it was prior to the update or delete operation.

This was most noticeable when an update operation used a subquery to obtain the rows to be updated. An example would be `UPDATE tbl1 SET col2 = val1 WHERE tbl1.col1 IN (SELECT col3 FROM tbl2 WHERE c4 = val2)` where there was an `AFTER UPDATE` trigger on table `tbl1`. In such cases, the trigger would fail to execute.

The problem occurred because the actual update or delete operations were deferred to be able to perform them later as one batch. The fix for this bug solves the problem by disabling this optimization for a given update or delete if the table has an `AFTER` trigger defined for this operation. (Bug#26242)

- **MySQL Cluster:** Condition pushdown did not work with prepared statements. (Bug#26225)
- **MySQL Cluster:** Joins on multiple tables containing `BLOB` columns could cause data nodes run out of memory, and to crash with the error `NDBOBJECTIDMAP: :EXPAND UNABLE TO EXPAND`. (Bug#26176)
- **MySQL Cluster:** After entering single user mode it was not possible to alter non-`NDB` tables on any SQL nodes other than the one having sole access to the cluster. (Bug#25275)
- **MySQL Cluster:** The management client command `node_id STATUS` displayed the message `Node node_id: not connected` when `node_id` was not the node ID of a data node.

Note

The `ALL STATUS` command in the cluster management client still displays status information for data nodes only. This is by design. See Section 19.7.2, “Commands in the MySQL Cluster Management Client”, for more information.

(Bug#21715)

- **MySQL Cluster:** The message `ERROR 0 IN READAUTOINCREMENTVALUE(): NO ERROR` was written to the error log whenever `SHOW TABLE STATUS` was performed on a Cluster table that did not have an `AUTO_INCREMENT` column. (Bug#21033)
- **MySQL Cluster:** Some values of `MaxNoOfTables` caused the error `JOB BUFFER CONGESTION` to occur. (Bug#19378)
- **MySQL Cluster:** When trying to create tables on an SQL node not connected to the cluster, a misleading error message `TABLE 'TBL_NAME' ALREADY EXISTS` was generated. The error now generated is `COULD NOT CONNECT TO STORAGE ENGINE`. (Bug#18676)
- **Replication:** Out-of-memory errors were not reported. Now they are written to the error log. (Bug#26844)
- **Cluster Replication:** Some queries that updated multiple tables were not backed up correctly. (Bug#27748)
- **Cluster API:** Using `NdbBlob::writeData()` to write data in the middle of an existing blob value (that is, updating the value) could overwrite some data past the end of the data to be changed. (Bug#27018)
- Some equi-joins containing a `WHERE` clause that included a `NOT IN` subquery caused a server crash. (Bug#27870)

- `SELECT DISTINCT` could return incorrect results if the select list contained duplicated columns. (Bug#27659)
- With `NO_AUTO_VALUE_ON_ZERO` SQL mode enabled, `LOAD DATA` operations could assign incorrect `AUTO_INCREMENT` values. (Bug#27586)
- Incorrect results could be returned for some queries that contained a select list expression with `IN` or `BETWEEN` together with an `ORDER BY` or `GROUP BY` on the same expression using `NOT IN` or `NOT BETWEEN`. (Bug#27532)
- Evaluation of an `IN ()` predicate containing a decimal-valued argument caused a server crash. (Bug#27513, Bug#27362, CVE-2007-2583)
- Profiling overhead was incurred even with profiling disabled. (Bug#27501)
- In out-of-memory conditions, the server might crash or otherwise not report an error to the Windows event log. (Bug#27490)
- Passing nested row expressions with different structures to an `IN` predicate caused a server crash. (Bug#27484)
- The `decimal.h` header file was incorrectly omitted from binary distributions. (Bug#27456)
- With `innodb_file_per_table` enabled, attempting to rename an `InnoDB` table to a non-existent database caused the server to exit. (Bug#27381)
- A subquery could get incorrect values for references to outer query columns when it contained aggregate functions that were aggregated in outer context. (Bug#27321)
- In a view, a column that was defined using a `GEOMETRY` function was treated as having the `LONGBLOB` data type rather than the `GEOMETRY` type. (Bug#27300)
- Queries containing subqueries with `COUNT (*)` aggregated in an outer context returned incorrect results. This happened only if the subquery did not contain any references to outer columns. (Bug#27257)
- `SELECT ... INTO OUTFILE` with a long `FIELDS ENCLOSED BY` value could crash the server. (Bug#27231)
- Use of an aggregate function from an outer context as an argument to `GROUP_CONCAT ()` caused a server crash. (Bug#27229)
- String truncation upon insertion into an integer or year column did not generate a warning (or an error in strict mode). (Bug#27176, Bug#26359)
- Storing `NULL` values in spatial fields caused excessive memory allocation and crashes on some systems. (Bug#27164)
- Row equalities in `WHERE` clauses could cause memory corruption. (Bug#27154)
- `GROUP BY` on a `ucs2` column caused a server crash when there was at least one empty string in the column. (Bug#27079)
- Duplicate members in `SET` or `ENUM` definitions were not detected. Now they result in a warning; if strict SQL mode is enabled, an error occurs instead. (Bug#27069)
- For `INSERT ... ON DUPLICATE KEY UPDATE` statements on tables containing `AUTO_INCREMENT` columns, `LAST_INSERT_ID ()` was reset to 0 if no rows were successfully inserted or changed. “Not changed” includes the case where a row was updated to its current values, but in that case, `LAST_INSERT_ID ()` should not be reset to 0. Now `LAST_INSERT_ID ()` is reset to 0 only if no rows were successfully inserted or touched, whether or not touched rows were changed. (Bug#27033)

See also Bug#27210, Bug#27006

This regression was introduced by Bug#19978

- `mysql_install_db` could terminate with an error after failing to determine that a system table already existed. (Bug#27022)
- `AFTER UPDATE` triggers were not activated by the update part of `INSERT ... ON DUPLICATE KEY UPDATE` statements. (Bug#27006)

See also Bug#27033, Bug#27210

This regression was introduced by Bug#19978

- In a `MEMORY` table, using a `BTREE` index to scan for updatable rows could lead to an infinite loop. (Bug#26996)
- Invalid optimization of pushdown conditions for queries where an outer join was guaranteed to read only one row from the outer table led to results with too few rows. (Bug#26963)

- Windows binaries contained no debug symbol file. Now `.map` and `.pdb` files are included in 32-bit builds for `mysqld-nt.exe`, `mysqld-debug.exe`, and `mysqlmanager.exe`. (Bug#26893)
- For `MERGE` tables defined on underlying tables that contained a short `VARCHAR` column (shorter than four characters), using `ALTER TABLE` on at least one but not all of the underlying tables caused the table definitions to be considered different from that of the `MERGE` table, even if the `ALTER TABLE` did not change the definition. (Bug#26881)
- Improved out-of-memory detection when sending logs from a master server to slaves, and log a message when allocation fails. (Bug#26837)
- For `InnoDB` tables having a clustered index that began with a `CHAR` or `VARCHAR` column, deleting a record and then inserting another before the deleted record was purged could result in table corruption. (Bug#26835)
- Use of a subquery containing `GROUP BY` and `WITH ROLLUP` caused a server crash. (Bug#26830)
- Duplicates were not properly identified among (potentially) long strings used as arguments for `GROUP_CONCAT(DISTINCT)`. (Bug#26815)
- `ALTER VIEW` requires the `CREATE VIEW` and `DROP` privileges for the view. However, if the view was created by another user, the server erroneously required the `SUPER` privilege. (Bug#26813)
- Added support for `--debugger=dbx` for `mysql-test-run.pl` and added support for `--debugger=devenv`, `--debugger=DevEnv`, and `--debugger=/path/to/devenv`. (Bug#26792)
- A result set column formed by concatenation of string literals was incomplete when the column was produced by a subquery in the `FROM` clause. (Bug#26738)
- SSL connections failed on Windows. (Bug#26678)
- When using the result of `SEC_TO_TIME()` for time value greater than 24 hours in an `ORDER BY` clause, either directly or through a column alias, the rows were sorted incorrectly as strings. (Bug#26672)
- Use of a subquery containing a `UNION` with an invalid `ORDER BY` clause caused a server crash. (Bug#26661)
- The range optimizer could cause the server to run out of memory. (Bug#26625)
- The range optimizer could consume a combinatorial amount of memory for certain classes of `WHERE` clauses. (Bug#26624)
- In some error messages, inconsistent format specifiers were used for the translations in different languages. `comp_err` (the error message compiler) now checks for mismatches. (Bug#26571)
- Views that used a scalar correlated subquery returned incorrect results. (Bug#26560)
- `UNHEX()` `IS NULL` comparisons failed when `UNHEX()` returned `NULL`. (Bug#26537)
- On 64-bit Windows, large timestamp values could be handled incorrectly. (Bug#26536)
- `mysqldump` could crash or exhibit incorrect behavior when some options were given very long values, such as `--fields-terminated-by="some very long string"`. The code has been cleaned up to remove a number of fixed-sized buffers and to be more careful about error conditions in memory allocation. (Bug#26346)
- If the server was started with `--skip-grant-tables`, Selecting from `INFORMATION_SCHEMA` tables causes a server crash. (Bug#26285)
- For some values of the position argument, the `INSERT()` function could insert a NUL byte into the result. (Bug#26281)
- For an `INSERT` statement that should fail due to a column with no default value not being assigned a value, the statement succeeded with no error if the column was assigned a value in an `ON DUPLICATE KEY UPDATE` clause, even if that clause was not used. (Bug#26261)
- `INSERT DELAYED` statements inserted incorrect values into `BIT` columns. (Bug#26238)
- The temporary file-creation code was cleaned up on Windows to improve server stability. (Bug#26233)
- For `MyISAM` tables, `COUNT(*)` could return an incorrect value if the `WHERE` clause compared an indexed `TEXT` column to the empty string (''). This happened if the column contained empty strings and also strings starting with control characters such as tab or newline. (Bug#26231)
- For `INSERT INTO ... SELECT` where index searches used column prefixes, insert errors could occur when key value type conversion was done. (Bug#26207)

- For `DELETE FROM tbl_name ORDER BY col_name` (with no `WHERE` or `LIMIT` clause), the server did not check whether `col_name` was a valid column in the table. (Bug#26186)
- `REPAIR TABLE ... USE_FRM` with an `ARCHIVE` table deleted all records from the table. (Bug#26138)
- A multiple-row delayed insert with an auto-increment column could cause duplicate entries to be created on the slave in a replication environment. (Bug#26116, Bug#25507)
- `BENCHMARK()` did not work correctly for expressions that produced a `DECIMAL` result. (Bug#26093)
- `LOAD DATA INFILE` sent an okay to the client before writing the binary log and committing the changes to the table had finished, thus violating ACID requirements. (Bug#26050)
- `X() IS NULL` and `Y() IS NULL` comparisons failed when `X()` and `Y()` returned `NULL`. (Bug#26038)
- `mysqldump` crashed for `MERGE` tables if the `--complete-insert (-c)` option was given. (Bug#25993)
- Indexes on `TEXT` columns were ignored when `ref` accesses were evaluated. (Bug#25971)
- If a thread previously serviced a connection that was killed, excessive memory and CPU use by the thread occurred if it later serviced a connection that had to wait for a table lock. (Bug#25966)
- Setting a column to `NOT NULL` with an `ON DELETE SET NULL` clause foreign key crashes the server. (Bug#25927)
- `VIEW` restrictions were applied to `SELECT` statements after a `CREATE VIEW` statement failed, as though the `CREATE` had succeeded. (Bug#25897)
- Several deficiencies in resolution of column names for `INSERT ... SELECT` statements were corrected. (Bug#25831)
- Inserting `utf8` data into a `TEXT` column that used a single-byte character set could result in spurious warnings about truncated data. (Bug#25815)
- On Windows, debug builds of `mysqld` could fail with heap assertions. (Bug#25765)
- In certain situations, `MATCH ... AGAINST` returned false hits for `NULL` values produced by `LEFT JOIN` when no full-text index was available. (Bug#25729)
- In certain cases it could happen that deleting a row corrupted an `RTREE` index. This affected indexes on spatial columns. (Bug#25673)
- When `RAND()` was called multiple times inside a stored procedure, the server did not write the correct random seed values to the binary log, resulting in incorrect replication. (Bug#25543)
- `OPTIMIZE TABLE` might fail on Windows when it attempts to rename a temporary file to the original name if the original file had been opened, resulting in loss of the `.MYD` file. (Bug#25521)
- For `SHOW ENGINE INNODB STATUS`, the `LATEST DEADLOCK INFORMATION` was not always cleared properly. (Bug#25494)
- `mysql_stmt_fetch()` did an invalid memory deallocation when used with the embedded server. (Bug#25492)
- `GRANT` statements were not replicated if the server was started with the `--replicate-ignore-table` or `--replicate-wild-ignore-table` option. (Bug#25482)
- Expressions involving `SUM()`, when used in an `ORDER BY` clause, could lead to out-of-order results. (Bug#25376)
- Use of a `GROUP BY` clause that referred to a stored function result together with `WITH ROLLUP` caused incorrect results. (Bug#25373)
- A stored procedure that made use of cursors failed when the procedure was invoked from a stored function. (Bug#25345)
- Difficult repair or optimization operations could cause an assertion failure, resulting in a server crash. (Bug#25289)
- On Windows, the server exhibited a file-handle leak after reaching the limit on the number of open file descriptors. (Bug#25222)
- The `REPEAT()` function did not allow a column name as the `count` parameter. (Bug#25197)
- Duplicating the usage of a user variable in a stored procedure or trigger would not be replicated correctly to the slave. (Bug#25167)
- A reference to a non-existent column in the `ORDER BY` clause of an `UPDATE ... ORDER BY` statement could cause a serv-

er crash. (Bug#25126)

- A view on a join is insertable for `INSERT` statements that store values into only one table of the join. However, inserts were being rejected if the inserted-into table was used in a self-join because MySQL incorrectly was considering the insert to modify multiple tables of the view. (Bug#25122)
- MySQL would not compile when configured using `--without-query-cache`. (Bug#25075)
- Duplicate entries were not assessed correctly in a `MEMORY` table with a `BTREE` primary key on a `utf8 ENUM` column. (Bug#24985)
- Selecting the result of `AVG()` within a `UNION` could produce incorrect values. (Bug#24791)
- `MBROverlaps()` returned incorrect values in some cases. (Bug#24563)
- Increasing the width of a `DECIMAL` column could cause column values to be changed. (Bug#24558)
- `IF(expr, unsigned_expr, unsigned_expr)` was evaluated to a signed result, not unsigned. This has been corrected. The fix also affects constructs of the form `IS [NOT] {TRUE|FALSE}`, which were transformed internally into `IF()` expressions that evaluated to a signed result.

For existing views that were defined using `IS [NOT] {TRUE|FALSE}` constructs, there is a related implication. The definitions of such views were stored using the `IF()` expression, not the original construct. This is manifest in that `SHOW CREATE VIEW` shows the transformed `IF()` expression, not the original one. Existing views will evaluate correctly after the fix, but if you want `SHOW CREATE VIEW` to display the original construct, you must drop the view and re-create it using its original definition. New views will retain the construct in their definition. (Bug#24532)

- A problem in handling of aggregate functions in subqueries caused predicates containing aggregate functions to be ignored during query execution. (Bug#24484)
- `DROP TRIGGER` statements would not be filtered on the slave when using the `replication-wild-do-table` option. (Bug#24478)
- For `INSERT ... ON DUPLICATE KEY UPDATE` statements where some `AUTO_INCREMENT` values were generated automatically for inserts and some rows were updated, one auto-generated value was lost per updated row, leading to faster exhaustion of the range of the `AUTO_INCREMENT` column.

Because the original problem can affect replication (different values on master and slave), it is recommended that the master and its slaves be upgraded to the current version. (Bug#24432)

- The test for the `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` option for `mysql_options()` was performed incorrectly. Also changed as a result of this bugfix: The `arg` option for the `mysql_options()` C API function was changed from `char *` to `void *`. (Bug#24121)
- A user-defined variable could be assigned an incorrect value if a temporary table was employed in obtaining the result of the query used to determine its value. (Bug#24010)
- Queries that used a temporary table for the outer query when evaluating a correlated subquery could return incorrect results. (Bug#23800)
- Replication between master and slave would infinitely retry binary log transmission where the `max_allowed_packet` on the master was larger than that on the slave if the size of the transfer was between these two values. (Bug#23775)
- On Windows, debug builds of `mysqlbinlog` could fail with a memory error. (Bug#23736)
- When using certain server SQL modes, the `mysql.proc` table was not created by `mysql_install_db`. (Bug#23669)
- The values displayed for the `InnoDB_row_lock_time`, `InnoDB_row_lock_time_avg`, and `InnoDB_row_lock_time_max` status variables were incorrect. (Bug#23666)
- `DOUBLE` values such as `20070202191048.000000` were being treated as illegal arguments by `WEEK()`. (Bug#23616)
- The server could crash if two or more threads initiated query cache resize operation at moments very close in time. (Bug#23527)
- `SHOW CREATE VIEW` qualified references to stored functions in the view definition with the function's database name, even when the database was the default database. This affected `mysqldump` (which uses `SHOW CREATE VIEW` to dump views) because the resulting dump file could not be used to reload the database into a different database. `SHOW CREATE VIEW` now suppresses the database name for references to functions in the default database. (Bug#23491)
- An `INTO OUTFILE` clause is allowed only for the final `SELECT` of a `UNION`, but this restriction was not being enforced cor-

rectly. (Bug#23345)

- `NOW()` returned the wrong value in statements executed at server startup with the `--init-file` option. (Bug#23240)
- With the `NO_AUTO_VALUE_ON_ZERO` SQL mode enabled, `LAST_INSERT_ID()` could return 0 after `INSERT ... ON DUPLICATE KEY UPDATE`. Additionally, the next rows inserted (by the same `INSERT`, or the following `INSERT` with or without `ON DUPLICATE KEY UPDATE`), would insert 0 for the auto-generated value if the value for the `AUTO_INCREMENT` column was `NULL` or missing. (Bug#23233)
- `SOUNDEX()` returned an invalid string for international characters in multi-byte character sets. (Bug#22638)
- When nesting stored procedures within a trigger on a table, a false dependency error was thrown when one of the nested procedures contained a `DROP TABLE` statement. (Bug#22580)
- Instance Manager did not remove the angel PID file on a clean shutdown. (Bug#22511)
- `EXPLAIN EXTENDED` did not show `WHERE` conditions that were optimized away. (Bug#22331)
- `COUNT(decimal_expr)` sometimes generated a spurious truncation warning. (Bug#21976)
- `IN ((subquery))`, `IN (((subquery)))`, and so forth, are equivalent to `IN (subquery)`, which is always interpreted as a table subquery (so that it is allowed to return more than one row). MySQL was treating the “over-parenthesized” subquery as a single-row subquery and rejecting it if it returned more than one row. This bug primarily affected automatically generated code (such as queries generated by Hibernate), because humans rarely write the over-parenthesized forms. (Bug#21904)
- An `INSERT` trigger invoking a stored routine that inserted into a table other than the one on which the trigger was defined would fail with a `TABLE '...' DOESN'T EXIST` referring to the second table when attempting to delete records from the first table. (Bug#21825)
- `InnoDB`: The first read statement, if served from the query cache, was not consistent with the `READ COMMITTED` isolation level. (Bug#21409)
- `CURDATE()` is less than `NOW()`, either when comparing `CURDATE()` directly (`CURDATE() < NOW()` is true) or when casting `CURDATE()` to `DATE` (`CAST(CURDATE() AS DATE) < NOW()` is true). However, storing `CURDATE()` in a `DATE` column and comparing `col_name < NOW()` incorrectly yielded false. This is fixed by comparing a `DATE` column as `DATETIME` for comparisons to a `DATETIME` constant. (Bug#21103)
- When a stored routine attempted to execute a statement accessing a nonexistent table, the error was not caught by the routine's exception handler. (Bug#20713, Bug#8407)
- For a stored procedure containing a `SELECT` statement that used a complicated join with an `ON` expression, the expression could be ignored during re-execution of the procedure, yielding an incorrect result. (Bug#20492)
- The conditions checked by the optimizer to allow use of indexes in `IN` predicate calculations were unnecessarily tight and were relaxed. (Bug#20420)
- When a `TIME_FORMAT()` expression was used as a column in a `GROUP BY` clause, the expression result was truncated. (Bug#20293)
- The creation of MySQL system tables was not checked for by `mysql-test-run.pl`. (Bug#20166)
- For index reads, the `BLACKHOLE` engine did not return end-of-file (which it must because `BLACKHOLE` tables contain no rows), causing some queries to crash. (Bug#19717)
- In some cases, the optimizer preferred a range or full index scan access method over lookup access methods when the latter were much cheaper. (Bug#19372)
- For `expr IN(value_list)`, the result could be incorrect if `BIGINT UNSIGNED` values were used for `expr` or in the value list. (Bug#19342)
- When attempting to call a stored procedure creating a table from a trigger on a table `tbl` in a database `db`, the trigger failed with `ERROR 1146 (42S02): TABLE 'DB.TBL' DOESN'T EXIST`. However, the actual reason that such a trigger fails is due to the fact that `CREATE TABLE` causes an implicit `COMMIT`, and so a trigger cannot invoke a stored routine containing this statement. A trigger which does so now fails with `ERROR 1422 (HY000): EXPLICIT OR IMPLICIT COMMIT IS NOT ALLOWED IN STORED FUNCTION OR TRIGGER`, which makes clear the reason for the trigger's failure. (Bug#18914)
- The update columns for `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` could be assigned incorrect values if a temporary table was used to evaluate the `SELECT`. (Bug#16630)
- Conversion of `DATETIME` values in numeric contexts sometimes did not produce a double (`YYYYMMDDHHMMSS.uuuuuu`)

value. (Bug#16546)

- For `SUBSTRING()` evaluation using a temporary table, when `SUBSTRING()` was used on a `LONGTEXT` column, the `max_length` metadata value of the result was incorrectly calculated and set to 0. Consequently, an empty string was returned instead of the correct result. (Bug#15757)
- Loading data using `LOAD DATA INFILE` may not replicate correctly (due to character set incompatibilities) if the `character_set_database` variable is set before the data is loaded. (Bug#15126)
- User defined variables used within stored procedures and triggers are not replicated correctly when operating in statement-based replication mode. (Bug#14914, Bug#20141)
- Local variables in stored routines or triggers, when declared as the `BIT` type, were interpreted as strings. (Bug#12976)
- `CONNECTION` is no longer treated as a reserved word. (Bug#12204)

D.1.7. Release Notes for MySQL Community Server 5.0.37 (27 February 2007)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.33.

Functionality added or changed:

- **Incompatible Change: MySQL Cluster:** The `LockPagesInMainMemory` configuration parameter has changed its type and possible values. For more information, see `LockPagesInMainMemory` .

Important

The values `true` and `false` are no longer accepted for this parameter. If you were using this parameter and had it set to `false` in a previous release, you must change it to `0`. If you had this parameter set to `true`, you should instead use `1` to obtain the same behavior as previously, or `2` to take advantage of new functionality introduced with this release, as described in the section cited above.

(Bug#25686)

- **Incompatible Change:** Previously, the `DATE_FORMAT()` function returned a binary string. Now it returns a string with a character set and collation given by `character_set_connection` and `collation_connection` so that it can return month and weekday names containing non-ASCII characters. (Bug#22646)
- **Important Change:** When using `MERGE` tables the definition of the `MERGE` table and the `MyISAM` tables are checked each time the tables are opened for access (including any `SELECT` or `INSERT` statement. Each table is compared for column order, types, sizes and associated. If there is a difference in any one of the tables then the statement will fail.
- Added the `Uptime_since_flush_status` status variable, which indicates the number of seconds since the most recent `FLUSH STATUS` statement. (From Jeremy Cole) (Bug#24822)
- Added the `SHOW PROFILES` and `SHOW PROFILE` statements to display statement profile data, and the accompanying `INFORMATION_SCHEMA.PROFILING` table. Profiling is controlled via the `profiling` and `profiling_history_size` session variables. see [Section 12.5.5.25, “SHOW PROFILES and SHOW PROFILE Syntax”](#), and [Section 22.17, “The INFORMATION_SCHEMA PROFILING Table”](#). (From Jeremy Cole)

The profiling feature is enabled via a new `--enable-profiling` option to `configure`. (Bug#24795)

- The `localhost` anonymous user account created during MySQL installation on Windows now has no global privileges. Formerly this account had all global privileges. For operations that require global privileges, the `root` account can be used instead. (Bug#24496)
- The `--skip-thread-priority` option now is enabled by default for binary Mac OS X distributions. Use of thread priorities degrades performance on Mac OS X. (Bug#18526)
- This is the last version for which MySQL-Max RPM distributions are available. (This change was already made for non-RPM binary distributions in 5.0.27.)
- The bundled yaSSL library was upgraded to version 1.5.8.
- Added the `--disable-grant-options` option to `configure`. If `configure` is run with this option, the `--bootstrap`, `--skip-grant-tables`, and `--init-file` options for `mysqld` are disabled and cannot be used. For Windows, the `configure.js` script recognizes the `DISABLE_GRANT_OPTIONS` flag, which has the same effect.

Bugs fixed:

- **Security Fix:** Using an `INFORMATION_SCHEMA` table with `ORDER BY` in a subquery could cause a server crash.
We would like to thank Oren Isacson of Flowgate Security Consulting and Stefan Streichsbier of SEC Consult for informing us of this problem. (Bug#24630, Bug#26556, CVE-2007-1420)
- **Incompatible Change:** For `ENUM` columns that had enumeration values containing commas, the commas were mapped to `0xff` internally. However, this rendered the commas indistinguishable from true `0xff` characters in the values. This no longer occurs. However, the fix requires that you dump and reload any tables that have `ENUM` columns containing any true `0xff` values. Dump the tables using `mysqldump` with the current server before upgrading from a version of MySQL 5.0 older than 5.0.36 to version 5.0.36 or newer. (Bug#24660)
- **Partitioning: MySQL Cluster:** A query with an `IN` clause against an `NDB` table employing explicit user-defined partitioning did not always return all matching rows. (Bug#25821)
- **MySQL Cluster:** It was not possible to create an `NDB` table with a key on two `VARCHAR` columns where both columns had a storage length in excess of 256. (Bug#25746)
- **MySQL Cluster:** Hosts in clusters with large numbers of nodes could experience excessive CPU usage while obtaining configuration data. (Bug#25711)
- **MySQL Cluster:** In some circumstances, shutting down the cluster could cause connected `mysqld` processes to crash. (Bug#25668)
- **MySQL Cluster:** Memory allocations for `TEXT` columns were calculated incorrectly, resulting in space being wasted and other issues. (Bug#25562)
- **MySQL Cluster:** The failure of a master node during a node restart could lead to a resource leak, causing later node failures. (Bug#25554)
- **MySQL Cluster:** An `UPDATE` using an `IN` clause on an `NDB` table on which there was a trigger caused `mysqld` to crash. (Bug#25522)
- **MySQL Cluster:** A node shutdown occurred if the master failed during a commit. (Bug#25364)
- **MySQL Cluster:** Creating a non-unique index with the `USING HASH` clause silently created an ordered index instead of issuing a warning. (Bug#24820)
- **MySQL Cluster:** The `ndb_size.tmp` file (necessary for using the `ndb_size.pl` script) was missing from binary distributions. (Bug#24191)
- **MySQL Cluster:** When a data node was shut down using the management client `STOP` command, a connection event (`NDB_LE_Connected`) was logged instead of a disconnection event (`NDB_LE_Disconnected`). (Bug#22773)
- **MySQL Cluster:** The management server did not handle logging of node shutdown events correctly in certain cases. (Bug#22013)
- **MySQL Cluster:** `SELECT` statements with a `BLOB` or `TEXT` column in the selected column list and a `WHERE` condition including a primary key lookup on a `VARCHAR` primary key produced empty result sets. (Bug#19956)
- **Cluster API:** Deletion of an `Ndb_cluster_connection` object took a very long time. (Bug#25487)
- **Cluster API:** Invoking the `NdbTransaction::execute()` method using execution type `Commit` and abort option `AO_IgnoreError` could lead to a crash of the transaction coordinator (`DBTC`). (Bug#25090)
- **Cluster API:** A unique index lookup on a non-existent tuple could lead to a data node timeout (error 4012). (Bug#25059)
- **Cluster API:** `libndbclient.so` was not versioned. (Bug#13522)
- Using `ORDER BY` or `GROUP BY` could yield different results when selecting from a view and selecting from the underlying table. (Bug#26209)
- `DISTINCT` queries that were executed using a loose scan for an `InnoDB` table that had been emptied caused a server crash. (Bug#26159)
- A `WHERE` clause that used `BETWEEN` for `DATETIME` values could be treated differently for a `SELECT` and a view defined as that `SELECT`. (Bug#26124)
- Collation for `LEFT JOIN` comparisons could be evaluated incorrectly, leading to improper query results. (Bug#26017)

- The `WITH CHECK OPTION` clause for views was ignored for updates of multiple-table views when the updates could not be performed on fly and the rows to update had to be put into temporary tables first. ([Bug#25931](#))
- `LOAD DATA INFILE` did not work with pipes. ([Bug#25807](#))
- The `SEC_TO_TIME()` and `QUARTER()` functions sometimes did not handle `NULL` values correctly. ([Bug#25643](#))
- The `InnoDB` parser sometimes did not account for null bytes, causing spurious failure of some queries. ([Bug#25596](#))
- View definitions that used the `!` operator were treated as containing the `NOT` operator, which has a different precedence and can produce different results. . ([Bug#25580](#))
- An error in the name resolution of nested `JOIN ... USING` constructs was corrected. ([Bug#25575](#))
- `GROUP BY` and `DISTINCT` did not group `NULL` values for columns that have a `UNIQUE` index. . ([Bug#25551](#))
- The `--with-readline` option for `configure` did not work for commercial source packages, but no error message was printed to that effect. Now a message is printed. ([Bug#25530](#))
- `mysql_stmt_fetch()` did an invalid memory deallocation when used with the embedded server. ([Bug#25492](#))
- Referencing an ambiguous column alias in an expression in the `ORDER BY` clause of a query caused the server to crash. ([Bug#25427](#))
- A `yaSSL` program named `test` was installed, causing conflicts with the `test` system utility. It is no longer installed. ([Bug#25417](#))
- For a `UNIQUE` index containing many `NULL` values, the optimizer would prefer the index for `col IS NULL` conditions over other more selective indexes. . ([Bug#25407](#))
- An `AFTER UPDATE` trigger on an `InnoDB` table with a composite primary key caused the server to crash. ([Bug#25398](#))
- Passing a `NULL` value to a user-defined function from within a stored procedure crashes the server. ([Bug#25382](#))
- `pererror` crashed on some platforms due to failure to handle a `NULL` pointer. ([Bug#25344](#))
- `mysql.server stop` timed out too quickly (35 seconds) waiting for the server to exit. Now it waits up to 15 minutes, to ensure that the server exits. ([Bug#25341](#))
- A query that contained an `EXIST` subquery with a `UNION` over correlated and uncorrelated `SELECT` queries could cause the server to crash. ([Bug#25219](#))
- `mysql_kill()` caused a server crash when used on an SSL connection. ([Bug#25203](#))
- `yaSSL` was sensitive to the presence of whitespace at the ends of lines in PEM-encoded certificates, causing a server crash. ([Bug#25189](#))
- A query with `ORDER BY` and `GROUP BY` clauses where the `ORDER BY` clause had more elements than the `GROUP BY` clause caused a memory overrun leading to a crash of the server. ([Bug#25172](#))
- Use of `ON DUPLICATE KEY UPDATE` defeated the usual restriction against inserting into a join-based view unless only one of the underlying tables is used. ([Bug#25123](#))
- Using a view in combination with a `USING` clause caused column aliases to be ignored. ([Bug#25106](#))
- A multiple-table `DELETE QUICK` could sometimes cause one of the affected tables to become corrupted. ([Bug#25048](#))
- `ALTER TABLE ... ENABLE KEYS` acquired a global lock, preventing concurrent execution of other statements that use tables. . ([Bug#25044](#))
- An assertion failed incorrectly for prepared statements that contained a single-row uncorrelated subquery that was used as an argument of the `IS NULL` predicate. ([Bug#25027](#))
- A return value of `-1` from user-defined handlers was not handled well and could result in conflicts with server code. ([Bug#24987](#))
- Accessing a fixed record format table with a crashed key definition results in server/`myisamchk` segmentation fault. ([Bug#24855](#))
- `mysqld_multi` and `mysqlaccess` looked for option files in `/etc` even if the `--sysconfdir` option for `configure` had been given to specify a different directory. ([Bug#24780](#))

- If there was insufficient memory available to `mysqld`, this could sometimes cause the server to hang during startup. (Bug#24751)
- Optimizations that are legal only for subqueries without tables and `WHERE` conditions were applied for any subquery without tables. (Bug#24670)
- If an `ORDER BY` or `GROUP BY` list included a constant expression being optimized away and, at the same time, containing single-row subselects that returned more than one row, no error was reported. If a query required sorting by expressions containing single-row subselects that returned more than one row, execution of the query could cause a server crash. (Bug#24653)
- For `ALTER TABLE`, using `ORDER BY expression` could cause a server crash. Now the `ORDER BY` clause allows only column names to be specified as sort criteria (which was the only documented syntax, anyway). (Bug#24562)
- A workaround was implemented to avoid a race condition in the NPTL `pthread_exit()` implementation. (Bug#24507)
- `mysqltest` crashed with a stack overflow. (Bug#24498)
- Within stored routines or prepared statements, inconsistent results occurred with multiple use of `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` when the `ON DUPLICATE KEY UPDATE` clause erroneously tried to assign a value to a column mentioned only in its `SELECT` part. (Bug#24491)
- Expressions of the form `(a, b) IN (SELECT a, MIN(b) FROM t GROUP BY a)` could produce incorrect results when column `a` of table `t` contained `NULL` values while column `b` did not. (Bug#24420)
- If a prepared statement accessed a view, access to the tables listed in the query after that view was checked in the security context of the view. (Bug#24404)
- Attempts to access a `MyISAM` table with a corrupt column definition caused a server crash. (Bug#24401)
- When opening a corrupted `.frm` file during a query, the server crashes. (Bug#24358)
- Some joins in which one of the joined tables was a view could return erroneous results or crash the server. (Bug#24345)
- A view was not handled correctly if the `SELECT` part contained “\z”. (Bug#24293)
- A query using `WHERE unsigned_column NOT IN ('negative_value')` could cause the server to crash. (Bug#24261)
- When `SET PASSWORD` was written to the binary log double quotes were included in the statement. If the slave was running in with the server SQL mode set to `ANSI_QUOTES`, then the event failed, which halted the replication process. (Bug#24158)
- Expressions of the form `(a, b) IN (SELECT c, d ...)` could produce incorrect results if `a`, `b`, or both were `NULL`. (Bug#24127)
- A `FETCH` statement using a cursor on a table which was not in the table cache could sometimes cause the server to crash. (Bug#24117)
- Queries that evaluate `NULL IN (SELECT ... UNION SELECT ...)` could produce an incorrect result (`FALSE` instead of `NULL`). (Bug#24085)
- Hebrew-to-Unicode conversion failed for some characters. Definitions for the following Hebrew characters (as specified by the ISO/IEC 8859-8:1999) were added: LEFT-TO-RIGHT MARK (LRM), RIGHT-TO-LEFT MARK (RLM) (Bug#24037)
- Some `UPDATE` statements were slower than in previous versions when the search key could not be converted to a valid value for the type of the search column. (Bug#24035)
- `ISNULL(DATE(NULL))` and `ISNULL(CAST(NULL AS DATE))` erroneously returned false. (Bug#23938)
- Within a stored routine, accessing a declared routine variable with `PROCEDURE ANALYSE()` caused a server crash. (Bug#23782)
- When reading from the standard input on Windows, `mysqlbinlog` opened the input in text mode rather than binary mode and consequently misinterpreted some characters such as Control-Z. (Bug#23735)
- A stored procedure, executed from a connection using a binary character set, and which wrote multibyte data, would write incorrectly escaped entries to the binary log. This caused syntax errors, and caused replication to fail. (Bug#23619, Bug#24492)
- `OPTIMIZE TABLE` tried to sort R-tree indexes such as spatial indexes, although this is not possible (see Section 12.5.2.5, “`OPTIMIZE TABLE` Syntax”). (Bug#23578)
- For an `InnoDB` table with any `ON DELETE` trigger, `TRUNCATE TABLE` mapped to `DELETE` and activated triggers. Now a

fast truncation occurs and triggers are not activated. . (Bug#23556)

- The row count for `MyISAM` tables was not updated properly, causing `SHOW TABLE STATUS` to report incorrect values. (Bug#23526)
- User-defined variables could consume excess memory, leading to a crash caused by the exhaustion of resources available to the `MEMORY` storage engine, due to the fact that this engine is used by MySQL for variable storage and intermediate results of `GROUP BY` queries. Where `SET` had been used, such a condition could instead give rise to the misleading error message `YOU MAY ONLY USE CONSTANT EXPRESSIONS WITH SET`, rather than `OUT OF MEMORY (NEEDED NNNNNN BYTES)`. (Bug#23443)
- With `ONLY_FULL_GROUP_BY` enabled, the server was too strict: Some expressions involving only aggregate values were rejected as non-aggregate (for example, `MAX(a) - MIN(a)`). (Bug#23417)
- The arguments to the `ENCODE()` and the `DECODE()` functions were not printed correctly, causing problems in the output of `EXPLAIN EXTENDED` and in view definitions. (Bug#23409)
- A table created with the `ROW_FORMAT = FIXED` table option lost the option if an index was added or dropped with `CREATE INDEX` or `DROP INDEX`. (Bug#23404)
- A deadlock could occur, with the server hanging on `Closing tables`, with a sufficient number of concurrent `INSERT DELAYED`, `FLUSH TABLES`, and `ALTER TABLE` operations. (Bug#23312)
- Some queries against `INFORMATION_SCHEMA` that used subqueries failed. . (Bug#23299)
- `readline` detection did not work correctly on NetBSD. (Bug#23293)
- If there was insufficient memory to store or update a blob record in a `MyISAM` table then the table will be marked as crashed. (Bug#23196)
- `LAST_INSERT_ID()` was not reset to 0 if `INSERT ... SELECT` inserted no rows. (Bug#23170)
- A compressed `MyISAM` table that became corrupted could crash `myisamchk` and possibly the MySQL Server. (Bug#23139)
- The number of `setsockopt()` calls performed for reads and writes to the network socket was reduced to decrease system call overhead. (Bug#22943)
- `mysql_upgrade` failed when called with a `basedir` pathname containing spaces. (Bug#22801)
- `SET lc_time_names = value` allowed only exact literal values, not expression values. (Bug#22647)
- Changes to the `lc_time_names` system variable were not replicated. (Bug#22645)
- The `STDDEV()` function returned a positive value for data sets consisting of a single value. (Bug#22555)
- Storing values specified as hexadecimal values 64 or more bits long in `BIT(64)`, `BIGINT`, or `BIGINT UNSIGNED` columns did not raise any warning or error if the value was out of range. (Bug#22533)
- `SHOW COLUMNS` reported some `NOT NULL` columns as `NULL`. (Bug#22377)
- Type conversion errors during formation of index search conditions were not correctly checked, leading to incorrect query results. (Bug#22344)
- Changing the value of `MI_KEY_BLOCK_LENGTH` in `myisam.h` and recompiling MySQL resulted in a `myisamchk` that saw existing `MyISAM` tables as corrupt. (Bug#22119)
- A crash of the MySQL Server could occur when unpacking a `BLOB` column from a row in a corrupted `MyISAM` table. This could happen when trying to repair a table using either `REPAIR TABLE` or `myisamchk`; it could also happen when trying to access such a “broken” row using statements like `SELECT` if the table was not marked as crashed. (Bug#22053)
- The code for generating `USE` statements for binary logging of `CREATE PROCEDURE` statements resulted in confusing output from `mysqlbinlog` for `DROP PROCEDURE` statements. (Bug#22043)
- For the `IF()` and `COALESCE()` function and `CASE` expressions, large unsigned integer values could be mishandled and result in warnings. (Bug#22026)
- SSL connections could hang at connection shutdown. (Bug#21781, Bug#24148)
- The `FEDERATED` storage engine did not support the `euckr` character set. (Bug#21556)
- When updating a table that used a `JOIN` of the table itself (for example, when building trees) and the table was modified on one side of the expression, the table would either be reported as crashed or the wrong rows in the table would be updated.

[Bug#21310](#))

- `mysqld_error.h` was not installed when only the client libraries were built. ([Bug#21265](#))
- **InnoDB**: During a restart of the MySQL Server that followed the creation of a temporary table using the **InnoDB** storage engine, MySQL failed to clean up in such a way that **InnoDB** still attempted to find the files associated with such tables. ([Bug#20867](#))
- Inserting **DEFAULT** into a column with no default value could result in garbage in the column. Now the same result occurs as when inserting **NULL** into a **NOT NULL** column. ([Bug#20691](#))
- A stored routine containing semicolon in its body could not be reloaded from a dump of a binary log. ([Bug#20396](#))
- **SELECT ... FOR UPDATE**, **SELECT ... LOCK IN SHARE MODE**, **DELETE**, and **UPDATE** statements executed using a full table scan were not releasing locks on rows that did not satisfy the **WHERE** condition. ([Bug#20390](#))
- On Windows, if the server was installed as a service, it did not auto-detect the location of the data directory. ([Bug#20376](#))
- The `BUILD/check-cpu` script did not recognize Celeron processors. ([Bug#20061](#))
- If a duplicate key value was present in the table, **INSERT ... ON DUPLICATE KEY UPDATE** reported a row count indicating that a record was updated, even when no record actually changed due to the old and new values being the same. Now it reports a row count of zero. ([Bug#19978](#))

See also [Bug#27006](#), [Bug#27033](#), [Bug#27210](#)

- For **SET**, **SELECT**, and **DO** statements that invoked a stored function from a database other than the default database, the function invocation could fail to be replicated. ([Bug#19725](#))
- **ORDER BY** values of the **DOUBLE** or **DECIMAL** types could change the result returned by a query. ([Bug#19690](#))
- The `readline` library wrote to uninitialized memory, causing `mysql` to crash. ([Bug#19474](#))
- `mysqltest` incorrectly tried to retrieve result sets for some queries where no result set was available. ([Bug#19410](#))
- Use of already freed memory caused SSL connections to hang forever. ([Bug#19209](#))
- Some **CASE** statements inside stored routines could lead to excessive resource usage or a crash of the server. ([Bug#19194](#), [Bug#24854](#))
- Instance Manager could crash during shutdown. ([Bug#19044](#))
- The server might fail to use an appropriate index for **DELETE** when **ORDER BY**, **LIMIT**, and a non-restricting **WHERE** are present. ([Bug#17711](#))
- No warning was issued for use of the **DATA DIRECTORY** or **INDEX DIRECTORY** table options on a platform that does not support them. ([Bug#17498](#))
- The **FEDERATED** storage engine did not support the `utf8` character set. ([Bug#17044](#))
- The optimizer removes expressions from **GROUP BY** and **DISTINCT** clauses if they happen to participate in `expression = constant` predicates of the **WHERE** clause, the idea being that, if the expression is equal to a constant, then it cannot take on multiple values. However, for predicates where the expression and the constant item are of different result types (for example, when a string column is compared to 0), this is not valid, and can lead to invalid results in such cases. The optimizer now performs an additional check of the result types of the expression and the constant; if their types differ, then the expression is not removed from the **GROUP BY** list. ([Bug#15881](#))
- When a prepared statement failed during the prepare operation, the error code was not cleared when it was reused, even if the subsequent use was successful. ([Bug#15518](#))
- Dropping a user-defined function sometimes did not remove the UDF entry from the `mysql.proc` table. ([Bug#15439](#))
- Inserting a row into a table without specifying a value for a **BINARY(N) NOT NULL** column caused the column to be set to spaces, not zeroes. ([Bug#14171](#))
- On Windows, the `SLEEP()` function could sleep too long, especially after a change to the system clock. ([Bug#14094](#), [Bug#24686](#), [Bug#17635](#))
- `mysqldump --order-by-primary` failed if the primary key name was an identifier that required quoting. ([Bug#13926](#))
- To enable installation of MySQL RPMs on Linux systems running RHEL 4 (which includes SE-Linux) additional information

was provided to specify some actions that are allowed to the MySQL binaries. (Bug#12676)

- The presence of `ORDER BY` in a view definition prevented the `MERGE` algorithm from being used to resolve the view even if nothing else in the definition required the `TEMPTABLE` algorithm. (Bug#12122)
- If a slave server closed its relay log (for example, due to an error during log rotation), the I/O thread did not recognize this and still tried to write to the log, causing a server crash. (Bug#10798)
- The internal functions for table preparation, creation, and alteration were not re-execution friendly, causing problems in code that: repeatedly altered a table; repeatedly created and dropped a table; opened and closed a cursor on a table, altered the table, and then reopened the cursor; used `ALTER TABLE` to change a table's current `AUTO_INCREMENT` value; created indexes on `utf8` columns.

Re-execution of `CREATE DATABASE`, `CREATE TABLE`, and `ALTER TABLE` statements in stored routines or as prepared statements also caused incorrect results or crashes. (Bug#4968, Bug#6895, Bug#19182, Bug#19733, Bug#22060, Bug#24879)

D.1.8. Release Notes for MySQL Community Server 5.0.33 (09 January 2007)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.27.

Note

This version of MySQL Community Server has been released as a source tarball only; there are no binaries built by MySQL.

Functionality added or changed:

- **Incompatible Change:** `InnoDB` rolls back only the last statement on a transaction timeout. A new option, `--innodb_rollback_on_timeout`, causes `InnoDB` to abort and roll back the entire transaction if a transaction timeout occurs (the same behavior as in MySQL 5.0.13 and earlier). (Bug#24200)
- **Incompatible Change:** The `prepared_stmt_count` system variable has been converted to the `Prepared_stmt_count` global status variable (viewable with the `SHOW GLOBAL STATUS` statement). (Bug#23159)
- **MySQL Cluster:** Setting the configuration parameter `LockPagesInMainMemory` had no effect. (Bug#24461)
- **MySQL Cluster:** The `ndb_config` utility now accepts `-c` as a short form of the `--ndb-connectstring` option. (Bug#22295)
- **MySQL Cluster:** Added the `--bind-address` option for `ndbd`. This allows a data node process to be bound to a specific network interface. (Bug#22195)
- **MySQL Cluster:** It is now possible to create a unique hashed index on a column that is not defined as `NOT NULL`.

Note

This change applies only to tables using the `NDB` storage engine.

Unique indexes on columns in `NDB` tables do not store null values because they are mapped to primary keys in an internal index table (and primary keys cannot contain nulls).

Normally, an additional ordered index is created when one creates unique indexes on `NDB` table columns; this can be used to search for `NULL` values. However, if `USING HASH` is specified when such an index is created, no ordered index is created.

The reason for permitting unique hash indexes with null values is that, in some cases, the user wants to save space if a large number of records are pre-allocated but not fully initialized. This also assumes that the user will *not* try to search for null values. Since MySQL does not support indexes that are not allowed to be searched in some cases, the `NDB` storage engine uses a full table scan with pushed conditions for the referenced index columns to return the correct result.

A warning is returned if one creates a unique nullable hash index, since the query optimizer should be provided a hint not to use it with `NULL` values if this can be avoided. (Bug#21507)

- **MySQL Cluster:** The `Ndb_number_of_storage_nodes` system variable was renamed to `Ndb_number_of_data_nodes`. (Bug#20848)
- **MySQL Cluster:** The `HELP` command in the Cluster management client now provides command-specific help. For example, `HELP RESTART` in `ndb_mgm` provides detailed information about the `RESTART` command. (Bug#19620)

- `DROP TRIGGER` now supports an `IF EXISTS` clause. (Bug#23703)
- The `Com_create_user` status variable was added (for counting `CREATE USER` statements). (Bug#22958)
- The `--memlock` option relies on system calls that are unreliable on some operating systems. If a crash occurs, the server now checks whether `--memlock` was specified and if so issues some information about possible workarounds. (Bug#22860)
- If the user specified the server options `--max-connections=N` or `--table-open-cache=M`, a warning would be given in some cases that some values were recalculated, with the result that `--table-open-cache` could be assigned greater value.

In such cases, both the warning and the increase in the `--table-open-cache` value were completely harmless. Note also that it is not possible for the MySQL Server to predict or to control limitations on the maximum number of open files, since this is determined by the operating system.

The value of `--table-open-cache` is no longer increased automatically, and a warning is now given only if some values had to be decreased due to operating system limits. (Bug#21915)

- For the `CALL` statement, stored procedures that take no arguments now can be invoked without parentheses. That is, `CALL p()` and `CALL p` are equivalent. (Bug#21462)
- `mysql_upgrade` now passes all the parameters specified on the command line to both `mysqlcheck` and `mysql` using the `upgrade_defaults` file. (Bug#20100)
- `SHOW STATUS` is no longer logged to the slow query log. (Bug#19764)
- `mysqldump --single-transaction` now uses `START TRANSACTION /*!40100 WITH CONSISTENT SNAPSHOT */` rather than `BEGIN` to start a transaction, so that a consistent snapshot will be used on those servers that support it. (Bug#19660)
- The bundled yaSSL library was upgraded to version 1.5.0.

Bugs fixed:

- **MySQL Cluster:** The failure of a data node failure during a schema operation could lead to additional node failures. (Bug#24752)
- **MySQL Cluster:** A committed read could be attempted before a data node had time to connect, causing a timeout error. (Bug#24717)
- **MySQL Cluster:** Sudden disconnection of an SQL or data node could lead to shutdown of data nodes with the error `FAILED NDBREQUIRE`. (Bug#24447)
- **MySQL Cluster:** `ndb_config` failed when trying to use 2 management servers and node IDs. (Bug#23887)
- **MySQL Cluster:** Backup of a cluster failed if there were any tables with 128 or more columns. (Bug#23502)
- **MySQL Cluster:** Cluster backups failed when there were more than 2048 schema objects in the cluster. (Bug#23499)
- **MySQL Cluster:** The management client command `ALL DUMP 1000` would cause the cluster to crash if data nodes were connected to the cluster but not yet fully started. (Bug#23203)
- **MySQL Cluster:** `INSERT ... ON DUPLICATE KEY UPDATE` on an NDB table could lead to deadlocks and memory leaks. (Bug#23200)
- **MySQL Cluster:** (NDB API): Inactivity timeouts for scans were not correctly handled. (Bug#23107)
- **MySQL Cluster:** If a node restart could not be performed from the REDO log, no node takeover took place. This could cause partitions to be left empty during a system restart. (Bug#22893)
- **MySQL Cluster:** Multiple node restarts in rapid succession could cause a system restart to fail, or induce a race condition. (Bug#22892, Bug#23210)
- **MySQL Cluster:** (NDB API): Attempting to read a nonexistent tuple using `Commit` mode for `NdbTransaction::execute()` caused node failures. (Bug#22672)
- **MySQL Cluster:** The `--help` output from NDB binaries did not include file-related options. (Bug#21994)
- **MySQL Cluster:** (NDB API): Scans closed before being executed were still placed in the send queue. (Bug#21941)

- **MySQL Cluster:** A scan timeout returned Error 4028 (`NODE FAILURE CAUSED ABORT OF TRANSACTION`) instead of Error 4008 (`NODE FAILURE CAUSED ABORT OF TRANSACTION...`). ([Bug#21799](#))
- **MySQL Cluster:** The node recovery algorithm was missing a version check for tables in the `ALTER_TABLE_COMMITTED` state (as opposed to the `TABLE_ADD_COMMITTED` state, which has the version check). This could cause inconsistent schemas across nodes following node recovery. ([Bug#21756](#))
- **MySQL Cluster:** The output for the `--help` option used with NDB executable programs (such as `ndbd`, `ndb_mgm`, `ndb_restore`, `ndb_config`, and others mentioned in [Section 19.10, “Cluster Utility Programs”](#)) referred to the `Ndb.cfg` file, instead of to `my.cnf`. ([Bug#21585](#))
- **MySQL Cluster:** Partition distribution keys were updated only for the primary and starting replicas during node recovery. This could lead to node failure recovery for clusters having an odd number of replicas.

Note

We recommend values for `NumberOfReplicas` that are even powers of 2, for best results.

([Bug#21535](#))

- **MySQL Cluster:** The `ndb_mgm` management client did not set the exit status on errors, always returning 0 instead. ([Bug#21530](#))
- **MySQL Cluster:** Cluster logs were not rotated following the first rotation cycle. ([Bug#21345](#))
- **MySQL Cluster:** When inserting a row into an NDB table with a duplicate value for a non-primary unique key, the error issued would reference the wrong key. ([Bug#21072](#))
- **MySQL Cluster:** Condition pushdown did not work correctly with `DATETIME` columns. ([Bug#21056](#))
- **MySQL Cluster:** Under some circumstances, local checkpointing would hang, keeping any unstarted nodes from being started. ([Bug#20895](#))
- **MySQL Cluster:** Using an invalid node ID with the management client `STOP` command could cause `ndb_mgm` to hang. ([Bug#20575](#))
- **MySQL Cluster:** Data nodes added while the cluster was running in single user mode were all assigned node ID 0, which could later cause multiple node failures. Adding nodes while in single user mode is no longer possible. ([Bug#20395](#))
- **MySQL Cluster:** In some cases where `SELECT COUNT(*)` from an NDB table should have yielded an error, `MAX_INT` was returned instead. ([Bug#19914](#))
- **MySQL Cluster:** Following the restart of a management node, the Cluster management client did not automatically reconnect. ([Bug#19873](#))
- **MySQL Cluster:** Error messages given when trying to make online changes to parameters such as `NoOfReplicas` that can only be changed via a complete shutdown and restart of the cluster did not indicate the true nature of the problem. ([Bug#19787](#))
- **MySQL Cluster:** `ndb_restore` did not always make clear that it had recovered successfully from temporary errors while restoring a cluster backup. ([Bug#19651](#))
- **MySQL Cluster:** In rare situations with resource shortages, a crash could result from insufficient `IndexScanOperations`. ([Bug#19198](#))
- **MySQL Cluster:** `ndb_mgm -e show | head` would hang after displaying the first 10 lines of output. ([Bug#19047](#))
- **MySQL Cluster:** The error returned by the cluster when too many nodes were defined did not make clear the nature of the problem. ([Bug#19045](#))
- **MySQL Cluster:** A unique constraint violation was not ignored by an `UPDATE IGNORE` statement when the constraint violation occurred on a non-primary key. ([Bug#18487](#), [Bug#24303](#))
- **MySQL Cluster:** The `ndb_config` utility did not perform host lookups correctly when using the `--host` option ([Bug#17582](#))
- **MySQL Cluster:** A problem with takeover during a system restart caused ordered indexes to be rebuilt incorrectly. ([Bug#15303](#))
- **Cluster API:** Using `BIT` values with any of the comparison methods of the `NdbScanFilter` class caused data nodes to fail. ([Bug#24503](#))

- **Cluster API:** Some MGM API function calls could yield incorrect return values in certain cases where the cluster was operating under a very high load, or experienced timeouts in inter-node communications. (Bug#24011)
- **Cluster API:** The `NdbOperation::getBlobHandle()` method, when called with the name of a nonexistent column, caused a segmentation fault. (Bug#21036)
- **Cluster API:** When multiple processes or threads in parallel performed the same ordered scan with exclusive lock and updated the retrieved records, the scan could skip some records, which as a result were not updated. (Bug#20446)
- The `REPEAT()` function could return `NULL` when passed a column for the count argument. (Bug#24947)
- `mysql_upgrade` failed if the `--password` (or `-p`) option was given. (Bug#24896)
- With `innodb_file_per_table` enabled, InnoDB displayed incorrect file times in the output from `SHOW TABLE STATUS`. (Bug#24712)
- `ALTER ENABLE KEYS` or `ALTER TABLE DISABLE KEYS` combined with another `ALTER TABLE` option other than `RENAME TO` did nothing. In addition, if `ALTER TABLE` was used on a table having disabled keys, the keys of the resulting table were enabled. (Bug#24395)
- The InnoDB mutex structure was simplified to reduce memory load. (Bug#24386)
- The `--extern` option for `mysql-test-run.pl` did not function correctly. (Bug#24354)
- Foreign key identifiers for InnoDB tables could not contain certain characters. (Bug#24299)
- The `mysql.server` script used the `source` command, which is less portable than the `.` command; it now uses `.` instead. (Bug#24294)
- `ALTER TABLE` statements that performed both `RENAME TO` and `{ENABLE|DISABLE} KEYS` operations caused a server crash. (Bug#24219)
- The loose index scan optimization for `GROUP BY` with `MIN` or `MAX` was not applied within other queries, such as `CREATE TABLE ... SELECT ...`, `INSERT ... SELECT ...`, or in the `FROM` clauses of subqueries. (Bug#24156)
- There was a race condition in the InnoDB `fil_flush_file_spaces()` function. (Bug#24089)
This regression was introduced by Bug#15653
- Subqueries for which a pushed-down condition did not produce exactly one key field could cause a server crash. (Bug#24056)
- The size of `MEMORY` tables and internal temporary tables was limited to 4GB on 64-bit Windows systems. (Bug#24052)
- yaSSL-related memory leaks were detected by Valgrind. (Bug#23981)
- The internal SQL interpreter of InnoDB placed an unnecessary lock on the supremum record when `innodb_locks_unsafe_for_binlog=1`. This caused an assertion failure when InnoDB was built with debugging enabled. (Bug#23769)
- `ROW_COUNT()` did not work properly as an argument to a stored procedure. (Bug#23760)
- `LAST_DAY('0000-00-00')` could cause a server crash. (Bug#23653)
- A trigger that invoked a stored function could cause a server crash when activated by different client connections. (Bug#23651)
- The stack size for NetWare binaries was increased to 128KB to prevent problems caused by insufficient stack size. (Bug#23504)
- If elements in a non-top-level `IN` subquery were accessed by an index and the subquery result set included a `NULL` value, the quantified predicate that contained the subquery was evaluated to `NULL` when it should return a non-`NULL` value. (Bug#23478)
- When applying the `group_concat_max_len` limit, `GROUP_CONCAT()` could truncate multi-byte characters in the middle. (Bug#23451)
- MySQL 5.0.26 introduced an ABI incompatibility, which this release reverts. Programs compiled against 5.0.26 are not compatible with any other version and must be recompiled. (Bug#23427)
- `M % 0` returns `NULL`, but `(M % 0) IS NULL` evaluated to false. (Bug#23411)
- `mysql_affected_rows()` could return values different from `mysql_stmt_affected_rows()` for the same sequence of statements. (Bug#23383)

- For not-yet-authenticated connections, the `Time` column in `SHOW PROCESSLIST` was a random value rather than `NULL`. (Bug#23379)
- Accuracy was improved for comparisons between `DECIMAL` columns and numbers represented as strings. (Bug#23260)
- MySQL failed to build on Linux/Alpha. (Bug#23256)
This regression was introduced by Bug#21250
- If `COMPRESS()` returned `NULL`, subsequent invocations of `COMPRESS()` within a result set or within a trigger also returned `NULL`. (Bug#23254)
- Calculation of `COUNT(DISTINCT)`, `AVG(DISTINCT)`, or `SUM(DISTINCT)` when they are referenced more than once in a single query with `GROUP BY` could cause a server crash. (Bug#23184)
- Insufficient memory (`myisam_sort_buffer_size`) could cause a server crash for several operations on `MyISAM` tables: repair table, create index by sort, repair by sort, parallel repair, bulk insert. (Bug#23175)
- The column default value in the output from `SHOW COLUMNS` or `SELECT FROM INFORMATION_SCHEMA.COLUMNS` was truncated to 64 characters. (Bug#23037)
- `mysql` did not check for errors when fetching data during result set printing. (Bug#22913)
- Changes to character set variables prior to an action on a replication-ignored table were forgotten by slave servers. (Bug#22877)
- `InnoDB` exhibited thread thrashing with more than 50 concurrent connections under an update-intensive workload. (Bug#22868)
- The return value from `my_seek()` was ignored. (Bug#22828)
- The optimizer failed to use equality propagation for `BETWEEN` and `IN` predicates with string arguments. (Bug#22753)
- The `Handler_rollback` status variable sometimes was incremented when no rollback had taken place. (Bug#22728)
- The `Host` column in `SHOW PROCESSLIST` output was blank when the server was started with the `--skip-grant-tables` option. (Bug#22723)
- If a table contains an `AUTO_INCREMENT` column, inserting into an insertable view on the table that does not include the `AUTO_INCREMENT` column should not change the value of `LAST_INSERT_ID()`, because the side effects of inserting default values into columns not part of the view should not be visible. MySQL was incorrectly setting `LAST_INSERT_ID()` to zero. (Bug#22584)
- Queries using a column alias in an expression as part of an `ORDER BY` clause failed, an example of such a query being `SELECT mycol + 1 AS mynum FROM mytable ORDER BY 30 - mynum`. (Bug#22457)
- Using `EXPLAIN` caused a server crash for queries that selected from `INFORMATION_SCHEMA` in a subquery in the `FROM` clause. (Bug#22413)
- Instance Manager had a race condition involving `mysqld` PID file removal. (Bug#22379)
- A server crash occurred when using `LOAD DATA` to load a table containing a `NOT NULL` spatial column, when the statement did not load the spatial column. Now a `NULL supplied to NOT NULL column` error occurs. (Bug#22372)
- The optimizer used the `ref` join type rather than `eq_ref` for a simple join on strings. (Bug#22367)
- Some queries that used `MAX()` and `GROUP BY` could incorrectly return an empty result. (Bug#22342)
- `DATE_ADD()` requires complete dates with no “zero” parts, but sometimes did not return `NULL` when given such a date. (Bug#22229)
- If an `init_connect` SQL statement produced an error, the connection was silently terminated with no error message. Now the server writes a warning to the error log. (Bug#22158)
- Some small double precision numbers (such as `1.00000001e-300`) that should have been accepted were truncated to zero. (Bug#22129)
- For a nonexistent table, `DROP TEMPORARY TABLE` failed with an incorrect error message if `read_only` was enabled. (Bug#22077)
- Trailing spaces were not removed from Unicode `CHAR` column values when used in indexes. This resulted in excessive usage

of storage space, and could affect the results of some `ORDER BY` queries that made use of such indexes.

Note

When upgrading, it is necessary to re-create any existing indexes on Unicode `CHAR` columns in order to take advantage of the fix. This can be done by using a `REPAIR TABLE` statement on each affected table.

([Bug#22052](#))

- The code for generating `USE` statements for binary logging of `CREATE PROCEDURE` statements resulted in confusing output from `mysqlbinlog` for `DROP PROCEDURE` statements. ([Bug#22043](#))
- `STR_TO_DATE()` returned `NULL` if the format string contained a space following a non-format character. ([Bug#22029](#))
- Use of a DES-encrypted SSL certificate file caused a server crash. ([Bug#21868](#))
- Use of `PREPARE` with a `CREATE PROCEDURE` statement that contained a syntax error caused a server crash. ([Bug#21856](#))
- Adding a day, month, or year interval to a `DATE` value produced a `DATE`, but adding a week interval produced a `DATETIME` value. Now all produce a `DATE` value. ([Bug#21811](#))
- In some cases, the parser failed to distinguish a user-defined function from a stored function. ([Bug#21809](#))
- Use of a subquery that invoked a function in the column list of the outer query resulted in a memory leak. ([Bug#21798](#))
- Inserting a default or invalid value into a spatial column could fail with `Unknown error` rather than a more appropriate error. ([Bug#21790](#))
- It was possible to use `DATETIME` values whose year, month, and day parts were all zeroes but whose hour, minute, and second parts contained nonzero values, an example of such an illegal `DATETIME` being `'0000-00-00 11:23:45'`.

Note

This fix was reverted in MySQL 5.0.40.

([Bug#21789](#))

See also [Bug#25301](#)

- `yaSSL` crashed on pre-Pentium Intel CPUs. ([Bug#21765](#))
- Evaluation of subqueries that require the filesort algorithm were allocating and freeing the `sort_buffer_size` buffer many times, resulting in slow performance. Now the buffer is allocated once and reused. ([Bug#21727](#))
- Through the C API, the member strings in `MYSQL_FIELD` for a query that contains expressions may return incorrect results. ([Bug#21635](#))
- Selecting from a `MERGE` table could result in a server crash if the underlying tables had fewer indexes than the `MERGE` table itself. ([Bug#21617](#), [Bug#22937](#))
- View columns were always handled as having implicit derivation, leading to `illegal mix of collation errors` for some views in `UNION` operations. Now view column derivation comes from the original expression given in the view definition. ([Bug#21505](#))
- `InnoDB` crashed while performing XA recovery of prepared transactions. ([Bug#21468](#))
- `INET_ATON()` returned a signed `BIGINT` value, not an unsigned value. ([Bug#21466](#))
- After `FLUSH TABLES WITH READ LOCK` followed by `UNLOCK TABLES`, attempts to drop or alter a stored routine failed with an error that the routine did not exist, and attempts to execute the routine failed with a lock conflict error. ([Bug#21414](#))
- It was possible to set the backslash character (`" \ "`) as the delimiter character using `DELIMITER`, but not actually possible to use it as the delimiter. ([Bug#21412](#))
- For multiple-table `UPDATE` statements, storage engines were not notified of duplicate-key errors. ([Bug#21381](#))
- Within a prepared statement, `SELECT (COUNT(*) = 1)` (or similar use of other aggregate functions) did not return the correct result for statement re-execution. ([Bug#21354](#))
- It was possible for a stored routine with a non-`latin1` name to cause a stack overrun. ([Bug#21311](#))

- Certain malformed `INSERT` statements could crash the `mysql` client. (Bug#21142)
- Creating a `TEMPORARY` table with the same name as an existing table that was locked by another client could result in a lock conflict for `DROP TEMPORARY TABLE` because the server unnecessarily tried to acquire a name lock. (Bug#21096)
- Incorrect results could be obtained from re-execution of a parametrized prepared statement or a stored routine with a `SELECT` that uses `LEFT JOIN` with a second table having only one row. (Bug#21081)
- Within a stored routine, a view definition cannot refer to routine parameters or local variables. However, an error did not occur until the routine was called. Now it occurs during parsing of the routine creation statement.

Note

A side effect of this fix is that if you have already created such routines, an error will occur if you execute `SHOW CREATE PROCEDURE` or `SHOW CREATE FUNCTION`. You should drop these routines because they are erroneous.

(Bug#20953)

- In `mysql`, invoking `connect` or `\r` with very long `db_name` or `host_name` parameters caused buffer overflow. (Bug#20894)
- `SHOW VARIABLES` truncated the `Value` field to 256 characters. (Bug#20862)
- Selecting into variables sometimes returned incorrect wrong results. (Bug#20836)
- `WITH ROLLUP` could group unequal values. (Bug#20825)
- Range searches on columns with an index prefix could miss records. (Bug#20732)
- On slave servers, transactions that exceeded the lock wait timeout failed to roll back properly. (Bug#20697)
- Inserting `DEFAULT` into a column with no default value could result in garbage in the column. Now the same result occurs as when inserting `NULL` into a `NOT NULL` column. (Bug#20691)
- An `UPDATE` that referred to a key column in the `WHERE` clause and activated a trigger that modified the column resulted in a loop. (Bug#20670)
- `CONCURRENT` did not work correctly for `LOAD DATA INFILE`. (Bug#20637)
- `mysql_fix_privilege_tables.sql` altered the `table_privs.table_priv` column to contain too few privileges, causing loss of the `CREATE VIEW` and `SHOW VIEW` privileges. (Bug#20589)
- `LIKE` searches failed for indexed `utf8` character columns. (Bug#20471)
- With `lower_case_table_names` set to 1, `SHOW CREATE TABLE` printed incorrect output for table names containing Turkish I (LATIN CAPITAL LETTER I WITH DOT ABOVE). (Bug#20404)
- A query with a subquery that references columns of a view from the outer `SELECT` could return an incorrect result if used from a prepared statement. (Bug#20327)
- For queries that select from a view, the server was returning `MYSQL_FIELD` metadata inconsistently for view names and table names. For view columns, the server now returns the view name in the `table` field and, if the column selects from an underlying table, the table name in the `org_table` field. (Bug#20191)
- Invalidating the query cache caused a server crash for `INSERT INTO ... SELECT` statements that selected from a view. (Bug#20045)
- With `SQL_MODE=TRADITIONAL`, MySQL incorrectly aborted on warnings within stored routines and triggers. (Bug#20028)
- Unsigned `BIGINT` values treated as signed values by the `MOD()` function. (Bug#19955)
- Compiling PHP 5.1 with the MySQL static libraries failed on some versions of Linux. (Bug#19817)
- The `DELIMITER` statement did not work correctly when used in an SQL file run using the `SOURCE` statement. (Bug#19799)
- `mysqldump --xml` produced invalid XML for `BLOB` data. (Bug#19745)
- Column names were not quoted properly for replicated views. (Bug#19736)
- For a cast of a `DATETIME` value containing microseconds to `DECIMAL`, the microseconds part was truncated without generating a warning. Now the microseconds part is preserved. (Bug#19491)

- `InnoDB`: Reduced optimization level for Windows 64 builds to handle possible memory overrun. (Bug#19424)
- SQL statements close to the size of `max_allowed_packet` could produce binary log events larger than `max_allowed_packet` that could not be read by slave servers. (Bug#19402)
- `VARBINARY` column values inserted on a MySQL 4.1 server had trailing zeroes following upgrade to MySQL 5.0 or later. (Bug#19371)
- `FLUSH INSTANCES` in Instance Manager triggered an assertion failure. (Bug#19368)
- For a debug server, a reference to an undefined user variable in a prepared statement executed with `EXECUTE` caused an assertion failure. (Bug#19356)
- The server could send incorrect column count information to the client for queries that produce a larger number of columns than can fit in a two-byte number. (Bug#19216)
- Within a trigger for a base table, selecting from a view on that base table failed. (Bug#19111)
- The value of the `warning_count` system variable was not being calculated correctly (also affecting `SHOW COUNT(*) WARNINGS`). (Bug#19024)
- For some problems relating to character set conversion or incorrect string values for `INSERT` or `UPDATE`, the server was reporting truncation or length errors instead. (Bug#18908)
- `DELETE IGNORE` could hang for foreign key parent deletes. (Bug#18819)
- Constant expressions and some numeric constants used as input parameters to user-defined functions were not treated as constants. (Bug#18761)
- `InnoDB` used table locks (not row locks) within stored functions. (Bug#18077)
- `myisampack` wrote to unallocated memory, causing a crash. (Bug#17951)
- `FLUSH LOGS` or `mysqladmin flush-logs` caused a server crash if the binary log was not open. (Bug#17733)
- `mysql_fix_privilege_tables` did not accept a password containing embedded space or apostrophe characters. (Bug#17700)
- `mysql` would lose its connection to the server if its standard output was not writable. (Bug#17583)
- Attempting to use a view containing `DEFINER` information for a non-existent user resulted in an error message that revealed the definer account. Now the definer is revealed only to superusers. Other users receive only an `access denied` message. (Bug#17254)
- `mysql-test-run` did not work correctly for RPM-based installations. (Bug#17194)
- `IN()` and `CHAR()` can return `NULL`, but did not signal that to the query processor, causing incorrect results for `IS NULL` operations. (Bug#17047)
- A client library crash was caused by executing a statement such as `SELECT * FROM t1 PROCEDURE ANALYSE()` using a server side cursor on a table `t1` that does not have the same number of columns as the output from `PROCEDURE ANALYSE()`. (Bug#17039)
- The `WITH CHECK OPTION` for a view failed to prevent storing invalid column values for `UPDATE` statements. (Bug#16813)
- Slave servers would retry the execution of an SQL statement an infinite number of times, ignoring the value `SLAVE_TRANSACTION_RETRIES` when using the NDB engine. (Bug#16228)
- `InnoDB` showed substandard performance with multiple queries running concurrently. (Bug#15815)
- `ALTER TABLE` was not able to rename a view. (Bug#14959)
- Statements such as `DROP PROCEDURE` and `DROP VIEW` were written to the binary log too late due to a race condition. (Bug#14262)
- A literal string in a `GROUP BY` clause could be interpreted as a column name. (Bug#14019)
- Instance Manager didn't close the client socket file when starting a new `mysqld` instance. `mysqld` inherited the socket, causing clients connected to Instance Manager to hang. (Bug#12751)
- Entries in the slow query log could have an incorrect `Rows_examined` value. (Bug#12240)

- Warnings were generated when explicitly casting a character to a number (for example, `CAST('x' AS SIGNED)`), but not for implicit conversions in simple arithmetic operations (such as `'x' + 0`). Now warnings are generated in all cases. ([Bug#11927](#))
- Lack of validation for input and output `TIME` values resulted in several problems: `SEC_TO_TIME()` in some cases did not clip large values to the `TIME` range appropriately; `SEC_TO_TIME()` treated `BIGINT UNSIGNED` values as signed; only truncation warnings were produced when both truncation and out-of-range `TIME` values occurred. ([Bug#11655](#), [Bug#20927](#))
- Metadata for columns calculated from scalar subqueries was limited to integer, double, or string, even if the actual type of the column was different. ([Bug#11032](#))
- Several string functions could return incorrect results when given very large length arguments. ([Bug#10963](#))
- `FROM_UNIXTIME()` did not accept arguments up to `POWER(2, 31) - 1`, which it had previously. ([Bug#9191](#))
- Subqueries of the form `NULL IN (SELECT ...)` returned invalid results. ([Bug#8804](#), [Bug#23485](#))
- `OPTIMIZE TABLE` with `myisam_repair_threads > 1` could result in `MyISAM` table corruption. ([Bug#8283](#))
- Transient errors in replication from master to slave may trigger multiple `Got fatal error 1236: 'binlog truncated in the middle of event'` errors on the slave. ([Bug#4053](#))

D.1.9. Release Notes for MySQL Community Server 5.0.27 (21 October 2006)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.26.

Functionality added or changed:

- This is the last version for which binary MySQL-Max distributions are available, except for RPM distributions. (For RPM distributions, the last version is 5.0.37.)

Bugs fixed:

- MySQL 5.0.26 introduced an ABI incompatibility, which this release reverts. Programs compiled against 5.0.26 are not compatible with any other version and must be recompiled. ([Bug#23427](#))

Appendix E. MySQL Change History

Note

This appendix lists the changes from version to version in the MySQL 5.0 source code through MySQL 5.0.26. For changes made to versions following 5.0.26, see [Appendix C, MySQL Enterprise Release Notes](#), and [Appendix D, MySQL Community Server Enhancements and Release Notes](#).

Starting with MySQL 5.0, we began offering a new version of the Manual for each new series of MySQL releases (5.0, 5.1, and so on). For information about changes in previous release series of the MySQL database software, see the corresponding version of this Manual. For information about legacy versions of the MySQL software through the 4.1 series, see *MySQL 3.23, 4.0, 4.1 Reference Manual*.

We update this section as we add new features in the 5.0 series, so that everybody can follow the development process.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (<http://dev.mysql.com/downloads/>), it means that the version has not yet been released.

The date mentioned with a release version is the date of the last Bazaar commit on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

The manual included in the source and binary distributions may not be fully accurate when it comes to the release changelog entries, because the integration of the manual happens at build time. For the most up-to-date release changelog, please refer to the online version instead.

E.1. Changes in release 5.0.x (Production)

The following changelog shows what has been done in the 5.0 tree:

- Basic support for read-only server side cursors. For information about using cursors within stored routines, see [Section 12.8.5, “Cursors”](#). For information about using cursors from within the C API, see [Section 24.7.7.3, “mysql_stmt_attr_set\(\)”](#).
- Basic support for (updatable) views. See, for example, [Section 12.1.11, “CREATE VIEW Syntax”](#).
- Basic support for stored procedures and functions (SQL:2003 style). See [Section 21.2, “Using Stored Routines \(Procedures and Functions\)”](#).
- Initial support for rudimentary triggers.
- Added `SELECT INTO list_of_vars`, which can be of mixed (that is, global and local) types. See [Section 12.8.3.3, “SELECT ... INTO Statement”](#).
- Removed the update log. It is fully replaced by the binary log. If the MySQL server is started with `--log-update`, it is translated to `--log-bin` (or ignored if the server is explicitly started with `--log-bin`), and a warning message is written to the error log. Setting `SQL_LOG_UPDATE` silently sets `SQL_LOG_BIN` instead (or do nothing if the server is explicitly started with `--log-bin`).
- Support for the `ISAM` storage engine has been removed. If you have `ISAM` tables, you should convert them before upgrading. See [Section 2.4.17.2, “Upgrading from MySQL 4.1 to 5.0”](#).
- Support for `RAID` options in `MyISAM` tables has been removed. If you have tables that use these options, you should convert them before upgrading. See [Section 2.4.17.2, “Upgrading from MySQL 4.1 to 5.0”](#).
- User variable names are now case insensitive: If you do `SET @a=10;` then `SELECT @A;` now returns `10`. Case sensitivity of a variable's value depends on the collation of the value.
- Strict mode, which in essence means that you get an error instead of a warning when inserting an incorrect value into a column. See [Section 5.1.7, “SQL Modes”](#).
- `VARCHAR` and `VARBINARY` columns remember end space. A `VARCHAR()` or `VARBINARY` column can contain up to 65,535 characters or bytes, respectively.
- `MEMORY (HEAP)` tables can have `VARCHAR` columns.
- When using a constant string or a function that generates a string result in `CREATE ... SELECT`, MySQL creates the result column based on the maximum length of the string or expression:

Maximum Length	Data type
= 0	CHAR(0)
< 512	VARCHAR(max_length)
>= 512	TEXT

- A fixed-point math library is introduced that supports precision math, resulting in more accurate results when working with the `DECIMAL` and `NUMERIC` data types. For details, see [Chapter 23, Precision Math](#).

For a full list of changes, please refer to the changelog sections for each individual 5.0.x release.

E.1.1. Changes for release 5.0.27 and up

Beginning with MySQL 5.0.27, change notes are listed separately for MySQL Enterprise and MySQL Community Server. See [Appendix C, MySQL Enterprise Release Notes](#), and [Appendix D, MySQL Community Server Enhancements and Release Notes](#).

E.1.2. Changes in MySQL 5.0.26 (03 October 2006)

This is a bugfix release for the current production release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Important Change: MySQL Cluster:** `LOAD DATA INFILE` no longer causes an implicit commit for all storage engines. It now causes an implicit commit only for tables using the `NDB` storage engine. ([Bug#11151](#))
- The number of `InnoDB` threads is no longer limited to 1,000 on Windows. ([Bug#22268](#))
- `mysqldump` now has a `--flush-privileges` option. It causes `mysqldump` to emit a `FLUSH PRIVILEGES` statement after dumping the `mysql` database. This option should be used any time the dump contains the `mysql` database and any other database that depends on the data in the `mysql` database for proper restoration. ([Bug#21424](#))
- The output generated by the server when using the `--xml` option has changed with regard to null values. It now matches the output from `mysqldump --xml`. That is, a column containing a `NULL` value is now reported as

```
<field name="column_name" xsi:nil="true" />
```

whereas a column containing the string value 'NULL' is reported as

```
<field name="column_name">NULL</field>
```

and a column containing an empty string is reported as

```
<field name="column_name">>/field>
```

([Bug#21263](#))

- The source distribution has been updated so that the UDF example can be compiled under Windows with CMake. See [Section 25.2.2.5, "Compiling and Installing User-Defined Functions"](#). ([Bug#19121](#))
- The `LOAD DATA FROM MASTER` and `LOAD TABLE FROM MASTER` statements are deprecated. See [Section 12.6.2.2, "LOAD DATA FROM MASTER Syntax"](#), for recommended alternatives. ([Bug#9125](#), [Bug#20596](#), [Bug#14399](#), [Bug#12187](#), [Bug#15025](#), [Bug#18822](#))

Bugs fixed:

- Deleting entries from a large `MyISAM` index could cause index corruption when it needed to shrink. Deletes from an index can happen when a record is deleted, when a key changes and must be moved, and when a key must be un-inserted because of a du-

- uplicate key. This can also happen in `REPAIR TABLE` when a duplicate key is found and in `myisamchk` when sorting the records by an index. (Bug#22384)
- yaSSL had a conflicting definition for `socklen_t` on hurd-i386 systems. (Bug#22326)
 - Conversion of values inserted into a `BIT` column could affect adjacent columns. (Bug#22271)
 - `mysql_com.h` unnecessarily referred to the `ulong` type. (Bug#22227)
 - The source distribution would not build on Windows due to a spurious dependency on `ib_config.h`. (Bug#22224)
 - Execution of a prepared statement that uses an `IN` subquery with aggregate functions in the `HAVING` clause could cause a server crash. (Bug#22085)
 - Using `GROUP_CONCAT()` on the result of a subquery in the `FROM` clause that itself used `GROUP_CONCAT()` could cause a server crash. (Bug#22015)
 - A query that used `GROUP BY` and an `ALL` or `ANY` quantified subquery in a `HAVING` clause could trigger an assertion failure. (Bug#21853)
 - `UPGRADE` was treated as a reserved word, although it is not. (Bug#21772)
 - The value of `LAST_INSERT_ID()` was not always updated correctly within stored routines. (Bug#21726)
 - A function result in a comparison was replaced with a constant by the optimizer under some circumstances when this optimization was invalid. (Bug#21698)
 - If `mysqld` was linked against a system-installed `zlib` library compiled without large-file support, it would likely exit with a `SIGXFSZ` (file size exceeded) signal if an `ARCHIVE` table reached 2GB. The server now checks for space before writing. (Bug#21675)
 - The presence of a subquery in the `ON` clause of a join in a view definition prevented the `MERGE` algorithm from being used for the view in cases where it should be allowed. (Bug#21646)
 - When records are merged from the insert buffer and the page needs to be reorganized, `InnoDB` used incorrect column length information when interpreting the records of the page. This caused a server crash due to apparent corruption of secondary indexes in `ROW_FORMAT=COMPACT` that contain prefix indexes of fixed-length columns. Data files should not be corrupted, but the crash was likely to repeat every time the server was restarted. (Bug#21638)
 - For character sets having a `mbmaxlen` value of 2, any `ALTER TABLE` statement changed `TEXT` columns to `MEDIUMTEXT`. (Bug#21620)
 - `mysql` displayed an empty string for `NULL` values. (Bug#21618)
 - For `INSERT ... ON DUPLICATE KEY UPDATE`, use of `VALUES(col_name)` within the `UPDATE` clause sometimes was handled incorrectly. (Bug#21555)
 - Subqueries with aggregate functions but no `FROM` clause could return incorrect results. (Bug#21540)
 - The server could crash for the second execution of a function containing a `SELECT` statement that uses an aggregating `IN` subquery. (Bug#21493)
 - `myisam_ftdump` produced bad counts for common words. (Bug#21459)
 - The URL into the online manual that is printed in the stack trace message by the server was out of date. (Bug#21449)
 - Table aliases in multiple-table `DELETE` statements sometimes were not resolved. (Bug#21392)
 - `mysql_config --libmysqld-libs` did not produce any SSL options necessary for linking `libmysqld` with SSL support enabled. (Bug#21239)
 - In the package of pre-built time zone tables that is available for download at timezones.html, the tables now explicitly use the `utf8` character set so that they work the same way regardless of the system character set value. (Bug#21208)
 - A subquery that uses an index for both the `WHERE` and `ORDER BY` clauses produced an empty result. (Bug#21180)
 - `mysql_upgrade` produced a malformed `upgrade_defaults` file by overwriting the `[client]` group header with a `password` option. This prevented `mysqlcheck` from running successfully when invoked by `mysql_upgrade`. (Bug#21011)
 - On Windows, inserting into a `MERGE` table after renaming an underlying `MyISAM` table caused a server crash. (Bug#20789)

- Within stored routines, some error messages were printed incorrectly. A non-null-terminated string was passed to a message-printing routine that expected a null-terminated string. (Bug#20778)
- `INSERT DELAYED` did not honor `SET INSERT_ID` or the `auto_increment_*` system variables. (Bug#20627, Bug#20830)
- If the `auto_increment_offset` setting causes MySQL to generate a value larger than the column's maximum possible value, the `INSERT` statement is accepted in strict SQL mode, whereas but should fail with an error. (Bug#20573)
- User names have a maximum length of 16 characters (even if they contain multi-byte characters), but were being truncated to 16 bytes. (Bug#20393)
- `PROCEDURE ANALYSE()` returned incorrect values of `M FLOAT(M, D)` and `DOUBLE(M, D)`. (Bug#20305)
- For a `MyISAM` table locked with `LOCK TABLES ...WRITE`, queries optimized using the `index_merge` method did not show rows inserted with the lock in place. (Bug#20256)
- `SUBSTRING()` results sometimes were stored improperly into a temporary table when multi-byte character sets were used. (Bug#20204)
- For an `ENUM` column that used the `ucs2` character set, using `ALTER TABLE` to modify the column definition caused the default value to be lost. (Bug#20108)
- Join conditions using index prefixes on `utf8` columns of `InnoDB` tables incorrectly ignored rows where the length of the actual value was greater than the length of the index prefix. (Bug#19960)
- `make install` tried to build files that should already have been built by `make all`, causing a failure if installation was performed using a different account than the one used for the initial build. (Bug#19738)
- For a `MyISAM` table with a `FULLTEXT` index, compression with `myisampack` or a check with `myisamchk` after compression resulted in table corruption. (Bug#19702)
- Column names supplied for a view created on a master server could be lost on a slave server. (Bug#19419)
- The build process incorrectly tried to overwrite `sql/lex_hash.h`. This caused the build to fail when using a shadow link tree pointing to original sources that were owned by another account. (Bug#18888)
- Linking the `pthread` library to single-threaded MySQL libraries caused `dlopen()` to fail at runtime on HP-UX. (Bug#18267)
- The source distribution failed to compile when configured with the `--with-libwrap` option. (Bug#18246)
- Queries containing a subquery that used aggregate functions could return incorrect results. (Bug#16792)
- Row equalities (such as `WHERE (a,b) = (c,d)`) were not taken into account by the optimizer, resulting in slow query execution. Now they are treated as conjunctions of equalities between row elements. (Bug#16081)
- `BIN()`, `OCT()`, and `CONV()` did not work with BIT values. (Bug#15583)
- The parser rejected queries that selected from a table twice using a `UNION` within a subquery. The parser now supports arbitrary subquery, join, and parenthesis operations within `EXISTS` subqueries. A limitation still exists for scalar subqueries: If the subquery contains `UNION`, the first `SELECT` of the `UNION` cannot be within parentheses. For example, `SELECT (SELECT a FROM t1 UNION SELECT b FROM t2)` will work, but `SELECT ((SELECT a FROM t1) UNION (SELECT b FROM t2))` will not. (Bug#14654)
- On Mac OS X, zero-byte `read()` or `write()` calls to an SMB-mounted filesystem could return a non-standard return value, leading to data corruption. Now such calls are avoided. (Bug#12620)
- The server returns a more informative error message when it attempts to open a `MERGE` table that has been defined to use non-`MyISAM` tables. (Bug#10974)
- With `TRADITIONAL SQL` mode, assignment of out-of-bound values and rounding of assigned values was done correctly, but assignment of the same numbers represented as strings sometimes was handled differently. (Bug#6147)
- On an `INSERT` into an updatable but non-insertable view, an error message was issued stating that the view was not updatable. Now the message says the view is not insertable-into. (Bug#5505)
- `EXPLAIN` sometimes returned an incorrect `select_type` for a `SELECT` from a view, compared to the `select_type` for the equivalent `SELECT` from the base table. (Bug#5500)
- Incorporated portability fixes into the definition of `__attribute__` in `my_global.h`. (Bug#2717)

E.1.3. Changes in MySQL 5.0.25 (15 September 2006)

End of Product Lifecycle

Active development and support for MySQL database server versions 3.23, 4.0, and 4.1 has ended. However, for MySQL 4.0 and 4.1, there is still extended support available. For details, see <http://www.mysql.com/company/legal/lifecycle/#calendar>. According to the MySQL Lifecycle Policy (see <http://www.mysql.com/company/legal/lifecycle/#policy>), only Security and Severity Level 1 issues will still be fixed for MySQL 4.0 and 4.1. Please consider upgrading to a recent version (MySQL 5.0 or 5.1).

This is a bugfix release for the current production release family. This version was released as MySQL Classic 5.0.25 to commercial customers only.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- MySQL did not properly do stack dumps on `x86_64` and `i386/NPTL` systems. (Note that the initial fix for this problem was discovered not to be correct. Further work on the problem was undertaken only for MySQL 5.1 and up. See [Bug#31891](#).) ([Bug#21250](#))
- The `mysqld` and `mysqlmanager` man pages have been reclassified from volume 1 to volume 8. ([Bug#21220](#))
- `InnoDB` now honors `IGNORE INDEX`. Previously using `IGNORE INDEX` in cases where an index sort would be slower than a filesort had no effect when used with `InnoDB` tables.

Note

This fix was reverted in MySQL 5.0.26, and a new fix made in MySQL 5.0.40.

([Bug#21174](#))

- `TIMESTAMP` columns that are `NOT NULL` now are reported that way by `SHOW COLUMNS` and `INFORMATION_SCHEMA`. ([Bug#20910](#))
- The MySQL distribution now compiles on UnixWare 7.13. ([Bug#20190](#))
- `configure` now defines the symbol `DEBUG_ON` in `config.h` to indicate whether the source tree is configured to be compiled with debugging support. ([Bug#19517](#))
- `mysql_upgrade` no longer reads the `[client]` option file group because it is not a client and did not understand client options such as `host`. Now it reads only the `[mysql_upgrade]` group. ([Bug#19452](#))
- For `mysqlshow`, if a database name argument contains wildcard characters (such as “`_`”) but matches a single database name exactly, treat the name as a literal name. This allows a command such as `mysqlshow information_schema` work without having to escape the wildcard character. ([Bug#19147](#))
- On Windows, typing Control-C while a query was running caused the `mysql` client to crash. Now it causes `mysql` to attempt to kill the current statement. If this cannot be done, or Control-C is typed again before the statement is killed, `mysql` exits. (In other words, `mysql`'s behavior with regard to Control-C is now the same as it is on Unix platforms.) ([Bug#17926](#))

See also [Bug#1989](#)

- The `VIEW_DEFINITION` column of the `INFORMATION_SCHEMA VIEWS` table now contains information about the view algorithm. ([Bug#16832](#))
- The bundled `yaSSL` library licensing has added a FLOSS exception similar to MySQL to resolve licensing incompatibilities with MySQL. (See the `extra/yaSSL/FLOSS-EXCEPTIONS` file in a MySQL source distribution for details.) ([Bug#16755](#))
- Table comments longer than 60 characters and column comments longer than 255 characters were truncated silently. Now a warning is issued, or an error in strict mode. ([Bug#13934](#))
- The `mysql` client used the default character set if it automatically reconnected to the server, which is incorrect if the character set had been changed. To enable the character set to remain synchronized on the client and server, the `mysql` command `charset` (or `\C`) that changes the default character set and now also issues a `SET NAMES` statement. The changed character set is used for reconnects. ([Bug#11972](#))
- If a `DROP VIEW` statement named multiple views, it stopped with an error if a non-existent view was named and did not drop

the remaining views. Now it continues on and reports an error at the end, similar to `DROP TABLE`. (Bug#11551)

- The server now issues a warning if it removes leading spaces from an alias. (Bug#10977)
- For a successful dump, `mysqldump` now writes a SQL comment to the end of the dump file in the following format:

```
-- Dump completed on YYYY-MM-DD hh:mm:ss
```

(Bug#10877)

- For spatial data types, the server formerly returned these as `VARSTRING` values with a binary collation. Now the server returns spatial values as `BLOB` values. (Bug#10166)
- A new system variable, `lc_time_names`, specifies the locale that controls the language used to display day and month names and abbreviations. This variable affects the output from the `DATE_FORMAT()`, `DAYNAME()` and `MONTHNAME()` functions. See Section 9.8, “MySQL Server Locale Support”.
- Using `--with-debug` to configure MySQL with debugging support enables you to use the `-debug="d,parser_debug"` option when you start the server. This causes the Bison parser that is used to process SQL statements to dump a parser trace to the server's standard error output. Typically, this output is written to the error log.
- The bundled yaSSL library was upgraded to version 1.3.7.

Bugs fixed:

- **Security Fix:** A stored routine created by one user and then made accessible to a different user using `GRANT EXECUTE` could be executed by that user with the privileges of the routine's definer. (Bug#18630, CVE-2006-4227)
- **Security Fix:** On Linux, and possibly other platforms using case-sensitive filesystems, it was possible for a user granted rights on a database to create or access a database whose name differed only from that of the first by the case of one or more letters. (Bug#17647, CVE-2006-4226)
- **MySQL Cluster: Packaging:** The `ndb_mgm` program was included in both the `MySQL-ndb-tools` and `MySQL-ndb-management` RPM packages, resulting in a conflict if both were installed. Now `ndb_mgm` is included only in `MySQL-ndb-tools`. (Bug#21058)
- **MySQL Cluster:** Setting `TransactionDeadlockDetectionTimeout` to a value greater than 12000 would cause scans to deadlock, time out, fail to release scan records, until the cluster ran out of scan records and stopped processing. (Bug#21800)
- **MySQL Cluster:** A memory leak occurred when running `ndb_mgm -e "SHOW"`. (Bug#21670)
- **MySQL Cluster:** The server provided a non-descriptive error message when encountering a fatally corrupted REDO log. (Bug#21615)
- **MySQL Cluster:** A partial rollback could lead to node restart failures. (Bug#21536)
- **MySQL Cluster:** The failure of a unique index read due to an invalid schema version could be handled incorrectly in some cases, leading to unpredictable results. (Bug#21384)
- **MySQL Cluster:** In a cluster with more than 2 replicas, a manual restart of one of the data nodes could fail and cause the other nodes in the same node group to shut down. (Bug#21213)
- **MySQL Cluster:** Some queries involving joins on very large NDB tables could crash the MySQL server. (Bug#21059)
- **MySQL Cluster:** Restarting a data node while DDL operations were in progress on the cluster could cause other data nodes to fail. This could also lead to `mysqld` hanging or crashing under some circumstances. (Bug#21017, Bug#21050)
- **MySQL Cluster:** In some situations with a high disk-load, writing of the redo log could hang, causing a crash with the error message `GCP STOP DETECTED`. (Bug#20904)
- **MySQL Cluster:** When the redo buffer ran out of space, a `POINTER TOO LARGE` error was raised and the cluster could become unusable until restarted with `--initial`. (Bug#20892)
- **MySQL Cluster:** A vague error message was returned when reading both schema files during a restart of the cluster. (Bug#20860)
- **MySQL Cluster:** Incorrect values were inserted into `AUTO_INCREMENT` columns of tables restored from a cluster backup. (Bug#20820)

- **MySQL Cluster:** When attempting to restart the cluster following a data import, the cluster failed during Phase 4 of the restart with `ERROR 2334: JOB BUFFER CONGESTION`. (Bug#20774)
- **MySQL Cluster:** `REPLACE` statements did not work correctly on an `NDB` table having both a primary key and a unique key. In such cases, proper values were not set for columns which were not explicitly referenced in the statement. (Bug#20728)
- **MySQL Cluster:** The server did not honor the value set for `ndb_cache_check_time` in the `my.cnf` file. (Bug#20708)
- **MySQL Cluster:** `ndb_size.pl` and `ndb_error_reporter` were missing from RPM packages. (Bug#20426)
- **MySQL Cluster:** Running `ndbd --nowait-nodes=id` where `id` was the node ID of a node that was already running would fail with an invalid error message. (Bug#20419)
- **MySQL Cluster:** (Direct APIs): `NdbScanOperation::readTuples()` and `NdbIndexScanOperation::readTuples()` ignored the `batch` parameter. (Bug#20252)
- **MySQL Cluster:** A node failure during a scan could sometime cause the node to crash when restarting too quickly following the failure. (Bug#20197)
- **MySQL Cluster:** It was possible to use port numbers greater than 65535 for `ServerPort` in the `config.ini` file. (Bug#19164)
- **MySQL Cluster:** Under certain circumstances, a node that was shut down then restarted could hang during the restart. (Bug#18863)
- **MySQL Cluster:** Trying to create or drop a table while a node was restarting caused the node to crash. This is now handled by raising an error. (Bug#18781)
- **MySQL Cluster:** The server failed with a non-descriptive error message when out of data memory. (Bug#18475)
- **MySQL Cluster:** For `NDB` and possibly `InnoDB` tables, a `BEFORE UPDATE` trigger could insert incorrect values. (Bug#18437)
- **MySQL Cluster:** `SELECT ... FOR UPDATE` failed to lock the selected rows. (Bug#18184)
- **MySQL Cluster:** `pererror` did not properly report `NDB` error codes. (Bug#16561)
- **MySQL Cluster:** A Cluster whose storage nodes were installed from the `MySQL-ndb-storage-*` RPMs could not perform `CREATE` or `ALTER` operations that made use of non-default character sets or collations. (Bug#14918)
- **MySQL Cluster:** The management client `ALL STATUS` command could sometimes report the status of some data nodes incorrectly. (Bug#13985)
- **MySQL Cluster:** An issue that arose from a patch for Bug#19852 made in MySQL 5.0.23 was corrected. (See Section E.1.6, “Changes in MySQL 5.0.23 (Not released)”.)
- **Cluster Replication:** In some cases, a large number of MySQL servers sending requests to the cluster simultaneously could cause the cluster to crash. This could also be triggered by many `NDB` API clients making simultaneous event subscriptions or unsubscriptions. (Bug#20683)
- **Cluster API:** Invoking the MGM API function `ndb_mgm_listen_event()` caused a memory leak. (Bug#21671)
- **Cluster API:** The MGM API function `ndb_logevent_get_fd()` was not implemented. (Bug#21129)
- Some Linux-x86_64-icc packages (of previous releases) mistakenly contained 32-bit binaries. Only `ICC` builds are affected, not `gcc` builds. Solaris and FreeBSD x86_64 builds are not affected. (Bug#22238)
- Running `SHOW MASTER LOGS` at the same time as binary log files were being switched would cause `mysqld` to hang. (Bug#21965)
- `libmysqlclient` defined a symbol `BN_bin2bn` which belongs to OpenSSL. This could break applications that also linked against OpenSSL's `libcrypto` library. The fix required correcting an error in a build script that was failing to add rename macros for some functions. (Bug#21930)
- `character_set_results` can be `NULL` to signify “no conversion,” but some code did not check for `NULL`, resulting in a server crash. (Bug#21913)
- A `NUL` byte within a prepared statement string caused the rest of the string not to be written to the query log, allowing logging to be bypassed. (Bug#21813)
- `COUNT(*)` queries with `ORDER BY` and `LIMIT` could return the wrong result.

Note

This problem was introduced by the fix for [Bug#9676](#), which limited the rows stored in a temporary table to the `LIMIT` clause. This optimization is not applicable to non-group queries with aggregate functions. The current fix disables the optimization in such cases.

([Bug#21787](#))

- `INSERT ... SELECT` sometimes generated a spurious `Column count doesn't match value count` error. ([Bug#21774](#))
- `EXPORT_SET()` did not accept arguments with coercible character sets. ([Bug#21531](#))
- `mysqldump` incorrectly tried to use `LOCK TABLES` for tables in the `INFORMATION_SCHEMA` database. ([Bug#21527](#))
- Memory overruns could occur for certain kinds of subqueries. ([Bug#21477](#))
- A `DATE` can be represented as an integer (such as `20060101`) or as a string (such as `'2006.01.01'`). When a `DATE` (or `TIME`) column is compared in one `SELECT` against both representations, constant propagation by the optimizer led to comparison of `DATE` as a string against `DATE` as an integer. This could result in integer comparisons such as `2006` against `20060101`, erroneously producing a false result. ([Bug#21475](#))
- Adding `ORDER BY` to a `SELECT DISTINCT(expr)` query could produce incorrect results. ([Bug#21456](#))
- Database and table names have a maximum length of 64 characters (even if they contain multi-byte characters), but were truncated to 64 bytes.

Note

This fix was reverted in MySQL 5.0.26.

([Bug#21432](#))

- With `max_sp_recursion` set to 0, a stored procedure that executed a `SHOW CREATE PROCEDURE` statement for itself triggered a recursion limit exceeded error, though the statement involves no recursion. ([Bug#21416](#))
- On 64-bit Windows, a missing table generated error 1017, not the correct value of 1146. ([Bug#21396](#))
- The optimizer sometimes produced an incorrect row-count estimate after elimination of `const` tables. This resulted in choosing extremely inefficient execution plans in some cases when distribution of data in joins were skewed. ([Bug#21390](#))
- A query result could be sorted improperly when using `ORDER BY` for the second table in a join. ([Bug#21302](#))
- Query results could be incorrect if the `WHERE` clause contained `t.key_part NOT IN (val_list)`, where `val_list` is a list of more than 1000 constants. ([Bug#21282](#))
- For user-defined functions created with `CREATE FUNCTION`, the `DEFINER` clause is not legal, but no error was generated. ([Bug#21269](#))

- The `SELECT` privilege was required for an insert on a view, instead of the `INSERT` privilege. ([Bug#21261](#))

This regression was introduced by [Bug#20989](#)

- Subqueries on `INFORMATION_SCHEMA` tables could erroneously return an empty result. ([Bug#21231](#))
- `mysql_upgrade` created temporary files in a possibly insecure way. ([Bug#21224](#))
- When `DROP DATABASE` or `SHOW OPEN TABLES` was issued while concurrently in another connection issuing `DROP TABLE`, `RENAME TABLE`, `CREATE TABLE LIKE` or any other statement that required a name lock, the server crashed. ([Bug#21216](#), [Bug#19403](#))
- The `--master-data` option for `mysqldump` requires certain privileges, but `mysqldump` generated a truncated dump file without producing an appropriate error message or exit status if the invoking user did not have those privileges. ([Bug#21215](#))
- Some prepared statements caused a server crash when executed a second time. ([Bug#21166](#))
- The optimizer assumed that if `(a=x AND b=x)` is true, `(a=x AND b=x) AND a=b` is also true. But that is not always so if `a` and `b` have different data types. ([Bug#21159](#))
- `SHOW INNODB STATUS` contained some duplicate output. ([Bug#21113](#))

- InnoDB was slow with more than 100,000 .idb files. (Bug#21112)
- Performing an INSERT on a view that was defined using a SELECT that specified a collation and a column alias caused the server to crash. (Bug#21086)
- ALTER VIEW did not retain existing values of attributes that had been originally specified but were not changed in the ALTER VIEW statement. (Bug#21080)
- For InnoDB tables, the server could crash when executing NOT IN(. . .) subqueries. (Bug#21077)
- The myisam_stats_method variable was mishandled when set from an option file or on the command line. (Bug#21054)
- With query_cache_type set to 0, RESET QUERY CACHE was very slow and other threads were blocked during the operation. Now a cache reset is faster and non-blocking. (Bug#21051)
- mysql crashed for very long arguments to the connect command. (Bug#21042)
- A query using WHERE column = constant OR column IS NULL did not return consistent results on successive invocations. The column in each part of the WHERE clause could be either the same column, or two different columns, for the effect to be observed. (Bug#21019)
- Performance during an import on a table with a trigger that called a stored procedure was severely degraded. This issue first arose in MySQL 5.0.18. (Bug#21013)
- A query of the form shown here caused the server to crash:

```
SELECT * FROM t1 NATURAL JOIN (
  t2 JOIN (
    t3 NATURAL JOIN t4,
    t5 NATURAL JOIN t6
  )
  ON (t3.id3 = t2.id3 AND t5.id5 = t2.id5)
);
```

(Bug#21007)

- STR_TO_DATE() sometimes would return NULL if the %D format specifier was not the last specifier in the format string. (Bug#20987)
- A query using WHERE NOT (column < ANY (subquery)) yielded a different result from the same query using the same column and subquery with WHERE (column > ANY (subquery)). (Bug#20975)
- In debugging mode, mysqld printed server_init rather than network_init during network initialization. (Bug#20968)
- Under certain circumstances, AVG(key_val) returned a value but MAX(key_val) returned an empty set due to incorrect application of MIN()/MAX() optimization. (Bug#20954)
- On Windows, mysql_upgrade.exe could not find mysqlcheck.exe. (Bug#20950)
- Use of zero-length variable names caused a server crash. (Bug#20908)
- The server crashed when using the range access method to execute a subquery with an ORDER BY DESC clause. (Bug#20869)
- For certain queries, the server incorrectly resolved a reference to an aggregate function and crashed. (Bug#20868)
- Using aggregate functions in subqueries yielded incorrect results under certain circumstances due to incorrect application of MIN()/MAX() optimization. (Bug#20792)
- If a column definition contained a character set declaration, but a DEFAULT value began with an introducer, the introducer character set was used as the column character set. (Bug#20695)
- Multiplication of DECIMAL values could produce incorrect fractional part and trailing garbage caused by signed overflow. (Bug#20569)
- Users who had the SHOW VIEW privilege for a view and privileges on one of the view's base tables could not see records in INFORMATION_SCHEMA tables relating to the base table. (Bug#20543)
- The MD5(), SHA1(), and ENCRYPT() functions should return a binary string, but the result sometimes was converted to the character set of the argument. MAKE_SET() and EXPORT_SET() now use the correct character set for their default separators, resulting in consistent result strings which can be coerced according to normal character set rules. (Bug#20536)
- A subquery that contained LIMIT N, 1 could return more than one row. (Bug#20519)

- Creation of a view as a join of views or tables could fail if the views or tables are in different databases. ([Bug#20482](#))
- `SELECT` statements using `GROUP BY` against a view could have missing columns in the output when there was a trigger defined on one of the base tables for the view. ([Bug#20466](#))
- `CREATE PROCEDURE`, `CREATE FUNTION`, `CREATE TRIGGER`, and `CREATE VIEW` statements containing multi-line comments (`/* ... */`) could not be replicated. ([Bug#20438](#))
- For connections that required a `SUBJECT` value, a check was performed to verify that the value was correct, but the connection was not refused if not. ([Bug#20411](#))
- Some user-level errors were being written to the server's error log, which is for server errors. ([Bug#20402](#))
- `peror` crashed on Solaris due to `NULL` return value of `strerror()` system call. ([Bug#20145](#))
- For `mysql`, escaping with backslash sometimes did not work. ([Bug#20103](#))
- Use of `MIN()` or `MAX()` with `GROUP BY` on a `ucs2` column could cause a server crash. ([Bug#20076](#))
- `mysqld --flush` failed to flush `MyISAM` table changes to disk following an `UPDATE` statement for which no updated column had an index. ([Bug#20060](#))
- A user-defined function that is called on each row of a returned result set, could receive an `in_null` state that is set, if it was set previously. Now, the `is_null` state is reset to false before each invocation of a UDF. ([Bug#19904](#))
- The `query` command for `mysqltest` did not work. ([Bug#19890](#))
- When executing a `SELECT` with `ORDER BY` on a view that is constructed from a `SELECT` statement containing a stored function, the stored function was evaluated too many times. ([Bug#19862](#))
- The first time a user who had been granted the `CREATE ROUTINE` privilege used that privilege to create a stored function or procedure, the `Password` column in that user's row in the `mysql.user` table was set to `NULL`. ([Bug#19857](#))
- For `TIME_FORMAT()`, the `%H` and `%k` format specifiers can return values larger than two digits (if the hour is greater than 99), but for some query results that contained three-character hours, column values were truncated. ([Bug#19844](#))
- Using `SELECT` on a corrupt `MyISAM` table using the dynamic record format could cause a server crash. ([Bug#19835](#))
- Using cursors with `READ COMMITTED` isolation level could cause `InnoDB` to crash. ([Bug#19834](#))
- The `yaSSL` library bundled with `libmysqlclient` had some conflicts with `OpenSSL`. Now macros are used to rename the conflicting symbols to have a prefix of `ya`. ([Bug#19810](#))
- On 64-bit systems, use of the `cp1250` character set with a primary key column in a `LIKE` clause caused a server crash for patterns having letters in the range 128..255. ([Bug#19741](#))
- `DESCRIBE` returned the type `BIGINT` for a column of a view if the column was specified by an expression over values of the type `INT`. ([Bug#19714](#))
- An issue with `yaSSL` prevented `Connector/J` clients from connecting to the server using a certificate. ([Bug#19705](#))
- A cast problem caused incorrect results for prepared statements that returned float values when MySQL was compiled with `gcc 4.0`. ([Bug#19694](#))
- The `mysql_list_fields()` C API function returned the incorrect table name for views. ([Bug#19671](#))
- If a query had a condition of the form `tableX.key = tableY.key`, which participated in equality propagation and also was used for `ref` access, then early `ref`-access `NULL` filtering was not performed for the condition. This could make query execution slower. ([Bug#19649](#))
- Repeated `DROP TABLE` statements in a stored procedure could sometimes cause the server to crash. ([Bug#19399](#))
- When not running in strict mode, the server failed to convert the invalid years portion of a `DATE` or `DATETIME` value to `'0000'` when inserting it into a table.

Note

This fix was reverted in MySQL 5.0.40.

([Bug#19370](#))

See also [Bug#25301](#)

- The final parenthesis of a `CREATE INDEX` statement occurring in a stored procedure was omitted from the binary log when the stored procedure was called. ([Bug#19207](#))
- A `SELECT` with a subquery that was bound to the outer query over multiple columns returned different results when a constant was used instead of one of the dependant columns. ([Bug#18925](#))
- Setting `myisam_repair_threads` caused any repair operation on a `MyISAM` table to fail to update the cardinality of indexes, instead making them always equal to 1. ([Bug#18874](#))
- `FEDERATED` tables raised invalid duplicate key errors when attempting on one server to insert rows having the same primary key values as rows that had been deleted from the linked table on the other server. ([Bug#18764](#))
- The implementation for `UNCOMPRESS()` did not indicate that it could return `NULL`, causing the optimizer to do the wrong thing. ([Bug#18539](#))
- Using `> ALL` with subqueries that return no rows yielded incorrect results under certain circumstances due to incorrect application of `MIN()/MAX()` optimization. ([Bug#18503](#))
- Referring to a stored function qualified with the name of one database and tables in another database caused a “table doesn't exist” error. ([Bug#18444](#))
- Triggers on tables in the `mysql` database caused a server crash. Triggers for tables in this database now are disallowed. ([Bug#18361](#), [Bug#18005](#))
- The length of the pattern string prefix for `LIKE` operations was calculated incorrectly for multi-byte character sets. As a result, the scanned range was wider than necessary if the prefix contained any multi-byte characters, and rows could be missing from the result set. ([Bug#18359](#), [Bug#16674](#))
- Multiple invocations of the `REVERSE()` function could return different results. ([Bug#18243](#))
- The optimizer did not take advantage of indexes on columns used for the second or third arguments of `BETWEEN`. ([Bug#18165](#))
- For table-format output, `mysql` did not always calculate columns widths correctly for columns containing multi-byte characters in the column name or contents. ([Bug#17939](#))
- The character set was not being properly initialized for `CAST()` with a type like `CHAR(2) BINARY`, which resulted in incorrect results or even a server crash. ([Bug#17903](#))
- Checking a `MyISAM` table (using `CHECK TABLE`) having a spatial index and only one row would wrongly indicate that the table was corrupted. ([Bug#17877](#))
- A stored procedure that created and invoked a prepared statement was not executed when called in a `mysqld` init-file. ([Bug#17843](#))
- It is possible to create `MERGE` tables into which data cannot be inserted (by not specifying a `UNION` clause. However, when an insert was attempted, the error message was confusing. Now an error occurs indicating that the table is read-only. ([Bug#17766](#))
- Attempting to insert a string of greater than 4096 bytes into a `FEDERATED` table resulted in the error `ERROR 1296 (HY000) AT LINE 2: GOT ERROR 10000 'ERROR ON REMOTE SYSTEM: 1054: UNKNOWN COLUMN 'STRING-VALUE' FROM FEDERATED`. This error was raised regardless of the type of column involved (`VARCHAR`, `TEXT`, and so on.) ([Bug#17608](#))
- Views could not be updated within a stored function or trigger. ([Bug#17591](#))
- Use of the `--prompt` option or `prompt` command caused `mysql` to be unable to connect to the Instance Manager. ([Bug#17485](#))
- `N'xxx'` and `_utf8'xxx'` were not treated as equivalent because `N'xxx'` failed to unescape backslashes (`\`) and doubled apostrophe/single quote characters (`'`). ([Bug#17313](#))
- Use of the join cache in favor of an index for `ORDER BY` operations could cause incorrect result sorting. ([Bug#17212](#))
- The `PASSWORD()` function returned invalid results when used in some `UNION` queries. ([Bug#16881](#))
- `ORDER BY RAND() LIMIT 1` always set a user variable to the last possible value from the table. ([Bug#16861](#))
- When performing a `GROUP_CONCAT()`, the server transformed `BLOB` columns `VARCHAR` columns, which could cause erroneous results when using Connector/J and possibly other MySQL APIs. ([Bug#16712](#))

- Stored procedures did not use the character set defined for the database in which they were created. (Bug#16676)
- Some server errors were not reported to the client, causing both to try to read from the connection until a hang or crash resulted. (Bug#16581)
- On Windows, a definition for `mysql_set_server_option()` was missing from the C client library. (Bug#16513)
- Updating a column of a `FEDERATED` table to `NULL` sometimes failed. (Bug#16494)
- For `SELECT ... FOR UPDATE` statements that used `DISTINCT` or `GROUP BY` over all key parts of a unique index (or primary key), the optimizer unnecessarily created a temporary table, thus losing the linkage to the underlying unique index values. This caused a `Result set not updatable` error. (The temporary table is unnecessary because under these circumstances the distinct or grouped columns must also be unique.) (Bug#16458)
- Using `ANY` with “non-table” subqueries such as `SELECT 1` yielded incorrect results under certain circumstances due to incorrect application of `MIN()`/`MAX()` optimization. (Bug#16302)
- A subquery in the `WHERE` clause of the outer query and using `IN` and `GROUP BY` returned an incorrect result. (Bug#16255)
- A query could produce different results with and without an index, if the `WHERE` clause contained a range condition that used an invalid `DATETIME` constant. (Bug#16249)
- `TIMESTAMPDIFF()` examined only the date and ignored the time when the requested difference unit was months or quarters. (Bug#16226)
- Using tables from MySQL 4.x in MySQL 5.x, in particular those with `VARCHAR` fields and using `INSERT DELAYED` to update data in the table would result in either data corruption or a server crash. (Bug#16218, Bug#17294, Bug#16611)
- The value returned by a stored function returning a string value was not of the declared character set. (Bug#16211)
- The `index_merge/Intersection` optimizer could experience a memory overrun when the number of table columns covered by an index was sufficiently large, possibly resulting in a server crash. (Bug#16201)
- `DECIMAL` columns were handled incorrectly in two respects :
 1. When the precision of the column was too small for the value. In this case, the original value was returned instead of an error.
 2. When the scale of the column was set to 0. In this case, the value was treated as though the scale had been defined as 2.(Bug#16172)
- Certain queries having a `WHERE` clause that included conditions on multi-part keys with more than 2 key parts could produce incorrect results and send `[NOTE] USE_COUNT: WRONG COUNT FOR KEY AT...` messages to `STDERR`. (Bug#16168)
- When a row was inserted through a view but did not specify a value for a column that had no default value in the base table, no warning or error occurred. Now a warning occurs, or an error in strict SQL mode. (Bug#16110)
- When `NOW()` was used in a `BETWEEN` clause of the definition for a view, it was replaced with a constant in the view. (Bug#15950)
- The C API failed to return a status message when invoking a stored procedure. (Bug#15752)
- `mysqlimport` sends a `set @@character_set_database=binary` statement to the server, but this is not understood by pre-4.1 servers. Now `mysqlimport` encloses the statement within a `/*!40101 ... */` comment so that old servers will ignore it. (Bug#15690)
- For the `CSV` storage engine, memory-mapped pages of the data file were not invalidated when new data was appended to the file via traditional (file descriptor-based) I/O primitives. (Bug#15669)
- `SHOW GRANTS FOR CURRENT_USER` did not return definer grants when executed in `DEFINER` context (such as within a stored procedure defined with `SQL SECURITY DEFINER`), it returned the invoker grants. (Bug#15298)
- The `--collation-server` server option was being ignored. With the fix, if you choose a non-default character set with `--character-set-server`, you should also use `--collation-server` to specify the collation. (Bug#15276)
- The server crashed if it tried to access a `CSV` table for which the data file had been removed. (Bug#15205)
- Tables created with the `FEDERATED` storage engine did not permit indexes using `NULL` columns. (Bug#15133)

- When using tables containing `VARCHAR` columns created under MySQL 4.1 with a 5.0 or later server, for some queries the metadata sent to the client could have an empty column name. (Bug#14897)
- `CREATE TABLE ... SELECT` statements that selected `GEOMETRY` values resulted in a table that contained `BLOB` columns, not `GEOMETRY` columns. (Bug#14807)
- When setting a column to its implicit default value as the result of inserting a `NULL` into a `NOT NULL` column as part of a multi-row insert or `LOAD DATA` operation, the server returned a misleading warning message. (Bug#14770)
- The use of `WHERE col_name IS NULL` in `SELECT` statements reset the value of `LAST_INSERT_ID()` to zero. (Bug#14553)
- Inserts into `BIT` columns of `FEDERATED` tables did not work. (Bug#14532)
- Using `SELECT` and a table join while running a concurrent `INSERT` operation would join incorrect rows. (Bug#14400)
- Prepared statements caused general log and server memory corruption. (Bug#14346)
- `libmysqld` produced some warnings to `stderr` which could not be silenced. These warnings now are suppressed. (Bug#13717)
- The Instance Manager allowed `STOP INSTANCE` to be used on a server instance that was not running. (Bug#12673)
- For very complex `SELECT` statements could create temporary tables that were too large, and for which the temporary files were not removed, causing subsequent queries to fail. (Bug#11824)
- `USE` did not refresh database privileges when employed to re-select the current database. (Bug#10979)
- The type of the value returned by the `VARIANCE()` function varied according to the type of the input value. The function should always return a `DOUBLE` value. (Bug#10966)
- The same trigger error message was produced under two conditions: The trigger duplicated an existing trigger name, or the trigger duplicated an existing combination of action and event. Now different messages are produced for the two conditions so as to be more informative. (Bug#10946)
- `CREATE USER` did not respect the 16-character username limit. (Bug#10668)
- A server or network failure with an open client connection would cause the client to hang even though the server was no longer available.

As a result of this change, the `MYSQL_OPT_READ_TIMEOUT` and `MYSQL_OPT_WRITE_TIMEOUT` options for `mysql_options()` now apply to TCP/IP connections on all platforms. Previously, they applied only to Windows. (Bug#9678)
- `INSERT INTO ... SELECT ... LIMIT 1` could be slow because the `LIMIT` was ignored when selecting candidate rows. (Bug#9676)
- The optimizer could produce an incorrect result after `AND` with collations such as `latin1_german2_ci`, `utf8_czech_ci`, and `utf8_lithianian_ci`. (Bug#9509)
- A stored procedure with a `CONTINUE` handler that encountered an error continued to execute a statement that caused an error, rather with the next statement following the one that caused the error. (Bug#8153)
- For ODBC compatibility, MySQL supports use of `WHERE col_name IS NULL` for `DATE` or `DATETIME` columns that are `NOT NULL`, to allow column values of `'0000-00-00'` or `'0000-00-00 00:00:00'` to be selected. However, this was not working for `WHERE` clauses in `DELETE` statements. (Bug#8143)
- A user variable set to a value selected from an unsigned column was stored as a signed value. (Bug#7498)
- The `--with-collation` option was not honored for client connections. (Bug#7192)
- When the precision of the column was too small for the value. In this case, the original value was returned instead of an error.
- When the scale of the column was set to 0. In this case, the value. In this case, the value was treated as though the scale had been defined as 2.

E.1.4. Changes in MySQL 5.0.24a (25 August 2006)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.24.

Bugs fixed:

- The shared compatibility RPM files were missing some files. ([Bug#22251](#))
- `mysqld` could crash when closing temporary tables. ([Bug#21582](#))
- MySQL 5.0.24 introduced an ABI incompatibility, which this release reverts. Programs compiled against 5.0.24 are not compatible with any other version and must be recompiled. ([Bug#21543](#))
- Pathname separator and device characters were not correctly parameterized for NetWare, causing `mysqld` startup errors. ([Bug#21537](#))
- Closing of temporary tables failed if binary logging was not enabled. ([Bug#20919](#))
- For statements that have a `DEFINER` clause such as `CREATE TRIGGER` or `CREATE VIEW`, long usernames or hostnames could cause a buffer overflow. ([Bug#16899](#))

E.1.5. Changes in MySQL 5.0.24 (27 July 2006)

This is a bugfix release for the current production release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- In the `INFORMATION_SCHEMA.ROUTINES` table the `ROUTINE_DEFINITION` column now is defined as `NULL` rather than `NOT NULL`. Also, `NULL` rather than the empty string is returned as the column value if the user does not have sufficient privileges to see the routine definition. ([Bug#20230](#))
- The `LEFT()` and `RIGHT()` functions return `NULL` if any argument is `NULL`. ([Bug#11728](#))
- The `innodb_log_arch_dir` system variable (which has been unused since MySQL 4.0.6) is now deprecated and should no longer be used. It will be removed in MySQL 5.1.
- Program Database files (extension `pdf`) are now included by default in Windows distributions. These can be used to help diagnose problems with `mysqld` and other tools. See [Section 25.4.1, “Debugging a MySQL Server”](#).

Bugs fixed:

- **Security Fix:** If a user has access to `MyISAM` table `t`, that user can create a `MERGE` table `m` that accesses `t`. However, if the user's privileges on `t` are subsequently revoked, the user can continue to access `t` by doing so through `m`. If this behavior is undesirable, you can start the server with the new `--skip-merge` option to disable the `MERGE` storage engine. ([Bug#15195](#), [CVE-2006-4031](#))
- **MySQL Cluster:** The `ndb_size.pl` script did not account for `TEXT` and `BLOB` column values correctly. ([Bug#21204](#))
- **MySQL Cluster:** The repeated creating and dropping of a table would eventually lead to `NDB Error 826, TOO MANY TABLES AND ATTRIBUTES ... INSUFFICIENT SPACE`. ([Bug#20847](#))
- Under heavy load (executing more than 1024 simultaneous complex queries), a problem in the code that handles internal temporary tables could lead to writing beyond allocated space and memory corruption.
Use of more than 1024 simultaneous cursors server wide also could lead to memory corruption. This applies to both stored procedure cursors and C API cursors. ([Bug#21206](#))
- Failure to account for a `NULL` table pointer on big-endian machines could cause a server crash during type conversion. ([Bug#21135](#))
- `mysqldump` sometimes did not select the correct database before trying to dump views from it, resulting in an empty result set that caused `mysqldump` to die with a segmentation fault. ([Bug#21014](#))
- A `SELECT` that used a subquery in the `FROM` clause that did not select from a table failed when the subquery was used in a join. ([Bug#21002](#))

- `REPLACE ... SELECT` for a view required the `INSERT` privilege for tables other than the table being modified. (Bug#20989)
- A race condition during slave server shutdown caused an assert failure. (Bug#20850)
- Issuing a `SHOW CREATE FUNCTION` or `SHOW CREATE PROCEDURE` statement without sufficient privileges could crash the `mysql` client. (Bug#20664)
- In a view defined with `SQL SECURITY DEFINER`, the `CURRENT_USER()` function returned the invoker, not the definer. (Bug#20570)
- With the `auto_increment_increment` system variable set larger than 1, if the next generated `AUTO_INCREMENT` value would be larger than the column's maximum value, the value would be clipped down to that maximum value and inserted, even if the resulting value would not be in the generated sequence. This could cause problems for master-master replication. Now the server clips the value down to the previous value in the sequence, which correctly produces a duplicate-key error if that value already exists in the column. (Bug#20524)
- `SELECT @@INSERT_ID` displayed a value unrelated to a preceding `SET INSERT_ID`. (It was returning `LAST_INSERT_ID` instead.) (Bug#20392)
- The `mysql` client did not understand `help` commands that had spaces at the end. (Bug#20328)
- `mysqldump` produced a malformed dump file when dumping multiple databases that contained views. (Bug#20221)
- If a table on a slave server had a higher `AUTO_INCREMENT` counter than the corresponding master table (even though all rows of the two tables were identical), in some cases `REPLACE` or `INSERT ... ON DUPLICATE KEY UPDATE` would not replicate properly using statement-based logging. (Different values would be inserted on the master and slave.) (Bug#20188)
- For a `DATE` parameter sent via a `MYSQL_TIME` data structure, `mysql_stmt_execute()` zeroed the hour, minute, and second members of the structure rather than treating them as read-only. (Bug#20152)
- Performing `INSERT ... SELECT ... JOIN ... USING` without qualifying the column names caused `ERROR 1052 "column 'x' in field list is ambiguous"` even in cases where the column references were unambiguous. (Bug#18080)
- Using the extended syntax for `TRIM()` — that is, `TRIM(... FROM ...)` — in a `SELECT` statement defining a view caused an invalid syntax error when selecting from the view. (Bug#17526)
- Assignments of values to variables of type `TEXT` were handled incorrectly in stored routines. (Bug#17225)
- `DATE_ADD()` and `DATE_SUB()` returned `NULL` when the result date was on the day '9999-12-31'. (Bug#12356)
- The `DATA DIRECTORY` table option did not work for `TEMPORARY` tables. (Bug#8706)
- Bug#10952 may cause inadvertent data loss. A fix for this bug was included in MySQL 5.0.23, but the approach used caused a loss of intended functionality. Because of this, that fix has been reverted in MySQL 5.0.24. As a consequence, the risk of inadvertent data loss still exists (see Bug#10952).

E.1.6. Changes in MySQL 5.0.23 (Not released)

MySQL 5.0.23 was never officially released.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Important Change: MySQL Cluster:** The status variables `Ndb_connected_host` and `Ndb_connected_port` were renamed to `Ndb_config_from_host` and `Ndb_config_from_port`, respectively.
- **MySQL Cluster:** The limit of 2048 ordered indexes per cluster has been lifted. There is now no upper limit on the number of ordered indexes (including `AUTO_INCREMENT` columns) that may be used. (Bug#14509)
- The `mysqldumpslow` script has been moved from client RPM packages to server RPM packages. This corrects a problem where `mysqldumpslow` could not be used with a client-only RPM install, because it depends on `my_print_defaults` which is in the server RPM. (Bug#20216)

- Added the `log_queries_not_using_indexes` system variable. (Bug#19616)
- Added the `ssl_ca`, `ssl_capath`, `ssl_cert`, `ssl_cipher`, and `ssl_key` system variables, which display the values given via the corresponding command options. See Section 5.5.7.3, “SSL Command Options”. (Bug#19606)
- SQL syntax for prepared statements now supports `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE`. (Bug#19308)
- For a table with an `AUTO_INCREMENT` column, `SHOW CREATE TABLE` now shows the next `AUTO_INCREMENT` value to be generated. (Bug#19025)
- The `ONLY_FULL_GROUP_BY` SQL mode now also applies to the `HAVING` clause. That is, columns not named in the `GROUP BY` clause cannot be used in the `HAVING` clause if not used in an aggregate function. (Bug#18739)
- Added the `--set-charset` option to `mysqlbinlog` to allow the character set to be specified for processing binary log files. (Bug#18351)
- The bundled yaSSL library was upgraded to version 1.3.5. This improves handling of certain problems with SSL-related command options. (Bug#17737)
- Added the `--ssl-verify-server-cert` option to MySQL client programs. This option causes the server's Common Name value in its certificate to be verified against the hostname used when connecting to the server, and the connection is rejected if there is a mismatch. Added `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` option for the `mysql_options()` C API function to enable this verification. This feature can be used to prevent man-in-the-middle attacks. Verification is disabled by default. (Bug#17208)
- It is now possible to use `NEW.var_name` values within triggers as `INOUT` parameters to stored procedures. (Bug#14635)
- Added the `--angel-pid-file` option to `mysqlmanager` for specifying the file in which the angel process records its process ID when `mysqlmanager` runs in daemon mode. (Bug#14106)
- The `mysql_get_ssl_cipher()` C API function was added.
- The `mysql_upgrade` command has been converted from a shell script to a C program, so it is available on non-Unix systems such as Windows. This program should be run for each MySQL upgrade. See Section 4.4.9, “mysql_upgrade — Check Tables for MySQL Upgrade”.
- Binary distributions that include SSL support now are built using yaSSL when possible.

Bugs fixed:

- **Security Fix:** A `NUL` byte within a comment in a statement string caused the rest of the string not to be written to the query log, allowing logging to be bypassed. (Bug#17667, CVE-2006-0903)
- **MySQL Cluster:** The `ndb_mgm` client command `ALL CLUSTERLOG STATISTICS=15` had no effect. (Bug#20336)
- **MySQL Cluster:** The failure of a data node when preparing to commit a transaction (that is, while the node's status was `CS_PREPARE_TO_COMMIT`) could cause the failure of other cluster data nodes. (Bug#20185)
- **MySQL Cluster:** An internal formatting error caused some management client error messages to be unreadable. (Bug#20016)
- **MySQL Cluster:** Renaming a table in such a way as to move it to a different database failed to move the table's indexes. (Bug#19967)
- **MySQL Cluster:** Running management client commands while `mgmd` was in the process of disconnecting could cause the management server to fail. (Bug#19932)
- **MySQL Cluster:** Running `ALL START` in the `NDB` management client or restarting multiple nodes simultaneously could under some circumstances cause the cluster to crash. (Bug#19930)
- **MySQL Cluster:** `TEXT` columns in Cluster tables having both an explicit primary key and a unique key were not correctly updated by `REPLACE` statements. (Bug#19906)
- **MySQL Cluster:** The cluster's data nodes failed while trying to load data when `NoOfFrangmentLogFiles` was set equal to 1. (Bug#19894)
- **MySQL Cluster:** Restoring a backup with `ndb_restore` failed when the backup had been taken from a cluster whose `DataMemory` had been completely used up. (Bug#19852)

- **MySQL Cluster:** Resources for unique indexes on Cluster table columns were incorrectly allocated, so that only one-fourth as many unique indexes as indicated by the value of `UniqueHashIndexes` could be created. (Bug#19623)
- **MySQL Cluster:** (NDBAPI): On big-endian platforms, `NdbOperation::write_attr()` did not update 32-bit fields correctly. (Bug#19537)
- **MySQL Cluster:** `LOAD DATA LOCAL` failed to ignore duplicate keys in Cluster tables. (Bug#19496)
- **MySQL Cluster:** For `ndb_mgmd`, Valgrind revealed problems with a memory leak and a dependency on an uninitialized variable. (Bug#19318, Bug#20333)
- **MySQL Cluster:** A problem with error handling when `ndb_use_exact_count` was enabled could lead to incorrect values returned from queries using `COUNT()`. A warning is now returned in such cases. (Bug#19202)
- **MySQL Cluster:** `TRUNCATE` failed on tables having `BLOB` or `TEXT` columns with the error `LOCK WAIT TIMEOUT EXCEEDED`. (Bug#19201)
- **MySQL Cluster:** `mysql-test-run.pl` started `NDB` even for test cases that did not need it. (Bug#19083)
- **MySQL Cluster:** Stopping multiple nodes could cause node failure handling not to be completed. (Bug#19039)
- **MySQL Cluster:** The management client `ALL STOP` command shut down `mgmd` processes (as well as `ndbd` processes). (Bug#18966)
- **MySQL Cluster:** `TRUNCATE TABLE` failed to reset the `AUTO_INCREMENT` counter. (Bug#18864)
- **MySQL Cluster:** Repeated `CREATE - INSERT - DROP` operations tables could in some circumstances cause the MySQL table definition cache to become corrupt, so that some `mysqld` processes could access table information but others could not. (Bug#18595)
- **MySQL Cluster:** Repeated use of the `SHOW` and `ALL STATUS` commands in the `ndb_mgm` client could cause the `mgmd` process to crash. (Bug#18591)
- **MySQL Cluster:** `ndbd` sometimes failed to start with the error `NODE FAILURE HANDLING NOT COMPLETED` following a graceful restart. (Bug#18550)
- **MySQL Cluster:** Backups could fail for large clusters with many tables, where the number of tables approached `MaxNumberOfTables`. (Bug#17607)
- **MySQL Cluster:** An issue with `ndb_mgmd` prevented more than 27 `mysqld` processes from connecting to a single cluster at one time. (Bug#17150)
- **MySQL Cluster:** Using “stale” `mysqld .FRM` files could cause a newly-restored cluster to fail. This situation could arise when restarting a MySQL Cluster using the `--initial` option while leaving connected `mysqld` processes running. (Bug#16875)
- **MySQL Cluster:** Data node failures could cause excessive CPU usage by `ndb_mgmd`. (Bug#13987)
- **MySQL Cluster:** Cluster system status variables were not updated properly. (Bug#11459)
- **MySQL Cluster:** Some queries having a `WHERE` clause of the form `c1=val1 OR c2 LIKE 'val2'` were not evaluated correctly. (Bug # 17421)
- **MySQL Cluster:** (NDBAPI): Update operations on blobs were not checked for illegal operations.

Note

Read locks with blob update operations are now upgraded from read committed to read shared.

- A buffer overwrite error in Instance Manager caused a crash. (Bug#20622)
- On Windows, temporary tables containing “ : ” in the name could not be created. (Bug#20616)
- The `fill_help_tables.sql` file did not contain a `SET NAMES 'utf8'` statement to indicate its encoding. This caused problems for some settings of the MySQL character set such as `big5`. (Bug#20551)
- The `fill_help_tables.sql` file did not load properly if the `ANSI_QUOTES` SQL mode was enabled. (Bug#20542)
- `mysql_upgrade` was missing from binary MySQL distributions. (Bug#20403, Bug#18516, Bug#20556)
- Several aspects of view privileges were being checked incorrectly. (Bug#20363, Bug#18681)

- Queries using an indexed column as the argument for the `MIN()` and `MAX()` functions following an `ALTER TABLE ... DISABLE KEYS` statement returned `GOT ERROR 124 FROM STORAGE ENGINE` until `ALTER TABLE ... ENABLE KEYS` was run on the table. (Bug#20357)
- The thread for `INSERT DELAYED` rows was maintaining a separate `AUTO_INCREMENT` counter, resulting in incorrect values being assigned if `DELAYED` and non-`DELAYED` inserts were mixed. (Bug#20195)
- On Linux, `libmysqlclient` when compiled with yaSSL using the `icc` compiler had a spurious dependency on C++ libraries. (Bug#20119)
- A number of dependency issues in the RPM `bench` and `test` packages caused installation of these packages to fail. (Bug#20078)
- A compatibility issue with NPTL (Native POSIX Thread Library) on Linux could result in a deadlock with `FLUSH TABLES WITH READ LOCK` under some conditions. (Bug#20048)
- Some outer joins were incorrectly converted to inner joins. (Bug#19816)
This regression was introduced by Bug#17146
- `CREATE DATABASE`, `RENAME DATABASE`, and `DROP DATABASE` could deadlock in cases where there was a global read lock. (Bug#19815)
- The `WITH CHECK OPTION` was not enforced when a `REPLACE` statement was executed against a view. (Bug#19789)
- Multiple-table updates with `FEDERATED` tables could cause a server crash. (Bug#19773)
- `InnoDB` unlocked its data directory before committing a transaction, potentially resulting in non-recoverable tables if a server crash occurred before the commit. (Bug#19727)
- Subqueries that produced a `BIGINT UNSIGNED` value were being treated as returning a signed value. (Bug#19700)
- `GROUP BY` on an expression that contained a cast to `DECIMAL` produced an incorrect result. (Bug#19667)
- `MERGE` tables did not work reliably with `BIT` columns. (Bug#19648)
- Re-execution of a prepared multiple-table `DELETE` statement that involves a trigger or stored function can result in a server crash. (Bug#19634)
- The range operator failed and caused a server crash for clauses of the form `tbl_name.unsigned_keypart NOT IN (negative_const, ...)`. (Bug#19618)
- `CHECK TABLE` on a `MyISAM` table briefly cleared its `AUTO_INCREMENT` value, while holding only a read lock. Concurrent inserts to that table could use the wrong `AUTO_INCREMENT` value. `CHECK TABLE` no longer modifies the `AUTO_INCREMENT` value. (Bug#19604)
- Using `CONCAT(@user_var, col_name)`, where `col_name` is a column in an `INFORMATION_SCHEMA` table, could cause erroneous duplication of data in the query result. (Bug#19599)
- Some yaSSL public function names conflicted with those from OpenSSL, causing conflicts for applications that linked against both OpenSSL and a version of `libmysqlclient` that was built with yaSSL support. The yaSSL public functions now are renamed to avoid this conflict. (Bug#19575)
- A view definition that referred to an alias in the `HAVING` clause could be saved in the `.frm` file with the alias replaced by the expression that it referred to, causing failure of subsequent `SELECT * FROM view_name` statements. (Bug#19573)
- `mysql` displayed `NULL` for strings that are empty or contain only spaces. (Bug#19564)
- `InnoDB` failed to increment the `handler_read_prev` counter. (Bug#19542)
- Selecting from a view that used `GROUP BY` on a non-constant temporal interval (such as `DATE(col) + INTERVAL TIME_TO_SEC(col) SECOND`) could cause a server crash. (Bug#19490)
- `mysqldump` did not dump the table name correctly for some table identifiers that contained unusual characters such as “:”. (Bug#19479)
- On 64-bit Windows systems, `REGEXP` for regular expressions with exactly 31 characters did not work. (Bug#19407)
- An outer join of two views that was written using `{ OJ ... }` syntax could cause a server crash. (Bug#19396)
- Race conditions on certain platforms could cause the Instance Manager to fail to initialize. (Bug#19391)

- Use of the `--no-pager` option caused `mysql` to crash. ([Bug#19363](#))
- In the `INFORMATION_SCHEMA.COLUMNS` table, the values for the `CHARACTER_MAXIMUM_LENGTH` and `CHARACTER_OCTET_LENGTH` columns were incorrect for multi-byte character sets. ([Bug#19236](#))
- Multiple-table `DELETE` statements containing a subquery that selected from one of the tables being modified caused a server crash. ([Bug#19225](#))
- On Windows, removal of binary log files would fail if the files were already open. ([Bug#19208](#))
- Flushing the compression buffer (via `FLUSH TABLE`) no longer increases the size of an unmodified `ARCHIVE` table. ([Bug#19204](#))
- An `ALTER TABLE` operation that does not need to copy data, when executed on a table created prior to MySQL 4.0.25, could result in a server crash for subsequent accesses to the table. ([Bug#19192](#))
- SSL connections using yaSSL on OpenBSD could fail. ([Bug#19191](#))
- Attempting to set the default value of an `ENUM` or `SET` column to `NULL` caused a server crash. ([Bug#19145](#))
- Use of uninitialized user variables in a subquery in the `FROM` clause resulted in invalid entries in the binary log. ([Bug#19136](#))
- A `CREATE TABLE` statement that created a table from a materialized view did not inherit default values from the underlying table. ([Bug#19089](#))
- Index prefixes for `utf8 VARCHAR` columns did not work for `UPDATE` statements. ([Bug#19080](#))
- Premature optimization of nested subqueries in the `FROM` clause that refer to aggregate functions could lead to incorrect results. ([Bug#19077](#))
- Valgrind revealed several issues with `mysqld` that were corrected: A dangling stack pointer being overwritten; possible uninitialized data in a string comparison; memory corruption in replication slaves when switching databases; `syscall()` write parameter pointing to an uninitialized byte. ([Bug#19022](#), [Bug#20579](#), [Bug#20769](#), [Bug#20783](#), [Bug#20791](#))
- The parser leaked memory when its stack needed to be extended. ([Bug#18930](#))
- `BIT` columns in a table could cause joins that use the table to fail. ([Bug#18895](#))
- The MySQL server startup script `/etc/init.d/mysql` (created from `mysql.server`) is now marked to ensure that the system services `yppbind`, `nscd`, `ldap`, and `NTP` are started first (if these are configured on the machine). ([Bug#18810](#))
- The `COM_STATISTICS` command was changed in 5.0.3 to display session status variable values rather than global values. This causes `mysqladmin status` information not to be useful for the `Slow queries` and `Opens` values. Now `COM_STATISTICS` displays the global values for `Slow queries` and `Opens`. ([Bug#18669](#))
- `LOAD DATA FROM MASTER` would fail when trying to load the `INFORMATION_SCHEMA` database from the master, because the `INFORMATION_SCHEMA` system database would already exist on the slave. ([Bug#18607](#))
- `BLOB` or `TEXT` arguments to or values returned from stored functions were not copied properly if too long and could become garbled. ([Bug#18587](#))
- The `IN-to-EXISTS` transformation was making a reference to a parse tree fragment that was left out of the parse tree. This caused problems with prepared statements. ([Bug#18492](#))
- `mysqldump` produced garbled output for view definitions. ([Bug#18462](#))
- The configuration information for building the embedded server on Windows was missing a file. ([Bug#18455](#))
- In `mysqltest`, `--sleep=0` had no effect. Now it correctly causes `sleep` commands in test case files to sleep for 0 seconds. ([Bug#18312](#))
- `INFORMATION_SCHEMA.TABLES` provided inconsistent info about invalid views. This could cause server crashes or result in incorrect data being returned for queries that attempt to obtain information from `INFORMATION_SCHEMA` tables about views using stored functions. ([Bug#18282](#))
- On Windows, corrected a crash stemming from differences in Visual C runtime library routines from POSIX behavior regarding invalid file descriptors. ([Bug#18275](#))
- On Windows, terminating `mysqld` with Control-C could result in a crash during shutdown. ([Bug#18235](#))
- Selecting data from a `MEMORY` table with a `VARCHAR` column and a `HASH` index over it returned only the first row matched.

Bug#18233)

- The use of `MIN()` and `MAX()` on columns with an index prefix produced incorrect results in some queries. (Bug#18206)
- An entry in the `mysql.proc` table with an empty routine name caused access to the `INFORMATION_SCHEMA.ROUTINES` table to crash the server. (Bug#18177)
- A `UNION` over more than 128 `SELECT` statements that use an aggregate function failed. (Bug#18175)
- Updates to a `MEMORY` table caused the size of `BTREE` indexes for the table to increase. (Bug#18160)
- `SELECT DISTINCT` queries sometimes returned only the last row. (Bug#18068)
- Returning the value of a system variable from a stored function caused a server crash. (Bug#18037)
- An update that used a join of a table to itself and modified the table on both sides of the join reported the table as crashed. (Bug#18036)
- Race conditions on certain platforms could cause the Instance Manager to try to restart the same instance multiple times. (Bug#18023)
- For a reference to a non-existent index in `FORCE INDEX`, the error message referred to a column, not an index. (Bug#17873)
- The `sql_big_selects` system variable was not displayed by `SHOW VARIABLES`. (Bug#17849)
- `REPAIR TABLE` did not restore the length for packed keys in tables created under MySQL 4.x, which caused them to appear corrupt to `CHECK TABLE` but not to `REPAIR TABLE`. (Bug#17810)
- Results from `INFORMATION_SCHEMA.SCHEMATA` could contain uppercase information when `lower_case_table_names` was not 0. (Bug#17661)
- `CREATE TABLE ... SELECT` did not always produce the proper column default value in `TRADITIONAL SQL` mode. (Bug#17626)
- A range access optimizer heuristic was invalid, causing some queries to be much slower in MySQL 5.0 than in 4.0. (Bug#17379, Bug#18940)
- `mysqldump` would not dump views that had become invalid because a table named in the view definition had been dropped. Instead, it quit with an error message. Now you can specify the `--force` option to cause `mysqldump` to keep going and write an SQL comment containing the view definition to the dump output. (Bug#17371)
- The `--core-file-size` option for `mysqld_safe` was effective only for `root`. (Bug#17353)
- On Windows, multiple clients simultaneously attempting to perform `ALTER TABLE` operations on an `InnoDB` table could deadlock. (Bug#17264)
- The binary log would create an incorrect `DROP` query when creating temporary tables during replication. (Bug#17263)
- Revised memory allocation for local objects within stored functions and triggers to avoid memory leak for repeated function or trigger invocation. (Bug#17260)
- Multiple calls to a stored procedure that selects from `INFORMATION_SCHEMA` could cause a server crash. (Bug#17204)
- Views created from prepared statements inside of stored procedures were created with a definition that included both `SQL_CACHE` and `SQL_NO_CACHE`. (Bug#17203)
- `mysqldump` wrote an extra pair of `DROP DATABASE` and `CREATE DATABASE` statements if run with the `--add-drop-database` option and the database contained views. (Bug#17201)
- A `TABLE ... DOESN'T EXIST` error could occur for statements that called a function defined in another database. (Bug#17199)
- For certain `CREATE TABLE ... SELECT` statements, the selected values were truncated when inserted into the new table. (Bug#17048)
- `ALTER TABLE` on a table created prior to 5.0.3 would cause table corruption if the `ALTER TABLE` did one of the following:
 - Change the default value of a column.
 - Change the table comment.
 - Change the table password.

(Bug#17001)

- MyISAM table deadlock was possible if one thread issued a `LOCK TABLES` request for write locks and then an administrative statement such as `OPTIMIZE TABLE`, if between the two statements another client meanwhile issued a multiple-table `SELECT` for some of the locked tables. (Bug#16986)
- Symlinking `.mysql_history` to `/dev/null` to suppress statement history saving by `mysql` did not work. (`mysql` deleted the symlink and recreated `.mysql_history` as a regular file, and then wrote history to it.) (Bug#16803)
- Concatenating the results of multiple constant subselects produced incorrect results. (Bug#16716)
- Privilege checking on the contents of the `INFORMATION_SCHEMA.VIEWS` table was insufficiently restrictive. (Bug#16681)
- `mysqlcheck` tried to check views instead of ignoring them. (Bug#16502)
- `IS_USED_LOCK()` could return an incorrect connection identifier. (Bug#16501)
- Concurrent reading and writing of privilege structures could crash the server. (Bug#16372)
- Grant table modifications sometimes did not refresh the in-memory tables if the hostname was `'` or not specified. (Bug#16297)
- The `sql_notes` and `sql_warnings` system variables were not always displayed correctly by `SHOW VARIABLES` (for example, they were displayed as `ON` after being set to `OFF`). (Bug#16195)
- The `max_length` metadata value for columns created from `CONCAT()` could be incorrect when the collation of an argument differed from the collation of the `CONCAT()` itself. In some contexts such as `UNION`, this could lead to truncation of the column contents. (Bug#15962)
- The server no longer uses a signal handler for signal 0 because it could cause a crash on some platforms. (Bug#15869)
- InnoDB does not support `SPATIAL` indexes, but did not prevent creation of such an index. (Bug#15860)
- Long multiple-row `INSERT` statements could take a very long time for some multi-byte character sets. (Bug#15811)
- The `system_time_zone` and `version_*` system variables could not be accessed via `SELECT @@var_name` syntax. (Bug#15684, Bug#12792)
- `EXPLAIN ... SELECT INTO` caused the client to hang. (Bug#15463)
- Nested natural joins worked executed correctly when executed as a non-prepared statement could fail with an `Unknown column 'col_name' in 'field list'` error when executed as a prepared statement, due to a name resolution problem. (Bug#15355)
- The `MD5()` and `SHA()` functions treat their arguments as case-sensitive strings. But when they are compared, their arguments were compared as case-insensitive strings, which leads to two function calls with different arguments (and thus different results) compared as being identical. This can lead to a wrong decision made in the range optimizer and thus to an incorrect result set. (Bug#15351)
- Invalid escape sequences in option files caused MySQL programs that read them to abort. (Bug#15328)
- Re-executing a stored procedure with a complex stored procedure cursor query could lead to a server crash. (Bug#15217)
- `CREATE TABLE ... SELECT ...` statements that used a stored function explicitly or implicitly (through a view) resulted in a `Table not locked` error. (Bug#15137, Bug#12472)
- An invalid comparison between keys with index prefixes over multi-byte character fields could lead to incorrect result sets if the selected query execution plan used a range scan by an index prefix over a `UTF8` character field. This also caused incorrect results under similar circumstances with many other character sets. (Bug#14896)
- A view with a non-existent account in the `DEFINER` clause caused `SHOW CREATE VIEW` to fail. Now `SHOW CREATE VIEW` issues a warning instead. (Bug#14875)
- For `BOOLEAN` mode full-text searches on non-indexed columns, `NULL` rows generated by a `LEFT JOIN` caused incorrect query results. (Bug#14708, Bug#25637)
- `SHOW CREATE TABLE` did not display the `AUTO_INCREMENT` column attribute if the SQL mode was `MYSQL323` or `MYSQL40`. This also affected `mysqldump`, which uses `SHOW CREATE TABLE` to get table definitions. (Bug#14515)
- Some queries were slower in 5.0 than in 4.1 because some 4.1 cost-evaluation code had not been merged into 5.0. (Bug#14292)

- The binary log lacked character set information for table names when dropping temporary tables. ([Bug#14157](#))
- The result from `CONV()` is a string, but was not always treated the same way as a string when converted to a real value for an arithmetic operation. ([Bug#13975](#))
- RPM packages had spurious dependencies on Perl modules and other programs. ([Bug#13634](#))
- `REPLACE` statements caused activation of `UPDATE` triggers, not `DELETE` and `INSERT` triggers. ([Bug#13479](#))
- With settings of `read_buffer_size` \geq 2G and `read_rnd_buffer_size` \geq 2G, `LOAD DATA INFILE` failed with no error message or caused a server crash for files larger than 2GB. ([Bug#12982](#))
- A `B-TREE` index on a `MEMORY` table erroneously reported duplicate entry error for multiple `NULL` values. ([Bug#12873](#))
- Use of `CONVERT_TZ()` in a stored function or trigger (or in a stored procedure called from a stored function or trigger) caused an error. ([Bug#11081](#))
- `LOAD_FILE()` returned an error if the file did not exist, rather than `NULL` as it should according to the manual. ([Bug#10418](#))
- When `myisamchk` needed to rebuild a table, `AUTO_INCREMENT` information was lost. ([Bug#10405](#))
- For certain `CREATE VIEW` statements, the server did not detect invalid subqueries within the `SELECT` part. ([Bug#7549](#))
- Within a trigger, `SET` used the SQL mode of the invoking statement, not the mode in effect at trigger creation time. ([Bug#6951](#))
- An invalid `GRANT` statement for which `Ok` was returned on a replication master caused an error on the slave and replication to fail. ([Bug#6774](#))
- Some queries that used `ORDER BY` and `LIMIT` performed quickly in MySQL 3.23, but slowly in MySQL 4.x/5.x due to an optimizer problem. ([Bug#4981](#))
- The `basedir` and `tmpdir` system variables could not be accessed via `@@var_name` syntax. ([Bug#1039](#))

E.1.7. Changes in MySQL 5.0.22 (24 May 2006)

This is a security fix release for the previous production release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Bugs fixed:

- **Security Fix:** An SQL-injection security hole has been found in multi-byte encoding processing. The bug was in the server, incorrectly parsing the string escaped with the `mysql_real_escape_string()` C API function.

This vulnerability was discovered and reported by Josh Berkus <josh@postgresql.org> and Tom Lane <tgl@sss.pgh.pa.us> as part of the inter-project security collaboration of the OSDB consortium. For more information about SQL injection, please see the following text.

Discussion. An SQL injection security hole has been found in multi-byte encoding processing. An SQL injection security hole can include a situation whereby when a user supplied data to be inserted into a database, the user might inject SQL statements into the data that the server will execute. With regards to this vulnerability, when character set-unaware escaping is used (for example, `addslashes()` in PHP), it is possible to bypass the escaping in some multi-byte character sets (for example, SJIS, BIG5 and GBK). As a result, a function such as `addslashes()` is not able to prevent SQL-injection attacks. It is impossible to fix this on the server side. The best solution is for applications to use character set-aware escaping offered by a function such `mysql_real_escape_string()`.

However, a bug was detected in how the MySQL server parses the output of `mysql_real_escape_string()`. As a result, even when the character set-aware function `mysql_real_escape_string()` was used, SQL injection was possible. This bug has been fixed.

Workarounds. If you are unable to upgrade MySQL to a version that includes the fix for the bug in `mysql_real_escape_string()` parsing, but run MySQL 5.0.1 or higher, you can use the `NO_BACKSLASH_ESCAPES` SQL mode as a workaround. (This mode was introduced in MySQL 5.0.1.) `NO_BACKSLASH_ESCAPES` enables an SQL standard compatibility mode, where backslash is not considered a special character. The result will be that queries will fail.

To set this mode for the current connection, enter the following SQL statement:

```
SET sql_mode='NO_BACKSLASH_ESCAPES';
```

You can also set the mode globally for all clients:

```
SET GLOBAL sql_mode='NO_BACKSLASH_ESCAPES';
```

This SQL mode also can be enabled automatically when the server starts by using the command-line option `--sql-mode=NO_BACKSLASH_ESCAPES` or by setting `sql_mode=NO_BACKSLASH_ESCAPES` in the server option file (for example, `my.cnf` or `my.ini`, depending on your system). (Bug#8378, CVE-2006-2753)

See also Bug#8303

- The dropping of a temporary table whose name contained a backtick (``) character was not correctly written to the binary log, which also caused it not to be replicated correctly. (Bug#19188)
- The client libraries were not compiled for position-independent code on Solaris-SPARC and AMD x86_64 platforms. (Bug#18091, Bug#13159, Bug#14202)
- Running `myisampack` followed by `myisamchk` with the `--unpack` option would corrupt the `auto_increment` key. (Bug#12633)
- The patch for Bug#8303 broke the fix for Bug#8378 and was reverted.

In string literals with an escape character (\\) followed by a multi-byte character that had (\\) as its second byte, the literal was not interpreted correctly. Now only next byte now is escaped, and not the entire multi-byte character. This means it a strict reverse of the `mysql_real_escape_string()` function.

E.1.8. Changes in MySQL 5.0.21 (02 May 2006)

This MySQL 5.0.21 release includes the patches for recently reported security vulnerabilities in the MySQL client-server protocol. We would like to thank Stefano Di Paola <stefano.dipaola@wisec.it> for finding and reporting these to us.

This is a bugfix release for the current production release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Enterprise* (a commercial MySQL offering). For more details please see <http://www.mysql.com/products/enterprise>.

Functionality added or changed:

- **Security Enhancement:** Added the global `max_prepared_stmt_count` system variable to limit the total number of prepared statements in the server. This limits the potential for denial-of-service attacks based on running the server out of memory by preparing huge numbers of statements. The current number of prepared statements is available through the `prepared_stmt_count` system variable. (Bug#16365)
- **MySQL Cluster:** It is now possible to perform a partial start of a cluster. That is, it is now possible to bring up the cluster without first running `ndbd --initial` on all configured data nodes. (Bug#18606)
- **MySQL Cluster:** Added the `--nowait-nodes` startup option for `ndbd`, making it possible to skip specified nodes without waiting for them to start when starting the cluster. See Section 19.6.5.1, “Command Options for `ndbd`”.
- **MySQL Cluster:** It is now possible to install MySQL with Cluster support to a non-default location and change the search path for font description files using either the `--basedir` or `--character-sets-dir` options. (Previously in MySQL 5.0, `ndbd` searched only the default path for character sets.)
- **Packaging:** The `MySQL-shared-compat-5.0.X-.i386.rpm` shared compatibility RPMs no longer contain libraries for MySQL 5.1. This avoids a conflict because the 5.0 and 5.1 libraries share the same soname number. They now contain libraries for MySQL 3.23, 4.0, 4.1, and 5.0 only. (Bug#19288)
- The default for the `innodb_thread_concurrency` system variable was changed to 8. (Bug#15868)
- Server and clients ignored the `--sysconfdir` option that was passed to `configure`. The directory specified by this option, if set, now is used as one of the standard locations in which to look for option files. (Bug#15069)
- In result set metadata, the `MYSQL_FIELD.length` value for `BIT` columns now is reported in number of bits. For example, the value for a `BIT(9)` column is 9. (Formerly, the value was related to number of bytes.) (Bug#13601)

Bugs fixed:

- **Security Fix:** Invalid arguments to `DATE_FORMAT()` caused a server crash. Thanks to Jean-David Maillefer for discovering and reporting this problem to the Debian project and to Christian Hammers from the Debian Team for notifying us of it. ([Bug#20729](#), [CVE-2006-3469](#))
- **Security Fix:** A malicious client, using specially crafted invalid `COM_TABLE_DUMP` packets was able to trigger an exploitable buffer overflow on the server. Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and reporting this bug. ([CVE-2006-1518](#))
- **Security Fix:** A malicious client, using specially crafted invalid login or `COM_TABLE_DUMP` packets was able to read uninitialized memory, which potentially, though unlikely in MySQL, could have led to an information disclosure. (,) Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and reporting this bug. ([CVE-2006-1516](#), [CVE-2006-1517](#))
- **MySQL Cluster:** A simultaneous `DROP TABLE` and table update operation utilising a table scan could trigger a node failure. ([Bug#18597](#))
- **MySQL Cluster:** When multiple node restarts were attempted without allowing each restart to complete, the error message returned was `ARRAY INDEX OUT OF BOUNDS` rather than `TOO MANY CRASHED REPLICAS`. ([Bug#18349](#))
- **MySQL Cluster:** In a 2-node cluster with a node failure, restarting the node with a low value for `StartPartialTimeout` could cause the cluster to come up partitioned (“split-brain” issue).

A similar issue could occur when the cluster was first started with a sufficiently low value for this parameter. ([Bug#16447](#), [Bug#18612](#))

- **MySQL Cluster:** On systems with multiple network interfaces, data nodes would get “stuck” in startup phase 2 if the interface connecting them to the management server was working on node startup while the interface interconnecting the data nodes experienced a temporary outage. ([Bug#15695](#))
- **MySQL Cluster:** On slow networks or CPUs, the management client `SHOW` command could sometimes erroneously show all data nodes as being master nodes belonging to nodegroup 0. ([Bug#15530](#))
- **MySQL Cluster:** `TRUNCATE` did not reset the `AUTO_INCREMENT` counter for `MyISAM` tables when issued inside a stored procedure.

Note

This bug did not affect `InnoDB` tables.

In addition, `TRUNCATE` does not reset the `AUTO_INCREMENT` counter for `NDB` tables regardless of when it is called.

([Bug#14945](#))

See also [Bug#18864](#)

- **MySQL Cluster:** Unused open handlers for tables in which the metadata had changed were not properly closed. This could result in stale results from `NDB` tables following an `ALTER TABLE` statement. ([Bug#13228](#))
- **MySQL Cluster:** Uninitialized internal variables could lead to unexpected results. ([Bug#11033](#), [Bug#11034](#))
- **MySQL Cluster:** When attempting to create an index on a `BIT` or `BLOB` column, `ERROR 743: UNSUPPORTED CHARACTER SET IN TABLE OR INDEX` was returned instead of `ERROR 906: UNSUPPORTED ATTRIBUTE TYPE IN INDEX`.
- `InnoDB` could read a delete mark from its system tables incorrectly. ([Bug#19217](#))
- Corrected a syntax error in `mysql-test-run.sh`. ([Bug#19190](#))
- Index corruption could occur in cases when `key_cache_block_size` was not a multiple of `myisam_block_size` (for example, with `key_cache_block_size=1536` and `myisam_block_size=1024`). ([Bug#19079](#))
- The optimizer could cause a server crash or use a non-optimal subset of indexes when evaluating whether to use `Index Merge/Intersection` variant of `index_merge` optimization. ([Bug#19021](#))
- A missing `DEBUG_RETURN()` caused the server to emit a spurious error message: `missing DEBUG_RETURN or DEBUG_VOID_RETURN macro in function "open_table"`. ([Bug#18964](#))
- Creating a table in an `InnoDB` database with a column name that matched the name of an internal `InnoDB` column (including `DB_ROW_ID`, `DB_TRX_ID`, `DB_ROLL_PTR` and `DB_MIX_ID`) would cause a crash. MySQL now returns Error 1005 `CANNOT CREATE TABLE` with `errno` set to -1. ([Bug#18934](#))

- MySQL would not compile on Linux distributions that use the `tinfo` library. (Bug#18912)
- `mysql_reconnect()` sent a `SET NAMES` statement to the server, even for pre-4.1 servers that do not understand the statement. (Bug#18830)
- For a reference to a non-existent stored function in a stored routine that had a `CONTINUE` handler, the server continued as though a useful result had been returned, possibly resulting in a server crash. (Bug#18787)
- For single-`SELECT` union constructs of the form `(SELECT ... ORDER BY order_list1 [LIMIT n]) ORDER BY order_list2`, the `ORDER BY` lists were concatenated and the `LIMIT` clause was ignored. (Bug#18767)
- `CREATE VIEW` statements would not be replicated to the slave if the `--replicate-wild-ignore-table` rule was enabled. (Bug#18715)
- Conversion of a number to a `CHAR UNICODE` string returned an invalid result. (Bug#18691)
- `UNCOMPRESS(NULL)` could cause subsequent `UNCOMPRESS()` calls to return `NULL` for legal non-`NULL` arguments. (Bug#18643)
- If the second or third argument to `BETWEEN` was a constant expression such as `'2005-09-01 - INTERVAL 6 MONTH` and the other two arguments were columns, `BETWEEN` was evaluated incorrectly. (Bug#18618)
- A `LOCK TABLES` statement that failed could cause `MyISAM` not to update table statistics properly, causing a subsequent `CHECK TABLE` to report table corruption. (Bug#18544)
- The `yaSSL` library returned a cipher list in a manner incompatible with `OpenSSL`. (Bug#18399)
- `InnoDB` did not use a consistent read for `CREATE ... SELECT` when `innodb_locks_unsafe_for_binlog` was set. (Bug#18350)
- `DROP DATABASE` did not drop stored routines associated with the database if the database name was longer than 21 characters. (Bug#18344)
- The euro sign (€) was not stored correctly in columns using the `latin1_german1_ci` or `latin1_general_ci` collation. (Bug#18321)
- A recent change caused the `mysql` client not to display `NULL` values correctly and to display numeric columns left-justified rather than right-justified. The problems have been corrected. (Bug#18265)
- `COUNT(*)` on a `MyISAM` table could return different results for the base table and a view on the base table. (Bug#18237)
- `EXTRACT(QUARTER FROM date)` returned unexpected results. (Bug#18100)
- Executing `SELECT` on a large table that had been compressed within `myisampack` could cause a crash. (Bug#17917)
- Updating a field value when also requesting a lock with `GET_LOCK()` would cause slave servers in a replication environment to terminate. (Bug#17284)
- Casting a string to `DECIMAL` worked, but casting a trimmed string (using `LTRIM()` or `RTRIM()`) resulted in loss of decimal digits. (Bug#17043)
- `mysql-test-run` could not be run as `root`. (Bug#17002)
- Queries of the form `SELECT DISTINCT timestamp_column WHERE date_function(timestamp_col) = constant` did not return all matching rows. (Bug#16710)
- IA-64 RPM packages for Red Hat and SuSE Linux that were built with the `icc` compiler incorrectly depended on `icc` runtime libraries. (Bug#16662)
- `MySQL-shared-compat-5.0.13-0.i386.rpm`, `MySQL-shared-compat-5.0.15-0.i386.rpm`, `MySQL-shared-compat-5.0.18-0.i386.rpm`, `MySQL-shared-compat-5.0.19-0.i386.rpm`, `MySQL-shared-compat-5.0.20-0.i386.rpm`, and `MySQL-shared-compat-5.0.20a-0.i386.rpm` incorrectly depended on `glibc 2.3` and could not be installed on a `glibc 2.2` system. (Bug#16539)
- The presence of multiple equalities in a condition after reading a constant table could cause the optimizer not to use an index. This resulted in certain queries being much slower than in MySQL 4.1. (Bug#16504)
- Within a trigger, `CONNECTION_ID()` did not return the connection ID of the thread that caused the trigger to be activated. (Bug#16461)
- For tables created in a MySQL 4.1 installation upgraded to MySQL 5.0 and up, multiple-table updates could update only the

first matching row. (Bug#16281)

- A query using WHERE (*column_1*, *column_2*) IN ((*value_1*, *value_2*)[, (...), ...]) would return incorrect results. (Bug#16248)
- For `mysql.server`, if the `basedir` option was specified after `datadir` in an option file, the setting for `datadir` was ignored and assumed to be located under `basedir`. (Bug#16240)
- If the first argument to BETWEEN was a DATE or TIME column of a view and the other arguments were constants, BETWEEN did not perform conversion of the constants to the appropriate temporary type, resulting in incorrect evaluation. (Bug#16069)
- After calling FLUSH STATUS, the `max_used_connections` variable did not increment for existing connections and connections which use the thread cache. (Bug#15933)
- Lettercase in database name qualifiers was not consistently handled properly in queries when `lower_case_table_names` was set to 1. (Bug#15917)
- DELETE and UPDATE statements that used large NOT IN (*value_list*) clauses could use large amounts of memory. (Bug#15872)
- InnoDB failure to release an adaptive hash index latch could cause a server crash if the query cache was enabled. (Bug#15758)
- LAST_INSERT_ID() in a stored function or trigger returned zero. (Bug#15728)
- DELETE with LEFT JOIN for InnoDB tables could crash the server if `innodb_locks_unsafe_for_binlog` was enabled. (Bug#15650)
- When running a query that contained a GROUP_CONCAT(SELECT GROUP_CONCAT(...)), the result was NULL except in the ROLLUP part of the result, if there was one. (Bug#15560)
- Use of CONVERT_TZ() in a view definition could result in spurious syntax or access errors. (Bug#15153)
- CAST(double AS SIGNED INT) for large double values outside the signed integer range truncated the result to be within range, but the result sometimes had the wrong sign, and no warning was generated. (Bug#15098)
- For InnoDB tables, an expression of the form *col_name* BETWEEN *col_name2* - INTERVAL *x* DAY AND *col_name2* + INTERVAL *x* DAY when used in a join returned incorrect results. (Bug#14360)
- Prevent recursive views caused by using RENAME TABLE on a view after creating it. (Bug#14308)
- INSERT DELAYED into a view caused an infinite loop. (Bug#13683)
- Avoid trying to include `<asm/atomic.h>` when it doesn't work in C++ code. (Bug#13621)
- Within stored routines, usernames were parsed incorrectly if they were enclosed within quotes. (Bug#13310)
- The server was always built as though `--with-extra-charsets=complex` had been specified. (Bug#12076)

E.1.9. Changes in MySQL 5.0.20a (18 April 2006)

This is a bugfix release for the current production release family. It replaces MySQL 5.0.20.

Additional information about SSL support

- Please note that the original 5.0.20 announcement included inexact wording: SSL support is “included” in both server and client, but by default not “enabled”. SSL can be enabled by passing the SSL-related options (`--ssl`, `--ssl-key=...`, `--ssl-cert=...`, `--ssl-ca=...`) when starting the server and the client or by specifying these options in an option file. For more information, see [Section 5.5.7, “Using SSL for Secure Connections”](#).
- With version 5.0.20a, SSL support is contained in all binaries for all Unix (including Linux) and Windows platforms except AIX, HP-UX, OpenServer 6, and the RPMs specific for RHAS3/RHAS4/SLES9 on Itanium CPUs (*ia64*); It is also not contained in those for Novell Netware. We are trying to add these platforms in future versions.

Bugs fixed:

- The fix for “Command line options are ignored for mysql client” has been revoked because it introduced an incompatible change in the way the `mysql` command-line client selects the server to connect to. In the worst case, this might have led to a

client issuing commands to a server for which they were not intended, and this must not happen. To help all users in understanding this subject, [Section 4.2.1, “Invoking MySQL Programs”](#) now includes additional explanation of how command options function with regard to host selection. ([Bug#16855](#))

- The code of the [yaSSL](#) library has been improved to avoid a dependency on a C++ runtime library, so a link with pure C applications is now possible on additional (but not yet all) platforms. We are working on fixing the remaining issues.

E.1.10. Changes in MySQL 5.0.20 (31 March 2006)

Functionality added or changed:

- **MySQL Cluster:** The `NDBCLUSTER` storage engine now supports `INSERT IGNORE` and `REPLACE` statements. Previously, these statements failed with an error. ([Bug#17431](#))
- Builds for Windows, Linux, and Unix (except AIX) platforms now have SSL support enabled, in the server as well as in the client libraries. Because part of the SSL code is written in C++, this does introduce dependencies on the system's C++ runtime libraries in several cases, depending on compiler specifics. ([Bug#18195](#))
- Large file support added to build for `QNX` platform. ([Bug#17336](#))
- **InnoDB:** The `InnoDB` storage engine now provides a descriptive error message if `ibdata` file information is omitted from `my.cnf`. ([Bug#16827](#))
- Triggers from older servers that included no `DEFINER` clause in the trigger definition now execute with the privileges of the invoker (which on the slave is the slave SQL thread). Previously, replication slaves could not replicate such triggers. ([Bug#16266](#))
- Added the `--sysdate-is-now` option to `mysqld` to enable `SYSDATE()` to be treated as an alias for `NOW()`. See [Section 11.6, “Date and Time Functions”](#). ([Bug#15101](#))
- Large file support was re-enabled for the MySQL server binary for the AIX 5.2 platform. ([Bug#13571](#))
- The syntax for `CREATE PROCEDURE` and `CREATE FUNCTION` statements now includes a `DEFINER` clause. The `DEFINER` value specifies the security context to be used when checking access privileges at routine invocation time if the routine has the `SQL SECURITY DEFINER` characteristic. See [Section 12.1.8, “CREATE PROCEDURE and CREATE FUNCTION Syntax”](#), for more information.

When `mysqldump` is invoked with the `--routines` option, it now dumps the `DEFINER` value for stored routines.

Bugs fixed:

- **MySQL Cluster:** A timeout in the handling of an `ABORT` condition with more than 32 operations could yield a node failure. ([Bug#18414](#))
- **MySQL Cluster:** A node restart immediately following a `CREATE TABLE` would fail.

Important

This fix supports 2-node Clusters only.

([Bug#18385](#))

- **MySQL Cluster:** In event of a node failure during a rollback, a “false” lock could be established on the backup for that node, which lock could not be removed without restarting the node. ([Bug#18352](#))
- **MySQL Cluster:** The cluster created a crashed replica of a table having an ordered index — or when logging was not enabled, of a table having a table or unique index — leading to a crash of the cluster following 8 successive restarts. ([Bug#18298](#))
- **MySQL Cluster:** When replacing a failed master node, the replacement node could cause the cluster to crash from a buffer overflow if it had an excessively large amount of data to write to the cluster log. ([Bug#18118](#))
- **MySQL Cluster:** Certain queries using `ORDER BY ... ASC` in the `WHERE` clause could return incorrect results. ([Bug#17729](#))
- **MySQL Cluster:** If a `mysql` or other client could not parse the result set returned from a `mysqld` process acting as an SQL node in a cluster, the client would crash instead of returning the appropriate error. For example, this could happen when the client attempted to use a character set was not available to the `mysqld`. ([Bug#17380](#))

- **MySQL Cluster:** Some query cache statistics were not always correctly reported for Cluster tables. ([Bug#16795](#))
- **MySQL Cluster:** Restarting nodes were allowed to start and join the cluster too early. ([Bug#16772](#))
- **MySQL Cluster:** Inserting and deleting `BLOB` column values while a backup was in process could cause data nodes to shut down. ([Bug#14028](#))
- **MySQL Cluster:** The server would not compile with `NDB` support on AIX 5.2. ([Bug#10776](#))
- A `SELECT ... ORDER BY ...` from a view defined using a function could crash the server. An example of such a view is `CREATE VIEW v1 AS SELECT SQRT(c1) FROM t1`. ([Bug#18386](#))
- `InnoDB` had a memory leak for duplicate-key errors with tables having 90 columns or more. ([Bug#18384](#))
- A `DELETE` using a subquery could crash the server. ([Bug#18306](#))
- If a row was inserted inside a stored procedure using the parameters passed to the procedure in the `INSERT` statement, the resulting binlog entry was not escaped properly. ([Bug#18293](#))
- If `InnoDB` encountered a `HA_ERR_LOCK_TABLE_FULL` error and rolled back a transaction, the transaction was still written to the binary log. ([Bug#18283](#))
- When using `ORDER BY` with a non-string column inside `GROUP_CONCAT()` the result's character set was converted to binary. ([Bug#18281](#))
See also [Bug#14169](#)
- Complex queries with nested joins could cause a server crash. ([Bug#18279](#))
- For `InnoDB` tables created in MySQL 4.1 or earlier, or created in 5.0 or later with compact format, updating a row so that a long column is updated or the length of some column changes, `InnoDB` later would fail to reclaim the `BLOB` storage space if the row was deleted. ([Bug#18252](#))
- If `InnoDB` ran out of buffer space for row locks and adaptive hashes, the server would crash. Now `InnoDB` rolls back the transaction. ([Bug#18238](#))
- Views that incorporated tables from the `INFORMATION_SCHEMA` database resulted in a server crash when queried. ([Bug#18224](#))
- `REPAIR TABLE`, `OPTIMIZE TABLE`, and `ALTER TABLE` operations on transactional tables (or on tables of any type on Windows) could corrupt triggers associated with those tables. ([Bug#18153](#))
- The server could deadlock under heavy load while writing to the binary log. ([Bug#18116](#))
- A `SELECT *` query on an `INFORMATION_SCHEMA` table by a user with limited privileges resulted in a server crash. ([Bug#18113](#))
- Connecting to a server with a UCS2 default character set with a client using a non-UCS2 character set crashed the server. ([Bug#18004](#))
- **MyISAM:** Performing a bulk insert on a table referenced by a trigger would crash the table. ([Bug#17764](#))
- Updating a view that filters certain rows to set a filtered out row to be included in the table caused infinite loop. For example, if the view has a `WHERE` clause of `salary > 100` then issuing an `UPDATE` statement of `SET salary = 200 WHERE id = 10`, caused an infinite loop. ([Bug#17726](#))
- **MyISAM:** Keys for which the first part of the key was a `CHAR` or `VARCHAR` column using the UTF-8 character set and longer than 254 bytes could become corrupted. ([Bug#17705](#))
- Updating the value of a Unicode `VARCHAR` column with the result returned by a stored function would cause the insertion of ASCII characters into the column instead of Unicode, even where the function's return type was also declared as Unicode. ([Bug#17615](#))
- For `FEDERATED` tables, a `SELECT` statement with an `ORDER BY` clause did not return rows in the proper order. ([Bug#17377](#))
- `SELECT ... WHERE column LIKE 'A%'`, when `column` had a key and used the `latin2_czech_cs` collation, caused the wrong number of rows to be returned. ([Bug#17374](#))
- A `LEFT JOIN` with a `UNION` that selects literal values could crash the server. ([Bug#17366](#))
- Checks for permissions on database operations could be performed in a case-insensitive manner (a user with permissions on

database `MYDATABASE` could by accident get permissions on database `myDataBase`), if the privilege data were still cached from a previous check. (Bug#17279)

- Stored procedures that call UDFs and pass local string variables caused server crashes. (Bug#17261)
- If the `WHERE` condition of a query contained an `OR`-ed `FALSE` term, the set of tables whose rows cannot serve for null-complements in outer joins was determined incorrectly. This resulted in blocking possible conversions of outer joins into joins by the optimizer for such queries. (Bug#17164)
- Use of `TRUNCATE TABLE` for a `TEMPORARY` table on a master server was propagated to slaves properly, but slaves did not decrement the `Slave_open_temp_tables` counter properly. (Bug#17137)
- `InnoDB` tables with an adaptive hash blocked other queries during `CHECK TABLE` statements while the entire hash was checked. This could be a long time for a large hash. (Bug#17126)
- Stored routine names longer than 64 characters were silently truncated. Now the limit is properly enforced and an error occurs. (Bug#17015)
- `InnoDB`: The `LATEST FOREIGN KEY ERROR` section in the output of `SHOW INNODB STATUS` was sometimes formatted incorrectly, causing problems with scripts that parsed the output of this statement. (Bug#16814)
- If the server was started with the `--skip-grant-tables` option, it was impossible to create a trigger or a view without explicitly specifying a `DEFINER` clause. (Bug#16777)
- The `FORMAT()` function returned an incorrect result when the client's `character_set_connection` value was `utf8`. (Bug#16678)
- Using `ORDER BY intvar` within a stored procedure (where `intvar` is an integer variable or expression) would crash the server.

Note

The use of an integer `i` in an `ORDER BY i` clause for sorting the result by the `i`th column is deprecated (and non-standard). It should *not* be used in new applications. See Section 12.2.8, “`SELECT Syntax`”.

(Bug#16474)

- The `DEFINER` value for stored routines was not replicated. (Bug#15963)
- Character set conversion of string constants for `UNION` of constant and table column was not done when it was safe to do so. (Bug#15949)
- Triggers created in MySQL 5.0.16 and earlier could not be dropped after upgrading the server to 5.0.17 or later. (Bug#15921)
- The `mysql_close()` C API function leaked handles for shared-memory connections on Windows. (Bug#15846)
- `COUNT(DISTINCT col1, col2)` and `COUNT(DISTINCT CONCAT(col1, col2))` operations produced different results if one of the columns was an indexed `DECIMAL` column. (Bug#15745)
- A `SELECT` using a function against a nested view would crash the server. (Bug#15683)
- The server displayed garbage in the error message warning about bad assignments to `DECIMAL` columns or routine variables. (Bug#15480)
- During conversion from one character set to `ucs2`, multi-byte characters with no `ucs2` equivalent were converted to multiple characters, rather than to `0x003F QUESTION MARK`. (Bug#15375)
- Certain combinations of joins with mixed `ON` and `USING` clauses caused `UNKNOWN COLUMN` errors. (Bug#15229)
- `SELECT COUNT(*)` for a `MyISAM` table could return different results depending on whether an index was used. (Bug#14980)
- Attempting to access an `InnoDB` table after starting the server with `--skip-innodb` caused a server crash. (Bug#14575)
- Use of stored functions with `DISTINCT` or `GROUP BY` can produce incorrect results when `ORDER BY` is also used. (Bug#13575)
- The server would execute stored routines that had a non-existent definer. (Bug#13198)
- `mysql_config` returned incorrect libraries on `x86_64` systems. (Bug#13158)

- Loading of UDFs in a statically linked MySQL caused a server crash. UDF loading is now blocked if the MySQL server is statically linked. (Bug#11835)

E.1.11. Changes in MySQL 5.0.19 (04 March 2006)

Functionality added or changed:

- **Incompatible Change:** The `InnoDB` storage engine no longer ignores trailing spaces when comparing `BINARY` or `VARBINARY` column values. This means that (for example) the binary values `'a'` and `'a '` are now regarded as *unequal* any time they are compared, as they are in `MyISAM` tables.

See Section 10.4.2, “The `BINARY` and `VARBINARY` Types” for more information about the `BINARY` and `VARBINARY` types. (Bug#14189)

- **MySQL Cluster:** More descriptive warnings are now issued when inappropriate logging parameters are set in `config.ini`. (Formerly, the warning issued was simply `COULD NOT ADD LOGFILE DESTINATION`.) (Bug#11331)
- **MySQL Cluster:** The `ndb_mgm` client commands `node_id START` and `node_id STOP` now work with management nodes as well as data nodes. However, using `ALL` for `node_id` continues to affect all data nodes only.
- `mysql` no longer terminates data value display when it encounters a NUL byte. Instead, it displays NUL bytes as spaces. (Bug#16859)
- New `charset` command added to `mysql` command-line client. By typing `charset name` or `\C name` (such as `\C UTF8`), the client character set can be changed without reconnecting. (Bug#16217)
- Added the `--wait-timeout` option to `mysqlmanager` to allow configuration of the timeout for dropping an inactive connection, and increased the default timeout from 30 seconds to 28,800 seconds (8 hours). (Bug#15980, Bug#12674)
- The `INFORMATION_SCHEMA` now skips data contained in unlistable/unreadable directories rather than returning an error. (Bug#15851)
- `InnoDB` now caches a list of unflushed files instead of scanning for unflushed files during a table flush operation. This improves performance when `--innodb_file_per_table` is set on a system with a large number of `InnoDB` tables. (Bug#15653)
- Added the `--port-open-timeout` option to `mysqld` to control how many seconds the server should wait for the TCP/IP port to become free if it cannot be opened. (Bug#15591)
- Wording of error 1329 changed to `NO DATA - ZERO ROWS FETCHED, SELECTED, OR PROCESSED`. (Bug#15206)
- The message for error 1109 changed from `UNKNOWN TABLE ... IN ORDER CLAUSE` to `UNKNOWN TABLE ... IN FIELD LIST`. (Bug#15091)
- A number of performance issues were resolved that had previously been encountered when using statements that repeatedly invoked stored functions. For example, calling `BENCHMARK()` using a stored function executed much more slowly than when invoking it with inline code that accomplished the same task. In most cases the two should now execute with approximately the same speed. (Bug#14946, Bug#15014)
- `mysqldump` now surrounds the `DEFINER`, `SQL SECURITY DEFINER` and `WITH CHECK OPTION` clauses of a `CREATE VIEW` statement with "not in version" comments to prevent errors in earlier versions of MySQL. (Bug#14871)
- When using the `GROUP_CONCAT()` function where the `group_concat_max_len` system variable was greater than 512, the type of the result was `BLOB` only if the query included an `ORDER BY` clause; otherwise the result was a `VARCHAR`.
The result type of the `GROUP_CONCAT()` function is now `VARCHAR` only if the value of the `group_concat_max_len` system variable is less than or equal to 512. Otherwise, this function returns a `BLOB`. (Bug#14169)
- The `mysql_ping` function will now retry if the `reconnect` flag is set and error `CR_SERVER_LOST` is encountered during the first attempt to ping the server. (Bug#14057)
- The `mysqltest` utility now converts all `CR/LF` combinations to `LF` to allow test cases intended for Windows to work properly on UNIX-like systems. (Bug#13809)
- `libmysqlclient` now uses versioned symbols with GNU ld. (Bug#3074)
- The client API now attempts to reconnect using TCP/IP if the `reconnect` flag is set, as is the case with sockets. (Bug#2845)
- Added the `--check-upgrade` to `mysqlcheck` that invokes `CHECK TABLE` with the `FOR UPGRADE` option.

- Added the `FOR UPGRADE` option for the `CHECK TABLE` statement. This option checks whether tables are incompatible with the current version of MySQL Server.
- Two new Hungarian collations are included: `utf8_hungarian_ci` and `ucs2_hungarian_ci`. These support the correct sort order for Hungarian vowels. However, they do not support the correct order for sorting Hungarian consonant contractions; we expect to fix this issue in a future release.
- Several changes were made to make upgrades easier:
 - Added the `mysql_upgrade` program that checks all tables for incompatibilities with the current version of MySQL Server and repairs them if necessary. This program should be run for each MySQL upgrade (rather than `mysql_fix_privilege_tables`). See Section 4.4.9, “`mysql_upgrade` — Check Tables for MySQL Upgrade”.
 - Added the `FOR UPGRADE` option for the `CHECK TABLE` statement. This option checks whether tables are incompatible with the current version of MySQL Server.
 - Added the `--check-upgrade` to `mysqlcheck` that invokes `CHECK TABLE` with the `FOR UPGRADE` option.
- Added the `mysql_upgrade` program that checks all tables for incompatibilities with the current version of MySQL Server and repairs them if necessary. This program should be run for each MySQL upgrade (rather than `mysql_fix_privilege_tables`). See Section 4.4.9, “`mysql_upgrade` — Check Tables for MySQL Upgrade”.

Bugs fixed:

- **MySQL Cluster:** Cluster log file paths were truncated to 128 characters. They may now be as long as `MAX_PATH` (the maximum path length permitted by the operating system). (Bug#17411)
- **MySQL Cluster:** Following multiple forced shutdowns and restarts of data nodes, `DROP DATABASE` could fail. (Bug#17325)
- **MySQL Cluster:** The `REDO` log would become corrupted (and thus unreadable) in some circumstances, due to a failure in the query handler. (Bug#17295)
- **MySQL Cluster:** An `UPDATE` with an inner join failed to match any records if both tables in the join did not have a primary key. (Bug#17257)
- **MySQL Cluster:** A `DELETE` with a join in the `WHERE` clause failed to retrieve any records if both tables in the join did not have a primary key. (Bug#17249)
- **MySQL Cluster:** The error message returned by `pererror --ndb` was prefixed with `OS ERROR CODE` instead of `NDB ERROR CODE`. (Bug#17235)
- **MySQL Cluster:** In some cases, `LOAD DATA INFILE` did not load all data into `NDB` tables. (Bug#17081)
- **MySQL Cluster:** `ndb_delete_all` ran out of memory when processing tables containing `BLOB` columns. (Bug#16693)
- **MySQL Cluster:** A `BIT` column whose offset and length totaled 32 caused the cluster to crash. (Bug#16125)
- **MySQL Cluster:** `UNIQUE` keys in Cluster tables were limited to 225 bytes in length. (Bug#15918)
- **MySQL Cluster:** The `ndb_autodiscover` test failed sporadically due to a node not being permitted to connect to the cluster. (Bug#15619)
- **MySQL Cluster:** `NDB` returned an incorrect `CAN'T FIND FILE ERROR` for OS error 24; this has been changed to `TOO MANY OPEN FILES`. (Bug#15020)
- **MySQL Cluster:** No error message was generated for setting `NoOfFragmentLogFiles` too low. (Bug#13966)
- **MySQL Cluster:** No error message was generated for setting `MaxNoOfAttributes` too low. (Bug#13965)
- **MySQL Cluster:** When running more than one management process in a cluster:
 - `ndb_mgm -c host:port -e "node_id STOP"` stopped a management process running only on the same system where the command was issued.
 - `ndb_mgm -e "SHUTDOWN"` failed to shut down any management processes at all. (Bug#12045, Bug#12124)
- **MySQL Cluster:** `ndb_mgm -c host:port -e "node_id STOP"` would stop a management process running only on the same system on which the command was issued.

- **MySQL Cluster:** `ndb_mgm -e "SHUTDOWN"` failed to shut down any management processes at all.
- **Cluster API:** Upon the completion of a scan where a key request remained outstanding on the primary replica and a starting node died, the scan did not terminate. This caused incomplete error handling for the failed node. (Bug#15908)
- `type_decimal` failed with the prepared statement protocol. (Bug#17826)
- The MySQL server could crash with out of memory errors when performing aggregate functions on a `DECIMAL` column. (Bug#17602)
- Using `DROP FUNCTION IF EXISTS func_name` to drop a user-defined function caused a server crash if the server was running with the `--skip-grant-tables` option. (Bug#17595)
- Data truncations on non-`UNIQUE` indexes could crash `InnoDB` when using multi-byte character sets. (Bug#17530)
- A natural join between `INFORMATION_SCHEMA` tables failed. (Bug#17523)
- A stored procedure failed to return data the first time it was called per connection. (Bug#17476)
- For certain `MERGE` tables, the optimizer wrongly assumed that using `index_merge/intersection` was too expensive. (Bug#17314)
- The parser allowed `CREATE AGGREGATE FUNCTION` for creating stored functions, even though `AGGREGATE` does not apply. (It is used only for `CREATE FUNCTION` only when creating user-defined functions.) (Bug#16896)
- Cursors in stored routines could cause a server crash. (Bug#16887)
- Triggers created without `BEGIN` and `END` clauses resulted in “You have an error in your SQL syntax” errors when dumping and replaying a binary log. (Bug#16878)
- Using `ALTER TABLE` to increase the length of a `BINARY(M)` column caused column values to be padded with spaces rather than `0x00` bytes. (Bug#16857)
- A `RETURN` statement within a trigger caused a server crash. `RETURN` now is disallowed within triggers. To exit immediately, use `LEAVE`. (Bug#16829)
- For a MySQL 5.0 server, using MySQL 4.1 tables in queries with a `GROUP BY` clause could result in buffer overrun or a server crash. (Bug#16752)
- An `INSERT` statement in a stored procedure corrupted the binary log. (Bug#16621)
- If the query optimizer transformed a `GROUP BY` clause in a subquery, it did not also transform the `HAVING` clause if there was one, producing incorrect results. (Bug#16603)
- In a highly concurrent environment, a server crash or deadlock could result from execution of a statement that used stored functions or activated triggers coincident with alteration of the tables used by these functions or triggers. (Bug#16593)
- A race condition could occur when dropping the adaptive hash index for a B-tree page in `InnoDB`. (Bug#16582)
- When evaluation of the test in a `CASE` failed in a stored procedure that contained a `CONTINUE` handler, execution resumed at the beginning of the `CASE` statement instead of at the end. (Bug#16568)
- For a transaction that used `MyISAM` and `InnoDB` tables, interruption of the transaction due to a dropped connection on a master server caused slaves to lose synchrony. (Bug#16559)
- Clients compiled from source with the `--without-readline` did not save command history from session to session. (Bug#16557)
- The `DECIMAL` data type was not being handled correctly with prepared statements. (Bug#16511)
- Instance Manager searched wrong location for password file on some platforms. (Bug#16499)
- `UPDATE` statement crashed multi-byte character set `FULLTEXT` index if update value was almost identical to initial value only differing in some spaces being changed to ` `. (Bug#16489)
- The `--replicate-do` and `--replicate-ignore` options were not being enforced on multiple-table statements. (Bug#16487, Bug#15699)
- Certain nested `LEFT JOIN` operations were not properly optimized. (Bug#16393)
- Dropping `InnoDB` constraints named `tbl_name_ibfk_0` could crash the server. (Bug#16387)

- `SELECT` with `GROUP BY` on a view could cause a server crash. (Bug#16382)
- An invalid stored routine could not be dropped. (Bug#16303)
- `InnoDB`: After upgrading an `InnoDB` table having a `VARCHAR BINARY` column created in MySQL 4.0 to MySQL 5.0, update operations on the table would cause the server to crash. (Bug#16298)
- Parallel builds occasionally failed on Solaris. (Bug#16282)
- A call to the `IF()` function using decimal arguments could return incorrect results. (Bug#16272)
- MySQL server dropped client connection for certain `SELECT` statements against views defined that used `MERGE` algorithm. (Bug#16260)
- `InnoDB` used full explicit table locks in trigger processing. (Bug#16229)
- Using `GROUP BY` on column used in `WHERE` clause could cause empty set to be returned. (Bug#16203)
- A memory leak caused warnings on slaves for certain statements that executed without warning on the master. (Bug#16175)
- The `FORCE INDEX` keyword in a query would prevent an index merge from being used where an index merge would normally be chosen by the optimizer. (Bug#16166)
- Setting `InnoDB` path settings to an empty string caused `InnoDB` storage engine to crash upon server startup. (Bug#16157)
- The `mysql_stmt_sqlstate()` C API function incorrectly returned an empty string rather than `'00000'` when no error occurred. (Bug#16143)
- `MIN()` and `MAX()` operations were not optimized for views. (Bug#16016)
- Performing a `RENAME TABLE` on an `InnoDB` table when the server was started with the `--innodb_file_per_table` option and the data directory was a symlink caused a server crash. (Bug#15991)
- Executing a `SHOW CREATE VIEW` query of an invalid view caused the `mysql_next_result()` function of `libMySQL.dll` to hang. (Bug#15943)
- Test suite `sp` test left behind tables when the test failed that could cause future tests to fail. (Bug#15866)
- `STR_TO_DATE(1, NULL)` caused a server crash. (Bug#15828, CVE-2006-3081)
- `CAST(... AS TIME)` operations returned different results when using versus not using prepared-statement protocol. (Bug#15805)
- Issuing a `DROP USER` command could cause some users to encounter a `hostname is not allowed to connect to this MySQL server` error. (Bug#15775)
- The contents of `fill_help_tables.sql` could not be loaded in strict SQL mode. (Bug#15760)
- `fill_help_tables.sql` was not included in binary distributions for several platforms. (Bug#15759)
- Certain `LEAVE` statements in stored procedures were not properly optimized. (Bug#15737)
- The `mysql_real_connect()` C API function incorrectly reset the `MYSQL_OPT_RECONNECT` option to its default value. (Bug#15719)
- Created a user function with an empty string (that is, `CREATE FUNCTION ''()`), was accepted by the server. Following this, calling `SHOW FUNCTION STATUS` would cause the server to crash. (Bug#15658)
- Trying to compile the server on Windows generated a stack overflow warning due to a recursive definition of the internal `Field_date::store()` method. (Bug#15634)
- In some cases the query optimizer did not properly perform multiple joins where inner joins followed left joins, resulting in corrupted result sets. (Bug#15633)
- Certain permission management statements could create a `NULL` hostname for a user, resulting in a server crash. (Bug#15598)
- Improper memory handling for stored routine variables could cause memory overruns and binary log corruption. (Bug#15588)
- The `COALESCE()` function truncated data in a `TINYTEXT` column. (Bug#15581)
- Binary distributions for Solaris contained files with group ownership set to the non-existing `wheel` group. Now the `bin` group is used. (Bug#15562)

- The absence of a table in the left part of a left or right join was not checked prior to name resolution, which resulted in a server crash. (Bug#15538)
- A `SELECT` of a stored function that references the `INFORMATION_SCHEMA` could crash the server. (Bug#15533)
- Characters in the `gb2312` and `euckr` character sets which did not have Unicode mappings were truncated. (Bug#15377)
- Certain subqueries where the inner query was the result of an aggregate function would return different results with MySQL 5.0 than with MySQL 4.1.
Subselects could also return wrong results when the query cache and grouping were involved. (Bug#15347)
- Performing an `ORDER BY` on an indexed `ENUM` column returned error. (Bug#15308)
- A `SELECT` query which contained a `GROUP_CONCAT()` and an `ORDER BY` clause against the `INFORMATION_SCHEMA` resulted in an empty result set. (Bug#15307)
- The `NOT FOUND` condition handler for stored procedures did not distinguish between a `NOT FOUND` condition and an exception or warning. (Bug#15231)
- The `SELECT` privilege was required for triggers that performed no selects. (Bug#15196)
- An attempt to open a table that requires a disabled storage engine could cause a server crash. (Bug#15185)
- The `UPDATE` privilege was required for triggers that performed no updates. (Bug#15166)
- Tarball install package was missing a proper `fill_help_tables.sql` file. (Bug#15151)
- Setting `innodb_log_file_size` to a value greater than 4G crashed the server. (Bug#15108)
- When multiple handlers are created for the same MySQL error number within nested blocks, the outermost handler took precedence. (Bug#15011)
- A statement containing `GROUP BY` and `HAVING` clauses could return incorrect results when the `HAVING` clause contained logic that returned `FALSE` for every row. (Bug#14927)
- Stored routines that contained only a single statement were not written properly to the dumpfile when using `mysqldump`. (Bug#14857)
- Killing a long-running query containing a subquery could cause a server crash. (Bug#14851)
- `GRANT` statements specifying schema names that included underscore characters (i.e. `my_schema`) did not match if the underscore was escaped in the `GRANT` statement (i.e. `GRANT ALL ON `my_schema` ...`). (Bug#14834)
- Previously, a stored function invocation was written to the binary log as `DO func_name()` if the invocation changes data and occurs within a non-logged statement, or if the function invokes a stored procedure that produces an error. These invocations now are logged as `SELECT func_name()` instead for better control over error code checking (slave servers could stop due to detecting a different error than occurred on the master). (Bug#14769)
- Generating an `AUTO_INCREMENT` value through a `FEDERATED` table did not set the value returned by `LAST_INSERT_ID()`. (Bug#14768)
- `SUBSTRING_INDEX()` could yield inconsistent results when applied with the same arguments to consecutive rows in a query. (Bug#14676)
- Running out of disk space in the location specified by the `tmpdir` option resulted in incorrect error message. (Bug#14634)
- `InnoDB`: Comparison of indexed `VARCHAR CHARACTER SET ucs2 COLLATE ucs2_bin` columns using `LIKE` could fail. (Bug#14583)
- A stored procedure with an undefined variable and an exception handler would hang the client when called. (Bug#14498)
- A `FULLTEXT` query in a prepared statement could result in unexpected behavior. (Bug#14496)
- Using an aggregate function as the argument for a `HAVING` clause resulted in the aggregate function always returning `FALSE`. (Bug#14274)
- The use of `LOAD INDEX` within a stored routine was permitted and caused the server to crash.

Note

`LOAD INDEX` statements within stored routines *are not supported*, and now yield an error if attempted. This behavior is intended.

([Bug#14270](#))

- A `COMMIT` statement followed by a `ALTER TABLE` statement on a BDB table caused server crash. ([Bug#14212](#))
- The `mysql_stmt_store_result()` C API function could not be used for a prepared statement if a cursor had been opened for the statement. ([Bug#14013](#))
- `SET sql_mode = N`, where $N > 31$, did not work properly. ([Bug#13897](#))
- Attempts to create `FULLTEXT` indexes on `VARCHAR` columns larger than 1000 bytes resulted in error. ([Bug#13835](#))
- The `RENAME TABLE` statement did not move triggers to the new table. ([Bug#13525](#))
- `BIT` fields were not properly handled when using row-based replication. ([Bug#13418](#))
- The length of a `VARCHAR()` column that used the `utf8` character set would increase each time the table was re-created in a stored procedure or prepared statement, eventually causing the `CREATE TABLE` statement to fail. ([Bug#13134](#))
- Instance Manager erroneously accepted a list of instance identifiers for the `START INSTANCE` and `STOP INSTANCE` commands (should accept only a single identifier). ([Bug#12813](#))
- A prepared statement created from a `SELECT ... LIKE` query (such as `PREPARE stmt1 FROM 'SELECT col_1 FROM tedd_test WHERE col_1 LIKE ?';`) would begin to produce erratic results after being executed repeatedly numerous (thousands) of times. ([Bug#12734](#))
- Multi-byte path names for `LOAD DATA` and `SELECT ... INTO OUTFILE` caused errors. Added the `character_set_filesystem` system variable, which controls the interpretation of string literals that refer to filenames. ([Bug#12448](#))
- Temporary table aliasing did not work inside stored functions. ([Bug#12198](#))
- The embedded server did not allow binding of columns to the `MYSQL_TYPE_VAR_STRING` data type in prepared statements. ([Bug#12070](#))
- When MyODBC or any other client called `my_init()/my_end()` several times, it caused corruption of charset data stored in `once_mem_pool`. ([Bug#11892](#))
- Setting the `myisam_repair_threads` system variable to a value larger than 1 could cause corruption of large MyISAM tables. ([Bug#11527](#))
- The `mysqlbinlog` utility did not output `DELIMITER` statements, causing syntax errors for stored routine creation statements. ([Bug#11312](#))
- The embedded server failed various tests in the automated test suite. ([Bug#10801](#), [Bug#10925](#), [Bug#15433](#), [Bug#9633](#), [Bug#10926](#), [Bug#9631](#), [Bug#10930](#), [Bug#10911](#), [Bug#9630](#), [Bug#10924](#))
- A large `BIGINT` value specified in a `WHERE` clause could be treated differently depending on whether it is specified as a quoted string. (For example, `WHERE bigint_col = 17666000000000000000` versus `WHERE bigint_col = '17666000000000000000'`). ([Bug#9088](#))
- `CHECKSUM TABLE` returned different values for MyISAM tables depending on whether the `QUICK` or `EXTENDED` option was used. ([Bug#8841](#))
- Using the `TRUNCATE()` function with a negative number for the second argument on a `BIGINT` column returned incorrect results. ([Bug#8461](#))
- Issuing `GRANT EXECUTE` on a procedure would display any warnings related to the creation of the procedure. ([Bug#7787](#))
- Repeated invocation of `my_init()` and `my_end()` caused corruption of character set data and connection failure. ([Bug#6536](#))
- An `INSERT ... SELECT` statement between tables in a `MERGE` set can return errors when statement involves insert into child table from merge table or vice-versa. ([Bug#5390](#))

E.1.12. Changes in MySQL 5.0.18 (21 December 2005)

Functionality added or changed:

- The server treats stored routine parameters and local variables (and stored function return values) according to standard SQL. Previously, parameters, variables, and return values were treated as items in expressions and were subject to automatic (silent) conversion and truncation. Now the data type is observed. Data type conversion and overflow problems that occur in assignments result in warnings, or errors in strict mode. The `CHARACTER SET` clause for character data type declarations is used. Parameters, variables, and return values must be scalars; it is no longer possible to assign a row value. Also, stored functions execute using the `sql_mode` value in force at function creation time rather than ignoring it. For more information, see [Section 12.1.8, “CREATE PROCEDURE and CREATE FUNCTION Syntax”](#). ([Bug#13808](#), [Bug#12903](#), [Bug#9078](#), [Bug#14161](#), [Bug#13705](#), [Bug#13909](#), [Bug#15148](#), [Bug#8769](#), [Bug#8702](#), [Bug#9572](#), [Bug#8768](#))
- It is now possible to build the server such that `MyISAM` tables can support up to 128 keys rather than the standard 64. This can be done by configuring the build using the option `--with-max-indexes=N`, where $N \leq 128$ is the maximum number of indexes to permit per table. ([Bug#10932](#))

Bugs fixed:

- **MySQL Cluster:** If an abort by the Transaction Coordinator timed out, the abort condition was incorrectly handled, causing the transaction record to be released prematurely. ([Bug#15685](#))
- **MySQL Cluster:** The `ndb_read_multi_range.test` script failed to drop a table, causing the test to fail. ([Bug#15675](#))
See also [Bug#15402](#)
- **MySQL Cluster:** Under some circumstances, it was possible for a restarting node to undergo a forced shutdown. ([Bug#15632](#))
- **MySQL Cluster:** A node which failed during cluster startup was sometimes not removed from the internal list of active nodes. ([Bug#15587](#))
- When a connection using `yaSSL` was aborted, the server would continue to try to read the closed socket, and the thread continued to appear in the output of `SHOW PROCESSLIST`. Note that this issue did not affect secure connection attempts using `OpenSSL`. ([Bug#15772](#))
- API function `mysql_stmt_prepare()` returned wrong field length for `TEXT` columns. ([Bug#15613](#))
- **InnoDB:** Having two tables in a parent-child relationship enforced by a foreign key where one table used `ROW_FORMAT=COMPACT` and the other used `ROW_FORMAT=REDUNDANT` could result in a MySQL server crash. Note that this problem did not exist prior to MySQL 5.0.3, when the compact row format for `InnoDB` was introduced. ([Bug#15550](#))
- **BDB:** A `DELETE`, `INSERT`, or `UPDATE` of a `BDB` table could cause the server to crash where the query contained a subquery using an index read. ([Bug#15536](#))
- Resolution of the argument to the `VALUES()` function to a variable inside a stored routine caused a server crash. The argument must be a table column. ([Bug#15441](#))
- A left join on a column that having a `NULL` value could cause the server to crash. ([Bug#15268](#))
- The output of `mysqldump --triggers` did not contain the `DEFINER` clause in dumped trigger definitions. ([Bug#15110](#))
- Reversing the order of operands in a `WHERE` clause testing a simple equality (such as `WHERE t1.col1 = t2.col2`) would produce different output from `EXPLAIN`. ([Bug#15106](#))
- The output of `SHOW TRIGGERS` contained extraneous whitespace. ([Bug#15103](#))
- Creating a trigger caused a server crash if the table or trigger database was not known because no default database had been selected. ([Bug#14863](#))
- Column aliases were displayed incorrectly in a `SELECT` from a view following an update to a base table of the view. ([Bug#14861](#))
- A replication slave server could sometimes crash on a `BEFORE UPDATE` trigger if the `UPDATE` query was not executed in the same database as the table with the trigger. ([Bug#14614](#))
- `SHOW [FULL] COLUMNS` and `SHOW INDEX` did not function with temporary tables. ([Bug#14387](#), [Bug#15224](#))
- The `INFORMATION_SCHEMA.COLUMNS` table did not report the size of `BINARY` or `VARBINARY` columns. ([Bug#14271](#))

- **InnoDB**: If `FOREIGN_KEY_CHECKS` was 0, **InnoDB** allowed inconsistent foreign keys to be created. (Bug#13778)
- The server would not compile under Cygwin. (Bug#13640)
- `DESCRIBE` did not function with temporary tables. (Bug#12770)
- Set functions could not be aggregated in outer subqueries. (Bug#12762)
- A race condition when creating temporary files caused a deadlock on Windows with threads in `Opening tables` or `Waiting for table` states. (Bug#12071)

E.1.13. Changes in MySQL 5.0.17 (14 December 2005)

Functionality added or changed:

- The syntax for `CREATE TRIGGER` now includes a `DEFINER` clause for specifying which access privileges to check at trigger invocation time. See Section 12.1.10, “`CREATE TRIGGER Syntax`”, for more information.

Known issue. If you attempt to replicate from a master server older than MySQL 5.0.17 to a slave running MySQL 5.0.17 through 5.0.19, replication of `CREATE TRIGGER` statements fails on the slave with a `DEFINER NOT FULLY QUALIFIED ERROR`. A workaround is to create triggers on the master using a version-specific comment embedded in each `CREATE TRIGGER` statement:

```
CREATE /*!50017 DEFINER = 'root'@'localhost' */ TRIGGER ... ;
```

`CREATE TRIGGER` statements written this way will replicate to newer slaves, which pick up the `DEFINER` clause from the comment and execute successfully.

(Bug#16266)

- Support files for compiling with Visual Studio 6 have been removed. (Bug#15094)
 - In the `latin5_turkish_ci` collation, the order of the characters `A WITH CIRCUMFLEX`, `I WITH CIRCUMFLEX`, and `U WITH CIRCUMFLEX` was changed. If you have used these characters in any indexed columns, you should rebuild those indexes. (Bug#13421)
 - Recursion is allowed in stored procedures. Recursive stored functions and triggers still are disallowed. (Bug#10100)
 - MySQL-*`-pro-5.0.17-1.rhel3.i386.rpm`, MySQL-*`-pro-5.0.17-1.rhel3.ia64.rpm`, MySQL-*`-pro-5.0.17-1.rhel3.x86_64.rpm`
 - MySQL-*`-pro-gpl-5.0.17-1.rhel3.i386.rpm`, MySQL-*`-pro-gpl-5.0.17-1.rhel3.ia64.rpm`, MySQL-*`-pro-gpl-5.0.17-1.rhel3.x86_64.rpm`
 - Added a `DEFINER` column to the `INFORMATION_SCHEMA.TRIGGERS` table.
 - Invoking a stored function or trigger creates a new savepoint level. When the function or trigger finishes, the previous savepoint level is restored.
- See also Bug#13825
- The maximum key length for **InnoDB** indexes was increased from 1024 bytes to 3072 bytes for all builds. (In MySQL 5.0.15, the length was increased but only for 64-bit builds.)
 - MySQL-{Max,client,devel,server,shared,ndb*}-5.0.17-1.i386.rpm
 - MySQL-*`-standard-5.0.17-1.rhel3.i386.rpm`, MySQL-*`-standard-5.0.17-1.rhel3.ia64.rpm`, MySQL-*`-standard-5.0.17-1.rhel3.x86_64.rpm`
 - Added the `SHOW FUNCTION CODE` and `SHOW PROCEDURE CODE` statements (available only for servers that have been built with debugging support). See Section 12.5.5.22, “`SHOW PROCEDURE CODE and SHOW FUNCTION CODE Syntax`”.

Bugs fixed:

- **MySQL Cluster**: A forced cluster shutdown occurred when the management daemon was restarted with a changed `config.ini` file that added an API or SQL node. (Bug#15512)
- **MySQL Cluster**: There was a small window for a node failure to occur during a backup without an error being reported. (Bug#15425)

- **MySQL Cluster:** Using `ORDER BY primary_key_column` when selecting from a table having the primary key on a `VARCHAR` column caused a forced shutdown of the cluster. ([Bug#15240](#), [Bug#15682](#), [Bug#14828](#), [Bug#15517](#))
- **MySQL Cluster:** Under certain circumstances, when `mysqld` connected to a cluster management server, the connection would fail before a node ID could be allocated. ([Bug#15215](#))
- **MySQL Cluster:** Creating a table with packed keys failed silently. `NDB` now supports the `PACK_KEYS` option to `CREATE TABLE` correctly. ([Bug#14514](#))
- **MySQL Cluster:** `REPLACE` failed when attempting to update a primary key value in a Cluster table. ([Bug#14007](#))
- Corrected an error-handling problem within stored routines on 64-bit platforms. ([Bug#15630](#))
- Slave SQL thread cleanup was not handled properly on Mac OS X when a statement was killed, resulting in a slave crash. ([Bug#15623](#), [Bug#15668](#))
- The `CREATE` test case in `mysql-test-run.pl` failed on AIX and SCO. ([Bug#15607](#))
- A bug in `mysql-test/t/mysqltest.test` caused that test to fail. ([Bug#15605](#))
- A statement that produced a warning, when fetched via `mysql_stmt_fetch()`, did not produce a warning count according to `mysql_warning_count()`. ([Bug#15510](#))
- The database-changing code for stored routine handling caused an error-handling problem resulting in a server crash. ([Bug#15392](#))
- The original Linux RPM packages (5.0.17-0) had an issue with a `zlib` dependency that would result in an error during an install or upgrade. They were replaced by new binaries, 5.0.17-1. Here is a list of the new RPM binaries:
 - `MySQL-{Max,client,devel,server,shared,ndb*}-5.0.17-1.i386.rpm`
 - `MySQL-*-standard-5.0.17-1.rhel3.i386.rpm`, `MySQL-*-standard-5.0.17-1.rhel3.ia64.rpm`, `MySQL-*-standard-5.0.17-1.rhel3.x86_64.rpm`
 - `MySQL-*-pro-5.0.17-1.rhel3.i386.rpm`, `MySQL-*-pro-5.0.17-1.rhel3.ia64.rpm`, `MySQL-*-pro-5.0.17-1.rhel3.x86_64.rpm`
 - `MySQL-*-pro-gpl-5.0.17-1.rhel3.i386.rpm`, `MySQL-*-pro-gpl-5.0.17-1.rhel3.ia64.rpm`, `MySQL-*-pro-gpl-5.0.17-1.rhel3.x86_64.rpm`([Bug#15223](#))
- `mysqld` would not start on Windows 9X operating systems including Windows Me. ([Bug#15209](#))
- Queries that select records based on comparisons to a set of column could crash the server if there was one index covering the columns, and a set of other non-covering indexes that taken together cover the columns. ([Bug#15204](#))
- Selecting from a view processed with the temptable algorithm caused a server crash if the query cache was enabled. ([Bug#15119](#))
- `mysql --help` was missing a newline after the version string when the bundled `readline` library was not used. ([Bug#15097](#))
- Creating a view that referenced a stored function that selected from a view caused a crash upon selection from the view. ([Bug#15096](#))
- The server crashed if compiled without any transactional storage engines. ([Bug#15047](#))
- Multiple-table update operations were counting updates and not updated rows. As a result, if a row had several updates it was counted several times for the “rows matched” value but updated only once. ([Bug#15028](#))
- Symbolic links did not function properly on Windows platforms. ([Bug#14960](#), [Bug#14310](#))
- `ROW_COUNT()` returned an incorrect result after `EXECUTE` of a prepared statement. ([Bug#14956](#))
- When using an aggregate function to select from a table that has a multiple-column primary key, adding `ORDER BY` to the query could produce an incorrect result. ([Bug#14920](#))
- `ANALYZE TABLE` did not properly update table statistics for a `MyISAM` table with a `FULLTEXT` index containing stopwords, so a subsequent `ANALYZE TABLE` would not recognize the table as having already been analyzed. ([Bug#14902](#))
- Creating a view within a stored procedure could result in an out of memory error or a server crash. ([Bug#14885](#))

- `GROUP BY` on a view column did not correctly account for the possibility that the column could contain `NULL` values. (Bug#14850)
- The `mysql_stmt_fetch()` C API function could return `MYSQL_NO_DATA` for a `SELECT COUNT(*) FROM tbl_name WHERE 1 = 0` statement, which should return 1 row. (Bug#14845)
- Selecting from a view used `filesort` retrieval when faster retrieval was possible. (Bug#14816)
- `InnoDB`: A race condition allowed two threads to drop a hash index simultaneously. (Bug#14747)
- `SHOW CREATE TABLE` for a view could fail if the client had locked the view. (Bug#14726)
- The grammar for supporting the `DEFINER = CURRENT_USER` clause in `CREATE VIEW` and `ALTER VIEW` was incorrect. (Bug#14719)
- `ALTER TABLE ... SET DEFAULT` had no effect. (Bug#14693)
- Using `ORDER BY` on a column from a view, when also selecting the column normally, and via an alias, caused a mistaken `Column 'x' in order clause is ambiguous` error. (Bug#14662)
- `SELECT` queries that began with an opening parenthesis were not being placed in the query cache. (Bug#14652)
- In a stored procedure, continuing (via a condition handler) after a failed variable initialization caused a server crash. (Bug#14643)
- A `LIMIT`-related optimization failed to take into account that `MyISAM` table indexes can be disabled, causing Error 124 when it tried to use such an index. (Bug#14616)
- `mysqlhotcopy` tried to copy `INFORMATION_SCHEMA` tables. (Bug#14610)
- A server crash resulted from the following sequence of events: 1) With no default database selected, create a stored procedure with the procedure name explicitly qualified with a database name (`CREATE PROCEDURE db_name.proc_name ...`). 2) Create another stored procedure with no database name qualifier. 3) Execute `SHOW PROCEDURE STATUS`. (Bug#14569)
- `mysqldump --triggers` did not account for the SQL mode and could dump trigger definitions with missing whitespace if the `IGNORE_SPACE` mode was enabled. (Bug#14554)
- `CREATE TABLE tbl_name (...) SELECT ...` could crash the server and write invalid data into the `.frm` file if the `CREATE TABLE` and `SELECT` both contained a column with the same name. Also, if a default value is specified in the column definition, it is now actually used. (Bug#14480)
- The value of `INFORMATION_SCHEMA.TABLES.TABLE_TYPE` sometimes was reported as empty. (Bug#14476)
- `mysql_fix_privilege_tables.sql` contained an erroneous comment that resulted in an error when the file contents were processed. (Bug#14469)
- Queries on `ARCHIVE` tables that used the `filesort` sorting method could result in a server crash. (Bug#14433)
- Creating a table containing an `ENUM` or `SET` column from within a stored procedure or prepared statement caused a server crash later when executing the procedure or statement. (Bug#14410)
- For a table that had been opened with `HANDLER OPEN`, issuing `OPTIMIZE TABLE`, `ALTER TABLE`, or `REPAIR TABLE` caused a server crash. (Bug#14397)
- Declaring a stored routine variable to have a `DEFAULT` value that referred to a variable of the same name caused a server crash. (For example: `DECLARE x INT DEFAULT x`) Now the `DEFAULT` variable is interpreted as referring to a variable in an outer scope, if there is one. (Bug#14376)
- Complex subqueries could cause improper internal query execution environment initialization and crash the server. (Bug#14342)
- Within a stored procedure, inserting with `INSERT ... SELECT` into a table with an `AUTO_INCREMENT` column did not generate the correct sequence number. (Bug#14304)
- Space truncation was being ignored when inserting into `BINARY` or `VARBINARY` columns. Now space truncation results in a warning, or an error in strict mode. (Bug#14299)
- Casting a `FLOAT` or `DOUBLE` whose value was less than `1.0E-06` to `DECIMAL` would yield an inappropriate value. (Bug#14268)
- `CAST(expr AS BINARY(N))` did not pad with `0x00` to a length of `N` bytes. (Bug#14255)

- Manual manipulation of the `mysql.proc` table could cause a server crash. This should not happen, but it is also not supported that the server will notice such changes. (Bug#14233)
- A `UNION` of `DECIMAL` columns could produce incorrect results. (Bug#14216)
- The maximum value of `MAX_ROWS` was handled incorrectly on 64-bit systems. (Bug#14155)
- `CHAR(... USING ...)` and `CONVERT(CHAR(...) USING ...)`, though logically equivalent, could produce different results. (Bug#14146)
- The server could misinterpret old trigger definition files created before MySQL 5.0.17. Now they are interpreted correctly, but this takes more time and the server issues a warning that the trigger should be re-created. (Bug#14090)
- Stored functions making use of cursors were not replicated. (Bug#14077)
- For a invalid view definition, selecting from the `INFORMATION_SCHEMA.VIEWS` table or using `SHOW CREATE VIEW` failed, making it difficult to determine what part of the definition was invalid. Now the server returns the definition and issues a warning. (Bug#13818)
- `InnoDB`: Activity on an `InnoDB` table caused execution time for `SHOW CREATE TABLE` for the table to increase. (Bug#13762)
- Within a stored procedure, exception handling for `UPDATE` statements that caused a duplicate-key error caused a `Packets out of order` error for the following statement. (Bug#13729)
- Statements that implicitly commit a transaction are prohibited in stored functions and triggers. An attempt to create a function or trigger containing such a statement produces an error. (The originally reported symptom was that a trigger that dropped another trigger could cause a server crash. That problem was fixed by the patch for Bug#13343.) (Bug#13627)
- A newline character in a column alias in a view definition caused an error when selecting from the view later. (Bug#13622)
- Invoking a stored procedure within another stored procedure caused the server to crash. (Bug#13549)
- Warnings from a previous command were not being reset when fetching from a cursor. (Bug#13524)
- In some cases, a left outer join could yield an invalid result or cause the server to crash, due to a `MYSQL_DATA_TRUNCATED` error. (Bug#13488)
- `DELETE` from `CSV` tables reported an incorrect rows-affected value. (Bug#13406)
- A server crash could occur if a prepared statement updated a table for which a trigger existed when the statement was prepared but had been dropped prior to statement execution. (Bug#13399)
- `RESET MASTER` failed to delete log files on Windows. One consequence of this change is that server opens the general query and slow log files in shared mode, so now they can be renamed while the server has them open (something not true in previous versions). (Bug#13377)
- For binary string data types, `mysqldump --hex-blob` produced an illegal output value of `0x` rather than `' '`. (Bug#13318)
- `REPAIR TABLES`, `BACKUP TABLES`, `RESTORE TABLES` within a stored procedure caused a server crash. (Bug#13012)
- Implicit versus explicit conversion of float to integer (such as inserting a float value into an integer column versus using `CAST(... AS UNSIGNED)` before inserting the value) could produce different results. Implicit and explicit typecasts now are done the same way, with a value equal to the nearest integer according to the prevailing rounding mode. (Bug#12956)
- Some comparisons for the `IN()` operator were inconsistent with equivalent comparisons for the `=` operator. (Bug#12612)
- A server crash could occur if a prepared statement invoked a stored procedure that existed when the statement was prepared but had been dropped and re-created prior to statement execution. (Bug#12329)
- `make` failed when attempting to build MySQL in different directory other than that containing the source. (Bug#11827)
- On Windows, the server could crash during shutdown if both replication threads and normal client connection threads were active. (Bug#11796)
- Revised table locking to allow proper assessment of view security. (Bug#11555)
- Perform character set conversion of constant values whenever possible without data loss. (Bug#10446)
- `InnoDB`: During replication, There was a failure to record events in the binary log that still occurred even in the event of a `ROLLBACK`. For example, this sequence of commands:

```
BEGIN;
CREATE TEMPORARY TABLE t1 (a INT) ENGINE=INNODB;
ROLLBACK;
INSERT INTO t1 VALUES (1);
```

would succeed on the replication master as expected. However, the `INSERT` would fail on the slave because the `ROLLBACK` would (erroneously) cause the `CREATE TEMPORARY TABLE` statement not to be written to the binlog. (Bug#7947)

- Within a trigger definition the `CURRENT_USER()` function evaluated to the user whose actions caused the trigger to be activated. Now that triggers have a `DEFINER` value, `CURRENT_USER()` evaluates to the trigger definer. (Bug#5861)
- `mysql` ignored the `MYSQL_TCP_PORT` environment variable. (Bug#5792)

E.1.14. Changes in MySQL 5.0.16 (10 November 2005)

Functionality added or changed:

- **MySQL Cluster:** The `InnoDB`, `NDB`, `BDB`, and `ARCHIVE` storage engines now support spatial columns. See [Chapter 20, Spatial Extensions](#).
- When a date column is set `NOT NULL` and contains `0000-00-00`, it will be updated for `UPDATE` statements that contains `columnname IS NULL` in the `WHERE` clause. (Bug#14186)
- When trying to run the server with `yaSSL` enabled, `MySQL` now tries to open `/dev/random` automatically if `/dev/urandom` is not available. (Bug#13164)
- `MySQL 5.0` now supports character set conversion for seven additional `cp950` characters into the `big5` character set: `0xF9D6`, `0xF9D7`, `0xF9D8`, `0xF9D9`, `0xF9DA`, `0xF9DB`, and `0xF9DC`.

Note

If you move data containing these additional characters to an older `MySQL` installation which does not support them, you may encounter errors.

(Bug#12476)

- You must now declare a prefix for an index on any column of any `Geometry` class, the only exception being when the column is a `POINT`. (Bug#12267)
- The `read_only` system variable no longer applies to `TEMPORARY` tables. (Bug#4544)
- Due to changes in binary logging, the restrictions on which stored routine creators can be trusted not to create unsafe routines have been lifted for stored procedures (but not stored functions). Consequently, the `log_bin_trust_routine_creators` system variable and the corresponding `--log-bin-trust-routine-creators` server option were renamed to `log_bin_trust_function_creators` and `--log-bin-trust-function-creators`. For backward compatibility, the old names are recognized but result in a warning. See [Section 21.5, “Binary Logging of Stored Programs”](#).
- The `CHECK TABLE` statement now works for `ARCHIVE` tables.
- Added a `--hexdump` option to `mysqlbinlog` that displays a hex dump of the log in comments. This output can be helpful for replication debugging.
- In `MySQL 5.0.13`, syntax for `DEFINER` and `SQL SECURITY` clauses was added to the `CREATE VIEW` and `ALTER VIEW` statements, but the clauses had no effect. They now are enabled. They specify the security context to be used when checking access privileges at view invocation time. See [Section 12.1.11, “CREATE VIEW Syntax”](#), for more information.
- Added the `Compression` status variable, which indicates whether the client connection uses compression in the client/server protocol.

Bugs fixed:

- **MySQL Cluster:** Repeated transactions using unique index lookups could cause a memory leak leading to error 288, [Out of index operations in transaction coordinator](#). (Bug#14199)
- **MySQL Cluster:** A memory leak occurred when performing ordered index scans using indexes on columns larger than 32

- bytes. This would eventually lead to the forced shutdown of all `mysqld` server processes used with the cluster. (Bug#13078)
- For some stored functions dumped by `mysqldump --routines`, the function definition could not be reloaded later due to a parsing error. (Bug#14723)
 - Deletes from a `CSV` table could cause table corruption. (Bug#14672)
 - Executing `REPAIR TABLE`, `ANALYZE TABLE`, or `OPTIMIZE TABLE` on a view for which an underlying table had been dropped caused a server crash. (Bug#14540)
 - `mysqlmanager` did not start up correctly on Windows 2003. (Bug#14537)
 - Selecting from a table in both an outer query and a subquery could cause a server crash. (Bug#14482)
 - `ORDER BY DESC` within the `GROUP_CONCAT()` function was not honored when used in a view. (Bug#14466)
 - The input polling loop for Instance Manager did not sleep properly. Instance Manager used up too much CPU as a result. (Bug#14388)
 - Indexes for `BDB` tables were being limited incorrectly to 255 bytes. (Bug#14381)
 - The `mysql` parser did not properly strip the delimiter from input lines less than nine characters long. For example, this could cause `USE abc;` to result in an `Unknown database: abc;` error. (Bug#14358)
 - The displayed value for the `CHARACTER_MAXIMUM_LENGTH` column in the `INFORMATION_SCHEMA.COLUMNS` table was not adjusted for multi-byte character sets. (Bug#14290)
 - The parser did not correctly recognize wildcards in the host part of the `DEFINER` user in `CREATE VIEW` statements. (Bug#14256)
 - Memory corruption and a server crash could be caused by statements that used a cursor and generated a result set larger than `max_heap_table_size`. (Bug#14210)
 - A bugfix in MySQL 5.0.15 caused the displayed values for the `CHARACTER_MAXIMUM_LENGTH` and `CHARACTER_OCTET_LENGTH` columns in the `INFORMATION_SCHEMA.COLUMNS` table to be reversed. (Bug#14207)
 - Statements of the form `CREATE TABLE ... SELECT ...` that created a column with a multi-byte character set could incorrectly calculate the maximum length of the column, resulting in a `Specified key was too long` error. (Bug#14139)
 - Use of `WITH ROLLUP PROCEDURE ANALYSE()` could hang the server. (Bug#14138)
 - On Windows, the value of `character_sets_dir` in `SHOW VARIABLES` output was displayed inconsistently (using both “/” and “\” as pathname component separators). (Bug#14137)
 - A comparison with an invalid date (such as `WHERE col_name > '2005-09-31'`) caused any index on `col_name` not to be used and a string comparison for each row, resulting in slow performance. (Bug#14093)
 - Subqueries in the `FROM` clause failed if the current database was `INFORMATION_SCHEMA`. (Bug#14089)
 - For `InnoDB` tables, using a column prefix for a `utf8` column in a primary key caused `Cannot find record` errors when attempting to locate records. (Bug#14056)
 - Some updatable views could not be updated. (Bug#14027)
 - A prepared statement that selected from a view processed using the merge algorithm could crash on the second execution. (Bug#14026)
 - When the `DATE_FORMAT()` function appeared in both the `SELECT` and `ORDER BY` clauses of a query but with arguments that differ by case (i.e. `%m` and `%M`), incorrect sorting may have occurred. (Bug#14016)
 - `TIMEDIFF()`, `ADDTIME()`, and `STR_TO_DATE()` were not reporting that they could return `NULL`, so functions that invoked them might misinterpret their results. (Bug#14009)
 - Within stored routines, `REPLACE()` could return an empty string (rather than the original string) when no replacement was done, and `IFNULL()` could return garbage results. (Bug#13941)
 - Inserting a new row into an `InnoDB` table could cause `DATETIME` values already stored in the table to change. (Bug#13900)
 - An update of a `CSV` table could cause a server crash. (Bug#13894)
 - Corrected a parser precedence problem that resulted in an `Unknown column ... in 'on clause'` error for some

joins. (Bug#13832)

- Trying to take the logarithm of a negative value is now handled in the same fashion as division by zero. That is, it produces a warning when `ERROR_FOR_DIVISION_BY_ZERO` is set, and an error in strict mode. (Bug#13820)
- The example configuration files supplied with MySQL distributions listed the `thread_cache_size` variable as `thread_cache`. (Bug#13811)
- `mysqld_safe` did not correctly start the `--max` version of the server (if it was present) if the `--ledir` option was given. (Bug#13774)
- `SHOW CREATE TABLE` did not display the `CONNECTION` string for `FEDERATED` tables. (Bug#13724)
- For a `MyISAM` table originally created in MySQL 4.1, `INSERT DELAYED` could cause a server crash. (Bug#13707)
- The server incorrectly accepted column definitions of the form `DECIMAL(0,D)` for `D` less than 11. (Bug#13667)
- Trying to create a stored routine with no database selected would crash the server. (Bug#13587, Bug#13514)
- Inserts of too-large `DECIMAL` values were handled inconsistently (sometimes set to the maximum `DECIMAL` value, sometimes set to 0). (Bug#13573)
- `TIMESTAMPDIFF()` returned an incorrect result if one argument but not the other was a leap year and a date was from March or later. (Bug#13534)
- Specifying `--default-character-set=cp-932` for `mysqld` would cause SQL scripts containing comments written using that character set to fail with a syntax error. (Bug#13487)
- Use of `col_name = VALUES(col_name)` in the `ON DUPLICATE KEY UPDATE` clause of an `INSERT` statement failed with an `Column 'col_name' in field list is ambiguous` error. (Bug#13392)
- The default value of `query_prealloc_size` was set to 8192, lower than its minimum of 16384. The minimum has been lowered to 8192. (Bug#13334)
- `InnoDB`: When dropping and adding a `PRIMARY KEY`, if a loose index scan using only the second part of multiple-part index was chosen, incorrect keys were created and an endless loop resulted. (Bug#13293)
- `mysqladmin` and `mysqldump` would hang on SCO OpenServer. (Bug#13238)
- `SELECT DISTINCT CHAR(col_name)` returned incorrect results after `SET NAMES utf8`. (Bug#13233)
- For queries with nested outer joins, the optimizer could choose join orders that query execution could not handle. The fix is that now the optimizer avoids choosing such join orders. (Bug#13126)
- The server did not take character set into account in checking the width of the `mysql.user.Password` column. As a result, it could incorrectly generate long password hashes even if the column was not long enough to hold them. (Bug#13064)
- The source distribution failed to compile when configured with the `--without-geometry` option. (Bug#12991)
- Use of the deprecated `--sql-bin-update-same` option caused a server crash. (Bug#12974)
- Maximum values were handled incorrectly for command-line options of type `GET_LL`. (Bug#12925)
- `mysqldump` could not dump views if the `-x` option was given. (Bug#12838)
- Two threads that were creating triggers on an `InnoDB` table at the same time could deadlock. (Bug#12739)
- `InnoDB`: Large `innobase_buffer_pool_size` and `innobase_log_file_size` values were displayed incorrectly on 64-bit systems. (Bug#12701)
- For `LIKE ... ESCAPE`, an escape sequence longer than one character was accepted as valid. Now the sequence must be empty or one character long. If the `NO_BACKSLASH_ESCAPES` SQL mode is enabled, the sequence must be one character long. (Bug#12595)
- Inserting `cp932` strings into a `VARCHAR` column caused a server crash rather than string truncation if the string was longer than the column definition. (Bug#12547)
- A prepared statement failed with `Illegal mix of collations` if the client character set was `utf8` and the statement used a table that had a character set of `latin1`. (Bug#12371)
- Using `ALTER TABLE` to add an index could fail if the operation ran out of temporary file space. Now it automatically makes a

second attempt that uses a slower method but no temporary file. In this case, problems that occurred during the first attempt can be displayed with `SHOW WARNINGS`. (Bug#12166)

- `mysqlimport` now issues a `SET @@character_set_database = binary` statement before loading data so that a file containing mixed character sets (columns with different character sets) can be loaded properly. (Bug#12123)
- Running `OPTIMIZE TABLE` and other data-updating statements concurrently on an InnoDB table could cause a crash or the following warnings in the error log: `Warning: Found locks from different threads in write: enter write_lock, Warning: Found locks from different threads in write: start of release lock`. (Bug#11704)
- `LOAD DATA INFILE` would not accept the same character for both the `ESCAPED BY` and the `ENCLOSED BY` clauses. (Bug#11203)
- The value of `Last_query_cost` was not updated for queries served from the query cache. (Bug#10303)
- Starting `mysqld` with the `--skip-innodb` and `--default-storage-engine=innodb` (or `--default-table-type=innodb`) caused a server crash. (Bug#9815)
- The `--exit-info=65536` option conflicted with `--temp-pool` and caused problems with the server's use of temporary files. Now `--temp-pool` is ignored if `--exit-info=65536` is specified. (Bug#9551)
- For a user that has the `SELECT` privilege on a view, the server erroneously was also requiring the user to have the `EXECUTE` privilege at view execution time for stored functions used in the view definition. (Bug#9505)
- Where one stored procedure called another stored procedure: If the second stored procedure generated an exception, the exception was not caught by the calling stored procedure. For example, if stored procedure `A` used an `EXIT` statement to handle an exception, subsequent statements in `A` would be executed regardless when `A` was called by another stored procedure `B`, even if an exception that should have been handled by the `EXIT` was generated in `A`. (Bug#7049)
- On Windows, the server was not ignoring hidden or system directories that Windows may have created in the data directory, and would treat them as available databases. (Bug#4375)

E.1.15. Changes in MySQL 5.0.15 (19 October 2005: Production)

Functionality added or changed:

- **Incompatible Change:** For `BINARY` columns, the pad value and how it is handled has changed. The pad value for inserts now is `0x00` rather than space, and there is no stripping of the pad value for selects. For details, see [Section 10.4.2, “The BINARY and VARBINARY Types”](#).
- **Incompatible Change:** The `CHAR()` function now returns a binary string rather than a string in the connection character set. An optional `USING charset` clause may be used to produce a result in a specific character set instead. Also, arguments larger than 256 produce multiple characters. They are no longer interpreted modulo 256 to produce a single character each. These changes may cause some incompatibilities, as noted in [Section 2.4.17.2, “Upgrading from MySQL 4.1 to 5.0”](#).
- **MySQL Cluster:** The `ndb_mgm` client now reports node startup phases automatically. (Bug#16197)
- **MySQL Cluster:** A new “smart” node allocation algorithm means that it is no longer necessary to use sequential IDs for cluster nodes, and that nodes not explicitly assigned IDs should now have IDs allocated automatically in most cases. In practical terms, this means that it is now possible to assign a set of node IDs such as `1, 2, 4, 5` without an error being generated due to the missing `3`. (Bug#13009)
- **MySQL Cluster:** A number of new or improved error messages have been implemented in this release in order to provide better and more accurate diagnostic information regarding cluster configuration issues and problems. (Bug#12786, Bug#11749, Bug#13197, Bug#11739, Bug#12044)
- The following statements now cause an implicit `COMMIT`:
 - `CREATE VIEW`
 - `ALTER VIEW`
 - `DROP VIEW`
 - `CREATE TRIGGER`
 - `DROP TRIGGER`

- `CREATE USER`
- `RENAME USER`
- `DROP USER`

([Bug#13343](#))

- Added the `--tz-utc` option to `mysqldump`. This option adds `SET TIME_ZONE= '+00:00'` to the dump file so that `TIMESTAMP` columns can be dumped and reloaded between servers in different time zones and protected from changes due to daylight saving time. ([Bug#13052](#))
- When executing single-table `UPDATE` or `DELETE` queries containing an `ORDER BY ... LIMIT N` clause, but not having any `WHERE` clause, MySQL can now take advantage of an index to read the first *N* rows in the ordering specified in the query. If an index is used, only the first *N* records will be read, as opposed to scanning the entire table. ([Bug#12915](#))
- The `MySQL-server` RPM now explicitly assigns the `mysql` system user to the `mysql` user group during the postinstallation process. This corrects an issue with upgrading the server on some Linux distributions whereby a previously existing `mysql` user was not changed to the `mysql` group, resulting in wrong groups for files created following the installation. ([Bug#12823](#))

- `CREATE VIEW`

- The maximum key length for `InnoDB` indexes was increased from 1024 bytes to 3072 bytes for 64-bit builds.

- `DROP USER`

- `DROP VIEW`

- `DROP TRIGGER`

- `CREATE USER`

- `ALTER VIEW`

- `CREATE TRIGGER`

- When declaring a local variable (or parameter) named `password` or `name`, and setting it with `SET` (for example, `SET password = ''`), the new error message `ERROR 42000: Variable 'nnn' must be quoted with `...``, or `renamed` is returned (where 'nnn' is 'password' or 'names'). This means there is a syntax conflict with special sentences like `SET PASSWORD = PASSWORD(...)` (for setting a user's password) and `set names default` (for setting charset and collation).

This must be resolved either by quoting the variable name: `SET `password` = ...`, which will set the local variable ``password``, or by renaming the variable to something else (if setting the user's password is the desired effect).

- `RENAME USER`

Bugs fixed:

- **MySQL Cluster:** The `percona` utility included with the `MySQL-Server` RPM did not provide support for the `--ndb` option. It now supports this option, and so can be used to obtain error message text for MySQL Cluster error codes. ([Bug#13740](#))
- **MySQL Cluster:** Placing multiple `[tcp default]` sections in the cluster's `config.ini` file crashed `ndb_mgmd`. (The process now exits gracefully in such cases, with an appropriate error message.) ([Bug#13611](#))
- **MySQL Cluster:** `ndb_mgmd` allowed a node to be stopped or restarted while another node was still starting up, which could crash the cluster. It should now not be possible to issue a node stop or restart while a different node is still restarting, and the cluster management client should issue an error when such an attempt is made. ([Bug#13461](#))
- **MySQL Cluster:** Trying to run `ndbd` as system `root` when connecting to a `mysqld` process running as the `mysql` system user via SHM caused the `ndbd` process to crash. (`ndbd` should now exit gracefully with an appropriate error message instead.) ([Bug#9249](#))
- Tests containing `SHOW TABLE STATUS` or `INFORMATION_SCHEMA` failed on `opnsrv6c`. ([Bug#14064](#), [Bug#14065](#))
- `mysqldump` could not dump views. ([Bug#14061](#))
- `mysqlcheck --all-databases --analyze --optimize` failed because it also tried to analyze and optimize the `INFORMATION_SCHEMA` tables which it can't. ([Bug#13783](#))

- Character set conversion was not being done for `FIND_IN_SET()`. (Bug#13751)
- On BSD systems, the system `crypt()` call could return an error for some salt values. The error was not handled, resulting in a server crash. (Bug#13619)
- When calling a stored procedure with the syntax `CALL schema.procedurename` and no default schema selected, `ERROR 1046` was displayed after the procedure returned. (Bug#13616)
- A column in the `ON` condition of a join that referenced a table in a nested join could not be resolved if the nested join was a right join. (Bug#13597)
- The server could over-allocate memory when performing a `FULLTEXT` search for stopwords only. (Bug#13582)
- `CREATE DEFINER=... VIEW ...` caused the server to crash when run with `--skip-grant-tables`. (Bug#13504)
- `InnoDB`: Queries that were executed using an `index_merge` union or intersection could produce incorrect results if the underlying table used the `InnoDB` storage engine and had a primary key containing `VARCHAR` members. (Bug#13484)
- A qualified reference to a view column in the `HAVING` clause could not be resolved. (Bug#13410)
- `CAST(1E+300 TO SIGNED INT)` produced an incorrect result on little-endian machines. (Bug#13344)
- Queries that use indexes in normal `SELECT` statements may cause range scans in `VIEWS`. (Bug#13327)
- `SELECT * INTO OUTFILE ... FROM INFORMATION_SCHEMA.schemata` failed with an `Access denied` error. (Bug#13202)
- `mysqldump --triggers` did not quote identifiers properly if the `--compatible` option was given, so the dump output could not be reloaded. (Bug#13146)
- A table or view named `Ç` (C-cedilla) couldn't be dropped. (Bug#13145)
- For XA transaction IDs (`gtrid.bqual.formatID`), uniqueness is supposed to be assessed based on `gtrid` and `bqual`. MySQL was also including `formatID` in the uniqueness check. (Bug#13143)
- Trying to create a view dynamically using a prepared statement within a stored procedure failed with error 1295. (Bug#13095)
- `comp_err` did not detect when multiple error messages for a language were given for an error symbol. (Bug#13071)
- If special characters such as `'_'`, `'%'`, or the escape character were included within the prefix of a column index, `LIKE` pattern matching on the indexed column did not return the correct result. (Bug#13046, Bug#13919)
- Using an undefined variable in an `IF` or `SET` clause inside a stored routine produced an incorrect `unknown column ... in 'order clause'` error message. (Bug#13037)
- With `--log-slave-updates` `Exec_master_log_pos` of SQL thread lagged IO (Bug#13023)
- `SHOW CREATE TABLE` did not display any `FOREIGN KEY` clauses if a temporary file could not be created. Now `SHOW CREATE TABLE` displays an error message in an SQL comment if this occurs. (Bug#13002)
- Local (non-XA) and XA transactions are supposed to be mutually exclusive within a given client connection, but this prohibition was not always enforced. (Bug#12935)
- Server crashed during a `SELECT` statement, writing a message like this to the error log:

```
InnoDB: Error: MySQL is trying to perform a SELECT
InnoDB: but it has not locked any tables in ::external_lock()!
```

(Bug#12736)
- An `UPDATE` query using a join would be executed incorrectly on a replication slave. (Bug#12618)
- An expression in an `ORDER BY` clause failed with `Unknown column 'col_name' in 'order clause'` if the expression referred to a column alias. (Bug#11694)
- Issuing `STOP SLAVE` after having acquired a global read lock with `FLUSH TABLES WITH READ LOCK` caused a deadlock. Now `STOP SLAVE` generates an error in such circumstances. (Bug#10942)
- Corrected a memory-copying problem for `big5` values when using `icc` compiler on Linux IA-64 systems. (Bug#10836)
- The `--interactive-timeout` and `--slave-net-timeout` options for `mysqld` were not being obeyed on Mac OS X and other BSD-based platforms. (Bug#8731)

- Queries of the form `(SELECT ...) ORDER BY ...` were being treated as a `UNION`. This improperly resulted in only distinct values being returned (because `UNION` by default eliminates duplicate results). Also, references to column aliases in `ORDER BY` clauses following parenthesized `SELECT` statements were not resolved properly. (Bug#7672)
- Character set file parsing during `mysql_real_connect()` read past the end of a memory buffer. (Bug#6413)

E.1.16. Changes in MySQL 5.0.14 (Not released)

Functionality added or changed:

- Multiple-table `UPDATE` and `DELETE` statements that do not affect any rows are now written to the binary log and will replicate. (Bug#13348, Bug#12844)
- Range scans can now be performed for queries on VIEWS such as `column IN (<constants>)` and `column BETWEEN ConstantA AND ConstantB`. (Bug#13317)
- The limit of 255 characters on the input buffer for `mysql` on Windows has been lifted. The exact limit depends on what the system allows, but can be up to 64K characters. A typical limit is 16K characters. (Bug#12929)
- Added the `myisam_stats_method`, which controls whether `NULL` values in indexes are considered the same or different when collecting statistics for `MyISAM` tables. This influences the query optimizer as described in Section 7.4.7, “`MyISAM Index Statistics Collection`”. (Bug#12232)
- The `CHAR()` function now takes into account the character set and collation given by the `character_set_connection` and `collation_connection` system variables. For an argument `n` to `CHAR()`, the result is `n mod 256` for single-byte character sets. For multi-byte character sets, `n` must be a valid code point in the character set. Also, the result string from `CHAR()` is checked for well-formedness. For invalid arguments, or a result that is not well-formed, MySQL generates a warning (or, in strict SQL mode, an error). (Bug#10504)
- Re-enabled the `--delayed-inserts` option for `mysqldump`, which now checks for each table dumped whether its storage engine supports `DELAYED` inserts. (Bug#7815)
- `RENAME TABLE` now works for views as well, as long as you do not try to rename a view into a different database. (Bug#5508)
- Configure-time checking for the availability of multi-byte macros and functions in the bundled `readline` library. This improves handling of multi-byte character sets in the `mysql` client. (Bug#3982)
- When an `InnoDB` foreign key constraint is violated, the error message now indicates which table, column, and constraint names are involved. (Bug#3443)

Bugs fixed:

- **MySQL Cluster:** A trigger updating the value of an `AUTO_INCREMENT` column in an `NDB` table would insert an error code rather than the expected value into the column. (Bug#13961)
- **MySQL Cluster:** If `ndb_restore` could not find a free `mysqld` process, it crashed. (Bug#13512)
- **MySQL Cluster:** Adding an index to a table with a large number of columns (more than 100) crashed the storage node. (Bug#13316)
- **MySQL Cluster:** `BIT` columns and following columns in `NDB` tables were corrupt when dumped by `mysqldump`. (Bug#13152)
- **MySQL Cluster:** Queries on `NDB` tables that were executed using `index_merge` could produce incorrect results. (Bug#13081)
- **MySQL Cluster:** Receipt of several `ENTER SINGLE USER MODE` commands by multiple `ndb_mgmd` processes within a short period of time resulted in cluster shutdown. (Bug#13053)
- **MySQL Cluster:** Multiple `ndb_mgmd` processes in a cluster did not know each other's IP addresses. (Bug#12037)
- **MySQL Cluster:** With two `mgmd` processes in a cluster, `ndb_mgm` output for `SHOW` would display the same IP address for both processes, even when they were on different hosts. (Bug#11595)
- **MySQL Cluster:** `LOAD DATA INFILE` with a large data file failed. (Bug#10694)

- **MySQL Cluster:** When deleting a great many (tens of thousands of) rows at once from an `NDB` table, an improperly dereferenced pointer could cause the `mysqld` process to crash. (Bug#9282)
- Certain joins using `Range checked for each record` in the query execution plan could cause the server to crash. (Bug#24776)
- Joins nested under `NATURAL` or `USING` joins were sometimes not initialized properly, causing a server crash. (Bug#13545)
- After running `configure` with the `--with-embedded-privilege-control` option, the embedded server failed to build. (Bug#13501)
- The optimizer chose a less efficient execution plan for `col_name BETWEEN const AND const` than for `col_name = const`, even though the two expressions are logically equivalent. Now the optimizer can use the `ref` access method for both expressions. (Bug#13455)
- Locking a view with the query cache enabled and `query_cache_wlock_invalidate` enabled could cause a server crash. (Bug#13424)
- A `HAVING` clause that references an unqualified view column name could crash the server. (Bug#13411)
- The `--skip-innodb-doublewrite` option disables use of the `InnoDB` doublewrite buffer. However, having this option in effect when creating a new MySQL installation prevented the buffer from even being created, resulting in a server crash later. (Bug#13367)
- Calling the `FORMAT()` function with a `DECIMAL` column value caused a server crash when the value was `NULL`. (Bug#13361)
- Comparisons involving row constructors containing constants could cause a server crash. (Bug#13356)
- Aggregate functions sometimes incorrectly were allowed in the `WHERE` clause of `UPDATE` and `DELETE` statements. (Bug#13180)
- `NATURAL` joins and joins with `USING` against a view could return `NULL` rather than the correct value. (Bug#13127)
- For queries with `DISTINCT` and `WITH ROLLUP`, the `DISTINCT` should be applied after the rollup operation, but was not always. (Bug#12887)
- It was possible to create a view that executed a stored function for which you did not have the `EXECUTE` privilege. (Bug#12812)
- Shared-memory connections were not working on Windows. (Bug#12723)
- The server was not rejecting `FLOAT(M,D)` or `DOUBLE(M,D)` columns specifications when `M` was less than `D`. (Bug#12694)
- `CHECKSUM TABLE` locked `InnoDB` tables and did not use a consistent read. (Bug#12669)
- Incorrect creation of `DECIMAL` local variables in a stored procedure could cause a server crash. (Bug#12589)
- For queries for which the optimizer determined a join type of “Range checked for each record” (as shown by `EXPLAIN`, the query sometimes could cause a server crash, depending on the data distribution. (Bug#12291)
- After running `configure` with the `--without-server` option, the distribution failed to build. (Bug#11680, Bug#13550)
- Use of a user-defined function within the `HAVING` clause of a query resulted in an `Unknown column` error. (Bug#11553)
- The server crashed when processing a view that invoked the `CONVERT_TZ()` function. (Bug#11416)
- When `SELECT ... FOR UPDATE` or `SELECT ... LOCK IN SHARE MODE` for an `InnoDB` table were executed from within a stored function or a trigger, they were converted to a non-locking consistent read. (Bug#11238)
- The `--replicate-rewrite-db` and `--replicate-do-table` options did not work for statements in which tables were aliased to names other than those listed by the options. (Bug#11139)
- Queries against a `MERGE` table that has a composite index could produce incorrect results. (Bug#9112)
- MySQL programs in binary distributions for Solaris 8/9/10 x86 systems would not run on Pentium III machines. (Bug#6772)
- Nested handlers within stored procedures didn't work. (Bug#6127)

E.1.17. Changes in MySQL 5.0.13 (22 September 2005: Release Candidate)

Functionality added or changed:

- `OPTIMIZE TABLE` and `HANDLER` now are prohibited in stored procedures and functions and in triggers. (Bug#12953, Bug#12995)
- The `LEAST()` and `GREATEST()` functions used to return `NULL` only if all arguments were `NULL`. Now they return `NULL` if any argument is `NULL`, the same as Oracle. (Bug#12791)
- **InnoDB:** The `TRUNCATE TABLE` statement for **InnoDB** tables always resets the counter for an `AUTO_INCREMENT` column now, regardless of whether there is a foreign key constraint on the table. (Beginning with 5.0.3, `TRUNCATE TABLE` reset the counter, but only if there was no such constraint.) (Bug#11946)
- Reorder network startup to come after all other initialization, particularly storage engine startup which can take a long time. This also prevents MySQL from being run on a privileged port (any port under 1024) unless run as the root user. (Bug#11707)
- The restriction on the use of `PREPARE`, `EXECUTE`, and `DEALLOCATE PREPARE` within stored procedures was lifted. The restriction still applies to stored functions and triggers. (Bug#10975, Bug#10605)

See also Bug#7115

- A new command line argument was added to `mysqld` to ignore client character set information sent during handshake, and use server side settings instead, to reproduce 4.0 behavior :

```
mysqld --skip-character-set-client-handshake
```

(Bug#9948)

- Added a `--routines` option for `mysqldump` that enables dumping of stored routines. (Bug#9056)
- `RAND()` no longer allows non-constant initializers. (Prior to MySQL 5.0.13, the effect of non-constant initializers is undefined.) (Bug#6172)
- Better detection of connection timeout for replication servers on Windows allows elimination of extraneous `Lost connection` errors in the error log. (Bug#5588)
- The syntax for `CREATE VIEW` and `ALTER VIEW` statements now includes `DEFINER` and `SQL SECURITY` clauses for specifying the security context to be used when checking access privileges at view invocation time. (The syntax is present in 5.0.13, but these clauses have no effect until 5.0.16.) See Section 12.1.11, “`CREATE VIEW Syntax`”, for more information.
- The `--hex-dump` option for `mysqldump` now also applies to `BIT` columns.
- Two new collations have been added for Esperanto: `utf8_esperanto_ci` and `ucs2_esperanto_ci`.
- The Windows binary packages are now compiled with the Microsoft Visual Studio 2003 compiler instead of Microsoft Visual C++ 6.0.
- The connection string for `FEDERATED` tables now is specified using a `CONNECTION` table option rather than a `COMMENT` table option.
- The binaries compiled with the Intel `icc` compiler are now built using `icc` 9.0 instead of `icc` 8.1. You will have to install new versions of the Intel `icc` runtime libraries, which are available from here: (<http://dev.mysql.com/downloads/os-linux.html>)

Bugs fixed:

- **Incompatible Change:** A lock wait timeout caused **InnoDB** to roll back the entire current transaction. Now it rolls back only the most recent SQL statement. (Bug#12308)
- **MySQL Cluster:** The cluster management client `START BACKUP` command could be interrupted by a `SHOW` command. (Bug#13054)
- **MySQL Cluster:** A cluster shutdown following the crash of a data node failed to terminate any remaining node processes, even though `ndb_mgm` showed the shutdown request as having been completed. (Bug#9996, Bug#10938, Bug#11623)
- **MySQL Cluster:** The average row size for Cluster tables was calculated incorrectly. This affected the values shown for the `Data_length` and `Avg_row_length` columns in the output generated by `SHOW TABLE STATUS` as well as the values for the `data_length` and `data_length/table_rows` columns shown in the `TABLES` table of the `INFORMATION_SCHEMA` database with respect to Cluster tables.

Tables using storage engines other than **NDB** were not affected by this bug. (Bug#9896)

- Local variables in stored routines were not always initialized correctly. ([Bug#13133](#))
- The `FEDERATED` storage engine does not support `ALTER TABLE`, but no appropriate error message was issued. ([Bug#13108](#))
- Columns named in the `USING()` clause of `JOIN ... USING()` were incorrectly resolved in case-sensitive fashion. ([Bug#13067](#))
- For a server compiled with yaSSL, clients that used MySQL Connector/J were not able to establish SSH connections. ([Bug#13029](#))
- When used in view definitions, `DAYNAME(expr)`, `DAYOFWEEK(expr)`, `WEEKDAY(expr)` were incorrectly treated as though the expression was `TO_DAYS(expr)` or `TO_DAYS(TO_DAYS(expr))`. ([Bug#13000](#))
- Using `AS` to rename a column selected from a view in a subquery made it not possible to refer to that column in the outer query. ([Bug#12993](#))
- Using an `INOUT` parameter with a `DECIMAL` data type in a stored procedure caused a server crash. ([Bug#12979](#))
- `SELECT ... JOIN ... ON ... JOIN ... USING` caused a server crash. ([Bug#12977](#))
- A bug introduced in MySQL 5.0.12 caused `SHOW TABLE STATUS` to display an `Auto_increment` value of 0 for `InnoDB` tables. ([Bug#12973](#))
- On HP-UX 11.x (PA-RISC), the `-L` option caused `mysqlimport` to crash. ([Bug#12958](#))
- `InnoDB`: A consistent read could return inconsistent results due to a bug introduced in MySQL 5.0.5. ([Bug#12947](#))
- Incorrect implicit nesting of joins caused the parser to fail on queries of the form `SELECT ... FROM t1 JOIN t2 JOIN t3 ON t1.t1col = t3.t3col` with an `Unknown column 't1.t1col' in 'on clause'` error. ([Bug#12943](#))
- Incorrect results could be returned from a view processed using a temporary table. ([Bug#12941](#))
- Multiplying a `DECIMAL` value within a loop in a stored routine could incorrectly result in a value of `NULL`. ([Bug#12938](#))
- Using `GROUP BY` when selecting from a view in some cases could cause incorrect results to be returned. ([Bug#12922](#))
- The counters for the `Key_read_requests`, `Key_reads`, `Key_write_requests`, and `Key_writes` status variables were changed from `unsigned long` to `unsigned longlong` to accommodate larger values before the variables roll over and restart from 0. ([Bug#12920](#))
- `mysql` and `mysqldump` were ignoring the `--defaults-extra-file` option. ([Bug#12917](#))
- `SHOW FIELDS FROM schemaname.viewname` caused error 1046 when no default schema was set. ([Bug#12905](#))
- `UNION [DISTINCT]` was not removing all duplicates for multi-byte character values. ([Bug#12891](#))
- A column that can be `NULL` was not handled properly for `WITH ROLLUP` in a subquery or view. ([Bug#12885](#))
- Within a transaction, the following statements now cause an implicit commit: `CREATE FUNCTION`, `DROP FUNCTION`, `DROP PROCEDURE`, `ALTER FUNCTION`, `ALTER PROCEDURE`, `CREATE PROCEDURE`. This corrects a problem where these statements followed by `ROLLBACK` might not be replicated properly. ([Bug#12870](#))
- `GROUP_CONCAT()` ignored an empty string if it was the first value to occur in the result. ([Bug#12863](#))
- If a client has opened an `InnoDB` table for which the `.ibd` file is missing, `InnoDB` would not honor a `DROP TABLE` statement for the table. ([Bug#12852](#))
- Within a stored procedure, a server crash was caused by assigning to a `VARCHAR INOUT` parameter the value of an expression that included the variable itself. (For example, `SET c = c.`) ([Bug#12849](#))
- The server crashed when one thread resized the query cache while another thread was using it. ([Bug#12848](#))
- A concurrency problem for `CREATE ... SELECT` could cause a server crash. ([Bug#12845](#))
- `DO IFNULL(NULL, NULL)` and `SELECT CAST(IFNULL(NULL, NULL) AS DECIMAL)` caused a server crash. ([Bug#12841](#))
- After changing the character set with `SET CHARACTER SET`, the result of the `GROUP_CONCAT()` function was not converted to the proper character set. ([Bug#12829](#))
- The Windows installer made a change to one of the `mysql.proc` table files, causing stored routine functionality to be compromised. The Windows installer now never overwrites files in the MySQL data directory. During an upgrade from one version

to another, a file in the data directory will not be overwritten even if it has not been modified since it was put there by an older installer.

If you have already lost access to stored routines because of this problem, you can get them back using the following procedure:

- Stop the server.
- In the `mysql\data` directory under your MySQL installation directory, and replace the `proc.frm` file with corresponding file from the version of MySQL that you were using before you upgraded.
- Start the server
- Start the `mysql` command-line client (use the `root` account or another account that has full database privileges) and execute the `mysql_fix_privilege_tables.sql` script that upgrades the grant tables to the current structure. Instructions for doing this are given in [Section 4.4.5, “mysql_fix_privilege_tables — Upgrade MySQL System Tables”](#).

After this, all stored routine functionality should work. ([Bug#12820](#))

- Queries with subqueries, where the inner subquery uses the `range` or `index_merge` access method, could return incorrect results. ([Bug#12720](#))
- The server failed to disallow `SET AUTOCOMMIT` in stored functions and triggers. It is allowed to change the value of `AUTO-COMMIT` in stored procedures, but a runtime error might occur if the procedure is invoked from a stored function or trigger. ([Bug#12712](#))
- Simultaneous execution of DML statements and `CREATE TRIGGER` or `DROP TRIGGER` statements on the same table could cause server crashes or errors. ([Bug#12704](#))
- Performing an `IS NULL` check on the `MIN()` or `MAX()` of an indexed column in a complex query could produce incorrect results. ([Bug#12695](#))
- Use of `PREPARE` and `EXECUTE` with a statement that selected from a view in a subquery could cause a server crash. ([Bug#12651](#))
- If the binary log is enabled, execution of a stored procedure that modifies table data and uses user variables could cause a server crash or incorrect information to be written to the binary log. ([Bug#12637](#))
- The `LIKE . . . ESCAPE` syntax produced invalid results when escape character was larger than one byte. ([Bug#12611](#))
- `mysqldump` did not dump triggers properly. ([Bug#12597](#))
- `InnoDB`: Limit recursion depth to 200 in deadlock detection to avoid running out of stack space. ([Bug#12588](#))
- The `mysql.server` script contained an incorrect path for the `libexec` directory. ([Bug#12550](#))
- A `UNION` of long `utf8 VARCHAR` columns was sometimes returned as a column with a `LONGTEXT` data type rather than `VARCHAR`. This could prevent such queries from working at all if selected into a `MEMORY` table because the `MEMORY` storage engine does not support the `TEXT` data types. ([Bug#12537](#))
- A client connection thread cleanup problem caused the server to crash when closing the connection if the binary log was enabled. ([Bug#12517](#))
- Use of the `mysql` client `HELP` command from within a stored routine caused a “packets out of order” error and a lost connection. Now `HELP` is detected and disallowed within stored routines. ([Bug#12490](#))
- The `SYSDATE()` function now returns the time at which it was invoked. In particular, within a stored routine or trigger, `SYSDATE()` returns the time at which it executes, not the time at which the stored routine or triggering statement began to execute. ([Bug#12480](#))
- `CREATE VIEW` inside a stored procedure caused a server crash if the table underlying the view had been deleted. ([Bug#12468](#))
- Deadlock occurred when several account management statements were run (particularly between `FLUSH PRIVILEGES/SET PASSWORD` and `GRANT/REVOKE` statements). ([Bug#12423](#))
- `InnoDB` was too permissive with `LOCK TABLE . . . READ LOCAL` and allowed new inserts into the table. Now `READ LOCAL` is equivalent to `READ` for `InnoDB`. This will cause slightly more locking in `mysqldump`, but makes `InnoDB` table dumps consistent with `MyISAM` table dumps. ([Bug#12410](#))
- If a stored function invoked from a `SELECT` failed with an error, it could cause the client connection to be dropped. Now such errors generate warnings instead so as not to interrupt the `SELECT`. ([Bug#12379](#))

- The value of `character_set_results` could be set to `NULL`, but returned the string "NULL" when retrieved. (Bug#12363)
- On Windows, the server was preventing tables from being created if the table name was a prefix of a forbidden name. For example, `nu1` is a forbidden name because it's the same as a Windows device name, but a table with the name of `n` or `nu` was being forbidden as well. (Bug#12325)
- `ALTER TABLE ... DISCARD TABLESPACE` for non-InnoDB table caused the client to lose the connection. (The server was not returning the error properly.) (Bug#12207)
- Outer join elimination was erroneously applied for some queries that used a `NOT BETWEEN` condition, an `IN(value_list)` condition, or an `IF()` condition. (Bug#12102, Bug#12101)
- Foreign keys were not properly enforced in `TEMPORARY` tables. Foreign keys now are disallowed in `TEMPORARY` tables. (Bug#12084)
- When using a cursor, a `SELECT` statement that uses a `GROUP BY` clause could return incorrect results. (Bug#11904)
- Replication of `LOAD DATA INFILE` failed between systems using different pathname syntax (such as delimiter characters). (Bug#11815)
- The `character_set_system` system variable could not be selected with `SELECT @@character_set_system`. (Bug#11775)
- A memory leak resulting from repeated `SELECT ... INTO` statements inside a stored procedure could cause the server to crash. (Bug#11333)
- Use of yaSSL for a secure client connection caused `LOAD DATA LOCAL INFILE` to fail. (Bug#11286)
- `mysqld_multi` now quotes arguments on command lines that it constructs to avoid problems with arguments that contain shell metacharacters. (Bug#11280)
- The server allowed privileges to be granted explicitly for the `INFORMATION_SCHEMA` database. Such privileges are always implicit and should not be grantable. (Bug#10734)
- `SHOW CREATE PROCEDURE` and `SHOW CREATE FUNCTION` no longer qualify the routine name with the database name, for consistency with the behavior of `SHOW CREATE TABLE`. (Bug#10362)
- The server incorrectly generated an `Unknown table` error message when for attempts to drop tables in the `INFORMATION_SCHEMA` database. Now it issues an `Access denied` message. (Bug#9846)
- Within a stored procedure, fetching a large number of rows in a loop using a cursor could result in a server crash or an out of memory error. Also, values inserted within a stored procedure using a cursor were interpreted as `latin1` even if character set variables had been set to a different character set. (Bug#9819, Bug#6513)
- The server allowed `TEMPORARY` tables and stored procedures to be created in the `INFORMATION_SCHEMA` database. (Bug#9683, Bug#10708)
- `SHOW FIELDS` truncated the `TYPE` column to 40 characters. (Bug#7142)

See also Bug#12817

- A view-creation statement of the form `CREATE VIEW name AS SELECT ... FROM tbl_name AS name` failed with a `Not unique table/alias: 'name'` error. (Bug#6808)
- `myisampack` did not properly pack `BLOB` values larger than 2^{24} bytes. (Bug#4214)
- Start the server
- In the `mysql\data` directory under your MySQL installation directory, and replace the `proc.frm` file with corresponding file from the version of MySQL that you were using before you upgraded.

E.1.18. Changes in MySQL 5.0.12 (02 September 2005)

Functionality added or changed:

- **Incompatible Change:** Beginning with MySQL 5.0.12, natural joins and joins with `USING`, including outer join variants, are processed according to the SQL:2003 standard. The changes include elimination of redundant output columns for `NATURAL` joins and joins specified with a `USING` clause and proper ordering of output columns. The precedence of the comma operator

also now is lower compared to `JOIN`.

In addition, a `DUPLICATE COLUMN NAME ERROR` no longer occurs when selecting from a view defined as `SELECT * FROM` a join that uses a `USING` clause on tables that have a common column name.

These changes make MySQL more compliant with standard SQL. However, they can result in different output columns for some joins. Also, some queries that appeared to work correctly prior to 5.0.12 must be rewritten to comply with the standard. For details about the scope of the changes and examples that show what query rewrites are necessary, see [Section 12.2.8.1, “JOIN Syntax”](#). ([Bug#6495](#), [Bug#6136](#), [Bug#10972](#), [Bug#9978](#), [Bug#10428](#), [Bug#10646](#), [Bug#6276](#), [Bug#6489](#), [Bug#6558](#), [Bug#9067](#), [Bug#4789](#), [Bug#12065](#), [Bug#13551](#))

- **MySQL Cluster:** The parsing of the `CLUSTERLOG` command by `ndb_mgm` was corrected to allow multiple items. ([Bug#12833](#))
- A query of the form `SHOW TABLE STATUS FROM db_name WHERE name IN (select_query)` would crash the server. ([Bug#12636](#))
- Using `DESCRIBE` on a view after renaming a column in one of the view's base tables caused the server to crash. ([Bug#12533](#))
- If a thread (connection) has tables locked, the query cache is switched off for that thread. This prevents invalid results where the locking thread inserts values between a second thread connecting and selecting from the table. ([Bug#12385](#))
- Interleaved execution of stored procedures and functions could be written to the binary log incorrectly, causing replication slaves to get out of sync. ([Bug#12335](#))
- Calls to stored procedures were written to the binary log even within transactions that were rolled back, causing them to be executed on replication slaves. ([Bug#12334](#))
- `SHOW TABLE STATUS FROM INFORMATION_SCHEMA` now sorts output by table name the same as it does for other databases. ([Bug#12315](#))
- It is no longer possible to issue `FLUSH` commands from within stored functions or triggers. See [Section F.1, “Restrictions on Stored Routines and Triggers”](#), for details. ([Bug#12280](#), [Bug#12307](#))
- `SHOW OPEN TABLES` now supports `FROM` and `LIKE` clauses. ([Bug#12183](#))
- Recursive triggers are detected and disallowed. Also, within a stored function or trigger, it is not allowable to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger. ([Bug#11896](#), [Bug#12644](#))
- `INFORMATION_SCHEMA` objects are now reported as a `SYSTEM VIEW` table type. ([Bug#11711](#))
- The stability of cursors when used with `InnoDB` tables was greatly improved. ([Bug#11309](#), [Bug#11832](#), [Bug#12243](#))
- Trying to drop the default keycache by setting `@global.key_buffer_size` to zero now returns a warning that the default keycache cannot be dropped. ([Bug#10473](#))
- `SHOW ENGINE INNODB STATUS` now can display longer query strings. ([Bug#7819](#))
- Added the `SLEEP()` function, which pauses for the number of seconds given by its argument. ([Bug#6760](#))
- `SHOW TABLE STATUS` for a view now shows `VIEW` in uppercase, consistent with `SHOW TABLES` and `INFORMATION_SCHEMA`. ([Bug#5501](#))

Bugs fixed:

- **MySQL Cluster:** When it could not copy a fragment, `ndbd` exited without printing a message about the condition to the error log. Now the message is written. ([Bug#12900](#))
- **MySQL Cluster:** When a `DISK IS FULL` condition occurred, `ndbd` exited without reporting this condition in the error log. ([Bug#12716](#))
- **MySQL Cluster:** Cluster failed to take character set data into account when recomputing hashes (and thus could not locate records for updating or deletion) following a configuration change and node restart. ([Bug#12220](#))
- **MySQL Cluster:** An `ALTER TABLE` command caused loss of data stored prior to the issuing of the command. ([Bug#12118](#))
- **MySQL Cluster:** Invalid values in `config.ini` caused `ndb_mgmd` to crash. ([Bug#12043](#))

- **MySQL Cluster:** When a schema was detected to be corrupt, `ndb` neglected to close it, resulting in a `FILE ALREADY OPEN` error if the schema was opened again later. written. ([Bug#12027](#))
- **MySQL Cluster:** Improved error messages related to filesystem issues. ([Bug#11218](#))
- **MySQL Cluster:** The wrong error message was displayed when the cluster management server port was closed while a `mysqld` process was trying to connect. ([Bug#10950](#))
- An optimizer estimate of zero rows for a non-empty `InnoDB` table used in a left or right join could cause incomplete rollback for the table. ([Bug#12779](#))
- `mysql_fix_privilege_tables.sql` was missing a comma, causing a syntax error when executed. ([Bug#12705](#))
- Invocations of the `SLEEP()` function incorrectly could get optimized away for statements in which it occurs. Statements containing `SLEEP()` incorrectly could be stored in the query cache. ([Bug#12689](#))
- Improper use of loose index scan in `InnoDB` sometimes caused incorrect query results. ([Bug#12672](#))
- A `SELECT DISTINCT` query with a constant value for one of the columns would return only a single row. ([Bug#12625](#))
- `SHOW TABLES FROM` returned wrong error message if the schema specified did not exist. ([Bug#12591](#))
- A server crash could result from an update of a view defined as a join, even though the update updated only a single table. ([Bug#12569](#))
- `DELETE` or `UPDATE` for an indexed `MyISAM` table could fail. This was due to a change in end-space comparison behavior from 4.0 to 4.1. ([Bug#12565](#))
- Some statements executed on a master server caused the SQL thread on a slave to run out of memory. ([Bug#12532](#))
- The `COLUMN_DEFAULT` column of the `INFORMATION_SCHEMA.COLUMNS` table should be returned as `NULL` if a column has no default value. An empty string was being returned if the column was defined as `NOT NULL`. ([Bug#12518](#))
- The `ROW()` constructor returned an incorrect result when comparison involved `NULL` values. ([Bug#12509](#))
- `STRCMP()` was not handled correctly in views. ([Bug#12489](#))
- Trigger and stored procedure execution could break replication. ([Bug#12482](#))
- `NOW()`, `CURRENT_TIME()` and values generated by timestamp columns are now constant for the duration of a stored function or trigger. This prevents the breaking of statements-based replication. ([Bug#12481](#))
- Selecting from a view defined as a join over many tables could result in a server crash due to miscalculation of the number of conditions in the `WHERE` clause. ([Bug#12470](#))
- `MEMORY` tables using `B-Tree` index on 64-bit platforms could produce false table is full errors. ([Bug#12460](#))
- The `CREATE_OPTIONS` column of `INFORMATION_SCHEMA.TABLES` showed incorrect options for tables in `INFORMATION_SCHEMA`. ([Bug#12397](#))
- Mishandling of comparison for rows containing `NULL` values against rows produced by an `IN` subquery could cause a server crash. ([Bug#12392](#))
- Selecting from a view after `INSERT` statements for the view's underlying table yielded different results than subsequent selects. ([Bug#12382](#))
- Concatenating `USER()` or `DATABASE()` with a column produced invalid results. ([Bug#12351](#))
- Comparison of `InnoDB` multi-part primary keys that include `VARCHAR` columns can result in incorrect results. ([Bug#12340](#))
- Renamed the `rest()` macro in `my_list.h` to `list_rest()` to avoid name clashes with user code. ([Bug#12327](#))
- When restoring `INFORMATION_SCHEMA` as the default database after failing to execute a stored procedure in an inaccessible database, the server returned a spurious `ERROR 42000: Unknown database 'information_schema'` message. ([Bug#12318](#))
- Users created using an IP address or other alias rather than a hostname listed in `/etc/hosts` could not set their own passwords. ([Bug#12302](#))
- The `NUMERIC_SCALE` column of the `INFORMATION_SCHEMA.COLUMNS` table should be returned as `0` for integer columns. It was being returned as `NULL`. ([Bug#12301](#))

- Creating a view that included the `TIMESTAMPDIFF()` function resulted in a invalid view. (Bug#12298)
- `CHECKSUM TABLE` command returned incorrect results for tables with deleted rows. After upgrading, users who used stored checksum information to detect table changes should rebuild their checksum data. (Bug#12296)
- Inserting `NULL` into a `GEOMETRY` column for a table that has a trigger could result in a server crash if the table was subsequently dropped. (Bug#12281)
- `mysampack` failed to delete `.TMD` temporary files when run with `-T` option. (Bug#12235)
- A race condition between server threads could cause a crash if one thread deleted a stored routine while another thread was executing a stored routine. (Bug#12228)
- Duplicate instructions in stored procedures resulted in incorrect execution when the optimizer optimized the duplicate code away. (Bug#12168)
- `XA` allowed two active transactions to be started with the same `XID`. (Bug#12162)
- `NULL` column definitions read incorrectly for inner tables of nested outer joins. (Bug#12154)
- `GROUP_CONCAT` ignores the `DISTINCT` modifier when used in a query joining multiple tables where one of the tables has a single row. (Bug#12095)
- A failure to obtain a lock for an `IN SHARE MODE` query could result in a server crash. (Bug#12082)
- `SELECT ... INTO var_name` within a trigger could cause a server crash. (Bug#11973)
- Using cursors and nested queries for the same table, corrupted results were returned for the outer query. (Bug#11909)
- A query using a `LEFT JOIN`, an `IN` subquery on the outer table, and an `ORDER BY` clause, caused the server to crash when cursors were enabled. (Bug#11901)
- `UNION` query with `FULLTEXT` could cause server crash. (Bug#11869)
- Some subqueries of the form `SELECT ... WHERE ROW(...) IN (subquery)` were being handled incorrectly. (Bug#11867)
- Column names in subqueries must be unique, but were not being checked for uniqueness. (Bug#11864)
- `TRUNCATE TABLE` did not work with `TEMPORARY InnoDB` tables. (Bug#11816)
- The `mysql_info()` C API function could return incorrect data when executed as part of a multi-statement that included a mix of statements that do and do not return information. (Bug#11688)
- A trigger that included a `SELECT` statement could cause a server crash. (Bug#11587)
- Built-in commands for the `mysql` client, such as `delimiter` and `\d` are now always parsed within files that are read using the `\.` and `source` commands. (Bug#11523)
- Added portability check for Intel compiler to address a problem compiling `InnoDB` code. (Bug#11510)
- `ALTER TABLE db_name.t RENAME t` did not move the table to default database unless the new name was qualified with the database name. (Bug#11493)
- Joins on `VARCHAR` columns of different lengths could produce incorrect results. (Bug#11398)
- For `PKG` installs on Mac OS X, the preinstallation and postinstallation scripts were being run only for new installations and not for upgrade installations, resulting in an incomplete installation process. (Bug#11380)
- Prepared statement parameters could cause errors in the binary log if the character set was `cp932`. (Bug#11338)
- Columns defined as `TINYINT(1)` were redefined as `TINYINT(4)` when incorporated into a `VIEW`. (Bug#11335)
- Stored procedures with particularly long loops could crash server due to memory leak. (Bug#11247, Bug#12297)
- `SET GLOBAL TRANSACTION ISOLATION LEVEL` was not working. (Bug#11207)
- A view was allowed to depend on a function that referred to a temporary table. (Bug#10970)
- Issuing `FLUSH INSTANCES` followed by `STOP INSTANCE` caused instance manager to crash. (Bug#10957)
- User variables were not automatically cast for comparisons, causing queries to fail if the column and connection character sets

differed. Now when mixing strings with different character sets but the same coercibility, allow conversion if one character set is a superset of the other. (Bug#10892)

- An incorrect conversion from `double` to `ulonglong` caused indexes not to be used for `BDB` tables on HP-UX. (Bug#10802)
- Slave I/O threads were considered to be in the running state when launched (rather than after successfully connecting to the master server), resulting in incorrect `SHOW SLAVE STATUS` output. (Bug#10780)
- `DATE_ADD()` and `DATE_SUB()` were converting invalid dates to `NULL` in `TRADITIONAL SQL` mode rather than rejecting them with an error. (Bug#10627)
- Views with multiple `UNION` and `UNION ALL` produced incorrect results. (Bug#10624)
- It was not possible to create a stored function with a spatial return value data type. (Bug#10499)
- `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` could fail with an erroneous “Column '`col_name`' specified twice” error. (Bug#10109)
- The only valid values for the `PACK_KEYS` table option are 0 and 1, but other values were being accepted. (Bug#10056)
- Using a stored procedure that referenced tables in the `INFORMATION_SCHEMA` database would return an empty result set. (Bug#10055, Bug#12278)
- `FLUSH TABLES WITH READ LOCK` combined with `LOCK TABLE ... WRITE` caused deadlock. (Bug#9459)
- A data type of `CHAR BINARY` was not recognized as valid for stored routine parameters. (Bug#9048)
- `ISO-8601` formatted dates were not being parsed correctly. (Bug#7308)
- On Windows when the `--innodb_buffer_pool_awesome_mem_mb` option has been given, the server detects whether AWE support is available and has been compiled into the server, and displays an appropriate error message if not. (Bug#6581)
- Pathname values for options such as `---basedir` or `--datadir` didn't work on Japanese Windows machines for directory names containing multi-byte characters having a second byte of `0x5C` (“\”). (Bug#5439)
- If a `DROP DATABASE` fails on a master server due to the presence of a non-database file in the database directory, the master have the database tables deleted, but not the slaves. To deal with failed database drops, we now write `DROP TABLE` statements to the binary log for the tables so that they are dropped on slaves. (Bug#4680)
- `SHOW TABLE STATUS` sometimes reported a `Row_format` value of `Dynamic` for `MEMORY` tables, though such tables always have a format of `Fixed`. (Bug#3094)

E.1.19. Changes in MySQL 5.0.11 (06 August 2005)

Functionality added or changed:

- **MySQL Cluster:** Improved handling of the configuration variables `NoOfPagesToDiskDuringRestartACC`, `NoOfPagesToDiskAfterRestartACC`, `NoOfPagesToDiskDuringRestartTUP`, and `NoOfPagesToDiskAfterRestartTUP` should result in noticeably faster startup times for MySQL Cluster. (Bug#12149)
- Added an optimization that avoids key access with `NULL` keys for the `ref` method when used in outer joins. (Bug#12144)
- Added support of where clause for queries with `FROM DUAL`. (Bug#11745)
- Maximum size of stored procedures increased from 64k to 4Gb. (Bug#11602)
- `SHOW CHARACTER SET` and `INFORMATION_SCHEMA` now properly report the `Latin1` character set as `cp1252`. (Bug#11216)
- Added new `ER_STACK_OVERRUN_NEED_MORE` error message to indicate that, while the stack is not completely full, more stack space is required. (Bug#11213)
- `mysqldump` now dumps triggers for each dumped table. This can be suppressed with the `--skip-triggers` option. (Bug#10431)
- Added error message for users who attempt `CREATE TABLE ... LIKE` and specify a non-table in the `LIKE` clause. (Bug#6859)
- Security improvement: Applied a patch that addresses a potential `zlib` data vulnerability that could result in an application

crash. This only affects the binaries for platforms that are linked statically against the bundled zlib (most notably Microsoft Windows and HP-UX). (CVE-2005-1849)

Bugs fixed:

- **MySQL Cluster:** The MySQL Cluster backup log was invalid where the number of Cluster nodes was not equal to a power of 2. (Bug#11675)
- Creation of the `mysql` group account failed during the RPM installation. (Bug#12348)
- Updated dependency list for RPM builds to include missing dependencies such as `useradd` and `groupadd`. (Bug#12233)
- A delayed insert that would duplicate an existing record crashed the server instead. (Bug#12226)
- When `DROP DATABASE` was called concurrently with a `DROP TABLE` of any table, the MySQL Server crashed. (Bug#12212)
- **InnoDB:** True `VARCHAR`: Return `NULL` columns in the format expected by MySQL. (Bug#12186)
- Information about a trigger was not displayed in the output of `SELECT ... FROM INFORMATION_SCHEMA.TRIGGERS` when the selected database was `INFORMATION_SCHEMA`, prior to the trigger's first invocation. (Bug#12127)
- **InnoDB:** Do not flush after each write, not even before setting up the doublewrite buffer. Flushing can be extremely slow on some systems. (Bug#12125)
- Two threads could potentially initialize different character sets and overwrite each other. (Bug#12109)
- `big5` strings were not being stored in `FULLTEXT` index. (Bug#12075)
- Character data truncated when GBK characters `0xA3A0` and `0xA1` are present. (Bug#11987)
- `ALTER TABLE` when `SQL_MODE = 'TRADITIONAL'` gave rise to an invalid error message. (Bug#11964)
- Issuing successive `FLUSH TABLES WITH READ LOCK` would cause the `mysql` client to hang. (Bug#11934)
- `mysql_install_db` used static `localhost` value in `GRANT` tables even when server hostname is not `localhost`, such as `localhost.localdomain`. This change is applied to version 5.0.10b on Windows. (Bug#11822)
- Comparisons like `SELECT "A\\" LIKE "A\\";` fail when using `SET NAMES utf8;` (Bug#11754)
- Attempting to repair a table having a fulltext index on a column containing words whose length exceeded 21 characters and where `myisam_repair_threads` was greater than 1 would crash the server. (Bug#11684)
- When used in a `SELECT` query against a view, the `GROUP_CONCAT()` function returned only a single row. (Bug#11412)
- Multiplying `ABS()` output by a negative number would return incorrect results. (Bug#11402)
- The `LPAD()` and `RPAD()` functions returned the wrong length to `mysql_fetch_fields()`. (Bug#11311)
- A `UNIQUE VARCHAR` column would be mis-identified as `MUL` in table descriptions. (Bug#11227)
- DDL statements are now allowed in stored procedures if the procedure is not invoked from a stored function or a trigger. This fix also resolves a problem where a `TEMPORARY` statement created by one stored routine was inaccessible to another routine invoked during the same connection. (Bug#11126)
- Calling the C API function `mysql_stmt_fetch()` after all rows of a result set were exhausted would return an error instead of `MYSQL_NO_DATA`. (Bug#11037)
- `SELECT @@local...` returned `@@session...` in the column header. (Bug#10724)
- Incorrect error message displayed if user attempted to create a table in a non-existing database using `CREATE database_name.table_name` syntax. (Bug#10407)
- Unsigned `LONG` system variables may return incorrect value when retrieved with a `SELECT` for certain values. (Bug#10351)
- `GROUP_CONCAT()` sometimes returned a result with a different collation from that of its arguments. (Bug#10201)
- Prepared statements were not being written to the Slow Query log. (Bug#9968)
- The value of `max_connections_per_hour` was capped by the unrelated `max_user_connections` setting.

[Bug#9947](#))

- In stored procedures, a cursor that fetched an empty string into a variable would set the variable to `NULL` instead. ([Bug#8692](#))
- Added checks to prevent error when allocating memory when there was insufficient memory available. ([Bug#7003](#))
- Multiple `SELECT SQL_CACHE` queries in a stored procedure causes error and client hang. ([Bug#6897](#))
- A trigger dependent on a feature of one `SQL_MODE` setting would cause an error when invoked after the `SQL_MODE` was changed. ([Bug#5891](#))

E.1.20. Changes in MySQL 5.0.10 (27 July 2005)

Functionality added or changed:

- **Incompatible Change:** The namespace for triggers has changed. Previously, trigger names had to be unique per table. Now they must be unique within the schema (database). An implication of this change is that `DROP TRIGGER` syntax now uses a schema name instead of a table name (schema name is optional and, if omitted, the current schema will be used).

Note

When upgrading from a previous version of MySQL 5 to MySQL 5.0.10 or newer, you must drop all triggers and re-create them or `DROP TRIGGER` will not work after the upgrade. A suggested procedure for doing this is given in [Section 2.4.17.2, “Upgrading from MySQL 4.1 to 5.0”](#).

([Bug#5892](#))

- **MySQL Cluster:** A new `-P` option is available for use with the `ndb_mgmd` client. When called with this option, `ndb_mgmd` prints all configuration data to `stdout`, then exits.
- On Windows, the search path used by MySQL applications for `my.ini` now includes `..\my.ini` (that is, the application's parent directory, and hence, the installation directory). ([Bug#10419](#))
- The viewing of triggers and trigger metadata has been enhanced as follows:
 - An extension to the `SHOW` command has been added: `SHOW TRIGGERS` can be used to view a listing of triggers. See [Section 12.5.5.31, “SHOW TRIGGERS Syntax”](#), for details.
 - The `INFORMATION_SCHEMA` database now includes a `TRIGGERS` table. See [Section 22.16, “The INFORMATION_SCHEMA TRIGGERS Table”](#), for details.

([Bug#9586](#))

- It is no longer necessary to issue an explicit `LOCK TABLES` for any tables accessed by a trigger prior to executing any statements that might invoke the trigger.

Previously, executing a statement that invoked a trigger would cause problems unless a `LOCK TABLES` was first issued for any tables accessed by the trigger. The exact nature of the problem depended upon the MySQL 5.0 release being used: prior to 5.0.3, this resulted in a crash; from 5.0.3 to 5.0.7, MySQL would issue a warning; in 5.0.9, the server would issue an error.

The same issue caused `LOCK TABLES` to fail following `UNLOCK TABLES` if triggers were involved. ([Bug#8406](#), [Bug#9581](#))

- The MySQL server now starts correctly with all combinations of `basedir` and `datadir` resolving an issue introduced by the original fix for this bug in MySQL 4.1.9. ([Bug#7249](#))

See also [Bug#7518](#)

- Added `mysql_get_character_set_info()` C API function for obtaining information about the default character set of the current connection.
- An extension to the `SHOW` command has been added: `SHOW TRIGGERS` can be used to view a listing of triggers. See [Section 12.5.5.31, “SHOW TRIGGERS Syntax”](#), for details.
- Add the `--defaults-group-suffix` option. See [Section 4.2.3.2, “Using Option Files”](#).
- The bundled version of the `readline` library was upgraded to version 5.0.
- Triggers can now reference tables by name. See [Section 12.1.10, “CREATE TRIGGER Syntax”](#), for more information.

- Add `table_lock_wait_timeout` global server system variable.

Bugs fixed:

- **Security Fix:** A vulnerability in `zlib` could result in a buffer overflow and arbitrary code execution. ([Bug#11844](#), [CVE-2005-2096](#), [CVE-2005-1849](#))
- **MySQL Cluster:** The temporary tables created by an `ALTER TABLE` on an `NDB` table were visible to all SQL nodes in the cluster. ([Bug#12055](#))
- **MySQL Cluster:** `NDB` ignored the `Hostname` option in the `[ndbd default]` section of the cluster configuration file. ([Bug#12028](#))
- **MySQL Cluster:** The output of `pererror --help` did not display any information about the `--ndb` option. ([Bug#11999](#))
- **MySQL Cluster:** Attempting to create or drop tables during a backup would cause the cluster to shut down. ([Bug#11942](#))
- **MySQL Cluster:** `ndb_mgmd` leaked file descriptors. ([Bug#11898](#))
- **MySQL Cluster:** The MySQL Server left core files following shutdown if data nodes had failed. ([Bug#11516](#))
- **MySQL Cluster:** When attempting to drop a table with a broken unique index, `NDB` failed to drop the table and erroneously report that the table was unknown. ([Bug#11355](#))
- **MySQL Cluster:** Trying to use a greater number of tables than specified by the value of `MaxNoOfTables` caused table corruption such that data nodes could not be restarted. ([Bug#9994](#))
- The server did not compile correctly when using `gcc4` on AMD64 platforms. ([Bug#12040](#))
- `SHOW BINARY LOGS` displayed a file size of 0 for all log files but the current one if the files were not located in the data directory. ([Bug#12004](#))
- Increased the version number of the `libmysqlclient` shared library from 14 to 15 because it is binary incompatible with the MySQL 4.1 client library. ([Bug#11893](#))
- The server crashed when dropping a trigger that invoked a stored procedure, if the procedure was not yet in the connection-specific stored routine cache. ([Bug#11889](#))
- `SELECT ... NOT IN()` gave unexpected results when only static value present between the `()`. ([Bug#11885](#))
- A recent optimizer change caused `DELETE ... WHERE ... NOT LIKE` and `DELETE ... WHERE ... NOT BETWEEN` to not properly identify the rows to be deleted. ([Bug#11853](#))
- Execution of a prepared statement that invoked a non-existent or dropped stored routine would crash the server. ([Bug#11834](#))
- Selecting the result of an aggregate function for an `ENUM` or `SET` column within a subquery could result in a server crash. ([Bug#11821](#))
- Creating a table with a `SET` or `ENUM` column with the `DEFAULT 0` clause caused a server crash if the table's character set was `utf8`. ([Bug#11819](#))
- Incorrect column values could be retrieved from views defined using statements of the form `SELECT * FROM tbl_name`. ([Bug#11771](#))
- When invoked within a view, `SUBTIME()` returned incorrect values. ([Bug#11760](#))
- For several character sets, MySQL incorrectly converted the character code for the division sign to the `eucjpms` character set. ([Bug#11717](#))
- Performing an `ORDER BY` on a `SELECT` from a `VIEW` produced unexpected results when `VIEW` and underlying table had the same column name on different columns. ([Bug#11709](#))
- Execution of `SHOW TABLES` failed to increment the `Com_show_tables` status variable. ([Bug#11685](#))
- `LIKE` pattern matching using prefix index didn't return correct result. ([Bug#11650](#))
- Invoking the `DES_ENCRYPT()` function could cause a server crash if the server was started without the `--des-key-file` option. ([Bug#11643](#))
- IP addresses not shown in `ndb_mgm SHOW` command on second `ndb_mgmd` (or on `ndb_mgmd` restart). ([Bug#11596](#))

- `SHOW PROCEDURE/FUNCTION STATUS` didn't work for users with limited access. (Bug#11577)
- `mysqlbinlog` was failing the test suite on Windows due to `BOOL` being incorrectly cast to `INT`. (Bug#11567)
- The server crashed upon execution of a statement that used a stored function indirectly (via a view) if the function was not yet in the connection-specific stored routine cache and the statement would update a `Handler_xxx` status variable. This fix allows the use of stored routines under `LOCK TABLES` without explicitly locking the `mysql.lock` table. However, you cannot use `mysql.proc` in statements that will combine locking of it with modifications for other tables. (Bug#11554)
- Aliasing the column names in a `VIEW` did not work when executing a `SELECT` query on the `VIEW`. (Bug#11399)
- The `mysql.proc` table was not being created properly with the proper `utf8` character set and collation, causing server crashes for stored procedure operations if the server was using a multi-byte character set. To take advantage of the bug fix, `mysql_fix_privilege_tables` should be run to correct the structure of the `mysql.proc` table.

Note that it is *necessary* to run `mysql_fix_privileges_tables` when upgrading from a previous installation that contains the `mysql.proc` table (that is, from a previous 5.0 installation). Otherwise, creating stored procedures might not work. (Bug#11365)

- For prepared statements, the SQL parser did not disallow “?” parameter markers immediately adjacent to other tokens, which could result in malformed statements in the binary log. (For example, `SELECT * FROM t WHERE? = 1` could become `SELECT * FROM t WHERE0 = 1`.) (Bug#11299)
- The C API function `mysql_stmt_reset()` did not clear error information. (Bug#11183)
- `INFORMATION_SCHEMA.COLUMNS` had some inaccurate values for some data types. (Bug#11057)
- MySQL server would crash if a fetch was performed after a `ROLLBACK` when cursors were involved. (Bug#10760)
- When two threads competed for the same table, a deadlock could occur if one thread also had a lock on another table through `LOCK TABLES` and the thread was attempting to remove the table in some manner while the other thread tried to place locks on both tables. (Bug#10600)
- When used within a subquery, `SUBSTRING()` returned an empty string. (Bug#10269)
- Multiple-table `UPDATE` queries using `CONVERT_TZ()` would fail with an error. (Bug#9979)
- With strict SQL mode enabled, `ALTER TABLE` reported spurious “Invalid default value” messages for columns that had no `DEFAULT` clause. (Bug#9881)
- `mysql_fetch_fields()` returned incorrect length information for `MEDIUM` and `LONG TEXT` and `BLOB` columns. (Bug#9735)
- Within a stored procedure, selecting from a table through a view caused subsequent updates to the table to fail with a message that the table was read-locked. (Bug#9597)
- Within a stored procedure that selects from a table, invoking another procedure that requires a write lock for the table caused that procedure to fail with a message that the table was read-locked. (Bug#9565)
- Server-side prepared statements failed for columns with a character set of `ucs2`. (Bug#9442)
- In SQL prepared statements, comparisons could fail for values not equally space-padded. For example, `SELECT 'a' = 'a '`; returns 1, but `PREPARE s FROM 'SELECT ?=?'; SET @a = 'a', @b = 'a '; PREPARE s FROM 'SELECT ?=?'; EXECUTE s USING @a, @b;` incorrectly returned 0. (Bug#9379)
- References to system variables in an SQL statement prepared with `PREPARE` were evaluated during `EXECUTE` to their values at prepare time, not to their values at execution time. (Bug#9359)
- The server did not accept some fully-qualified trigger names. (Bug#8758)
- Creating a trigger in one database that references a table in another database was being allowed without generating errors. (Bug#8751)
- For server shutdown on Windows, error messages of the form `Forcing close of thread n user: 'name'` were being written to the error log. Now connections are closed more gracefully without generating error messages. (Bug#7403)
- For a stored procedure defined with `SQL SECURITY DEFINER` characteristic, `CURRENT_USER()` incorrectly reported the user invoking the procedure, not the user who defined it. (Bug#7291)
- Labels in stored routines did not work if the character set was not `latin1`. (Bug#7088)

- Duplicate trigger names were allowed within a single schema. ([Bug#6182](#))
- For execution of a stored procedure that refers to a view, changes to the view definition were not seen. The procedure continued to see the old contents of the view. ([Bug#6120](#))
- The `traditional` SQL mode accepted invalid dates if the date value provided was the result of an implicit type conversion. ([Bug#5906](#))
- In a shared Windows environment, MySQL could not find its configuration file unless the file was in the `C:\` directory. ([Bug#5354](#))
- Functions that evaluate to constants (such as `NOW()` and `CURRENT_USER()`) were being evaluated in the definition of a `VIEW` rather than included verbatim. ([Bug#4663](#))

E.1.21. Changes in MySQL 5.0.9 (15 July 2005)

Functionality added or changed:

- The handling of `BIT` columns has been improved, and should now be much more reliable in a number of cases. ([Bug#11572](#), [Bug#11091](#), [Bug#10617](#))
- Recursion in stored routines is now disabled because it was crashing the server. We plan to modify stored routines to allow this to operate safely in a future release. ([Bug#11394](#))
- An attempt to create a `TIMESTAMP` column with a display width (for example, `TIMESTAMP(6)`) now results in a warning. Display widths have not been supported for `TIMESTAMP` since MySQL 4.1. ([Bug#10466](#))
- `mysql_real_escape_string()` API function now respects `NO_BACKSLASH_ESCAPES` SQL mode. ([Bug#10214](#))
- `InnoDB`: Made `CHECK TABLE` killable. ([Bug#9730](#))
- `InnoDB`: Make `innodb_thread_concurrency=20` by default. Bypass the concurrency checking if the setting is greater than or equal to 20.
- `InnoDB`: Various optimizations. Removed unreachable debug code from non-debug builds. Added hints for the branch predictor in `gcc`. Made assertions occupy less space.
- `InnoDB`: When creating or extending an `InnoDB` data file, at most one megabyte at a time is allocated for initializing the file. Previously, `InnoDB` allocated and initialized 1 or 8 megabytes of memory, even if only a few 16-kilobyte pages were to be written. This improves the performance of `CREATE TABLE` in `innodb_file_per_table` mode.

Bugs fixed:

- **MySQL Cluster**: When trying to open a table that could not be discovered or unpacked, the cluster returned error codes which the MySQL server falsely interpreted as operating system errors. ([Bug#10365](#))
- The `--master-data` option for `mysqldump` resulted in no error if the binary log was not enabled. Now an error occurs unless the `--force` option is given. ([Bug#11678](#))
- When a table had a primary key containing a `BLOB` column, creation of another index failed with the error `BLOB/TEXT column used in key specification without keylength`, even when the new index did not contain a `BLOB` column. ([Bug#11657](#))
- Incorrect results when using `GROUP BY ... WITH ROLLUP` on a `VIEW`. ([Bug#11639](#))
- MySQL would not compile correctly on QNX due to missing `rint()` function. ([Bug#11544](#))
- A `SELECT DISTINCT col_name` would work correctly with a `MyISAM` table only when there was an index on `col_name`. ([Bug#11484](#))
- Using `CONCAT_WS()` on a column set `NOT NULL` caused incorrect results when used in a `LEFT JOIN`. ([Bug#11469](#))
- Temporary tables were created in the data directory instead of `tmpdir`. ([Bug#11440](#))
- Running a `CHECK TABLES` on multiple views crashed the server. ([Bug#11337](#))
- Manually inserting a row with `host=''` into `mysql.tables_priv` and performing a `FLUSH PRIVILEGES` would cause

the server to crash. (Bug#11330)

- Wrong comparison method used in `VIEW` when relaxed date syntax used (for example, `2005.06.10`). (Bug#11325)
- Signed `BIGINT` would not accept `-9223372036854775808` as a `DEFAULT` value. (Bug#11215)
- Optimizer performed range check when comparing unsigned integers to negative constants, could cause errors. (Bug#11185)
- A cursor using a query with a filter on a `DATE` or `DATETIME` column would cause the server to crash server after the data was fetched. (Bug#11172)
- The `mysql_config` script did not handle symbolic linking properly. (Bug#10986)
- `mysqldump` failed when reloading a view if the view was defined in terms of a different view that had not yet been reloaded. `mysqldump` now creates a dummy table to handle this case. (Bug#10927)
- If a prepared statement cursor is opened but not completely fetched, attempting to open a cursor for a second prepared statement will fail. (Bug#10794)
- Combining cursors and subqueries could cause server crash or memory leaks. (Bug#10736)
- Instances of the `VAR_SAMP()` function in view definitions were converted to `VARIANCE()`. This is incorrect because `VARIANCE()` is the same as `VAR_POP()`, not `VAR_SAMP()`. (Bug#10651)
- `DES_ENCRYPT()` and `DES_DECRYPT()` require SSL support to be enabled, but were not checking for it. Checking for incorrect arguments or resource exhaustion was also improved for these functions. (Bug#10589)
- For `MEMORY` tables, it was possible for updates to be performed using outdated key statistics when the updates involved only very small changes in a very few rows. This resulted in the random failures of queries such as `UPDATE t SET col = col + 1 WHERE col_key = 2;` where the same query with no `WHERE` clause would succeed. (Bug#10178)
- When used in joins, `SUBSTRING()` failed to truncate to zero those string values that could not be converted to numbers. (Bug#10124)
- Views did not use indexes on all appropriate queries. (Bug#10031)
- Closing a cursor that was already closed would cause MySQL to hang. (Bug#9814)
- The server would lose table-level `CREATE VIEW` and `SHOW VIEW` privileges following a `FLUSH PRIVILEGES` or server restart. (Bug#9795)
- `mysqldump --xml` did not format `NULL` column values correctly. (Bug#9657)
- The `--no-data` option for `mysqldump` was being ignored if table names were given after the database name. (Bug#9558)
- Clients would hang following some errors with stored procedures. (Bug#9503)
- `mysqldump` could crash for illegal or non-existent table names. (Bug#9358)
- A compression algorithm issue caused `myisampack` to fail for very large data sets (where the total size of all records in a single column was on the order of 3 GB or more) on 64-bit platforms. (A fix for other platforms was made in MySQL 5.0.6.) (Bug#8321)
- The `ENCRYPT()` and `SUBSTRING_INDEX()` functions would cause errors when used with a `VIEW`. (Bug#7024)
- `SHOW CREATE VIEW` did not take the `ANSI MODE` into account when quoting identifiers. (Bug#6903)
- In strict mode, an `INSERT` into a view that did not include a value for a `NOT NULL` column but that did include a `WHERE` test on the same column would succeed. This happened even though the `INSERT` should have been prevented due to the failure to supply a value for the `NOT NULL` column. (Bug#6443)

E.1.22. Changes in MySQL 5.0.8 (Not released)

Note

Starting with version 5.0.8, changes for MySQL Cluster can be found in the combined Change History.

Functionality added or changed:

- **Incompatible Change:** Previously, conversion of `DATETIME` values to numeric form by adding zero produced a result in `YYYYMMDDHHMMSS` format. The result of `DATETIME+0` is now in `YYYYMMDDHHMMSS.000000` format. ([Bug#12268](#))
- Where a `GROUP BY` query uses a grouping column from the query's `SELECT` clause, MySQL now issues a warning. This is done because the SQL standard states that any grouping column must unambiguously reference a column of the table resulting from the query's `FROM` clause, and allowing columns from the `SELECT` clause to be used as grouping columns is a MySQL extension to the standard.

By way of example, consider the following table:

```
CREATE TABLE users (
  userid INT NOT NULL PRIMARY KEY,
  username VARCHAR(25),
  usergroupid INT NOT NULL
);
```

MySQL allows you to use the alias in this query:

```
SELECT usergroupid AS id, COUNT(userid) AS number_of_users
FROM users
GROUP BY id;
```

However, the SQL standard requires that the column name be used, as shown here:

```
SELECT usergroupid AS id, COUNT(userid) AS number_of_users
FROM users
GROUP BY usergroupid;
```

Queries such as the first of the two shown above will continue to be supported in MySQL; however, beginning with MySQL 5.0.8, using a column alias in this fashion will generate a warning. Note that in the event of a collision between column names and/or aliases used in joins, MySQL attempts to resolve the conflict by giving preference to columns arising from tables named in the query's `FROM` clause. ([Bug#11211](#))

- Using prepared statements within a stored routine (`PREPARE`, `EXECUTE`, `DEALLOCATE`) could cause the client connection to be dropped after the routine returned. In addition, executing a statement which called a function deallocating the same statement caused the server to crash. This is prevented by disabling dynamic SQL within stored routines.

Note

This restriction was lifted in 5.0.13 for stored procedures, but not stored functions or triggers.

([Bug#10975](#), [Bug#10605](#))

See also [Bug#7115](#)

- Added support for `B'10'` syntax for bit literal. ([Bug#10650](#))
- `MEMORY` tables now support indexes of up to 500 bytes. See [Section 13.4, "The MEMORY \(HEAP\) Storage Engine"](#). ([Bug#10566](#))
- Expanded on information provided in general log and slow query log for prepared statements. ([Bug#8367](#), [Bug#9334](#))
- Some data definition statements (`CREATE TABLE` where the table was not a temporary table, `TRUNCATE TABLE`, `DROP DATABASE`, and `CREATE DATABASE`) were not being written to the binary log after a `ROLLBACK`. This also caused problems with replication.

Important

As a result of this fix, the following statements now cause an implicit commit:

- `CREATE TABLE`
- `TRUNCATE TABLE`
- `DROP DATABASE`
- `CREATE DATABASE`

([Bug#6883](#))

- New `SQL_MODE - NO_ENGINE_SUBSTITUTION` Prevents automatic substitution of storage engine when the requested storage engine is disabled or not compiled in. ([Bug#6877](#))

Bugs fixed:

- **Security Fix:** On Windows systems, a user with any of the following privileges
 - `REFERENCES`
 - `CREATE TEMPORARY TABLES`
 - `GRANT OPTION`
 - `CREATE`
 - `SELECT`on `*.*` could crash `mysqld` by issuing a `USE LPT1;` or `USE PRN;` command. In addition, any of the commands `USE NUL;`, `USE CON;`, `USE COM1;`, or `USE AUX;` would report success even though the database was not in fact changed.

Note

Although this bug was thought to be fixed previously, it was later discovered to be present in the MySQL 5.0.7-beta release for Windows.

([Bug#9148](#))

- **MySQL Cluster:** Setting `TransactionInactiveTimeout = 0` did not result in an infinite timeout. ([Bug#11290](#))
- **MySQL Cluster:** `mysqld` processes did not reconnect to the cluster following a restart of `ndb_mgmd`. ([Bug#11221](#))
- **MySQL Cluster:** Insert records were incorrectly applied by `ndb_restore`, thus making restoring from backup inconsistent if the binlog contained inserts. ([Bug#11166](#))
- **MySQL Cluster:** A `DELETE` performed as part of a transaction caused an erroneous result. ([Bug#11133](#))
- **MySQL Cluster:** Connections between data nodes and management nodes were not closed following shutdown of `ndb_mgmd`. ([Bug#11132](#))
- **MySQL Cluster:** The `ndb_mgm` client's `SHOW` command displayed incorrect output after master data node failure. ([Bug#11050](#))
- **MySQL Cluster:** When using dynamically allocated ports on Linux, the cluster would hang on initial startup. ([Bug#10893](#))
- **MySQL Cluster:** Not allowing sufficient parallelism in the cluster's configuration (for example, by setting `NoOfTransactions` too small) caused `ndb_restore` to fail without providing any error messages. ([Bug#10294](#))
- **MySQL Cluster:** Running `ndb_select_count` crashed the cluster when running on Red Hat Enterprise 4/64-bit/Opteron. ([Bug#10058](#))
- **MySQL Cluster:** Data nodes failed to restart on 64-bit Solaris. ([Bug#9025](#))
- **MySQL Cluster:** On 64-bit Solaris 9, the cluster timed out and crashed after the first query was made. ([Bug#8918](#))
- Multiple range accesses in a subquery cause server crash. ([Bug#11487](#))
- A `CAST()` value could not be included in a `VIEW`. ([Bug#11387](#))
- Server crashed when using `GROUP BY` on the result of a `DIV` operation on a `DATETIME` value. ([Bug#11385](#))
- `INSERT INTO SELECT FROM view` produced incorrect result when using `ORDER BY`. ([Bug#11298](#))
- Possible `NULL` values in `BLOB` columns could crash the server when a `BLOB` was used in a `GROUP BY` query. ([Bug#11295](#))
- An outer join with an `ON` condition that evaluated to false could return an incorrect result. ([Bug#11285](#))
- An outer join with an empty derived table (a result from a subquery) returned no result. ([Bug#11284](#))
- `CAST(... AS DECIMAL)` didn't work for strings. ([Bug#11283](#))
- Corrected a problem with `IFNULL()` returning an incorrect result on 64-bit systems. ([Bug#11235](#))
- The `SHOW INSTANCE OPTIONS` command in MySQL Instance Manager displayed option values incorrectly for options for which no value had been given. ([Bug#11200](#))

- The default hostname for MySQL server was always `mysql`. (Bug#11174)
- Some internal functions did not take into account that, for multi-byte character sets, `CHAR` columns could exceed 255 bytes and `VARCHAR` columns could exceed 65,535 bytes, which could cause the server to crash. (Bug#11167)
- There were locking problems with multiple-statement `DELETE` statements performed within a stored routine, such as incorrectly locking the table to be read with a read lock rather than a write lock. (Bug#11158)
- Testing for `crypt()` support caused compilation problems when using OpenSSL/yaSSL on HP-UX and Mac OS X. (Bug#11150, Bug#10675)
- The `NULLIF()` function could produce incorrect results if the first argument was `NULL`. (Bug#11142)
- `mysqld_safe` would sometimes fail to remove the pid file for the old `mysql` process after a crash. As a result, the server would fail to start due to a false `A mysqld process already exists...` error. (Bug#11122)
- An invalid comparison caused warnings for packet length in replication on 64-bit compilers. (Bug#11064)
- Calling a stored procedure that made use of an `INSERT ... SELECT ... UNION SELECT ...` query caused a server crash. (Bug#11060)
- `sql_data_access` column of `routines` table of `INFORMATION_SCHEMA` was empty. (Bug#11055)
- `SELECT DISTINCT` queries or `GROUP BY` queries without `MIN()` or `MAX()` could return inconsistent results for indexed columns. (Bug#11044)
- A `CREATE TABLE db_name.tbl_name LIKE ...` statement would crash the server when no database was selected. (Bug#11028)
- On Windows, `mysqlshow` did not interpret wildcard characters properly if they were given in the table name argument. (Bug#10947)
- The hostname cache was not working. (Bug#10931)
- A three byte buffer overflow in the client functions caused improper exiting of the client when reading a command from the user. (Bug#10841)
- The `mysql` client would output a prompt twice following input of very long strings, because it incorrectly assumed that a call to the `_cgets()` function would clear the input buffer. (Bug#10840)
- Setting `@@SQL_MODE = NULL` caused an erroneous error message. (Bug#10732)
- When using a cursor with a prepared statement, the first execution returned the correct result but was not cleaned up properly, causing subsequent executions to return incorrect results. (Bug#10729)
- Converting a `VARCHAR` column having an index to a different type (such as `TINYTEXT`) gave rise to an incorrect error message.

Note that this bugfix induces a slight change in the behavior of indexes: If an index is defined to be the same length as a field (or is left to default to that field's length), and the length of the field is later changed, then the index will adopt the new length of the field. Previously, the size of the index did not change for some field types (such as `VARCHAR`) when the field type was changed. (Bug#10543)

- **InnoDB**: Pad UTF-8 `VARCHAR` columns with `0x20`. Pad UCS2 `CHAR` columns with `0x0020`. (Bug#10511)
- **InnoDB**: Enforce maximum `CHAR_LENGTH()` of UTF-8 data in `ON UPDATE CASCADE`. (Bug#10409)
- `SELECT * FROM table` returned incorrect results when called from a stored procedure, where `table` had a primary key. (Bug#10136)
- The granting and revocation of privileges on a stored routine was performed when running the server with `--skip-grant-tables` even after the statement `SET @@global.automatic_sp_privileges=1;` was executed. (Bug#9993)
- A stored procedure run while the query cache was enabled could cause the server to crash. (Bug#9715)
- Table names were not handled correctly when `lower_case_table_names=2` if the table name lettercase differed in the `FROM` and `WHERE` clauses. (Bug#9500)
- `SHOW CREATE DATABASE INFORMATION_SCHEMA` returned an "unknown database" error. (Bug#9434)

- `SELECT DISTINCT ... GROUP BY constant` returned multiple rows (it should return a single row). (Bug#8614)
- An issue with index merging could cause suboptimal index merge plans to be chosen when searching by indexes created on `DATE` columns. The same issue caused the InnoDB storage engine to issue the warning `using a partial-field key prefix in search`. (Bug#8441)
- The `mysqlhotcopy` script was not parsing the output of `SHOW SLAVE STATUS` correctly when called with the `-record_log_pos` option. (Bug#7967)
- A Boolean full-text search where a query contained more query terms than one-third of the query length caused the server to hang or crash. (Bug#7858)
- When used in defining a view, the `TIME_FORMAT()` function failed with calculated values, for example, when passed the value returned by `SEC_TO_TIME()`. (Bug#7521)
- Views could be created with duplicate column names. (Bug#7448)
- An `ORDER BY` clause sometimes had no effect on the ordering of a result when selecting specific columns (as opposed to using `SELECT *`) from a view. (Bug#7422)
- Using `PREPARE` to prepare a statement that invoked a stored routine that executed the prepared statement caused a `PACKETS OUT OF ORDER ERROR` the second time the routine was invoked. This is prevented by disabling dynamic SQL within stored routines.

Note

This restriction was lifted in 5.0.13 for stored procedures, but not for stored functions or triggers.

(Bug#7115)

See also [Bug#10975](#), [Bug#10605](#)

- Selecting from a view defined using `SELECT SUM(DISTINCT ...)` caused an error; attempting to execute a `SELECT * FROM INFORMATION_SCHEMA.TABLES` query after defining such a view crashed the server. (Bug#7015)
- REFERENCES
- SELECT
- CREATE TEMPORARY TABLES
- GRANT OPTION
- CREATE

E.1.23. Changes in MySQL 5.0.7 (10 June 2005)

Functionality added or changed:

- **Security Fix:** A UDF library-loading vulnerability could result in a buffer overflow and code execution. (CVE-2005-2558)
- Improved the optimizer to be able to use indexes for expressions of the form `indexed_col NOT IN (val1, val2, ...)` and `indexed_col NOT BETWEEN val1 AND val2`. (Bug#10561)
- The `table`, `type`, and `rows` columns of `EXPLAIN` output can now be `NULL`. This is required for using `EXPLAIN` on `SELECT` queries that use no tables, such as `EXPLAIN SELECT 1`. (Bug#9899)
- All characters occurring on the same line following the `DELIMITER` keyword will be set as delimiter. For example, `DELIMITER ;` will set `;` as the delimiter. This behavior is now consistent between MySQL 5.1 and MySQL 5.0. (Bug#9879)
- Added `mysql_set_character_set()` C API function for setting the default character set of the current connection. This allows clients to affect the character set used by `mysql_real_escape_string()`. (Bug#8317)
- The `--delayed-insert` option for `mysqldump` was disabled to avoid causing problems with storage engines that do not support `INSERT DELAYED`. (Bug#7815)
- Placeholders now can be used for `LIMIT` in prepared statements. (Bug#7306)
- InnoDB: In stored procedures and functions, InnoDB no longer takes full explicit table locks for every involved table. Only

'intention' locks are taken, similar to those in the execution of an ordinary SQL statement. This greatly reduces the number of deadlocks.

- `SHOW BINARY LOGS` now displays a `File_size` column that indicates the size of each file.
- Removed `WinMySQLAdmin` from the source distribution and from the “No Installer” Windows distribution (it had already been removed from the “With Installer” distribution before).
- The behavior of the `Last_query_cost` system variable has been changed. The default value is now 0 (rather than -1) and it now has session-level scope (rather than being global). See [Section 5.1.6, “Status Variables”](#), for additional information.
- Removed `mysqlshutdown.exe` and `mysqlwatch.exe` from the Windows “No Installer” distribution (they had already been removed from the “With Installer” distribution before). Removed those programs from the source distribution.

Bugs fixed:

- MySQL would pass an incorrect key length to storage engines for `MIN()`. This could cause spurious warnings such as `INNODB: WARNING: USING A PARTIAL-FIELD KEY PREFIX IN SEARCH` to appear in the `.err` log. ([Bug#13218](#), [Bug#11039](#))
- Build failures occurred when compiling the server on Windows using Visual Studio 6. ([Bug#11153](#))
- Corrected a problem where an incorrect data type was returned in the result set metadata when using a prepared `SELECT DISTINCT` statement to select from a view. ([Bug#11111](#))
- The server could crash due to an attempt to allocate too much memory when `GROUP BY blob_col` and `COUNT(DISTINCT)` were used. ([Bug#11088](#))
- Multiple-row `REPLACE` could fail on a duplicate-key error when having one `AUTO_INCREMENT` key and one unique key. ([Bug#11080](#))
- `InnoDB`: A duplicate key error occurred with `REPLACE` in a table having an `AUTO_INCREMENT` column. ([Bug#11005](#))
- `WITH ROLLUP` did not sum values properly. ([Bug#10982](#))
- **Security update:** A user with limited privileges could obtain information about the privileges of other users by querying objects in the `INFORMATION_SCHEMA` database for which that user did not have the requisite privileges. ([Bug#10964](#))
- The value returned by the `FIELD()` function was incorrect when its parameter list contained one or more instances of `NULL`. ([Bug#10944](#))
- Failure of a `BEFORE` trigger did not prevent the triggering statement from performing its operation on the row for which the trigger error occurred. Now the triggering statement fails as described in [Section 21.3, “Using Triggers”](#). ([Bug#10902](#))
- The `FEDERATED` storage engine properly handled outer joins, but not inner joins. ([Bug#10848](#))
- Executing `LOAD INDEX INTO CACHE` for a table while other threads were selecting from the table caused a deadlock. ([Bug#10602](#))
- The `TIME_FORMAT()` function returned incorrect results with some format specifiers. See [Section 11.6, “Date and Time Functions”](#). ([Bug#10590](#))
- The `LAST_DAY()` failed to return `NULL` when supplied with an invalid argument. See [Section 11.6, “Date and Time Functions”](#). ([Bug#10568](#))
- A problem with the `my_global.h` file caused compilation of MySQL to fail on single-processor Linux systems running 2.6 kernels. ([Bug#10364](#))
- Corrected inappropriate error messages that were displayed when attempting to set the read-only `warning_count` and `error_count` system variables. ([Bug#10339](#))
- The MySQL Instance manager caused the version to be displayed as `unknown` by `SHOW INSTANCE STATUS`. ([Bug#10229](#))
- A simultaneous `CREATE TABLE ... SELECT FROM table` and `ALTER TABLE table` on the same table caused the server to crash. ([Bug#10224](#))
- Under certain rare circumstances, inserting into the `mysql.host` table could cause the server to crash. ([Bug#10181](#))
- Consistently report `INFORMATION_SCHEMA` table names in uppercase in `SHOW TABLE STATUS` output. ([Bug#10059](#))

- Accessing `InnoDB` tables within stored functions caused the MySQL server to crash. Now, statements that perform an implicit or explicit commit or rollback are prohibited within stored functions or triggers. (Bug#10015)
- Issuing a write lock for a table from one client prevented other clients from accessing the table's metadata. For example, if one client issued a `LOCK TABLES mydb.mytable WRITE`, then a second client attempting to execute a `USE mydb;` would hang. (Bug#9998)
- Dropping stored routines when the MySQL server had been started with `--skip-grant-tables` generated extraneous warnings. (Bug#9993)
- The `mysql_next_result()` function could hang if you were executing many statements in a `mysql_real_query()` call and one of those statements raised an error. (Bug#9992)
- The functions `COALESCE()`, `IF()`, and `IFNULL()` performed incorrect conversions of their arguments. (Bug#9939)
- An incorrect result was returned from a view that selected a `COALESCE()` expression from the result of an outer join. (Bug#9938)
- `InnoDB`: Do very fast shutdown only if `innodb_fast_shutdown=2`, but wait for threads to exit and release allocated memory if `innodb_fast_shutdown=1`. Starting with MySQL/InnoDB 5.0.5, `InnoDB` would do brutal shutdown also when `innodb_fast_shutdown=1`. (Bug#9673)
- Using `ORDER BY` to sort the results of an `IF()` that contained a `FROM_UNIXTIME()` expression returned incorrect results due to integer overflow. (Bug#9669)
- On Windows, with `lower_case_table_names` set to 2, using `ALTER TABLE` to alter a `MEMORY` or `InnoDB` table that had a mixed-case name also improperly changed the name to lowercase. (Bug#9660)
- The combination of `COUNT()`, `DISTINCT`, and `CONCAT()` sometimes triggered a memory deallocation bug on Windows resulting in a server crash. (Bug#9593)
- `INSERT BEFORE` triggers were not being activated for implicit inserts (`LOAD DATA`). (Bug#8755)
- The `ucs2_turkish_ci` collation failed with upper('i'). `UPPER/LOWER` now can return a string with different length. (Bug#8610)
- The server timed out SSL connections too quickly on Windows. (Bug#8572)
- If a stored function contained a `FLUSH` statement, the function crashed when invoked. `FLUSH` now is disallowed within stored functions. (Bug#8409)
- `OPTIMIZE` run on an `InnoDB` table did not return a `TABLE IS FULL` error if there was insufficient room in the tablespace. (Bug#8135)
- An incorrect result was obtained for columns that included an aggregate function as part of an expression, and when `WITH ROLLUP` was used with `GROUP BY`. (Bug#7914)
- Queries with `ROLLUP` returned wrong results for expressions containing `GROUP BY` columns. (Bug#7894)
- The second invocation of a stored procedure that selected from a view defined as a join using `ON` in the join condition could cause the server to crash. (Bug#6866)
- `INSERT BEFORE` triggers were not being activated for `INSERT ... SELECT` statements. (Bug#6812)
- `INSERT` or `UPDATE` when the `WHERE` clause contained a correlated subquery that referred to a column of the table being modified caused the server to crash. (Bug#6384)
- MySQL was adding a `DEFAULT` clause to `ENUM` columns that included no explicit `DEFAULT` and were defined as `NOT NULL`. (This is supposed to happen only for columns that are `NULL`.) (Bug#6267)
- Using `ALTER TABLE` for a table that had a trigger caused a crash when executing a statement that activated the trigger, and also a crash later with `USE db_name` for the database containing the table. (Bug#5894)
- Triggers with dropped functions caused crashes. (Bug#5893)
- Triggers were not being activated for multiple-table `UPDATE` or `DELETE` statements. (Bug#5860)
- The incorrect sequence of statements `HANDLER tbl_name READ index_name NEXT` without a preceding `HANDLER tbl_name READ index_name = (value_list)` for an `InnoDB` table resulted in a server crash rather than an error. (Bug#5373)
- Multiple-table `DELETE` always deleted on the fly from the first table that was to be deleted from. In some cases, when using

many tables and when necessary to access the same row twice in the first table, some rows to be deleted from other tables could be missed.

E.1.24. Changes in MySQL 5.0.6 (26 May 2005)

Functionality added or changed:

- **Incompatible Change:** The behavior of `LOAD DATA INFILE` and `SELECT ... INTO OUTFILE` has changed when the `FIELDS TERMINATED BY` and `FIELDS ENCLOSED BY` values both are empty. Formerly, a column was read or written the display width of the column. For example, `INT(4)` was read or written using a field with a width of 4. Now columns are read and written using a field width wide enough to hold all values in the field. However, data files written before this change was made might not be reloaded correctly with `LOAD DATA INFILE` for MySQL 4.1.12 and up. This change also affects data files read by `mysqlimport` and written by `mysqldump --tab`, which use `LOAD DATA INFILE` and `SELECT ... INTO OUTFILE`. For more information, see [Section 12.2.6, “LOAD DATA INFILE Syntax”](#). (Bug#12564)
- **Incompatible Change:** `MyISAM` and `InnoDB` tables created with `DECIMAL` columns in MySQL 5.0.3 to 5.0.5 will appear corrupt after an upgrade to MySQL 5.0.6. Dump such tables with `mysqldump` before upgrading, and then reload them after upgrading. (The same incompatibility will occur for these tables created in MySQL 5.0.6 after a downgrade to MySQL 5.0.3 to 5.0.5.) (Bug#10465, Bug#10625)
- When the server cannot read a table because it cannot read the `.frm` file, print a message that the table was created with a different version of MySQL. (This can happen if you create tables that use new features and then downgrade to an older version of MySQL.) (Bug#10435)
- The `GRANT` and `REVOKE` statements now support an `object_type` clause to be used for disambiguating whether the grant object is a table, a stored function, or a stored procedure. Use of this clause requires that you upgrade your grant tables. See [Section 4.4.5, “mysql_fix_privilege_tables — Upgrade MySQL System Tables”](#). (Bug#10246)
- Added `REFERENCED_TABLE_SCHEMA`, `REFERENCED_TABLE_NAME`, and `REFERENCED_COLUMN_NAME` columns to the `KEY_COLUMN_USAGE` table of `INFORMATION_SCHEMA`. (Bug#9587)
- The use of `SESSION` or `GLOBAL` for user variables, or for local variables in stored routines, is now disallowed. (Bug#9286)
- New `/*>` prompt for `mysql`. This prompt indicates that a `/* ... */` comment was begun on an earlier line and the closing `*/` sequence has not yet been seen. (Bug#9186)
- The `INFORMATION_SCHEMA.SCHEMATA` table now has a `DEFAULT_COLLATION_NAME` column. (Bug#8998)
- Added a `--show-warnings` option to `mysql` to cause warnings to be shown after each statement if there are any. This option applies to interactive and batch mode. In interactive mode, `\w` and `\W` may be used to enable and disable warning display. (Bug#8684)
- If strict SQL mode is enabled, `VARCHAR` and `VARBINARY` columns with a length greater than 65,535 no longer are silently converted to `TEXT` or `BLOB` columns. Instead, an error occurs. (Bug#8295, Bug#8296)
- Removed a limitation that prevented use of FIFOs as logging targets (such as for the general query log). This modification *does not apply* to the binary log and the relay log. (Bug#8271)
- `SHOW VARIABLES` now shows the `slave_compressed_protocol`, `slave_load_tmpdir` and `slave_skip_errors` system variables. (Bug#7800)
- `InnoDB`: When the maximum length of `SHOW INNODB STATUS` output would be exceeded, truncate the beginning of the list of active transactions, instead of truncating the end of the output. (Bug#5436)
- Updated version of `libedit` to 2.9. (Bug#2596)
- `InnoDB`: If `innodb_locks_unsafe_for_binlog` option is set and the isolation level of the transaction is not set to serializable then `InnoDB` uses a consistent read for select in clauses like `INSERT INTO ... SELECT` and `UPDATE ... (SELECT)` that do not specify `FOR UPDATE` or `IN SHARE MODE`. Thus no locks are set to rows read from selected table.
- Added the `div_precision_increment` system variable, which indicates the number of digits by which to increase the scale of the result of division operations performed with the `/` operator.
- Removed `mysqlshutdown.exe` and `mysqlwatch.exe` from the Windows “With Installer” distribution.
- The precision of the `DECIMAL` data type has been increased from 64 to 65 decimal digits.
- Added the `--log-bin-trust-routine-creators` server option for setting the

`log_bin_trust_routine_creators` system variable from the command line.

- Implemented the `STMT_ATTR_PREFETCH_ROWS` option for the `mysql_stmt_attr_set()` C API function. This sets how many rows to fetch at a time when using cursors with prepared statements.
- Added the `log_bin_trust_routine_creators` system variable, which applies when binary logging is enabled. It controls whether stored routine creators can be trusted not to create stored routines that will cause unsafe events to be written to the binary log.
- Removed unused system variable `myisam_max_extra_sort_file_size`.
- Changed default value of `myisam_data_pointer_size` from 4 to 6. This allows us to avoid `table is full` errors for most cases.
- Added a `--debug` option to `my_print_defaults`.
- The variable `concurrent_insert` now takes 3 values. Setting this to 2 changes MyISAM to do concurrent inserts to end of table if table is in use by another thread.

Bugs fixed:

- **Security Fix:** `mysql_install_db` created the `mysql_install_db.X` file with a predictable filename and insecure permissions, which allowed local users to execute arbitrary SQL statements by modifying the file's contents. (CVE-2005-1636)
- `MERGE` tables could fail on Windows due to incorrect interpretation of pathname separator characters for filenames in the `.MRG` file. (Bug#10687)
- Repeated calls to `ABS()` when the argument evaluated to `NULL` crashed the server. (Bug#10599)
- Statements that create and drop triggers were not being written to the binary log, which affects replication and data recovery options. Trigger-related statements now are logged, subject to the issues and limitations discussed in Section 21.5, “Binary Logging of Stored Programs”. (Bug#10417)
- `SELECT 0/0` returned 0 rather than `NULL`. (Bug#10404)
- `INSERT ... ON DUPLICATE KEY UPDATE` with `MERGE` tables, which do not have unique indexes, caused the server to crash. (Bug#10400)
- `AUTO_INCREMENT` in InnoDB tables could assign the same value for several rows. (Bug#10359)
- `mysqldump` crashed using the `--complete-insert` option while dumping tables with a large number of long column names. (Bug#10286)
- Incomplete results were returned from `INFORMATION_SCHEMA.COLUMNS` for `INFORMATION_SCHEMA` tables for non-`root` users. (Bug#10261)
- `mysql.cc` did not compile correctly using VC++ on Windows. (Bug#10245)
- Using `#pragma interface` or `#pragma implementation` in source files caused portability issues for `cygwin`. (Bug#10241)
- Corrected a problem where `DEFAULT` values were not assigned properly to `BIT(1)` or `CHAR(1)` columns if certain other columns preceded them in the table definition. (Bug#10179)
- The `BLACKHOLE` storage engine failed in testing, causing the server to crash. (Bug#10175)
- The optimizer was choosing suboptimal execution plans for certain outer joins where the right table of a left join (or left table of a right join) had both `ON` and `WHERE` conditions. (Bug#10162)
- Corrected a problem resolving outer column references in correlated subqueries when using the prepared statements. (Bug#10041)
- `INFORMATION_SCHEMA` tables were inaccessible depending on the lettercase used to refer to them. (Bug#10018)
- `awk` script portability problems were found in `cmd-line-utils/libedit/makelist.sh`. (Bug#9954)
- The error message for exceeding `MAX_CONNECTIONS_PER_HOUR` mistakenly referred to `max_connections`. (Bug#9947)
- `RENAME TABLE` for an `ARCHIVE` table failed if the `.arn` file was not present. (Bug#9911)

- A `CHECK TABLE` statement whose arguments were a view name followed by a table name caused the server to crash. (Bug#9897)
- `my_print_defaults` was ignoring the `--defaults-extra-file` option or crashing when the option was given. (Bug#9851, Bug#9136)
- Within a stored procedure, attempting to update a view defined as an inner join failed with a `Table 'tbl_name' was locked with a READ lock and can't be updated` error. (Bug#9841)
- The `INFORMATION_SCHEMA.COLUMNS` table was missing columns of views for which the user has access. (Bug#9838)
- Use of a `CHAR` or `VARCHAR` column with `MIN()` or `MAX()` and `GROUP BY ... WITH ROLLUP` caused the server to crash. (Bug#9820)
- Use `DISTINCT AVG()` with `GROUP BY ... WITH ROLLUP` caused the server to crash. (Bug#9800)
- Using `AVG(DISTINCT)` with `GROUP BY ... WITH ROLLUP` caused the server to crash. (Bug#9799)
- Using `GROUP BY ... WITH ROLLUP` on an indexed column in an `InnoDB` table could cause the server to crash. (Bug#9798)
- Corrected some failures of prepared statements for SQL (`PREPARE` plus `EXECUTE`) to return all rows for some `SELECT` statements. (Bug#9777, Bug#9096)
- `CREATE TABLE ... LIKE` did not work correctly when `lower_case_table_names` was set on a case-sensitive filesystem and the source table name was not given in lowercase. (Bug#9761)
- Corrected an inability to select from a view within a stored procedure. (Bug#9758)
- `net_read_timeout` and `net_write_timeout` were not being respected on Windows. (Bug#9721)
- `libsupc++` was longer required for building on FreeBSD 5.3. (Bug#9714)
- The `mysql_stmt_attr_set()` C API function now returns an error for option values that are defined in `mysql.h` but not yet implemented, such as `CURSOR_TYPE_SCROLLABLE`. (Bug#9643)
- Memory block allocation did not function correctly for the query cache in the embedded server. (Bug#9549)
- `CREATE TABLE t AS SELECT UUID()` created a `VARCHAR(12)` column, which is too small to hold the 36-character result from `UUID()`. (Bug#9535)
- `SELECT DISTINCT` with a prepared statement that used a cursor could cause the server to crash. (Bug#9520)
- `NULL` key parts in hash indexes on `VARCHAR` columns were not handled correctly, resulting in incorrect query results. (Bug#9489, Bug#10176)
- The `mysql_stmt_execute()` and `mysql_stmt_reset()` C API functions now close any cursor that is open for the statement, which prevents a server crash. (Bug#9478)
- `SELECT` from `INFORMATION_SCHEMA` tables failed if the statement has a `GROUP BY` clause and an aggregate function in the select list. (Bug#9404)
- `MAX()` for an `INT UNSIGNED` (unsigned 4-byte integer) column could return negative values if the column contained values larger than 2^{31} . (Bug#9298)
- Disabled binary logging within stored routines to avoid writing spurious extra statements to the binary log. For example, if a routine `p()` executes an `INSERT` statement, then for `CALL p()`, the `CALL` statement appears in the binary log, but not the `INSERT` statement. (Bug#9100)
- `FORMAT()` now performs better rounding for double values (for example, `FORMAT(4.55, 1)` returns `4.6`, not `4.5`). (Bug#9060)
- `SHOW CREATE VIEW` got confused and could not find the view if there was a temporary table with the same name as the view. (Bug#8921)
- Selecting from a single-table view defined on multiple-table views caused a server crash. (Bug#8528)
- Remove extra slashes in `--tmpdir` value (for example, convert `/var//tmp` to `/var/tmp`, because they caused various errors. (Bug#8497)
- Invoking a stored function that executed a `SHOW` statement resulted in a server crash. (Bug#8408)

- An error in the implementation of the `MyISAM` compression algorithm caused `myisampack` to fail with very large sets of data (total size of all the records in a single column needed to be at least 3 GB in order to trigger this issue). (Bug#8321)
- Added `Create_routine_priv`, `Alter_routine_priv`, and `Execute_priv` privileges to the `mysql.host` privilege table. (They had been added to `mysql.db` in MySQL 5.0.3 but not to the `host` table.) (Bug#8166)
- A deadlock resulted from using `FLUSH TABLES WITH READ LOCK` while an `INSERT DELAYED` statement was in progress. (Bug#7823)
- In strict SQL mode, some assignments to numeric columns that should have been rejected were not (such as the result of an arithmetic expression or an explicit `CAST()` operation). (Bug#6961)
- For `MERGE` tables, avoid writing absolute pathnames in the `.MRG` file for the names of the constituent `MyISAM` tables so that if the data directory is moved, `MERGE` tables will not break. For `mysqld`, write just the `MyISAM` table name if it is in the same database as the `MERGE` table, and a path relative to the data directory otherwise. For the embedded servers, absolute pathnames may still be used. (Bug#5964)
- Multiple calls to a stored procedure that assigned the result of a subquery to a variable or compared it to a value with `IN` could cause the server to crash. (Bug#5963)
- If the file named by a `--defaults-extra-file` option does not exist or is otherwise inaccessible, an error now occurs. (Bug#5056)
- Statements that create and use stored routines were not being written to the binary log, which affects replication and data recovery options. Stored routine-related statements now are logged, subject to the issues and limitations discussed in Section 21.5, “Binary Logging of Stored Programs”. (Bug#2610)
- `configure` did not properly recognize whether NPTL was available on Linux. (Bug#2173)

E.1.25. Changes in MySQL 5.0.5 (Not released)

No public release of MySQL 5.0.5 was made. The changes described in this section are available in MySQL 5.0.6.

Functionality added or changed:

- **MySQL Cluster:** More informative error messages are provided when a query is issued against an `NDB` table that has been modified by another `mysqld` server. (Bug#6762)
- **InnoDB:** When `FOREIGN_KEY_CHECKS=0`, `ALTER TABLE` and `RENAME TABLE` will ignore any type incompatibilities between referencing and referenced columns. Thus, it will be possible to convert the character sets of columns that participate in a foreign key. Be sure to convert all tables before modifying any data! (Bug#9802)
- `SHOW VARIABLES` no longer displays the deprecated `log_update` system variable. (Bug#9738)
- Added support for the `BIT` data type to the `MEMORY`, `InnoDB`, and `BDB` storage engines.
- The behavior controlled by the `--innodb-fast-shutdown` option now can be changed at runtime by setting the value of the global `innodb_fast_shutdown` system variable. It now accepts values 0, 1 and 2 (except on Netware where 2 is disabled). If set to 2, then when the MySQL server shuts down, `InnoDB` will just flush its logs and shut down brutally (and quickly) as if a MySQL crash had occurred; no committed transaction will be lost, but a crash recovery will be done at next startup.

Bugs fixed:

- **Security Fix:** Starting `mysqld` with `--user=non_existent_user` caused it to run using the privileges of the account from which it was invoked, including the `root` account. (Bug#9833)
- A memory leak occurred when selecting from a view that contained a subquery. (Bug#10107)
- Setting the `storage_engine` system variable to `MEMORY` succeeded, but retrieving the variable resulted in a value of `HEAP` (the old name for the `MEMORY` storage engine) rather than `MEMORY`. (Bug#10039)
- Queries containing `CURRENT_USER()` incorrectly were registered in the query cache. (Bug#9796)
- Invoking a stored function that returned a value having an `ENUM` or `SET` data type caused the server to crash. (Bug#9775)
- A string length comparison problem caused `mysql` to fail when loading dump files containing certain escape sequences con-

- taining a backslash character (`\`). (Bug#9756)
- After an internal temporary table became too large in memory and had to be converted to an on-disk table, the error indicator was not cleared and the query failed with error 1023 `CAN'T FIND RECORD IN ''`. (Bug#9703)
 - Use of a subquery that used `WITH ROLLUP` in the `FROM` clause of the main query sometimes resulted in a `Column cannot be null` error. (Bug#9681)
 - InnoDB: Assertion failures of types `ut_a(cursor->old_stored == BTR_PCUR_OLD_STORED)` and `prebuilt->template_type == 0` could occur when performing multi-table updates. This bug was introduced in 4.1.10 and 4.0.24. (Bug#9670)
 - A problem with `readline` caused the `mysql` client to crash when the user pressed `Control-R`. (Bug#9568)
 - Executing `LOCK TABLES` and then calling a stored procedure caused an error and resulting in the server thinking that no stored procedures exist. (Bug#9566)
 - The server died with signal 11 if a non-existent location was specified for the location of the binary log. Now the server exits after printing an appropriate error message. (Bug#9542)
 - Incorrect results were returned for queries of the form `SELECT ... LEFT JOIN ... WHERE EXISTS (subquery)`, where the subquery selected rows based on an `IS NULL` condition. (Bug#9516)
 - A segmentation fault in `mysqlcheck` occurred when the last table checked in `--auto-repair` mode returned an error (such as the table being a `MERGE` table). (Bug#9492)
 - Within a stored procedure, attempting to execute a multiple-table `UPDATE` failed with a `Table 'tbl_name' was locked with a READ lock and can't be updated` error. (Bug#9486)
 - `mysqlshow` displayed an incorrect row count for tables. (Bug#9391)
 - InnoDB: Next-key locking did not allow inserts which did not produce a “phantom”. If the range is of type `'a' <= uniquecolumn`, InnoDB lock only the `RECORD`, if the record with the column value `'a'` exists in a `CLUSTERED` index. This allows inserts before a range. (Bug#9354)
 - The optimizer did not compute the union of two ranges for the `OR` operator correctly. (Bug#9348)
 - Corrected a failure to resolve a column reference correctly for a `LEFT JOIN` that compared a join column to an `IN` subquery. (Bug#9338)
 - `OPTIMIZE TABLE` was written twice to the binary log when used on InnoDB tables. (Bug#9149)
 - Multiple-table updates could produce spurious data-truncation warnings if they used a join across columns that are indexed using a column prefix. (Bug#9103)
 - Invocation of a stored function that returned a value having a `BLOB` data type caused the server to crash. (Bug#9102)
 - For stored functions that should return a `YEAR` value, corrected a failure of the value to be in `YEAR` format. (Bug#8861)
 - Selecting from a view containing a subquery caused the server to hang. (Bug#8490)
 - `TIMEDIFF()` with a negative time first argument and positive time second argument produced incorrect results. (Bug#8068)
 - Invocation of a stored function that returned a value having a `BIT` data type caused the server to crash. (Bug#7648)
 - `SET @var= CAST(NULL AS [INTEGER|CHAR])` now sets the result type of the variable to `INTEGER/CHAR`. (Bug#6598)
 - The client/server protocol allowed the server to close the connection before sending the final error message. The problem could show up as a `LOST CONNECTION TO MYSQL SERVER` error during a query when attempting to connect and access a non-existent database. (Bug#6387, Bug#9455)
 - Column references were not properly resolved when an outer join involving a view contained a subquery and the column was used both in the subquery and the outer query. (Bug#6107, Bug#6106)
 - InnoDB: Prevent `ALTER TABLE` from changing the storage engine if there are foreign key constraints on the table. (Bug#5574, Bug#5670)

E.1.26. Changes in MySQL 5.0.4 (16 April 2005)

Functionality added or changed:

- Added `ENGINE=MyISAM` table option when creating `mysql.proc` table in `mysql_create_system_tables` script to make sure the table is created as a `MyISAM` table even if the default storage engine has been changed. (Bug#9496)
- `SHOW CREATE TABLE` for an `INFORMATION_SCHEMA` table no longer prints a `MAX_ROWS` value because the value has no meaning. (Bug#8941)
- Invalid `DEFAULT` values for `CREATE TABLE` now generate errors. (Bug#5903)
- Added `--show-table-type` option to `mysqlshow`, to display a column indicating the table type, as in `SHOW FULL TABLES`. (Bug#5036)
- New configuration directives `!include` and `!includedir` implemented for including option files and searching directories for option files. See Section 4.2.3.2, “Using Option Files”, for usage.
- Added `--with-big-tables` compilation option to `configure`. (Previously it was necessary to pass `-DBIG_TABLES` to the compiler manually in order to enable large table support.) See Section 2.4.15.2, “Typical configure Options”, for details.
- The way the time zone information is stored in the binary log was changed, so that it is now possible to have a replication master and slave running with different global time zones. A drawback is that replication from 5.0.4 masters to pre-5.0.4 slaves is impossible.

Bugs fixed:

- **Security Fix:** Information in `INFORMATION_SCHEMA` could be exposed to a user with insufficient privileges. (Bug#7214)
- **MySQL Cluster:** The commit count cache for `NDB` was not properly invalidated when deleting a record using a cursor. (Bug#8585)
- **Replication:** If, on a replication master, a `LOAD DATA INFILE` operation was interrupted (by, for example, an integrity constraint violation or killed connection), the slave skipped the `LOAD DATA INFILE` entirely, thus missing changes if this command permanently inserted or updated table records before being interrupted. (Bug#3247)
- `mysql.server` no longer uses non-portable `alias` command or LSB functions. (Bug#9852)
- A server installed as a Windows service and started with `--shared-memory` could not be stopped. (Bug#9665)
- Selecting a `BIT` column failed if the binary client/server protocol was used. (Bug#9608)
- Creating a `PRIMARY KEY` on a table having a `BIT` column caused the server to crash. (Bug#9571)
- `ENUM` and `SET` columns in `InnoDB` tables were treated incorrectly as character strings. This bug did not manifest itself with `latin1` collations, but it caused malfunction with `utf8`. Old tables will continue to work. In new tables, `ENUM` and `SET` will be stored internally as unsigned integers. (Bug#9526)
- An error in division of floating point numbers could cause nine zeros (`00000000`) to be inserted in the middle of the quotient. (Bug#9501)
- Fixed option-parsing code for the embedded server to understand `K`, `M`, and `G` suffixes for the `net_buffer_length` and `max_allowed_packet` options. (Bug#9472)
- Some user variables were not being handled with “implicit” coercibility. (Bug#9425)
- Using `CREATE TABLE ... SELECT` or `INSERT INTO ... SELECT` to select from multiple-table view caused the server to crash. (Bug#9398, Bug#8703)
- Multiple executions of a prepared statement involving a join of an `INFORMATION_SCHEMA` table with another table could lead to a crash of the server. (Bug#9383)
- An `InnoDB` test suite failure was caused by a locking conflict between two server instances at server shutdown or startup. This conflict on advisory locks appears to be the result of a bug in the operating system; these locks should be released when the files are closed, but somehow that does not always happen immediately in Linux. (Bug#9381)
- Allow extra HKSCS and cp950 characters (`big5` extension characters) to be accepted in `big5` columns. (Bug#9357)
- The value of the `CHARACTER_MAXIMUM_LENGTH` and `CHARACTER_OCTET_LENGTH` columns of the `INFORMATION_SCHEMA.COLUMNS` table must be `NULL` for numeric columns, but were not. (Bug#9344)

- `INFORMATION_SCHEMA` tables had an implicit upper limit for the number of rows. As a result, not all data could be returned for some queries. (Bug#9317)
- `InnoDB`: True `VARCHAR`: `InnoDB` stored the 'position' of a row wrong in a column prefix primary key index; this could cause MySQL to complain `ERROR 1032: Can't find record ...` in an update of the primary key, and also some `ORDER BY` or `DISTINCT` queries. (Bug#9314)
- `ORDER BY` sometimes caused incorrect sorting of `UTF8` data. (Bug#9309)
- The `utf8_spanish2_ci` and `ucs2_spanish2_ci` collations no longer consider `r` equal to `rr`. If you upgrade to this version from an earlier version, you should rebuild the indexes of any affected tables. (Bug#9269)
- `CREATE OR REPLACE VIEW` and `ALTER VIEW` now require the `CREATE VIEW` and `DROP` privileges, not `CREATE VIEW` and `DELETE`. (`DELETE` is a row-level privilege, not a table-level privilege.) (Bug#9260)
- Using `GROUP BY` on a decimal expression caused the server to crash. (Bug#9210)
- `mysqldump` dumped core when invoked with `--tmp` and `--single-transaction` options and a non-existent table name. (Bug#9175)
- Calling `mysql_stmt_close()` for a single-row result set could cause the server to crash. (Bug#9159)
- Setting the `max_error_count` system variable to 0 resulted in a setting of 1. (Bug#9072)
- The use of `XOR` together with `NOT ISNULL()` erroneously resulted in some outer joins being converted to inner joins by the optimizer. (Bug#9017)
- Two prepared statements for single-row result sets being open simultaneously caused a `COMMANDS OUT OF SYNC ERROR` error. (Bug#8880)
- Extraneous comparisons between `NULL` values in indexed columns were performed by the optimizer for operators such as `=` that are never true for `NULL`. (Bug#8877)
- In the client/server protocol for prepared statements, reconnection failed when the connection was killed with reconnection enabled. (Bug#8866)
- In prepared statements, subqueries containing parameters were erroneously treated as `const` tables during preparation, resulting in a server crash. (Bug#8807)
- Do not try to space-pad `BLOB` columns containing `ucs2` characters. (Bug#8771)
This regression was introduced by Bug#7350
- The warning message from `GROUP_CONCAT()` did not always indicate the correct number of lines. (Bug#8681)
- `InnoDB`: SQL statements were not rolled back on error. (Bug#8650)
- Too many rows were returned from queries that combined `ROLLUP` and `LIMIT` if `SQL_CALC_FOUND_ROWS` was given. (Bug#8617)
- Incorrect results were returned from queries that combined `SELECT DISTINCT`, `GROUP BY`, and `ROLLUP`. (Bug#8616)
- Queries that combined `SELECT DISTINCT`, `SUM()`, and `ROLLUP` could cause the MySQL server to crash. (Bug#8615)
- The `tee` command could sometimes cause the `mysql` client to crash. (Bug#8499)
- `DROP TABLE` did not drop triggers that were defined for the table. `DROP DATABASE` did not drop triggers in the database. (Bug#6559, Bug#5859)
- Added linking with `libsupc++` on Fedora Core 3 to get language support functions. (Bug#6554)
- Unions between binary and non-binary columns failed due to a collation coercibility problem. (Bug#6519)
- Using `CONVERT('0000-00-00',DATE)` or `CAST('0000-00-00' as DATE)` with the `NO_ZERO_DATE` SQL mode enabled now produces a warning. (Bug#6145)
- `TRADITIONAL` SQL mode should prevent inserts where a column with no default value is omitted or set to a value of `DEFAULT`; however, in some cases, this restriction was not enforced. (Bug#5986)
- Inserting a zero date in a `DATE`, `DATETIME` or `TIMESTAMP` column during `TRADITIONAL` mode now produces an error. (Bug#5933)

- `CAST()` now produces warnings when casting incorrect `INTEGER` and `CHAR` values. This also applies to implicit `string` to `number` casts. (Bug#5912)
- An error now occurs if you try to insert an invalid value via a stored procedure in `STRICT` mode. (Bug#5907)
- `STR_TO_DATE()` now produces errors in strict mode (and warnings otherwise) when given an illegal argument. (Bug#5902)
- Inserting a zero date into a `DATETIME` column in `TRADITIONAL` mode now produces an error.
- `ALTER TABLE` now fails in `STRICT` mode if the alteration generates warnings.

E.1.27. Changes in MySQL 5.0.3 (23 March 2005: Beta)

Note

This Beta release, as any other pre-production release, should not be installed on “production” level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release.

Functionality added or changed:

- **Incompatible Change:** The C API `ER_WARN_DATA_TRUNCATED` warning symbol was renamed to `WARN_DATA_TRUNCATED`.
- **Incompatible Change:** The `DECIMAL` and `NUMERIC` data types now are handled with a fixed-point library that allows for precision math handling that results in more accurate results. See [Chapter 23, Precision Math](#).

A consequence of the change in handling of the `DECIMAL` and `NUMERIC` fixed-point data types is that the server is more strict to follow standard SQL. For example, a data type of `DECIMAL(3,1)` stores a maximum value of 99.9. Previously, the server allowed larger numbers to be stored. That is, it stored a value such as 100.0 as 100.0. Now the server clips 100.0 to the maximum allowable value of 99.9. If you have tables that were created before MySQL 5.0.3 and that contain floating-point data not strictly legal for the data type, you should alter the data types of those columns. For example:

```
ALTER TABLE tbl_name MODIFY col_name DECIMAL(4,1);
```

For user-defined functions, exact-value decimal arguments such as `1.3` or `DECIMAL` column values were passed as `REAL_RESULT` values prior to MySQL 5.0.3. As of 5.0.3, they are passed as strings with a type of `DECIMAL_RESULT`. If you upgrade to 5.0.3 and find that your UDF now receives string values, use the initialization function to coerce the arguments to numbers as described in [Section 25.2.2.3, “UDF Argument Processing”](#).

For the `FLOOR()` and `CEILING()` functions, the return type is no longer always `BIGINT`. For exact-value numeric arguments, the return value has an exact-value numeric type. For string or floating-point arguments, the return value has a floating-point type.

- **MySQL Cluster:** Added a new global system variable `slave_transaction_retries`: If the replication slave SQL thread fails to execute a transaction because of an `InnoDB` deadlock or exceeded `InnoDB`'s `innodb_lock_wait_timeout` or `NDBCLUSTER`'s `TransactionDeadlockDetectionTimeout` or `TransactionInactiveTimeout`, it automatically retries `slave_transaction_retries` times before stopping with an error. The default is 10. (Bug#8325)
- **MySQL Cluster:** When using this storage engine, the output of `SHOW TABLE STATUS` now displays properly-calculated values in the `Avg_row_length` and `Data_length` columns. (Note that `BLOB` columns are not yet taken into account.) In addition, the number of replicas is now shown in the `Comment` column (as `number_of_replicas`).
- Non-optimal `index_merge` query execution plans were chosen on IRIX. (Bug#8578)
- `mysqld_safe` will create the directory where the UNIX socket file is to be located if the directory does not exist. This applies only to the last component of the directory pathname. (Bug#8513)
- `ONLY_FULL_GROUP_BY` no longer is included in the `ANSI` composite SQL mode. (Bug#8510)
- The server now includes a timestamp in the `Ready for connections` message that is written to the error log at startup. (Bug#8444)
- `CHECKSUM TABLE` returns a warning for non-existing tables. The checksum value remains `NULL` as before. (Bug#8256)
- Setting the connection collation to a value different from the server collation followed by a `CREATE TABLE` statement that in-

- cluded a quoted default value resulted in a server crash. (Bug#8235)
- When a client releases a user-level lock, `DO RELEASE_LOCK()` will not be written to the binary log anymore (this makes the binary log smaller); as a counterpart, the slave does not actually take the lock when it executes `GET_LOCK()`. This is mainly an optimization and should not affect existing setups. (Bug#7998)
 - **InnoDB**: Corrected a bug in the crash recovery of `ROW_FORMAT=COMPACT` tables that caused corruption. There may still be bugs in the crash recovery, especially in `COMPACT` tables. (Bug#7973)
 - Allowed the service-installation command for Windows servers to specify a single option other than `--defaults-file` following the service name. This is for compatibility with MySQL 4.1. (Bug#7856)
 - Changed XML format for `mysql` from `<col_name>col_value</col_name>` to `<field name="col_name">col_value</field>` to allow for proper encoding of column names that are not legal as element names. (Bug#7811)
 - `SHOW CREATE TABLE` now uses `USING index_type` rather than `TYPE index_type` to specify an index type. (Bug#7233)
 - **InnoDB**: Implemented fast `TRUNCATE TABLE`. The old approach (deleting rows one by one) may be used if the table is being referenced by foreign keys. (Bug#7150)
 - Out-of-order packets were sent (`ERROR` after `OK` or `EOF`) following a `KILL QUERY` statement. (Bug#6804)
 - Added `SQL_NOTES` session variable to cause `Note`-level warnings not to be recorded. (Bug#6662)
 - Added `mysql_library_init()` and `mysql_library_end()` as synonyms for the `mysql_server_init()` and `mysql_server_end()` C API functions. `mysql_library_init()` and `mysql_library_end()` are `#define` symbols, but the names more clearly indicate that they should be called when beginning and ending use of a MySQL C API library no matter whether the application uses `libmysqlclient` or `libmysqld`. (Bug#6149)
 - Added `VAR_POP()` and `STDDEV_POP()` as standard SQL aliases for the `VARIANCE()` and `STDDEV()` functions that compute population variance and standard deviation. Added new `VAR_SAMP()` and `STDDEV_SAMP()` functions to compute sample variance and standard deviation. (Bug#3190)
 - **InnoDB**: A commit is now performed after every 10,000 copied rows when executing `ALTER TABLE`, `CREATE INDEX`, `DROP INDEX` or `OPTIMIZE TABLE`. This makes recovery from an aborted operations of these types much faster than previous to this change.
 - Added support for `AVG(DISTINCT)`.
 - A new `CREATE USER` privilege was added.
 - Support for `RAID` options in `MyISAM` tables has been removed. If you have tables that use these options, you should convert them before upgrading. See Section 2.4.17.2, "Upgrading from MySQL 4.1 to 5.0".
 - **InnoDB**: A shared record lock (`LOCK_REC_NOT_GAP`) is now taken for a matching record in the foreign key check because inserts can be allowed into gaps.
 - The MySQL server now aborts when started with the option `--log-bin-index` and without `--log-bin`, and when started with `--log-slave-updates` and without `--log-bin`.
 - API change: the `reconnect` flag in the `MYSQL` structure is now set to 0 by `mysql_real_connect()`. Only those client programs which didn't explicitly set this flag to 0 or 1 after `mysql_real_connect()` experience a change. Having automatic reconnection enabled by default was considered too dangerous (after reconnection, table locks, temporary tables, user and session variables are lost).
 - Bit-field values can be written using `b'value'` notation. `value` is a binary value written using 0s and 1s.
 - **InnoDB**: Relaxed locking in `INSERT ... SELECT`, single table `UPDATE ... (SELECT)` and single table `DELETE ... (SELECT)` clauses when `innodb_locks_unsafe_for_binlog` is used and isolation level of the transaction is not serializable. **InnoDB** uses consistent read in these cases for a selected table.
 - **InnoDB** now supports a fast `TRUNCATE TABLE`. One visible change from this is that auto-increment values for this table are reset on `TRUNCATE`.
 - **InnoDB**: Introduced a compact record format that does not store the number of columns or the lengths of fixed-size columns. The old format can be requested by specifying `ROW_FORMAT=REDUNDANT`. The new format (`ROW_FORMAT=COMPACT`) is the default. The new format typically saves 20% of disk space and memory.

The presence of the new compact row format decreases row storage space by about 20% at the cost of increasing CPU use for

some operations. If your workload is a typical one that is limited by cache hit rates and disk speed it is likely to be faster. If it is a rare case that is limited by CPU speed, it might be slower.

- From the Windows distribution, predefined accounts without passwords for remote users ("root@%", "@%") were removed (other distributions never had them).
- Added the `FEDERATED` storage engine. See [Section 13.7, “The FEDERATED Storage Engine”](#).
- `InnoDB`: Setting the initial `AUTO_INCREMENT` value for an `InnoDB` table using `CREATE TABLE ... AUTO_INCREMENT = n` now works, and `ALTER TABLE ... AUTO_INCREMENT = n` resets the current value.
- User variable coercibility has been changed from “coercible” to “implicit.” That is, user variables have the same coercibility as column values.
- Security improvement: User-defined functions should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` by default no longer loads UDFs unless they have at least one auxiliary symbol defined in addition to the main symbol. The `--allow-suspicious-udfs` option controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off. `mysqld` also checks UDF filenames when it reads them from the `mysql.func` table and rejects those that contain directory pathname separator characters. (It already checked names as given in `CREATE FUNCTION` statements.) See [Section 25.2.2.1, “UDF Calling Sequences for Simple Functions”](#), [Section 25.2.2.2, “UDF Calling Sequences for Aggregate Functions”](#), and [Section 25.2.2.6, “User-Defined Function Security Precautions”](#). Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and informing us about this issue. (CVE-2005-0709, CVE-2005-0710)
- Added `--large-pages` option for `mysqld`.
- The `LOAD DATA` statement was extended to support user variables in the target column list, and an optional `SET` clause. Now one can perform some transformations on data after they have been read and before they are inserted into the table. For example:

```
LOAD DATA INFILE 'file.txt'
INTO TABLE t1
(column1, @var1)
SET column2 = @var1/100;
```

Also, replication of `LOAD DATA` was changed, so you can't replicate such statements from a 5.0.3 master to pre-5.0.3 slaves.

- Added an `error` member to the `MYSQL_BIND` data structure that is used in the C API for prepared statements. This member is used for reporting data truncation errors. Truncation reporting is enabled via the new `MYSQL_REPORT_DATA_TRUNCATION` option for the `mysql_options()` C API function.
- Added the `multi_range_count` system variable.
- The coercibility for the return value of functions such as `USER()` or `VERSION()` now is “system constant” rather than “implicit.” This makes these functions more coercible than column values so that comparisons of the two do not result in `Illegal mix of collations` errors. `COERCIBILITY()` was modified to accommodate this new coercibility value. See [Section 11.10.3, “Information Functions”](#).
- **InnoDB: Upgrading from 4.1:** The sorting order for end-space in `TEXT` columns for `InnoDB` tables has changed. Starting from 5.0.3, `InnoDB` compares `TEXT` columns as space-padded at the end. If you have a non-unique index on a `TEXT` column, you should run `CHECK TABLE` on it, and run `OPTIMIZE TABLE` if the check reports errors. If you have a `UNIQUE INDEX` on a `TEXT` column, you should rebuild the table with `OPTIMIZE TABLE`.
- Boolean full-text phrase searching now requires only that matches contain exactly the same words as the phrase and in the same order. Non-word characters no longer need match exactly.
- `my.cnf` in the compile-time datadir (usually `/usr/local/mysql/data/` in the binary tarball distributions) is not being read anymore. The value of the environment variable `MYSQL_HOME` is used instead of the hard-coded path.
- Additional control over transaction completion was implemented. The `COMMIT` and `ROLLBACK` statements support `AND [NO] CHAIN` and `RELEASE` clauses. There is a new `RELEASE SAVEPOINT` statement. The `completion_type` system variable was added for setting the global and session default completion type.
- Security improvement: The server creates `.frm`, `.MYD`, `.MYI`, `.MRG`, `.ISD`, and `.ISM` table files only if a file with the same name does not already exist. Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and informing us about this issue. (CVE-2005-0711)
- Added the `engine_condition_pushdown` system variable. For `NDB`, setting this variable to 1 allows processing of some `WHERE` clause conditions to be processed in `NDB` nodes before rows are sent to the MySQL server, rather than having rows

sent to the server for evaluation.

- Support for the `ISAM` storage engine has been removed. If you have `ISAM` tables, you should convert them before upgrading. See [Section 2.4.17.2, “Upgrading from MySQL 4.1 to 5.0”](#).
- Added the `CREATE ROUTINE` and `ALTER ROUTINE` privileges, and made the `EXECUTE` privilege operational.
- `BIT` in column definitions now is a distinct data type; it no longer is treated as a synonym for `TINYINT(1)`.
- Added `cp932` (SJIS for Windows Japanese) and `ucjpm` (UJIS for Windows Japanese) character sets.
- The way the character set information is stored into the binary log was changed, so that it's now possible to have a replication master and slave running with different global character sets. A drawback is that replication from 5.0.3 masters to pre-5.0.3 slaves is impossible.
- `MEMORY (HEAP)` can have `VARCHAR` fields.
- If the MySQL server is started without an argument to `--log-bin` and without `--log-bin-index`, thus not providing a name for the binary log index file, a warning is issued because MySQL falls back to using the hostname for that name, and this is prone to replication issues if the server's hostname's gets changed later. See [Section B.1.8.1, “Open Issues in MySQL”](#).
- `SHOW DATABASES`, `SHOW TABLES`, `SHOW COLUMNS`, and so forth display information about the `INFORMATION_SCHEMA` database. Also, several `SHOW` statements now accept a `WHERE` clause specifying which output rows to display. See [Chapter 22, *INFORMATION_SCHEMA Tables*](#).
- `SHOW COLUMNS` now displays `NO` rather than blank in the `Null` output column if the corresponding table column cannot be `NULL`.
- When the `MyISAM` storage engine detects corruption of a `MyISAM` table, a message describing the problem now is written to the error log.
- A `VARCHAR` column can now contain up to 65535 bytes. In addition, `VARCHAR` columns now remember trailing spaces. For more details, see [Section E.1, “Changes in release 5.0.x \(Production\)”](#).

Note

If the table handler does not support the new `VARCHAR` type, then it is converted to a `CHAR` column. Currently this happens for `NDB` tables.

- Added `--innodb-checksums` and `--innodb-doublewrite` options for `mysqld`.
- Added several `InnoDB` status variables. See [Section 5.1.6, “Status Variables”](#).
- Added account-specific `MAX_USER_CONNECTIONS` limit, which allows you to specify the maximum number of concurrent connections for the account. Also, all limited resources now are counted per account (instead of being counted per user + host pair as it was before). Use the `--old-style-user-limits` option to get the old behavior.
- Implemented support for XA transactions. See [Section 12.4.7, “XA Transactions”](#). The implementation make the `innodb_safe_binlog` system variable obsolete, so it has been removed.
- `mysqlbinlog` now prints a `ROLLBACK` statement at the end of its output, in case the server crashed while it was in the process of writing the final entry into the last binary log named on the command line. This causes any half-written transaction to be rolled back when the output is executed. The `ROLLBACK` is harmless if the binary log file was written and closed normally.
- `Seconds_Behind_Master` is `NULL` (which means “unknown”) if the slave `SQL` thread is not running, or if the slave `I/O` thread is not running or not connected to master. It is zero if the `SQL` thread has caught up to the `I/O` thread. It no longer grows indefinitely if the master is idle.
- `FLUSH TABLES WITH READ LOCK` is now killable while it's waiting for running `COMMIT` statements to finish.
- The MySQL server aborts immediately instead of simply issuing a warning if it is started with the `--log-bin` option but cannot initialize the binary log at startup (that is, an error occurs when writing to the binary log file or binary log index file).
- The binary log file and binary log index file now are handled the same way as `MyISAM` tables when there is a “disk full” or “quota exceeded” error. See [Section B.1.4.3, “How MySQL Handles a Full Disk”](#).
- `InnoDB`: When MySQL/InnoDB is compiled on Mac OS X 10.2 or earlier, detect the operating system version at run time and use the `fcntl()` file flush method on Mac OS X versions 10.3 and later. In Mac OS X, `fsync()` does not flush the write cache in the disk drive, but the special `fcntl()` does; however, the flush request is ignored by some external devices. Failure to flush the buffers may cause severe database corruption at power outages.

Bugs fixed:

- `mysqldump` misinterpreted “_” and “%” characters in the names of tables to be dumped as wildcard characters. (Bug#9123)
- In strict or traditional SQL mode, too-long string values assigned to string columns (`CHAR`, `VARCHAR`, `BINARY`, `VARBINARY`, `TEXT`, or `BLOB`) were correctly truncated, but the server returned an `SQLSTATE` value of `01000` (should be `22001`). (Bug#9029, Bug#6999)
- The definition of the enumeration-valued `sql_mode` column of the `mysql.proc` table was missing some of the current allowable SQL modes, so stored routines would not necessarily execute with the SQL mode in effect at the time of routine definition. (Bug#8902)
- `TRUNCATE` did not work within stored procedures. Now, within stored procedures, `TRUNCATE` is executed in the same way as `DELETE`. This change was necessary because `TRUNCATE` implicitly locks tables. (Bug#8850)
- A rare race condition could cause `FLUSH TABLES WITH READ LOCK` to hang. (Bug#8682)
- `AES_DECRYPT(col_name, key)` could fail to return `NULL` for invalid values in `col_name`, if `col_name` was declared as `NOT NULL`. (Bug#8669)
- If `SELECT DISTINCT` named an index column multiple times in the select list, the server tried to access different key fields for each instance of the column, which could result in a crash. (Bug#8532)
- `MATCH ... AGAINST` in natural language mode could cause a server crash if the `FULLTEXT` index was not used in a join (that is, `EXPLAIN` did not show `fulltext` join mode) and the search query matched no rows in the table. (Bug#8522)
- `REPAIR TABLE` did not invalidate query results in the query cache that were generated from the table. (Bug#8480)
- `LOAD INDEX` statement now loads the index into memory. (Bug#8452)
- If multiple semicolon-separated statements were received in a single packet, they were written to the binary log as a single event rather than as separate per-statement events. For a server serving as a replication master, this caused replication to fail when the event was sent to slave servers. (Bug#8436)
- A replication master stamped a generated statement (such as a `SET` statement) with an error code intended only for another statement. This could happen, for example, when a statement generated a duplicate key error on the master but still had to be replicated to the slave. (Bug#8412)
- For a stored function that refers to a given table, invoking the function while selecting from the same table resulted in a server crash. (Bug#8405)
- Comparison of a `DECIMAL` column containing `NULL` to a subquery that produced `DECIMAL` values resulted in a server crash. (Bug#8397)
- `DELETE FROM tbl_name ... WHERE ... ORDER BY tbl_name.col_name` when the `ORDER BY` column was qualified with the table name caused the server to crash. (Bug#8392)
- Stored functions that used cursors could return incorrect results. (Bug#8386)
- The Cyrillic letters `И` (И) and `SHORT И` (Ї) were treated as being the same character by the `utf8_general_ci` collation. (Bug#8385)
- When performing boolean full-text searches on `utf8` columns, a double-quote character in the search string caused the server to crash. (Bug#8351)
- The `--set-character-set` option for `myisamchk` was changed to `--set-collation`. The value needed for specifying how to sort indexes is a collation name, not a character set name. (Bug#8349)
- Corruption of `MyISAM` table indexes could occur with `TRUNCATE TABLE` if the table had already been opened. For example, this was possible if the table had been opened implicitly by selecting from a `MERGE` table that mapped to the `MyISAM` table. The server now issues an error message for `TRUNCATE TABLE` under these conditions. (Bug#8306)
- For a query with both `GROUP BY` and `COUNT(DISTINCT)` clauses and a `FROM` clause with a subquery, `NULL` was returned for any `VARCHAR` column selected by the subquery. (Bug#8218)
- Selecting from an `INFORMATION_SCHEMA` table combined with a subquery on an `INFORMATION_SCHEMA` table caused an error with the message `Table tbl_name is corrupted`. (Bug#8164)
- Matching of table names by `mysqlhotcopy` now accommodates `DBD::mysql` versions 2.9003 and up, which implement identifier quoting. (Bug#8136)

- Re-execution of prepared statements containing subqueries caused the server to crash. ([Bug#8125](#))
- A problem with equality propagation optimization for prepared statements and stored procedures caused a server crash upon re-execution of the prepared statement or stored procedure. ([Bug#8115](#), [Bug#8849](#))
- If the slave was running with `--replicate-*-table` options which excluded one temporary table and included another, and the two tables were used in a single `DROP TEMPORARY TABLE IF EXISTS` statement, as the ones the master automatically writes to its binary log upon client's disconnection when client has not explicitly dropped these, the slave could forget to delete the included replicated temporary table. Only the slave needs to be upgraded. ([Bug#8055](#))
- Selecting from a view defined as a join caused a server crash if the query cache was enabled. ([Bug#8054](#))
- Results in the query cache generated from a view were not properly invalidated after `ALTER VIEW` or `DROP VIEW` on that view. ([Bug#8050](#))
- Creating a table using a name containing a character that is illegal in `character_set_client` resulted in the character being stripped from the name and no error. The character now is considered an error. ([Bug#8041](#))
- Certain correlated subqueries with forward references (referring to an alias defined later in the outer query) could crash the server. ([Bug#8025](#))
- Corrected a problem with references to `DUAL` where statements such as `SELECT 1 AS a FROM DUAL` would succeed but statements such as `SELECT 1 AS a FROM DUAL LIMIT 1` would fail. ([Bug#8023](#))
- Comparing a nested row expression (such as `ROW(1, (2, 3))`) with a subquery caused the server to crash. ([Bug#8022](#))
- The number of columns in a row comparison against a subquery was calculated incorrectly. ([Bug#8020](#))
- `mysqldump` now avoids writing `SET NAMES` to the dump output if the server is older than version 4.1 and would not understand that statement. ([Bug#7997](#))
- A deadlock could occur on an update followed by a `SELECT` on an `InnoDB` table without any explicit locks being taken. `InnoDB` now takes an exclusive lock when `INSERT ON DUPLICATE KEY UPDATE` is checking duplicate keys. ([Bug#7975](#))
- A slave running MySQL 3.23.51 or newer hung while trying to connect to a master running MySQL 3.23.50 or older. (The reason for this was a bug in the old masters — `SELECT @@unknown_var` caused the server to hang — which was fixed in MySQL 3.23.50.) ([Bug#7965](#))
- Erroneous output resulted from `SELECT DISTINCT` combined with a subquery and `GROUP BY`. ([Bug#7946](#))
- `FOUND_ROWS()` returned an incorrect value after a `SELECT SQL_CALC_FOUND_ROWS DISTINCT` statement that selected constants and included `GROUP BY` and `LIMIT` clauses. ([Bug#7945](#))
- `mysqld_safe` now understands the `--help` option. Previously, it ignored the option and attempted to start the server anyway. ([Bug#7931](#))
- Creating a user with grants failed when specifying a password but worked without one. ([Bug#7905](#))
- Comparing the result of a subquery to a non-existent column caused the server to crash. This issue affected MySQL on Windows platforms only. ([Bug#7885](#))
- `ALTER TABLE` improperly accepted an index on a `TIMESTAMP` column that `CREATE TABLE` would reject. ([Bug#7884](#))
- MySQL allowed concurrent updates (including inserts and deletes) to a table if binary logging was enabled. Now, all updates are executed in a serialized fashion, because they are executed serialized when the binlog is replayed. ([Bug#7879](#))
- Ensured that `mysqldump --single-transaction` sets its transaction isolation level to `REPEATABLE READ` before proceeding (otherwise if the MySQL server was configured to run with a default isolation level lower than `REPEATABLE READ` it could give an inconsistent dump). ([Bug#7850](#))
- `mysqlbinlog` forgot to add backquotes around the collation of user variables (causing later parsing problems as `BINARY` is a reserved word). ([Bug#7793](#))
- A `TABLE IS FULL` error occurred when the table was still smaller than `max_heap_table_size`. ([Bug#7791](#))
- Use of `GROUP_CONCAT()` with `HAVING` caused the server to crash. ([Bug#7769](#))
- The `CONV()` function returned an unsigned `BIGINT` number, which does not fit in 32 bits. ([Bug#7751](#))
- The `IN()` operator did not return correct results if all values in the list were constants and some of them used substring functions such as `LEFT()`, `RIGHT()`, or `MID()`. ([Bug#7716](#))

- When encountering a `DISK FULL` or `QUOTA EXCEEDED` write error, `MyISAM` sometimes failed to sleep and retry the write, resulting in a corrupted table. (Bug#7714)
- The `CONVERT_TZ()` function, when its second or third argument was from a `const` table, caused the server to crash. (See Section 12.3.2, “EXPLAIN Syntax”.) (Bug#7705)
- The output of the `STATUS (\s)` command in `mysql` had the values for the server and client character sets reversed. (Bug#7571)
- A `LEFT OUTER JOIN` between an empty base table and a view on an empty base table caused a server crash. (Bug#7433)
- Ordering by an unsigned expression (more complex than a column reference) was treating the value as signed, producing incorrectly sorted results. `HAVING` was also treating unsigned columns as signed. (Bug#7425)
- The server crashed when an error occurred during the filling of a temporary table created for handling a view or derived table. (Bug#7413)
- Made the MySQL server accept executing `SHOW CREATE DATABASE` even if the connection has an open transaction or locked tables. Refusing it made `mysqldump --single-transaction` sometimes fail to print a complete `CREATE DATABASE` statement for some dumped databases. (Bug#7358)
- Corrected the handling of trailing spaces in the `ucs2` character set. (Bug#7350)
- `--expire-log-days` was not honored if using only transactions. (Bug#7236)
- Some `INFORMATION_SCHEMA` columns that contained timestamp values were of type `VARBINARY`. These were changed to `TIMESTAMP`. (Bug#7217)
- Some `INFORMATION_SCHEMA` columns that contained catalog identifiers were of type `LONGTEXT`. These were changed to `VARCHAR(N)`, where `N` is the appropriate maximum identifier length. (Bug#7215)
- Use of `GROUP_CONCAT()` in the select list when selecting from a view caused a server crash. (Bug#7116)
- An expression that tested a case-insensitive character column against string constants that differed in lettercase could fail because the constants were treated as having a binary collation. (For example, `WHERE city='London' AND city='london'` could fail.) (Bug#7098, Bug#8690)
- Setting the initial `AUTO_INCREMENT` value for an `InnoDB` table using `CREATE TABLE ... AUTO_INCREMENT = n` did not work, and `ALTER TABLE ... AUTO_INCREMENT = n` did not reset the current value. (Bug#7061)
- Multiple-table updates did not replicate properly to slave servers where `--replicate-*-table` options had been specified. (Bug#7011)
- When setting integer system variables to a negative value with `SET VARIABLES`, the value was treated as a positive value modulo 2^{32} . (Bug#6958)
- Use of a view in a correlated subquery that contains `HAVING` but no `GROUP BY` caused a server crash. (Bug#6894)
- Preparing a query using the `CONVERT_TZ()` function with constant arguments caused the server to crash. (Bug#6849)
- Handling by `mysql_list_fields()` of references to stored functions within views was incorrect and could result in a server crash. (Bug#6814)
- A sequence of `BEGIN` (or `SET AUTOCOMMIT=0`), `FLUSH TABLES WITH READ LOCK`, transactional update, `COMMIT`, `FLUSH TABLES WITH READ LOCK` could hang the connection forever and possibly the MySQL server itself. This happened for example when running the `innobackup` script several times. (Bug#6732)
- Prevent adding `CREATE TABLE ... SELECT` query to the binary log when the insertion of new records partially failed. (Bug#6682)
- `mysqlbinlog` did not print `SET PSEUDO_THREAD_ID` statements in front of `LOAD DATA INFILE` statements inserting into temporary tables, thus causing potential problems when rolling forward these statements after restoring a backup. (Bug#6671)
- If a `MyISAM` table on Windows had `INDEX DIRECTORY` or `DATA DIRECTORY` table options, `mysqldump` dumped the directory pathnames with single-backslash pathname separators. This would cause syntax errors when importing the dump file. `mysqldump` now changes “\” to “/” in the pathnames on Windows. (Bug#6660)
- `SHOW CREATE TABLE` now reports `ENGINE=MEMORY` rather than `ENGINE=HEAP` for a `MEMORY` table (unless the `MYSQL323 SQL` mode is enabled). (Bug#6659)

- Incorrectly ordered results were returned from a query using a `FULLTEXT` index to retrieve rows and there was another index that was usable for `ORDER BY`. For such a query, `EXPLAIN` showed the `fulltext` join type, but showed the other (not `FULLTEXT`) index in the `Key` column. (Bug#6635)
- `CREATE TABLE ... LIKE` failed on Windows when the source or destination table was located in a symlinked database directory. (Bug#6607)
- Retrieving from a view defined as a `SELECT` that mixed `UNION ALL` and `UNION DISTINCT` resulted in a different result than retrieving from the original `SELECT`. (Bug#6565)
- A replication slave could crash after replicating many `ANALYZE TABLE`, `OPTIMIZE TABLE`, or `REPAIR TABLE` statements from the master. (Bug#6461, Bug#7658)
- Selecting from a view that had an `EXISTS` or `NOT EXISTS` subquery not always work properly, and selecting columns by name could cause a server crash. With `SELECT *`, crashes did not occur, but columns in the outer query were not resolved properly. (Bug#6394)
- Changed semantics of `CREATE/ALTER/DROP DATABASE` statements so that replication of `CREATE DATABASE` is possible when using `--binlog-do-db` and `--binlog-ignore-db`. (Bug#6391)
- Fixed a problem in `NO_BACKSLASH_ESCAPES` SQL mode for strings that contained both the string quoting character and backslash. (Bug#6368)
- The `CHAR()` function was not ignoring `NULL` arguments, contrary to the documentation. (Bug#6317)
- Starting and stopping the slave thread (only) could in some circumstance cause the server to crash. (Bug#6148)
- `InnoDB`: Honor the `--tmpdir` startup option when creating temporary files. Previously, `InnoDB` temporary files were always created in the temporary directory of the operating system. On Netware, `InnoDB` will continue to ignore `--tmpdir`. (Bug#5822)
- A `HAVING` clause that referred to `RAND()` or a user-defined function in the `SELECT` part of a query through an alias could cause MySQL to crash or to return an incorrect value. (Bug#5185)
- DDL statements for views were not being written to the binary log (and thus not subject to replication). (Bug#4838)
- Platform and architecture information in version information produced for `--version` option on Windows was always `Win95/Win98 (i32)`. More accurately determine platform as `Win32` or `Win64` for 32-bit or 64-bit Windows, and architecture as `ia32` for x86, `ia64` for Itanium, and `axp` for Alpha. (Bug#4445)
- When using the `RPAD()` function (or any function adding spaces to the right) in a query that had to be resolved by using a temporary table, all resulting strings had rightmost spaces removed (that is, `RPAD()` did not work) (Bug#4048)
- Hostname matching didn't work if a netmask was specified for table-specific privileges. (Bug#3309)
- `mysql_fix_privilege_tables` now makes it possible for `mysql` privilege tables created in MySQL 5.0 to be used with MySQL 4.1. This makes it possible to downgrade from 5.0 to 4.1, or to run MySQL 4.1 and 5.0 using the same privilege table files for testing purposes.
- Giving `mysqld` a `SIGHUP` caused it to crash.
- Prepared statements using `SUM(DISTINCT...)` did not perform correctly.
- `InnoDB`: Use native `tmpfile()` function on Netware. All `InnoDB` temporary files are created under `sys:\tmp`. Previously, `InnoDB` temporary files were never deleted on Netware.
- A symlink vulnerability in the `mysqlaccess` script was reported by Javier Fernandez-Sanguino Pena and [Debian Security Audit Team](#). (CVE-2005-0004)
- A number of portability issues relating to overflow in floating point values were corrected.
- Prepared statements now gives warnings on prepare.
- The combination of `-not` and `trunc*` operators in a full-text search did not work correctly. Using more than one truncated negative search term caused the result to be empty.
- Prepared statements did not work correctly with `OUTER JOIN`.

E.1.28. Changes in MySQL 5.0.2 (01 December 2004)

Functionality added or changed:

- **Incompatible Change:** The precedence of `NOT` operator has changed so that expressions such as `NOT a BETWEEN b AND c` are parsed correctly as `NOT (a BETWEEN b AND c)` rather than as `(NOT a) BETWEEN b AND c`. The pre-5.0 higher-precedence behavior can be obtained by enabling the new `HIGH_NOT_PRECEDENCE` SQL mode.
- **Incompatible Change:** `SHOW STATUS` now shows the session (thread-specific) status variables and `SHOW GLOBAL STATUS` shows the status variables for the whole server.

Before MySQL 5.0.2, `SHOW STATUS` returned global status values. Because the default as of 5.0.2 is to return session values, this is incompatible with previous versions. To issue a `SHOW STATUS` statement that will retrieve global status values for all versions of MySQL, write it like this:

```
SHOW /*!50002 GLOBAL */ STATUS;
```

- If a write to a `MyISAM` table fails because of a full disk or an exceeded disk quota, it now prints a message to the error log every 10 minutes, and waits until disk space becomes available. (Bug#3248)
- Made the MySQL server ignore `SIGHUP` and `SIGQUIT` on Mac OS X 10.3. This is needed because under this OS, the MySQL server receives lots of these signals. (Bug#2030)
- If the server finds that the `user` table has not been upgraded to include the view-related privilege columns, it treats each account as having view privileges that are the same as its `CREATE` privilege.
- A connection doing a rollback now displays "Rolling back" in the `State` column of `SHOW PROCESSLIST`.
- Renamed the `sql_updatable_view_key` system variable to `updatable_views_with_limit`. This variable now can have only two values:
 - `1` or `YES`: Don't issue an error message (warning only) if a `VIEW` without presence of a key in the underlying table is used in queries with a `LIMIT` clause for updating. (This is the default value.)
 - `0` or `NO`: Prohibit update of a `VIEW`, which does not contain a key in the underlying table and the query uses a `LIMIT` clause (usually get from GUI tools).
- Reverted output format of `SHOW TABLES` to old pre-5.0.1 format that did not include a table type column. To get the additional column that lists the table type, use `SHOW FULL TABLES` now.
- `CHECK TABLE` now works for views.
- Modify `DROP USER` so that it drops the account, including all its privileges. Formerly, it removed the account record only for an account that had all privileges revoked.
- `mysqldump --single-transaction --master-data` is now able to take an online (non-blocking) dump of `InnoDB` and report the corresponding binary log coordinates, which makes a backup suitable for point-in-time recovery, roll-forward or replication slave creation. See Section 4.5.4, "mysqldump — A Database Backup Program".
- `0` or `NO`: Prohibit update of a `VIEW`, which does not contain a key in the underlying table and the query uses a `LIMIT` clause (usually get from GUI tools).
- We now detect too-large floating point numbers during statement parsing and generate an error messages for them.
- New `--auto-increment-increment` and `--auto-increment-offset` startup options. These allow you to set up a server to generate auto-increment values that don't conflict with another server.
- Added the `CREATE USER` and `RENAME USER` statements.
- MySQL now by default checks dates and in strict mode allows only fully correct dates. If you want MySQL to behave as before, you should enable the new `ALLOW_INVALID_DATES` SQL mode.
- Added `NO_AUTO_CREATE_USER` SQL mode to prevent `GRANT` from automatically creating new users if it would otherwise do so, unless a password also is specified.
- MySQL now remembers which columns were declared to have default values. In `STRICT_TRANS_TABLES/STRICT_ALL_TABLES` mode, you now get an error if you do an `INSERT` without specifying all columns that don't have a default value. A side effect of this is that when you do `SHOW CREATE` for a new table, you no longer see a `DEFAULT` value for a column for which you didn't specify a default value.
- `InnoDB`: If you specify the option `innodb_locks_unsafe_for_binlog` in `my.cnf`, `InnoDB` in an `UPDATE` or a `DELETE` only locks the rows that it updates or deletes. This greatly reduces the probability of deadlocks.

- A `HAVING` clause in a `SELECT` statement now can refer to columns in the `GROUP BY` clause, as required by standard SQL.
- The `SCHEMA` and `SCHEMAS` keywords are now accepted as synonyms for `DATABASE` and `DATABASES`.
- Added several InnoDB status variables. See [Section 5.1.6, “Status Variables”](#).
- Added `STRICT_TRANS_TABLES`, `STRICT_ALL_TABLES`, `NO_ZERO_IN_DATE`, `NO_ZERO_DATE`, `ERROR_FOR_DIVISION_BY_ZERO`, and `TRADITIONAL` SQL modes. The `TRADITIONAL` mode is shorthand for all the preceding modes. When using mode `TRADITIONAL`, MySQL generates an error if you try to insert a wrong value in a column. It does not adjust the value to the closest possible legal value.
- The `mysql_fix_privilege_tables` script now initializes the global `CREATE VIEW` and `SHOW VIEW` privileges in the `user` table to the value of the `CREATE` privilege in that table.
- `1` or `YES`: Don't issue an error message (warning only) if a `VIEW` without presence of a key in the underlying table is used in queries with a `LIMIT` clause for updating. (This is the default value.)
- The compilation flag `DONT_USE_DEFAULT_FIELDS` was removed because you can get the same behavior by setting the `sql_mode` system variable to `STRICT_TRANS_TABLES`.
- `mysqlbinlog` now prints an informative commented line (thread id, timestamp, server id, and so forth) before each `LOAD DATA INFILE`, like it does for other queries; unless `--short-form` is used.
- Two new server system variables were introduced. `auto_increment_increment` and `auto_increment_offset` can be set locally or globally, and are intended for use in controlling the behavior of `AUTO_INCREMENT` columns in master-to-master replication. Note that these variables are not intended to take the place of sequences. See [Section 5.1.3, “System Variables”](#).
- Added `IS [NOT] boolean_value` syntax, where `boolean_value` is `TRUE`, `FALSE`, or `UNKNOWN`.
- Added `--start-datetime`, `--stop-datetime`, `--start-position`, `--stop-position` options to `mysqlbinlog` (makes point-in-time recovery easier).
- Added initial support for rudimentary triggers (the `CREATE TRIGGER` and `DROP TRIGGER` statements).
- Added basic support for read-only server side cursors.
- Implemented the `WITH CHECK OPTION` clause for `CREATE VIEW`.
- Added support for the `INFORMATION_SCHEMA` “information database” that provides database metadata. See [Chapter 22, `INFORMATION_SCHEMA` Tables](#).

Bugs fixed:

- `mysqlbinlog` was unable to read from `stdin`, for example, when piping the output from `zcat` to `mysqlbinlog`. ([Bug#7853](#))
- If a connection was interrupted by a network error and did a rollback, the network error code got stored into the `BEGIN` and `ROLLBACK` binary log events; that caused superfluous slave stops. ([Bug#6522](#))
- A problem introduced in MySQL 4.0.21 caused replication slaves to stop (error 1223) where a connection started a transaction, performed updates, then issued a `FLUSH TABLES WITH READ LOCK` followed by a `COMMIT`. This issue occurred when using the InnoDB `innobackup` script. ([Bug#5949](#))
- If a connection had an open transaction but had done no updates to transactional tables (for example if had just done a `SELECT FOR UPDATE` then executed a non-transactional update, that update automatically committed the transaction (thus releasing InnoDB's row-level locks etc). ([Bug#5714](#))
- If the slave SQL thread finds a syntax error in a query (which should be rare, as the master parsed it successfully), it now stops immediately. ([Bug#5711](#))
- `SET COLLATION_SERVER...` statements replicated by the slave SQL thread no longer advance its position. This is so that, if the thread is interrupted before the update is completed, it later performs the `SET` again. ([Bug#5705](#))
- `OPTIMIZE TABLE`, `REPAIR TABLE`, and `ANALYZE TABLE` are now replicated without any error code in the binary log. ([Bug#5551](#))
- `disable-local-infile` option had no effect if the client read it from a configuration file using `mysql_options(..., MYSQL_READ_DEFAULT, ...)`. ([Bug#5073](#))

- `SET GLOBAL SYNC_BINLOG` did not work on some platforms (Mac OS X). (Bug#5064)
- `mysql-test-run` failed the `rpl_trunc_binlog` test when running the test from the installation directory. (Bug#5050)
- `mysql_options(..., MYSQL_OPT_LOCAL_INFILE, ...)` failed to disable `LOAD DATA LOCAL INFILE`. (Bug#5038)
- The counter for an `AUTO_INCREMENT` column was not reset by `TRUNCATE TABLE` if the table was a temporary one. (Bug#5033)
- A `CREATE TABLE ... TYPE=HEAP ... AS SELECT...` statement caused the replication slave to stop. (Bug#4971)
- `FLUSH TABLES WITH READ LOCK` now blocks `COMMIT` statements if the server is running with binary logging enabled; this ensures that the binary log position is trustable when doing a full backup of tables and the binary log. (Bug#4953)
- `KILL`ing a connection while it was performing `START SLAVE` caused the server to crash. (Bug#4827)
- A deadlock could happen under certain rare circumstances when using `KILL`. (Bug#4810)
- `mysql-test-run` failed the `grant_cache` test when run as Unix root user. (Bug#4678)
- `mysqlbinlog --read-from-remote-server` sometimes could not accept 2 binary logs in a single invocation. (Bug#4507)
- `mysqlbinlog --position --read-from-remote-server` had incorrect output for # at `log_pos`. (Bug#4506)

E.1.29. Changes in MySQL 5.0.1 (27 July 2004)

Note

This build passes our test suite and fixes a lot of reported bugs found in the previous 5.0.0 release. However, please be aware that this is not a “standard MySQL build” in the sense that there are still some open critical bugs in our bugs database at <http://bugs.mysql.com/> that affect this release as well. We are actively fixing these and will make a new release where these are fixed as soon as possible. However, this binary should be a good candidate for testing new MySQL 5.0 features for future products.

Functionality added or changed:

- **Incompatible Change:** C API change: `mysql_shutdown()` now requires a second argument. This is a source-level incompatibility that affects how you compile client programs; it does not affect the ability of compiled clients to communicate with older servers. See [Section 24.7.3.65](#), “`mysql_shutdown()`”.
- The `Type` column name and values in the output from `SHOW TABLES` are now shown according to standard. The column name has changed from `Type` to `table_type`; permitted values are `BASE TABLE`, `VIEW`, and `ERROR`. (Bug#4603)
- For replication of `MEMORY` (`HEAP`) tables: Made the master automatically write a `DELETE FROM` statement to its binary log when a `MEMORY` table is opened for the first time since the master's startup. This is for the case where the slave has replicated a non-empty `MEMORY` table, and then the master is shut down and restarted: the table is now empty on the master; the `DELETE FROM` empties it on the slave as well.

Even with this fix, between the master's restart and the first use of the table on master, the slave still has out-of-date data in the table. However, if you use the `--init-file` option to populate the `MEMORY` table on the master at startup, it ensures that the failing time interval is zero. (Bug#2477)
- Added `Last_query_cost` status variable that reports optimizer cost for last compiled query.
- Changed that when the MySQL server has binary logging disabled (that is, no `--log-bin` option was used), then no transaction binary log cache is allocated for connections. This should save `binlog_cache_size` bytes of memory (32KB by default) for every connection.
- Implemented a new “greedy search” optimizer that can significantly reduce the time spent on query optimization for some many-table joins. (You are affected if not only some particular `SELECT` is slow, but even using `EXPLAIN` for it takes a noticeable amount of time.) Two new system variables, `optimizer_search_depth` and `optimizer_prune_level`, can be used to fine-tune optimizer behavior.
- `OPTIMIZE TABLE` for `InnoDB` tables is now mapped to `ALTER TABLE` instead of `ANALYZE TABLE`. This rebuilds the table, which updates index statistics and frees space in the clustered index.
- When a session having open temporary tables terminates, the statement automatically written to the binary log is now `DROP`

`TEMPORARY TABLE IF EXISTS` instead of `DROP TEMPORARY TABLE`, for more robustness.

- Added support for read-only and updatable views based on a single table or other updatable views. View use requires that you upgrade your grant tables to add the view-related privileges. See [Section 4.4.5, “mysql_fix_privilege_tables — Upgrade MySQL System Tables”](#).
 - Added the `sql_updatable_view_key` system variable.
 - The MySQL server now returns an error if `SET SQL_LOG_BIN` is issued by a user without the `SUPER` privilege (in previous versions it just silently ignored the statement in this case).
 - When a database is dropped, all routines belonging to that database are also dropped.
 - Added the `--to-last-log` option to `mysqlbinlog`, for use in conjunction with `--read-from-remote-server`.
 - Added the `--innodb-safe-binlog` server option, which adds consistency guarantees between the content of InnoDB tables and the binary log. See [Section 5.2.3, “The Binary Log”](#).
 - `sync_frm` is now a settable global variable (not only a startup option).
 - Added the `--replicate-same-server-id` server option.
 - Explicit `USE db_name` statements no longer are allowed in a stored procedure.
 - Added the `sync_binlog=N` global variable and startup option, which makes the MySQL server synchronize its binary log to disk (`fdatasync()`) after every Nth write to the binary log.
 - Killing a `CHECK TABLE` statement does not result in the table being marked as “corrupted” any more; the table remains as if `CHECK TABLE` had not even started. See [Section 12.5.6.3, “KILL Syntax”](#).
 - Changed the slave SQL thread to print less useless error messages (no more message duplication; no more messages when an error is skipped because of `slave-skip-errors`).
 - When executed from another database, an implicit `USE db_name` is in effect.
 - When installing a MySQL server as a Windows service, the installation command can include a `--local-service` option following the service name to cause the server to run using the `LocalService` Windows account that has limited privileges. This is in addition to the `--defaults-file` option that also can be given following the service name.
 - `DROP DATABASE IF EXISTS`, `DROP TABLE IF EXISTS`, single-table `DELETE`, and single-table `UPDATE` now are written to the binary log even if they changed nothing on the master (for example, even if a `DELETE` matched no rows). The old behavior sometimes caused bad surprises in replication setups.
 - Procedure names may be qualified, for example, `db.p()`
 - Replication and `mysqlbinlog` now have better support for the case that the session character set and collation variables are changed within a given session. See [Section 18.3.1, “Replication Features and Issues”](#).
 - A stored procedure is no longer “global.” That is, it now belongs to a specific database:
 - When a database is dropped, all routines belonging to that database are also dropped.
 - Procedure names may be qualified, for example, `db.p()`
 - When executed from another database, an implicit `USE db_name` is in effect.
 - Explicit `USE db_name` statements no longer are allowed in a stored procedure.
- See [Section 21.2, “Using Stored Routines \(Procedures and Functions\)”](#).

Bugs fixed:

- **Replication:** Complex expressions using `AND`, `OR`, or both could result in a crash if the query containing the expression query was ignored, either by a replication server due to `--replicate-*-table` rules, or by any MySQL server due to a syntax error. ([Bug#3969](#), [Bug#4494](#))
- When a multiple-table `DROP TABLE` failed to drop a table on the master server, the error was not written to the binary log. ([Bug#4553](#))
- If `CREATE TEMPORARY TABLE t SELECT` failed while loading the data, the temporary table was not dropped.

-)
- When the slave SQL thread was replicating a `LOAD DATA INFILE` statement, it didn't show the statement in the output of `SHOW PROCESSLIST`. (Bug#4326)
 - `mysql_fix_privilege_tables` did not handle the `--password=password_val` option correctly. (Bug#4240, Bug#4543)
 - Made `DROP DATABASE` honor the value of `lower_case_table_names`. (Bug#4066)
 - During the installation process of the server RPM on Linux, if `mysqld` was run as the `root` system user and with `-log-bin` pointing to a directory outside of `/var/lib/mysql`, it created binary log files owned by `root` in this directory, which remained owned by `root` after the installation. Now `mysqld` is started as the `mysql` system user instead. (Bug#4038)
 - A potential memory overrun could occur in `mysql_real_connect()` (which required a compromised DNS server and certain operating systems). (Bug#4017)
 - `mysqlbinlog` didn't escape the string content of user variables, and did not deal well when these variables were in non-ASCII character sets; this is now fixed by always printing the string content of user variables in hexadecimal. The character set and collation of the string is now also printed. (Bug#3875)
 - The slave SQL thread refused to replicate `INSERT ... SELECT` if it examined more than 4 billion rows. (Bug#3871)
 - If `server-id` was not set using startup options but with `SET GLOBAL`, the replication slave still complained that it was not set. (Bug#3829)
 - A MySQL slave server built using `--with-debug`, and replicating itself, crashed. (Bug#3568)
 - Multiple-table `DELETE` statements were always replicated by the slave if there were some `-replicate-*-ignore-table` options and no `-replicate-*-do-table` options. (Bug#3461)
 - Memory could be corrupted by replicating a `LOAD DATA INFILE` from a MySQL 3.23 master. Some less critical issues remain; see Section 18.3.1, “Replication Features and Issues”. (Bug#3422)
 - `mysqlbinlog` failed to print a `USE` statement under those rare circumstances where the binary log contained a `LOAD DATA INFILE` statement. (Bug#3415)
 - A rare error condition caused the slave SQL thread spuriously to print the message `BINLOG HAS BAD MAGIC NUMBER` and stop when it was not necessary to do so. (Bug#3401)
 - In some replication error messages, a very long query caused the rest of the message to be invisible (truncated), by putting the query last in the message. (Bug#3357)
 - `mysqlbinlog --read-from-remote-server` now print the exact positions of events in lines beginning with `at #` in the log. (Bug#3214)
 - `mysqlbinlog --read-from-remote-server` read all binary logs following the one that was requested. It now stops at the end of the requested file, the same as it does when reading a local binary log. There is an option `--to-last-log` to get the old behavior. (Bug#3204)
 - Strange results with index `(x, y) ... WHERE x=val_1 AND y>=val_2 ORDER BY pk;` (Bug#3155)
 - Adding `ORDER BY` to a query that uses a subquery can cause incorrect results. (Bug#3118)
 - Changed that when a thread handling `INSERT DELAYED` (also known as a `delayed_insert` thread) is killed, its statements are recorded with an error code of value zero (killing such a thread does not endanger replication, so we thus avoid a superfluous error on the slave). (Bug#3081)
 - Changed that when a `DROP TEMPORARY TABLE` statement is automatically written to the binary log when a session ends, the statement is recorded with an error code of value zero (this ensures that killing a `SELECT` on the master does not result in a superfluous error on the slave). (Bug#3063)
 - When a `Rotate` event was found by the slave SQL thread in the middle of a transaction, the value of `Relay_Log_Pos` in `SHOW SLAVE STATUS` was incorrectly altered. (Bug#3017)
 - Corrected the master's binary log position that `InnoDB` reports when it is doing a crash recovery on a slave server. (Bug#3015)
 - `--replicate-wild-*-table` rules now apply to `ALTER DATABASE` when the table pattern is `%`, as is the case for `CREATE DATABASE` and `DROP DATABASE`. (Bug#3000)
 - Statements did not raise errors on the slave, if the slave was excluded given the `--replicate-*` options in use at the time.

The effect of this problem was: when a statement was killed on the master, the slave stopped. (Bug#2983)

- Running `LOAD DATA FROM MASTER` after `RESET SLAVE` caused a segmentation fault. (Bug#2922)
- A deadlock occurred when two `START SLAVE` commands were run at the same time. (Bug#2921)
- Changed the column `Seconds_Behind_Master` in `SHOW SLAVE STATUS` to never show a value of -1. (Bug#2826)
- Made clearer the error message that one gets when an update is refused because of the `--read-only` option. (Bug#2757)
- The MySQL server did not report any error if a statement (submitted through `mysql_real_query()` or `mysql_stmt_prepare()`) was terminated by garbage characters. This can happen if you pass a wrong `length` parameter to these functions. The result was that the garbage characters were written into the binary log. (Bug#2703)
- Multiple-table `DELETE` statements were never replicated by the slave if there were any `--replicate-*-table` options. (Bug#2527)
- `SLAVE START` (which is a deprecated syntax, `START SLAVE` should be used instead) could crash the slave. (Bug#2516)
- `ALTER DATABASE` caused the client to hang if the database did not exist. (Bug#2333)
- Replication: If a client connects to a slave server and issues an administrative statement for a table (for example, `OPTIMIZE TABLE` or `REPAIR TABLE`), this could sometimes stop the slave SQL thread. This does not lead to any corruption, but you must use `START SLAVE` to get replication going again. (Bug#1858)
- The `--local-load` option of `mysqlbinlog` now requires an argument.

E.1.30. Changes in MySQL 5.0.0 (22 December 2003: Alpha)

Functionality added or changed:

- **Important Change:** If you upgrade to MySQL 4.1.1 or higher, it is difficult to downgrade back to 4.0 or 4.1.0. That is because, for earlier versions, `InnoDB` is not aware of multiple tablespaces.
- Added `TIMESTAMPADD()` and `TIMESTAMPDIFF()` functions.
- The `KILL` statement now takes `CONNECTION` and `QUERY` modifiers. The first is the same as `KILL` with no modifier (it kills a given connection thread). The second kills only the statement currently being executed by the connection.
- Added support for `SUM(DISTINCT)`, `MIN(DISTINCT)`, and `MAX(DISTINCT)`.
- Basic support for stored procedures and functions (SQL:2003 style). See [Section 21.2, “Using Stored Routines \(Procedures and Functions\)”](#).
- The output of the `SHOW BINLOG EVENTS` statement has been modified. The `Orig_log_pos` column has been renamed to `End_log_pos` and now represents the offset of the last byte of the event, plus one.
- Implemented Index Merge optimization for `OR` clauses. See [Section 7.2.6, “Index Merge Optimization”](#).
- Easier replication upgrade (5.0.0 masters can read older binary logs and 5.0.0 slaves can read older relay logs). See [Section 18.3.2, “Replication Compatibility Between MySQL Versions”](#), for more details). The format of the binary log and relay log is changed compared to that of MySQL 4.1 and older.
- For user-defined functions (UDFs), the `UDF_ARGS` structure now has `attributes` and `attribute_lengths` members that provide information about the argument names. [Section 25.2.2.3, “UDF Argument Processing”](#).
- Added `WEEK` and `QUARTER` values as `INTERVAL` arguments for the `DATE_ADD()` and `DATE_SUB()` functions.
- The precedence of the `XOR` operator now lies between `OR` and `AND`. Previously, `XOR` had the same precedence as `OR`.
- Added `SELECT INTO list_of_vars`, which can be of mixed (that is, global and local) types. See [Section 12.8.3.3, “SELECT ... INTO Statement”](#).
- New binary log format that enables replication of these session variables: `sql_mode`, `SQL_AUTO_IS_NULL`, `FOREIGN_KEY_CHECKS` (which was replicated since 4.0.14, but here it's done more efficiently and takes less space in the binary logs), `UNIQUE_CHECKS`. Other variables (like character sets, `SQL_SELECT_LIMIT`, ...) will be replicated in upcoming 5.0.x releases.
- `LOAD DATA INFILE` causes an implicit commit.

Important

The behavior of `LOAD DATA INFILE` in this regard was changed again in MySQL 5.0.26. See [Section E.1.2, “Changes in MySQL 5.0.26 \(03 October 2006\)”](#).

E.2. Changes in MySQL Cluster

Starting from 4.1.13 and 5.0.7, all Cluster changes are included in the MySQL Change History, and this manual section is no longer separately maintained.

E.2.1. Changes in MySQL Cluster-5.0.7 (10 June 2005)

Note

Starting with version 5.0.8, changes for MySQL Cluster can be found in the combined MySQL Change History.

Functionality added or changed:

Bugs fixed:

- ([Bug#11019](#)) `mgmapi` start backup in some cases returns wrong backupid
- ([Bug#10190](#)) Backup from cluster with `NoOfReplica=1` is corrupt
- ([Bug#9246](#)) Condition pushdown and left join, wrong result
- ([Bug#10956](#)) More than 7 node restarts with `--initial` caused cluster to fail.
- ([Bug#9945](#)) `ALTER TABLE` caused server crash. (Linux/390)
- ([Bug#9826](#)) ([Bug#10948](#)) Schema change (`DROP TABLE`, `ALTER TABLE`) crashed HP-UX and PPC32.
- ([Bug#10711](#)) ([Bug#9363](#)) ([Bug#8918](#)) ([Bug#10058](#)) ([Bug#9025](#)) Cluster would time out and crash after first query; setting `DataMemory` to more than 2GB prevented cluster from starting; calling `ndb_select_count()` crashed the cluster. (64-bit Unix OSes)

E.2.2. Changes in MySQL Cluster-5.0.6 (26 May 2005)

Functionality added or changed:

- Limit on number of metadata objects (number of tables, indexes and BLOBs) now increased to 20,320

Bugs fixed:

- The server would hang on successive calls to an `INSERT ... ON DUPLICATE KEY UPDATE` query. ([Bug#9725](#))
- ([Bug#10193](#)) Invalid `DataDir` in config causes `ndbd` segmentation fault
- ([Bug#10813](#)) Build with SCI Transporter fails
- ([Bug#10831](#)) `ndb mgmd LogDestination maxfiles` does not rotate logs properly

E.2.3. Changes in MySQL Cluster-5.0.5 (Not released)

Functionality added or changed:

- Decreased IndexMemory Usage
- Parallel key lookup (read-multi-range) for queries like `SELECT * FROM t1 WHERE primary_key IN (1,2,3,4,5,6,7,8,9,10);`

Bugs fixed:

Patches merged from versions 4.1.11 and 4.1.12

- ([Bug#8315](#)) NdbScanFilter cmp method only works for strings of exact word boundary length
- ([Bug#8103](#)) Configuration handling error
- ([Bug#8035](#)) mysqld signal 10 when ndbd is shutdown
- ([Bug#7631](#)) NDB\$EVENT contains unreadable event and table names
- ([Bug#7628](#)) Filtered event types are ignored
- ([Bug#7627](#)) Drop Event operation fails
- ([Bug#7424](#)) create index on datetime fails

E.2.4. Changes in MySQL Cluster-5.0.4 (16 April 2005)

Functionality added or changed:

- Condition pushdown to storage engine now works for update and delete as well

Bugs fixed:

- ([Bug#9675](#)) Auto-increment not working with INSERT..SELECT and NDB storage
- ([Bug#9517](#)) Condition pushdown to storage engine does not work for update/delete
- ([Bug#9282](#)) API Node Crashes/Reloads on 'DELETE FROM'
- ([Bug#9280](#)) Memory leak in cluster when dependent sub-queries are used
- ([Bug#8585](#)) ndb_cache2 fails on aix52

E.2.5. Changes in MySQL Cluster-5.0.3 (23 March 2005: Beta)

Functionality added or changed:

- Condition pushdown to storage engine
- Query cache enabled for cluster

Bugs fixed:

- Patches merged from version 4.1.10

E.2.6. Changes in MySQL Cluster-5.0.1 (27 July 2004)

Functionality added or changed:

- This was the first MySQL Cluster release in the 5.0 series. As nearly all attention was still focused on getting 4.1 stable, it is not recommended to use MySQL 5.0.1 for MySQL Cluster.

Bugs fixed:

- N/A

E.2.7. Changes in MySQL Cluster-4.1.13 (15 July 2005)

Functionality added or changed:

Bugs fixed:

- ([Bug#11132](#)) Connections between data nodes and management nodes were not being closed following shutdown of `ndb_mgmd`.
- ([Bug#11050](#)) `ndb_mgm> show` printed incorrectly after master data node failure.
- ([Bug#10956](#)) More than 7 node restarts with `--initial` caused cluster to fail.
- ([Bug#9826](#)) ([Bug#10948](#)) Schema change (`DROP TABLE`, `ALTER TABLE`) crashed HPUX and PPC32.
- ([Bug#9025](#)) Data nodes failed to restart on 64-bit Solaris.
- ([Bug#11166](#)) Insert records were incorrectly applied by `ndb_restore`, thus making restoration from backup inconsistent if the binlog contained inserts.
- ([Bug#8918](#)) ([Bug#9363](#)) ([Bug#10711](#)) ([Bug#10058](#)) ([Bug#9025](#)) Cluster would time out and crash after first query; setting `DataMemory` to more than 2GB prevented cluster from starting; calling `ndb_select_count()` crashed the cluster. (64-bit Unix OSes)
- ([Bug#10190](#)) When making a backup of a cluster where `NumberOfReplicas` was equal to 1, the backup's metadata was corrupted. (Linux)
- ([Bug#9945](#)) `ALTER TABLE` caused server crash. (Linux/390)
- ([Bug#11133](#)) A delete operation performed as part of a transaction caused an erroneous result.
- ([Bug#10294](#)) Not allowing sufficient parallelism in cluster configuration (for example, `NoOfTransactions` too small) caused `ndb_restore` to fail without generating any error messages.
- ([Bug#11290](#)) Setting `TransactionInactiveTimeout=0` did not result in an infinite timeout.

E.2.8. Changes in MySQL Cluster-4.1.12 (13 May 2005)

Functionality added or changed:

Bugs fixed:

- ([Bug#10471](#)) Backup can become inconsistent with certain combinations of multiple-row updates
- ([Bug#10287](#)) `ndb_select_all "delimiter"` option non functional
- ([Bug#10142](#)) Unhandled resource shortage in UNIQUE index code
- ([Bug#10029](#)) crash in ordered index scan after db full
- ([Bug#10001](#)) 2 NDB nodes get signal 6 (abort) in DBTC
- ([Bug#9969](#)) 4012 - has misleading error message
- ([Bug#9960](#)) START BACKUP reports failure albeit succeeding
- ([Bug#9924](#)) ABORT BACKUP 1 crashes 4 node cluster
- ([Bug#9892](#)) Index activation file during node recovery
- ([Bug#9891](#)) Crash in DBACC (line 7004) during commit
- ([Bug#9865](#)) SELECT does not function properly
- ([Bug#9839](#)) Column with AUTOINC contains -1 Value on node stop
- ([Bug#9757](#)) Uncompleted node failure after gracefully stopping node
- ([Bug#9749](#)) Transactions causes deadlock in ACC

- ([Bug#9724](#)) Node fails to start: Message: File has already been opened
- ([Bug#9691](#)) UPDATE fails on attempt to update primary key
- ([Bug#9675](#)) Auto-increment not working with INSERT..SELECT and NDB storage
- ([Bug#9318](#)) drop database does not drop ndb tables
- ([Bug#9280](#)) Memory leak in cluster when dependent sub-queries are used
- ([Bug#8928](#)) create table with keys will shutdown the cluster
- Creating a table did not work for a cluster with 6 nodes. ([Bug#8928](#)) Databases with 1, 2, 4, 8, ... (2^n nodes) did not have the problem. After a rolling upgrade, restart each node manually by restarting it with the `--initial` option. Otherwise, use dump and restore after an upgrade.

E.2.9. Changes in MySQL Cluster-4.1.11 (01 April 2005)

Functionality added or changed:

Bugs fixed:

- ([Bug#9916](#)) DbaccMain.cpp / DBACC (Line: 4876) / Pointer too large
- ([Bug#9435](#)) TIMESTAMP columns don't update
- ([Bug#9052](#)) Uninitialized data during unique index build, potential cluster crash
- ([Bug#8876](#)) Timeout when committing aborted transaction after node failure
- ([Bug#8786](#)) ndb_autodiscover, drop index can fail, wait 2 minutes timeout
- ([Bug#8853](#)) Transaction aborted after long time during node failure (4012)
- ([Bug#8753](#)) Invalid schema object version after dropping index (crash fixed, currently retry required)
- ([Bug#8645](#)) Assertion failure with multiple management servers
- ([Bug#8557](#)) ndbd does not get same nodeid on restart
- ([Bug#8556](#)) corrupt ndb_mgm show printout for certain configurations
- ([Bug#8167](#)) cluster shared memory and mysqld signal usage clash

E.2.10. Changes in MySQL Cluster-4.1.10 (12 February 2005)

Bugs fixed:

- ([Bug#8284](#)) Out of fragment memory in DBACC
- ([Bug#8262](#)) Node crash due to bug in DBLQH
- ([Bug#8208](#)) node restart fails on Aix 5.2
- ([Bug#8167](#)) cluster shared memory and mysqld signal usage clash
- ([Bug#8101](#)) unique index and error 4209 while selecting
- ([Bug#8070](#)) ([Bug#7937](#)) ([Bug#6716](#)) various ndb_restore core dumps on HP-UX
- ([Bug#8010](#)) 4006 forces MySQL Node Restart
- ([Bug#7928](#)) out of connection objects
- ([Bug#7898](#)) mysqld crash with ndb (solaris)
- ([Bug#7864](#)) Not possible to have more than 4.5G data memory

E.2.11. Changes in MySQL Cluster-4.1.9 (13 January 2005)

Functionality added or changed:

- New implementation of shared memory transporter.
- Cluster automatically configures shared memory transporter if possible.
- Cluster prioritizes usage of transporters with shared memory and localhost TCP
- Added switches to control the above functions, `ndb-shm` and `ndb-optimized-node-selection`.

Bugs fixed:

- ([Bug#7805](#)) config.ini parsing error
- ([Bug#7798](#)) Running range scan after alter table in different thread causes node failure
- ([Bug#7761](#)) Alter table does not autocommit
- ([Bug#7725](#)) Indexed DATETIME Columns Return Random Results
- ([Bug#7660](#)) START BACKUP does not increment BACKUP-ID (Big Endian machines)
- ([Bug#7593](#)) Cannot Create A Large NDB Data Warehouse
- ([Bug#7480](#)) Mysqlld crash in ha_ndbcluster using Query Browser
- ([Bug#7470](#)) shared memory transporter does not connect
- ([Bug#7396](#)) Primary Key not working in NDB Mysql Clustered table (solaris)
- ([Bug#7379](#)) ndb restore fails to handle blobs and multiple databases
- ([Bug#7346](#)) ndb_restore enters infinite loop
- ([Bug#7340](#)) Problem for inserting data into the Text field on utf8
- ([Bug#7124](#)) ndb_mgmd is aborted on startup when using SHM connection

E.2.12. Changes in MySQL Cluster-4.1.8 (14 December 2004)

Functionality added or changed:

- Default port for `ndb_mgmd` was changed to 1186 (from 2200) as this port number was officially assigned to MySQL Cluster by IANA.
- New command in `ndb_mgm`, PURGE STALE SESSIONS, as a workaround for cases where nodes fail to allocate a node id even if it is free to use.
- New command in `ndb_mgm`, CONNECT.
- The ndb executables have been changed to make use of the regular MySQL command-line option parsing features. See [Section 19.6.5, "Command Options for MySQL Cluster Processes"](#), for notes on changes.
- As bonus of the above you can now specify all command line options in `my.cnf` using the executable names as sections, that is, `[ndbd]`, `[ndb_mgmd]`, `[ndb_mgm]`, `[ndb_restore]`, and so forth.

```
[ndbd]
ndb-connectstring=myhost.domain.com:1234
[ndb_mgm]
ndb-connectstring=myhost.domain.com:1234
```

- Added use of section `[mysql_cluster]` in `my.cnf`. All cluster executables, including `mysqld`, parse this section. For example, this is a convenient place to put `ndb-connectstring` so that it need be specified only once.
- Added cluster log info events on allocation and deallocation of nodeid's.

- Added cluster log info events on connection refuse as a result of version mismatch.
- Extended connectstring syntax to allow for leaving the port number out. For example, `ndb-connect-string|connect-string=myhost1,myhost2,myhost3` is a valid connectstring and connect occurs on default port 1186.
- Clear text ndb error messages provided also for error codes that are mapped to corresponding mysql error codes, by executing `SHOW WARNINGS` after an error has occurred which relates to the ndb storage engine.
- Significant performance improvements done for read performance, especially for blobs.
- Added some variables for performance tuning, `ndb_force_send` and `ndb_use_exact_count`. Do `show variables like 'ndb%';` in mysql client for listing. Use `set` command to alter variables.
- Added variables to set some options, `ndb_use_transactions` and `ndb_autoincrement_prefetch_sz`.

Bugs fixed:

- (Bug#7303) ndb_mgm: Trying to set CLUSTERLOG for a specific node id core dumps
- (Bug#7193) start backup gives false error printout
- (Bug#7153) Cluster nodes don't report error on endianness mismatch
- (Bug#7152) ndb_mgmd segmentation fault on incorrect HostName in configuration
- (Bug#7104) clusterlog filtering and level setting broken
- (Bug#6995) ndb_recover on varchar fields results in changing case of data
- (Bug#6919) all status only shows 2 nodes on a 8-node cluster
- (Bug#6871) DBD execute failed: Got error 897 'Unknown error code' from ndbcluster
- (Bug#6794) Wrong outcome of update operation of ndb table
- (Bug#6791) Segmentation fault when config.ini is not correctly set
- (Bug#6775) failure in acc when running many mysql clients
- (Bug#6696) ndb_mgm command-line options inconsistent with behavior
- (Bug#6684) ndb_restore doesn't give error messages if improper command given
- (Bug#6677) ndb_mgm can crash on "ALL CLUSTERLOG"
- (Bug#6538) Error code returned when select max() on empty table with index
- (Bug#6451) failing create table gives "ghost" tables which are impossible to remove
- (Bug#6435) strange behavior of left join
- (Bug#6426) update with long pk fails
- (Bug#6398) update of primary key fails
- (Bug#6354) mysql does not complain about --ndbcluster option when NDB is not compiled in
- (Bug#6331) INSERT IGNORE .. SELECT breaks subsequent inserts
- (Bug#6288) cluster nodes crash on data import
- (Bug#6031) To drop database you have to execute DROP DATABASE command twice
- (Bug#6020) LOCK TABLE + delete returns error 208
- (Bug#6018) REPLACE does not work for BLOBs + NDB
- (Bug#6016) Strange crash with blobs + different DATABASES

- ([Bug#5973](#)) ndb table belonging to different database shows up in show tables
- ([Bug#5872](#)) ALTER TABLE with blob from ndb table to myisam fails
- ([Bug#5844](#)) Failing mysql-test-run leaves stray NDB processes behind
- ([Bug#5824](#)) HELP text messed up in ndb_mgm
- ([Bug#5786](#)) Duplicate key error after restore
- ([Bug#5785](#)) lock timeout during concurrent update
- ([Bug#5782](#)) Unknown error when using LIMIT with ndb table
- ([Bug#5756](#)) RESTART node from ndb_mgm fails
- A few more not reported bugs fixed

E.2.13. Changes in MySQL Cluster-4.1.7 (23 October 2004)

Functionality added or changed:

- Optimization 1: Improved performance on index scans. Measured 30% performance increase on query which do large amounts of index scans.
- Optimization 2: Improved performance on primary key lookups. Around double performance for autocommitted primary key lookups.
- Optimization 3: Improved performance when using blobs by avoiding usage of exclusive locks for blobs.

Bugs fixed:

- A few bugs fixed.

E.2.14. Changes in MySQL Cluster-4.1.6 (10 October 2004)

Functionality added or changed:

- Limited character set support for storage engine NDBCLUSTER:

Char set	Collation
big5	big5_chinese_ci
	big5_bin
binary	binary
	euckr_bin
euckr	euckr_korean_ci
	euckr_bin
gb2312	gb2312_chinese_ci
	gb2312_bin
gbk	gbk_chinese_ci
	gbk_bin
latin1	latin1_swedish_ci
	latin1_bin
sjis	sjis_japanese_ci
	sjis_bin
tis620	tis620_bin
ucs2	ucs2_general_ci
	ucs2_bin

ujjis	ujjis_japanese_ci
	ujjis_bin
utf8	utf8_general_ci
	utf8_bin

- The SCI Transporter has been brought up-to-date with all changes and now works and has been documented as well.
- Optimizations when several clients to a MySQL Server access ndb tables.
- Added more checks and warnings for erroneous and inappropriate cluster configurations.
- `SHOW TABLES` now directly shows ndb tables created on a different MySQL server, that is, without a prior table access.
- Enhanced support for starting MySQL Server independently of ndbd and ndb_mgmd.
- Clear text ndb error messages provided by executing `SHOW WARNINGS` after an error has occurred which relates to the ndb storage engine.

Bugs fixed:

- Quite a few bugs fixed.

E.2.15. Changes in MySQL Cluster-4.1.5 (16 September 2004)

Functionality added or changed:

- Many queries in MySQL Cluster are executed as range scans or full table scans. All queries that don't use a unique hash index or the primary hash index use this access method. In a distributed system it is crucial that batching is properly performed.

In previous versions, the batch size was fixed to 16 per data node. In this version it is configurable per MySQL Server. So for queries using lots of large scans it is appropriate to set this parameter rather large and for queries using many small scans only fetching a small amount of records it is appropriate to set it low.

The performance of queries can easily change as much as 40% based on how this variable is set.

In future versions more logic will be implemented for assessing the batch size on a per-query basis. Thus, the semantics of the new configuration variable `ScanBatchSize` are likely to change.

- The fixed size overhead of the ndbd process has been greatly decreased. This is also true for the overhead per operation record as well as overhead per table and index.

A number of new configuration variables have been introduced to enable configuration of system buffers. Configuration variables for specifying the numbers of tables, unique hash indexes, and ordered indexes have also been introduced.

New configuration variables: `MaxNoOfOrderedIndexes`, `MaxNoOfUniqueHashIndexes`

Configuration variables no longer used: `MaxNoOfIndexes` (split into the two above).

- In previous versions `ALTER TABLE`, `TRUNCATE TABLE`, and `LOAD DATA` were performed as one big transaction. In this version, all of these statements are automatically separated into several distinct transactions.

This removes the limitation that one could not change very large tables due to the `MaxNoOfConcurrentOperations` parameter.

- MySQL CLuster's online backup feature now backs up indexes so that both data and indexes are restored.
- In previous versions it was not possible to use `NULL` in indexes. This is now possible for all supported index types.
- Much work has been put onto making `AUTO_INCREMENT` features work as for other table handlers. Autoincrements as a partial key is still only supported by `MyISAM`.
- In earlier versions, `mysqld` would crash if the cluster wasn't started with the `--ndbcluster` option. Now `mysqld` handles cluster crashes and starts without crashing.

- The `-i` option for initial startup of `ndbd` has been removed. Initial startup still can be specified by using the `--initial` option. The reason for this is to ensure that it is clear what takes place when using `--initial`: this option completely removes all data from the disk and should only be used at initial start, in certain software upgrade cases, and in some cases as a workaround when nodes cannot be restarted successfully.
- The management client (`ndb_mgm`) now has additional commands and more information is printed for some commands such as `show`.
- In previous versions, the files were called `ndb_0..` when it wasn't possible to allocate a node ID when starting the node. To ensure that files are not so easily overwritten, these files are now named `ndb_pid..`, where `pid` is the process ID assigned by the OS.
- The default parameters have changed for `ndb_mgmd` and `ndbd`. In particular, they are now started as daemons by default. The `-n` option has been removed since it could cause confusion as to its meaning (nstart or nodaemon).
- In the configuration file, you can now use `[NDBD]` as an alias for `[DB]`, `[MYSQLD]` as an alias for `[API]`, and `[NDB_MGMD]` as an alias for `[MGM]`.

Note

In fact, `[NDBD]`, `[MYSQLD]`, and `[NDB_MGMD]` are now the preferred designations, although the older ones will continue to be supported for some time to come in order to maintain backward compatibility.

- Many more checks for consistency in configuration have been introduced to in order to provide quicker feedback on configuration errors.
- In the connect string, it is now possible to use both “;” and “,” as the separator between entries. Thus, “nodeid=2,host=localhost:2200” is equivalent to “nodeid=2;host=localhost:2200”.

In the configuration file, it is also possible to use “:” or “=” for assignment values. For example, `MaxNoOfOrderedIndexes : 128` and `MaxNoOfOrderedIndexes = 128` are equivalent expressions.

- The configuration variable names are now case insensitive, so `MaxNoOfOrderedIndexes : 128` is equivalent to `MAXNOOFORDEREDINDEXES = 128`.
- It is possible now to set the backup directory separately from the `FileSystemPath` by using the `BackupDir` configuration variable.

Log files and trace files can now be placed in any directory by setting the `DataDir` configuration variable.

`FileSystemPath` is no longer mandatory and defaults to `DataDir`.

- Queries involving tables from different databases are now supported.
- It is now possible to update the primary key.
- The performance of ordered indexes has been greatly improved, particularly the maintenance of indexes on updates, inserts and deletes.

Bugs fixed:

- Quite a few bugs fixed.

E.2.16. Changes in MySQL Cluster-4.1.4 (31 August 2004)

Functionality added or changed:

- The names of the log files and trace files created by the `ndbd` and `ndb_mgmd` processes have changed.
- Support for the many `BLOB` data types was introduced in this version.

Bugs fixed:

- Quite a few bugs were fixed in the 4.1.4 release.

E.2.17. Changes in MySQL Cluster-4.1.3 (28 June 2004)

Functionality added or changed:

- This was the first MySQL Cluster release so all functionality was new.

Bugs fixed:

- Various bugs fixed in the development process leading up to 4.1.3.

E.3. MySQL Connector/ODBC (MyODBC) Change History

E.3.1. Changes in MySQL Connector/ODBC 5.1.5 (18 August 2008)

Bugs fixed:

- ODBC `TIMESTAMP` string format is not handled properly by the MyODBC driver. When passing a `TIMESTAMP` or `DATE` to MyODBC, in the ODBC format: {d <date>} or {ts <timestamp>}, the string that represents this is copied once into the SQL statement, and then added again, as an escaped string. ([Bug#37342](#))
- The connector failed to prompt for additional information required to create a DSN-less connection from an application such as Microsoft Excel. ([Bug#37254](#))
- `SQLDriverConnect` does not return `SQL_NO_DATA` on cancel. The ODBC documentation specifies that this method should return `SQL_NO_DATA` when the user cancels the dialog to connect. The connector, however, returns `SQL_ERROR`. ([Bug#36293](#))
- Assigning a string longer than 67 characters to the `TableType` parameter resulted in a buffer overrun when the `SQLTables()` function was called. ([Bug#36275](#))
- The ODBC connector randomly uses logon information stored in `odbc-profile`, or prompts the user for connection information and ignores any settings stored in `odbc-profile`. ([Bug#36203](#))
- After having successfully established a connection, a crash occurs when calling `SQLProcedures()` followed by `SQLFreeStmt()`, using the ODBC C API. ([Bug#36069](#))

E.3.2. Changes in MySQL Connector/ODBC 5.1.4 (15 April 2008)

Bugs fixed:

- Wrong result obtained when using `sum()` on a `decimal(8,2)` field type. ([Bug#35920](#))
- The driver installer could not create a new DSN if many other drivers were already installed. ([Bug#35776](#))
- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE` (`SQL_COLUMN_MONEY`) attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. ([Bug#35581](#))
- On Linux, `SQLGetDiagRec()` returned `SQL_SUCCESS` in cases when it should have returned `SQL_NO_DATA`. ([Bug#33910](#))
- The driver crashes ODBC Administrator on attempting to add a new DSN. ([Bug#32057](#))

E.3.3. Changes in MySQL Connector/ODBC 5.1.3 (26 March 2008)

Platform specific notes:

- **Important Change:** You must uninstall previous 5.1.x editions of Connector/ODBC before installing the new version.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.

Bugs fixed:

- **Important Change:** In previous versions, the SSL certificate would automatically be verified when used as part of the Connector/ODBC connection. The default mode is now to ignore the verificate of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. ([Bug#29955](#), [Bug#34648](#))
- Inserting characters to a UTF8 table using surrogate pairs would fail and insert invalid data. ([Bug#34672](#))
- Installation of Connector/ODBC would fail because it was unable to uninstall a previous installed version. The file being requested would match an older release version than any installed version of the connector. ([Bug#34522](#))
- Using `SqlGetData` in combination with `SQL_C_WCHAR` would return overlapping data. ([Bug#34429](#))
- Descriptor records were not cleared correctly when calling `SQLFreeStmt (SQL_UNBIND)`. ([Bug#34271](#))
- The dropdown selection for databases on a server when creating a DSN was too small. The list size now automatically adjusts up to a maximum size of 20 potential databases. ([Bug#33918](#))
- Microsoft Access would be unable to use `DBEngine.RegisterDatabase` to create a DSN using the Connector/ODBC driver. ([Bug#33825](#))
- Connector/ODBC erroneously reported that it supported the `CAST ()` and `CONVERT ()` ODBC functions for parsing values in SQL statements, which could lead to bad SQL generation during a query. ([Bug#33808](#))
- Using a linked table in Access 2003 where the table has a `BIGINT` column as the first column in the table, and is configured as the primary key, shows `#DELETED` for all rows of the table. ([Bug#24535](#))
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. ([Bug#19065](#))

E.3.4. Changes in MySQL Connector/ODBC 5.1.2 (13 February 2008)

MySQL Connector/ODBC 5.1.2-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the second beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that un-install any existing versions of Connector/ODBC 5.1.x before upgrading.

See also [Bug#34571](#)

Functionality added or changed:

- Explicit descriptors are implemented. ([Bug#32064](#))
- A full implementation of `SQLForeignKeys` based on the information available from `INFORMATION_SCHEMA` in 5.0 and later versions of the server has been implemented.

- Changed `SQL_ATTR_PARAMSET_SIZE` to return an error until support for it is implemented.
- Disabled `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` when using an SSL connection.
- `SQLForeignKeys` uses `INFORMATION_SCHEMA` when it is available on the server, which allows more complete information to be returned.

Bugs fixed:

- The `SSLCIPHER` option would be incorrectly recorded within the SSL configuration on Windows. (Bug#33897)
- Within the GUI interface, when connecting to a MySQL server on a non-standard port, the connection test within the GUI would fail. The issue was related to incorrect parsing of numeric values within the DSN when the option was not configured as the last parameter within the DSN. (Bug#33822)
- Specifying a non-existent database name within the GUI dialog would result in an empty list, not an error. (Bug#33615)
- When deleting rows from a static cursor, the cursor position would be incorrectly reported. (Bug#33388)
- `SQLGetInfo()` reported characters for `SQL_SPECIAL_CHARACTERS` that were not encoded correctly. (Bug#33130)
- Retrieving data from a `BLOB` column would fail within `SQLGetData` when the target data type was `SQL_C_WCHAR` due to incorrect handling of the character buffer. (Bug#32684)
- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. (Bug#31165)
- Reading a `TEXT` column that had been used to store UTF8 data would result in the wrong information being returned during a query. (Bug#28617)
- `SQLForeignKeys` would return an empty string for the schema columns instead of `NULL`. (Bug#19923)
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

- `SQLColumns`
- `SQLColAttribute`
- `SQLColAttributes`
- `SQLDescribeCol`
- `SQLSpecialColumns` (theoretically can have the same problem) (Bug#12805, Bug#30890)
- Dynamic cursors on statements with parameters were not supported. (Bug#11846)
- Evaluating a simple numeric expression when using the OLEDB for ODBC provider and ADO would return an error, instead of the result. (Bug#10128)
- Adding or updating a row using `SQLSetPos()` on a result set with aliased columns would fail. (Bug#6157)

E.3.5. Changes in MySQL Connector/ODBC 5.1.1 (13 December 2007)

MySQL Connector/ODBC 5.1.1-beta, a new version of the ODBC driver for the MySQL database management system, has been released. This release is the first beta (feature-complete) release of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is a beta release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data.

Includes changes from [Connector/ODBC 3.51.21](#) and [3.51.22](#).

Built using MySQL 5.0.52.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- The installer for 64-bit Windows installs both the 32-bit and 64-bit driver. Please note that Microsoft does not yet supply a 64-bit bridge from ADO to ODBC.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that un-install any existing versions of Connector/ODBC 5.1.x before upgrading.

See also [Bug#34571](#)

Functionality added or changed:

- **Incompatible Change:** Replaced myodbc3i (now myodbc-installer) with Connector/ODBC 5.0 version.
- **Incompatible Change:** Removed monitor (myodbc3m) and dsn-editor (myodbc3c).
- **Incompatible Change:** Disallow `SET NAMES` in initial statement and in executed statements.
- A wrapper for the `SQLGetPrivateProfileStringW()` function, which is required for Unicode support, has been created. This function is missing from the unixODBC driver manager. ([Bug#32685](#))
- Added MSI installer for Windows 64-bit. ([Bug#31510](#))
- Implemented support for `SQLCancel()`. ([Bug#15601](#))
- Added support for `SQL_NUMERIC_STRUCT`. ([Bug#3028](#), [Bug#24920](#))
- Removed non-threadsafe configuration of the driver. The driver is now always built against the threadsafe version of libmysql.
- Implemented native Windows setup library
- Replaced the internal library which handles creation and loading of DSN information. The new library, which was originally a part of Connector/ODBC 5.0, supports Unicode option values.
- The Windows installer now places files in a subdirectory of the `Program Files` directory instead of the Windows system directory.

Bugs fixed:

- The `SET NAMES` statement has been disabled because it causes problems in the ODBC driver when determining the current client character set. ([Bug#32596](#))
- `SQLDescribeColW` returned UTF-8 column as `SQL_VARCHAR` instead of `SQL_WVARCHAR`. ([Bug#32161](#))
- ADO was unable to open record set using dynamic cursor. ([Bug#32014](#))
- ADO applications would not open a `RecordSet` that contained a `DECIMAL` field. ([Bug#31720](#))
- Memory usage would increase considerably. ([Bug#31115](#))
- SQL statements are limited to 64KB. ([Bug#30983](#), [Bug#30984](#))
- `SQLSetPos` with `SQL_DELETE` advances dynamic cursor incorrectly. ([Bug#29765](#))
- Using an ODBC prepared statement with bound columns would produce an empty result set when called immediately after inserting a row into a table. ([Bug#29239](#))
- ADO Not possible to update a client side cursor. ([Bug#27961](#))
- Recordset `Update()` fails when using `adUseClient` cursor. ([Bug#26985](#))
- Connector/ODBC would fail to connect to the server if the password contained certain characters, including the semicolon and

other punctuation marks. ([Bug#16178](#))

- Fixed `SQL_ATTR_PARAM_BIND_OFFSET`, and fixed row offsets to work with updatable cursors.
- `SQLSetConnectAttr()` did not clear previous errors, possibly confusing `SQLError()`.
- `SQLError()` incorrectly cleared the error information, making it unavailable from subsequent calls to `SQLGetDiagRec()`.
- NULL pointers passed to `SQLGetInfo()` could result in a crash.
- `SQL_ODBC_SQL_CONFORMANCE` was not handled by `SQLGetInfo()`.
- `SQLCopyDesc()` did not correctly copy all records.
- Diagnostics were not correctly cleared on connection and environment handles.

E.3.6. Changes in MySQL Connector/ODBC 5.1.0 (10 September 2007)

This release is the first of the new 5.1 series and is suitable for use with any MySQL server version since MySQL 4.1, including MySQL 5.0, 5.1, and 6.0. (It will not work with 4.0 or earlier releases.)

Keep in mind that this is an alpha release, and as with any other pre-production release, caution should be taken when installing on production level systems or systems with critical data. Not all of the features planned for the final Connector/ODBC 5.1 release are implemented.

Functionality is based on Connector/ODBC 3.51.20.

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no installer packages for Microsoft Windows x64 Edition.
- Due to differences with the installation process used on Windows and potential registry corruption, it is recommended that uninstall any existing versions of Connector/ODBC 5.1.x before upgrading.

See also [Bug#34571](#)

Functionality added or changed:

- Added support for Unicode functions (`SQLConnectW`, etc).
- Added descriptor support (`SQLGetDescField`, `SQLGetDescRec`, etc).
- Added support for `SQL_C_WCHAR`.

E.3.7. Changes in MySQL Connector/ODBC 5.0.12 (Never released)

Note

Development on Connector/ODBC 5.0.x has ceased. New features and functionality will be incorporated into Connector/ODBC 5.1. See [Section 24.1.2.1, “Connector/ODBC Roadmap”](#).

Bugs fixed:

- Inserting NULL values into a `DATETIME` column from Access reports an error. ([Bug#27896](#))
- Tables with `TEXT` columns would be incorrectly identified, returning an `Unknown SQL type - 65535` error. ([Bug#20127](#))

E.3.8. Changes in MySQL Connector/ODBC 5.0.11 (31 January 2007)

Functionality added or changed:

- Added support for ODBC v2 statement options using attributes.
- Driver now builds and is partially tested under Linux with the iODBC driver manager.

Bugs fixed:

- Connection string parsing for DSN-less connections could fail to identify some parameters. ([Bug#25316](#))
- Updates of `MEMO` or `TEXT` columns from within Microsoft Access would fail. ([Bug#25263](#))
- Transaction support has been added and tested. ([Bug#25045](#))
- Internal function, `my_setpos_delete_ignore()` could cause a crash. ([Bug#22796](#))
- Fixed occasional mis-handling of the `SQL_NUMERIC_C` type.
- Fixed the binding of certain integer types.

E.3.9. Changes in MySQL Connector/ODBC 5.0.10 (14 December 2006)

Connector/ODBC 5.0.10 is the sixth BETA release.

Functionality added or changed:

- Significant performance improvement when retrieving large text fields in pieces using `SQLGetData()` with a buffer smaller than the whole data. Mainly used in Access when fetching very large text fields. ([Bug#24876](#))
- Added initial unicode support in data and metadata. ([Bug#24837](#))
- Added initial support for removing braces when calling stored procedures and retrieving result sets from procedure calls. ([Bug#24485](#))
- Added loose handling of retrieving some diagnostic data. ([Bug#15782](#))
- Added wide-string type info for `SQLGetTypeInfo()`.

Bugs fixed:

- Editing DSN no longer crashes ODBC data source administrator. ([Bug#24675](#))
- String query parameters are now escaped correctly. ([Bug#19078](#))

E.3.10. Changes in MySQL Connector/ODBC 5.0.9 (22 November 2006)

Connector/ODBC 5.0.9 is the fifth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for column binding as `SQL_NUMERIC_STRUCT`.
- Added recognition of `SQL_C_SHORT` and `SQL_C_TINYINT` as C types.

Bugs fixed:

- Fixed wildcard handling of and listing of catalogs and tables in `SQLTables`.

- Added limit of display size when requested via [SQLColAttribute/SQL_DESC_DISPLAY_SIZE](#).
- Fixed buffer length return for `SQLDriverConnect`.
- ODBC v2 behaviour in driver now supports ODBC v3 date/time types (since `DriverManager` maps them).
- Catch use of [SQL_ATTR_PARAMSET_SIZE](#) and report error until we fully support.
- Fixed statistics to fail if it couldn't be completed.
- Corrected retrieval multiple field types bit and blob/text.
- Fixed `SQLGetData` to clear the NULL indicator correctly during multiple calls.

E.3.11. Changes in MySQL Connector/ODBC 5.0.8 (17 November 2006)

Connector/ODBC 5.0.8 is the fourth BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Also made [SQL_DESC_NAME](#) only fill in the name if there was a data pointer given, otherwise just the length.
- Fixed display size to be length if max length isn't available.
- Made distinction between [CHAR/BINARY](#) (and VAR versions).
- Wildcards now support escaped chars and underscore matching (needed to link tables with underscores in access).

Bugs fixed:

- Fixed binding using [SQL_C_LONG](#).
- Fixed using wrong pointer for [SQL_MAX_DRIVER_CONNECTIONS](#) in `SQLGetInfo`.
- Set default return to [SQL_SUCCESS](#) if nothing is done for `SQLSpecialColumns`.
- Fixed `MDiagnostic` to use correct v2/v3 error codes.
- Allow `SQLDescribeCol` to be called to retrieve the length of the column name, but not the name itself.
- Length now used when handling bind parameter (needed in particular for [SQL_WCHAR](#)) - this enables updating char data in MS Access.
- Updated retrieval of descriptor fields to use the right pointer types.
- Fixed handling of numeric pointers in `SQLColAttribute`.
- Fixed type returned for [MYSQL_TYPE_LONG](#) to [SQL_INTEGER](#) instead of [SQL_TINYINT](#).
- Fix size return from `SQLDescribeCol`.
- Fixed string length to chars, not bytes, returned by `SQLGetDiagRec`.

E.3.12. Changes in MySQL Connector/ODBC 5.0.7 (08 November 2006)

Connector/ODBC 5.0.7 is the third BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Functionality added or changed:

- Added support for [SQLStatistics](#) to `MYODBCShell`.

- Improved trace/log.

Bugs fixed:

- `SQLBindParameter` now handles `SQL_C_DEFAULT`.
- Corrected incorrect column index within `SQLStatistics`. Many more tables can now be linked into MS Access.
- Fixed `SQLDescribeCol` returning column name length in bytes rather than chars.

E.3.13. Changes in MySQL Connector/ODBC 5.0.6 (03 November 2006)

Connector/ODBC 5.0.6 is the second BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release

- Connector/ODBC supports both `User` and `System` DSNs.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).
- You no longer have to have Connector/ODBC 3.51 installed before installing this version.

Bugs fixed:

- You no longer have to have Connector/ODBC 3.51 installed before installing this version.
- Connector/ODBC supports both `User` and `System` DSNs.
- Installation is provided in the form of a standard Microsoft System Installer (MSI).

E.3.14. Changes in MySQL Connector/ODBC 5.0.5 (17 October 2006)

Connector/ODBC 5.0.5 is the first BETA release.

This is an implementation and testing release, and is not designed for use within a production environment.

You no longer have to have Connector/ODBC 3.51 installed before installing this version.

Bugs fixed:

- You no longer have to have Connector/ODBC 3.51 installed before installing this version.

E.3.15. Changes in Connector/ODBC 5.0.3 (Connector/ODBC 5.0 Alpha 3) (20 June 2006)

This is an implementation and testing release, and is not designed for use within a production environment.

Features, limitations and notes on this release:

- The following ODBC API functions have been added in this release:
 - `SQLBindParameter`
 - `SQLBindCol`

E.3.16. Changes in Connector/ODBC 5.0.2 (Never released)

Connector/ODBC 5.0.2 was an internal implementation and testing release.

E.3.17. Changes in Connector/ODBC 5.0.1 (Connector/ODBC 5.0 Alpha 2) (05 June 2006)

Features, limitations and notes on this release:

- Connector/ODBC 5.0 is Unicode aware.
- Connector/ODBC is currently limited to basic applications. ADO applications and Microsoft Office are not supported.
- Connector/ODBC must be used with a Driver Manager.
- The following ODBC API functions are implemented:
 - `SQLAllocHandle`
 - `SQLCloseCursor`
 - `SQLColAttribute`
 - `SQLColumns`
 - `SQLConnect`
 - `SQLCopyDesc`
 - `SQLDisconnect`
 - `SQLExecDirect`
 - `SQLExecute`
 - `SQLFetch`
 - `SQLFreeHandle`
 - `SQLFreeStmt`
 - `SQLGetConnectAttr`
 - `SQLGetData`
 - `SQLGetDescField`
 - `SQLGetDescRec`
 - `SQLGetDiagField`
 - `SQLGetDiagRec`
 - `SQLGetEnvAttr`
 - `SQLGetFunctions`
 - `SQLGetStmtAttr`
 - `SQLGetTypeInfo`
 - `SQLNumResultCols`
 - `SQLPrepare`
 - `SQLRowcount`
 - `SQLTables`

The following ODBC API function are implemented, but not yet support all the available attributes/options:

- `SQLSetConnectAttr`

- `SQLSetDescField`
- `SQLSetDescRec`
- `SQLSetEnvAttr`
- `SQLSetStmtAttr`

E.3.18. Changes in MySQL Connector/ODBC 3.51.26 (07 July 2008)

Functionality added or changed:

- There is a new connection option, `FLAG_NO_BINARY_RESULT`. When set this option disables charset 63 for columns with an empty `org_table`. ([Bug#29402](#))

Bugs fixed:

- When an `ADOConnection` is created and attempts to open a schema with `ADOConnection.OpenSchema` an access violation occurs in `myodbc3.dll`. ([Bug#30770](#))
- When `SHOW CREATE TABLE` was invoked and then the field values read, the result was truncated and unusable if the table had many rows and indexes. ([Bug#24131](#))

E.3.19. Changes in MySQL Connector/ODBC 3.51.25 (11 April 2008)

Bugs fixed:

- The `SQLColAttribute()` function returned `SQL_TRUE` when querying the `SQL_DESC_FIXED_PREC_SCALE` (`SQL_COLUMN_MONEY`) attribute of a `DECIMAL` column. Previously, the correct value of `SQL_FALSE` was returned; this is now again the case. ([Bug#35581](#))
- The driver crashes ODBC Administrator on attempting to add a new DSN. ([Bug#32057](#))
- When accessing column data, `FLAG_COLUMN_SIZE_S32` did not limit the octet length or display size reported for fields, causing problems with Microsoft Visual FoxPro.

The list of ODBC functions that could have caused failures in Microsoft software when retrieving the length of `LONGBLOB` or `LONGTEXT` columns includes:

- `SQLColumns`
- `SQLColAttribute`
- `SQLColAttributes`
- `SQLDescribeCol`
- `SQLSpecialColumns` (theoretically can have the same problem) ([Bug#12805](#), [Bug#30890](#))

E.3.20. Changes in MySQL Connector/ODBC 3.51.24 (14 March 2008)

Bugs fixed:

- **Security Enhancement:** Accessing a parameter with the type of `SQL_C_CHAR`, but with a numeric type and a length of zero, the parameter marker would get stripped from the query. In addition, an SQL injection was possible if the parameter value had a non-zero length and was not numeric, the text would be inserted verbatim. ([Bug#34575](#))
- **Important Change:** In previous versions, the SSL certificate would automatically be verified when used as part of the Connector/ODBC connection. The default mode is now to ignore the verification of certificates. To enforce verification of the SSL certificate during connection, use the `SSLVERIFY` DSN parameter, setting the value to 1. ([Bug#29955](#), [Bug#34648](#))

- When using ADO, the count of parameters in a query would always return zero. ([Bug#33298](#))
- Using tables with a single quote or other non-standard characters in the table or column names through ODBC would fail. ([Bug#32989](#))
- When using Crystal Reports, table and column names would be truncated to 21 characters, and truncated columns in tables where the truncated name was the duplicated would lead to only a single column being displayed. ([Bug#32864](#))
- `SQLExtendedFetch()` and `SQLFetchScroll()` ignored the rowset size if the `Don't cache result` DSN option was set. ([Bug#32420](#))
- When using the ODBC `SQL_TXN_READ_COMMITTED` option, 'dirty' records would be read from tables as if the option had not been applied. ([Bug#31959](#))
- When creating a System DSN using the ODBC Administrator on Mac OS X, a User DSN would be created instead. The root cause is a problem with the iODBC driver manager used on Mac OS X. The fix works around this issue.

Note

ODBC Administrator may still be unable to register a System DSN unless the `/Library/ODBC/odbc.ini` file has the correct permissions. You should ensure that the file is writable by the `admin` group.

([Bug#31495](#))

- Calling `SQLFetch` or `SQLFetchScroll` would return negative data lengths when using `SQL_C_WCHAR`. ([Bug#31220](#))
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length - 1). ([Bug#29871](#))
- Static cursor was unable to be used through ADO when dynamic cursors were enabled. ([Bug#27351](#))
- Using `connection.Execute` to create a record set based on a table without declaring the cmd option as `adCmdTable` will fail when communicating with versions of MySQL 5.0.37 and higher. The issue is related to the way that `SQLSTATE` is returned when ADO tries to confirm the existence of the target object. ([Bug#27158](#))
- Updating a `RecordSet` when the query involves a `BLOB` field would fail. ([Bug#19065](#))
- With some connections to MySQL databases using Connector/ODBC, the connection would mistakenly report 'user cancelled' for accesses to the database information. ([Bug#16653](#))

E.3.21. Changes in MySQL Connector/ODBC 3.51.23 (09 January 2008)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- There are no installer packages for Microsoft Windows x64 Edition.

Bugs fixed:

- Connector/ODBC would incorrectly return `SQL_SUCCESS` when checking for distributed transaction support. ([Bug#32727](#))
- When using unixODBC or directly linked applications where the thread level is set to less than 3 (within `odbcinst.ini`), a thread synchronization issue would lead to an application crash. This was because `SQLAllocStmt()` and `SQLFreeStmt()` did not synchronize access to the list of statements associated with a connection. ([Bug#32587](#))
- Cleaning up environment handles in multithread environments could result in a five (or more) second delay. ([Bug#32366](#))
- Renaming an existing DSN entry would create a new entry with the new name without deleting the old entry. ([Bug#31165](#))
- Setting the default database using the `DefaultDatabase` property of an ADO `Connection` object would fail with the error `Provider does not support this property`. The `SQLGetInfo()` returned the wrong value for `SQL_DATABASE_NAME` when no database was selected. ([Bug#3780](#))

E.3.22. Changes in MySQL Connector/ODBC 3.51.22 (13 November 2007)

Functionality added or changed:

- The workaround for this bug was removed due to the fixes in MySQL Server 5.0.48 and 5.1.21.

This regression was introduced by [Bug#10491](#)

Bugs fixed:

- The `English` locale would be used when formatting floating point values. The `C` locale is now used for these values. ([Bug#32294](#))
- When accessing information about supported operations, the driver would return incorrect information about the support for `UNION`. ([Bug#32253](#))
- Unsigned integer values greater than the maximum value of a signed integer would be handled incorrectly. ([Bug#32171](#))
- The wrong result was returned by `SQLGetData()` when the data was an empty string and a zero-sized buffer was specified. ([Bug#30958](#))
- Added the `FLAG_COLUMN_SIZE_S32` option to limit the reported column size to a signed 32-bit integer. This option is automatically enabled for ADO applications to provide a work around for a bug in ADO. ([Bug#13776](#))

E.3.23. Changes in MySQL Connector/ODBC 3.51.21 (08 October 2007)

Bugs fixed:

- When using a rowset/cursor and add a new row with a number of fields, subsequent rows with fewer fields will include the original fields from the previous row in the final `INSERT` statement. ([Bug#31246](#))
- Uninitiated memory could be used when C/ODBC internally calls `SQLGetFunctions()`. ([Bug#31055](#))
- The wrong `SQL_DESC_LITERAL_PREFIX` would be returned for date/time types. ([Bug#31009](#))
- The wrong `COLUMN_SIZE` would be returned by `SQLGetTypeInfo` for the `TIME` columns (`SQL_TYPE_TIME`). ([Bug#30939](#))
- Clicking outside the character set selection box when configuring a new DSN could cause the wrong character set to be selected. ([Bug#30568](#))
- Not specifying a user in the DSN dialog would raise a warning even though the parameter is optional. ([Bug#30499](#))
- `SQLSetParam()` caused memory allocation errors due to driver manager's mapping of deprecated functions (buffer length - 1). ([Bug#29871](#))
- When using ADO, a column marked as `AUTO_INCREMENT` could incorrectly report that the column allowed `NULL` values. This was due to an issue with `NULLABLE` and `IS_NULLABLE` return values from the call to `SQLColumns()`. ([Bug#26108](#))
- Connector/ODBC would return the wrong the error code when the server disconnects the active connection because the configured `wait_timeout` has expired. Previously it would return `HY000`. Connector/ODBC now correctly returns an `SQLSTATE` of `08S01`. ([Bug#3456](#))

E.3.24. Changes in MySQL Connector/ODBC 3.51.20 (10 September 2007)

Bugs fixed:

- Using `FLAG_NO_PROMPT` doesn't suppress the dialogs normally handled by `SQLDriverConnect`. ([Bug#30840](#))
- The specified length of the username and authentication parameters to `SQLConnect()` were not being honored. ([Bug#30774](#))
- The wrong column size was returned for binary data. ([Bug#30547](#))
- `SQLGetData()` will now always return `SQL_NO_DATA_FOUND` on second call when no data left, even if requested size is 0.

([Bug#30520](#))

- `SQLGetConnectAttr()` did not reflect the connection state correctly. ([Bug#14639](#))
- Removed checkbox in setup dialog for `FLAG_FIELD_LENGTH` (identified as `Don't Optimize Column Width` within the GUI dialog), which was removed from the driver in 3.51.18.

E.3.25. Changes in MySQL Connector/ODBC 3.51.19 (10 August 2007)

Connector/ODBC 3.51.19 fixes a specific issue with the 3.51.18 release. For a list of changes in the 3.51.18 release, see [Section E.3.26, "Changes in MySQL Connector/ODBC 3.51.18 \(08 August 2007\)"](#).

Functionality added or changed:

- Because of [Bug#10491](#) in the server, character string results were sometimes incorrectly identified as `SQL_VARBINARY`. Until this server bug is corrected, the driver will identify all variable-length strings as `SQL_VARCHAR`.

E.3.26. Changes in MySQL Connector/ODBC 3.51.18 (08 August 2007)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- Binary packages as disk images with installers are now available for Mac OS X.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

Functionality added or changed:

- **Incompatible Change:** The `FLAG_DEBUG` option was removed.
- When connecting to a specific database when using a DSN, the system tables from the `mysql` database are no longer also available. Previously, tables from the `mysql` database (catalog) were listed as `SYSTEM TABLES` by `SQLTables()` even when a different catalog was being queried. ([Bug#28662](#))
- Installed for Mac OS X has been re-instated. The installer registers the driver at a system (not user) level and makes it possible to create both user and system DSNs using the Connector/ODBC driver. The installer also fixes the situation where the necessary drivers would be installed local to the user, not globally. ([Bug#15326](#), [Bug#10444](#))
- Connector/ODBC now supports batched statements. In order to enable cached statement support you must switch enable the batched statement option (`FLAG_MULTI_STATEMENTS`, 67108864, or `ALLOW MULTIPLE STATEMENTS` within a GUI configuration). Be aware that batched statements create an increased chance of SQL injection attacks and you must ensure that your application protects against this scenario. ([Bug#7445](#))
- The `SQL_ATTR_ROW_BIND_OFFSET_PTR` is now supported for row bind offsets. ([Bug#6741](#))
- The `TRACE` and `TRACEFILE` DSN options have been removed. Use the ODBC driver manager trace options instead.

Bugs fixed:

- When using a table with multiple `TIMESTAMP` columns, the final `TIMESTAMP` column within the table definition would not be updateable. Note that there is still a limitation in MySQL server regarding multiple `TIMESTAMP` columns. ([Bug#9927](#)) ([Bug#30081](#))
- Fixed an issue where the `myodbc3i` would update the user ODBC configuration file (`~/Library/ODBC/odbcinst.ini`) instead of the system `/Library/ODBC/odbcinst.ini`. This was caused because `myodbc3i` was not honouring the `s` and `u` modifiers for the `-d` command-line option. ([Bug#29964](#))

- Getting table metadata (through the `SQLColumns()`) would fail, returning a bad table definition to calling applications. (Bug#29888)
- `DATETIME` column types would return `FALSE` in place of `SQL_SUCCESS` when requesting the column type information. (Bug#28657)
- The `SQL_COLUMN_TYPE`, `SQL_COLUMN_DISPLAY` and `SQL_COLUMN_PRECISION` values would be returned incorrectly by `SQLColumns()`, `SQLDescribeCol()` and `SQLColAttribute()` when accessing character columns, especially those generated through `concat()`. The lengths returned should now conform to the ODBC specification. The `FLAG_FIELD_LENGTH` option no longer has any affect on the results returned. (Bug#27862)
- Obtaining the length of a column when using a character set for the connection of `utf8` would result in the length being returned incorrectly. (Bug#19345)
- The `SQLColumns()` function could return incorrect information about `TIMESTAMP` columns, indicating that the field was not nullable. (Bug#14414)
- The `SQLColumns()` function could return incorrect information about `AUTO_INCREMENT` columns, indicating that the field was not nullable. (Bug#14407)
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- `BIT(n)` columns are now treated as `SQL_BIT` data where `n = 1` and binary data where `n > 1`.
- The wrong value from `SQL_DESC_LITERAL_SUFFIX` was returned for binary fields.
- The `SQL_DATETIME_SUB` column in `SQLColumns()` was not correctly set for date and time types.
- The value for `SQL_DESC_FIXED_PREC_SCALE` was not returned correctly for values in MySQL 5.0 and later.
- The wrong value for `SQL_DESC_TYPE` was returned for date and time types.
- `SQLConnect()` and `SQLDriverConnect()` were rewritten to eliminate duplicate code and ensure all options were supported using both connection methods. `SQLDriverConnect()` now only requires the setup library to be present when the call requires it.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- Binary packages as disk images with installers are now available for Mac OS X.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- The wrong value for `DECIMAL_DIGITS` in `SQLColumns()` was reported for `FLOAT` and `DOUBLE` fields, as well as the wrong value for the scale parameter to `SQLDescribeCol()`, and the `SQL_DESC_SCALE` attribute from `SQLColAttribute()`.
- The `SQL_DATA_TYPE` column in `SQLColumns()` results did not report the correct value for date and time types.

E.3.27. Changes in MySQL Connector/ODBC 3.51.17 (14 July 2007)

Platform specific notes:

- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Binary packages for Sun Solaris are now available as `PKG` packages.
- Binary packages as disk images with installers are now available for Mac OS X.
- A binary package without an installer is available for Microsoft Windows x64 Edition. There are no installer packages for Microsoft Windows x64 Edition.

Functionality added or changed:

- It is now possible to specify a different character set as part of the DSN or connection string. This must be used instead of the `SET NAMES` statement. You can also configure the character set value from the GUI configuration. ([Bug#9498](#), [Bug#6667](#))
- Fixed calling convention ptr and wrong free in `myodbc3i`, and fixed the null terminating (was only one, not two) when writing DSN to string.
- Dis-allow NULL ptr for null indicator when calling `SQLGetData()` if value is null. Now returns `SQL_ERROR` w/state 22002.
- The setup library has been split into its own RPM package, to allow installing the driver itself with no GUI dependencies.

Bugs fixed:

- `myodbc3i` did not correctly format driver info, which could cause the installation to fail. ([Bug#29709](#))
- Connector/ODBC crashed with Crystal Reports due to a rproblem with `SQLProcedures()`. ([Bug#28316](#))
- Fixed a problem where the GUI would crash when configuring or removing a System or User DSN. ([Bug#27315](#))
- Fixed error handling of out-of-memory and bad connections in catalog functions. This might raise errors in code paths that had ignored them in the past. ([Bug#26934](#))
- For a stored procedure that returns multiple result sets, Connector/ODBC returned only the first result set. ([Bug#16817](#))
- Calling `SQLGetDiagField` with `RecNumber 0`, `DiagIdentifier NOT 0` returned `SQL_ERROR`, preventing access to diagnostic header fields. ([Bug#16224](#))
- Added a new DSN option (`FLAG_ZERO_DATE_TO_MIN`) to retrieve `XXXX-00-00` dates as the minimum allowed ODBC date (`XXXX-01-01`). Added another option (`FLAG_MIN_DATE_TO_ZERO`) to mirror this but for bound parameters. `FLAG_MIN_DATE_TO_ZERO` only changes `0000-01-01` to `0000-00-00`. ([Bug#13766](#))
- If there was more than one unique key on a table, the correct fields were not used in handling `SQLSetPos()`. ([Bug#10563](#))
- When inserting a large `BLOB` field, Connector/ODBC would crash due to a memory allocation error. ([Bug#10562](#))
- The driver was using `mysql_odbc_escape_string()`, which does not handle the `NO_BACKSLASH_ESCAPES` SQL mode. Now it uses `mysql_real_escape_string()`, which does. ([Bug#9498](#))
- `SQLColumns()` did not handle many of its parameters correctly, which could lead to incorrect results. The table name argument was not handled as a pattern value, and most arguments were not escaped correctly when they contained non-alphanumeric characters. ([Bug#8860](#))
- There are no binary packages for Microsoft Windows x64 Edition.
- There is no binary package for Mac OS X on 64-bit PowerPC because Apple does not currently provide a 64-bit PowerPC version of iODBC.
- Correctly return error if `SQLBindCol` is called with an invalid column.
- Fixed possible crash if `SQLBindCol()` was not called before `SQLSetPos()`.
- The Mac OS X binary packages are only provided as tarballs, there is no installer.
- The binary packages for Sun Solaris are only provided as tarballs, not the PKG format.
- The HP-UX 11.23 IA64 binary package does not include the GUI bits because of problems building Qt on that platform.

E.3.28. Changes in MySQL Connector/ODBC 3.51.16 (14 June 2007)

Functionality added or changed:

- Connector/ODBC now supports using SSL for communication. This is not yet exposed in the setup GUI, but must be enabled through configuration files or the DSN. ([Bug#12918](#))

Bugs fixed:

- Calls to `SQLNativeSql()` could cause stack corruption due to an incorrect pointer cast. ([Bug#28758](#))
- Using cursors on results sets with multi-column keys could select the wrong value. ([Bug#28255](#))
- `SQLForeignKeys` does not escape `_` and `%` in the table name arguments. ([Bug#27723](#))
- When using stored procedures, making a `SELECT` or second stored procedure call after an initial stored procedure call, the second statement will fail. ([Bug#27544](#))
- `SQLTables()` did not distinguish tables from views. ([Bug#23031](#))
- Data in `TEXT` columns would fail to be read correctly. ([Bug#16917](#))
- Specifying strings as parameters using the `adBSTR` or `adVarChar` types, (`SQL_WVARCHAR` and `SQL_WLONGVARCHAR`) would be incorrectly quoted. ([Bug#16235](#))
- `SQL_WVARCHAR` and `SQL_WLONGVARCHAR` parameters were not properly quoted and escaped. ([Bug#16235](#))
- Using `BETWEEN` with date values, the wrong results could be returned. ([Bug#15773](#))
- When using the `Don't Cache Results` (option value `1048576`) with Microsoft Access, the connection will fail using DAO/VisualBasic. ([Bug#4657](#))
- Return values from `SQLTables()` may be truncated. (Bugs #22797)

E.3.29. Changes in MySQL Connector/ODBC 3.51.15 (07 May 2007)

Bugs fixed:

- Connector/ODBC would incorrectly claim to support `SQLProcedureColumns` (by returning true when queried about `SQL-PROCEDURECOLUMNS` with `SQLGetFunctions`), but this functionality is not supported. ([Bug#27591](#))
- An incorrect transaction isolation level may not be returned when accessing the connection attributes. ([Bug#27589](#))
- Adding a new DSN with the `myodbc3i` utility under AIX would fail. ([Bug#27220](#))
- When inserting data using bulk statements (through `SQLBulkOperations`), the indicators for all rows within the insert would not updated correctly. ([Bug#24306](#))
- Using `SQLProcedures` does not return the database name within the returned resultset. ([Bug#23033](#))
- The `SQLTransact()` function did not support an empty connection handle. ([Bug#21588](#))
- Using `SQLDriverConnect` instead of `SQLConnect` could cause later operations to fail. ([Bug#7912](#))
- When using blobs and parameter replacement in a statement with `WHERE CURSOR OF`, the SQL is truncated. ([Bug#5853](#))
- Connector/ODBC would return too many foreign key results when accessing tables with similar names. ([Bug#4518](#))
-

E.3.30. Changes in MySQL Connector/ODBC 3.51.14 (08 March 2007)

Functionality added or changed:

- Use of `SQL_ATTR_CONNECTION_TIMEOUT` on the server has now been disabled. If you attempt to set this attribute on your connection the `SQL_SUCCESS_WITH_INFO` will be returned, with an error number/string of `HYC00: Optional feature not supported`. ([Bug#19823](#))
- Added auto is null option to Connector/ODBC option parameters. ([Bug#10910](#))
- Added auto-reconnect option to Connector/ODBC option parameters.
- Added support for the `HENV` handlers in `SQLEndTran()`.

Bugs fixed:

- On 64-bit systems, some types would be incorrectly returned. ([Bug#26024](#))
- When retrieving `TIME` columns, C/ODBC would incorrectly interpret the type of the string and could interpret it as a `DATE` type instead. ([Bug#25846](#))
- Connector/ODBC may insert the wrong parameter values when using prepared statements under 64-bit Linux. ([Bug#22446](#))
- Using Connector/ODBC, with `SQLBindCol` and binding the length to the return value from `SQL_LEN_DATA_AT_EXEC` fails with a memory allocation error. ([Bug#20547](#))
- Using `DataAdapter`, Connector/ODBC may continually consume memory when reading the same records within a loop (Windows Server 2003 SP1/SP2 only). ([Bug#20459](#))
- When retrieving data from columns that have been compressed using `COMPRESS()`, the retrieved data would be truncated to 8KB. ([Bug#20208](#))
- The ODBC driver name and version number were incorrectly reported by the driver. ([Bug#19740](#))
- A string format exception would be raised when using iODBC, Connector/ODBC and the embedded MySQL server. ([Bug#16535](#))
- The `SQLDriverConnect()` ODBC method did not work with recent Connector/ODBC releases. ([Bug#12393](#))

E.3.31. Changes in MySQL Connector/ODBC 3.51.13 (Never released)

Connector/ODBC 3.51.13 was an internal implementation and testing release.

E.3.32. Changes in MySQL Connector/ODBC 3.51.12 (11 February 2005)

Functionality added or changed:

- N/A

Bugs fixed:

- Using stored procedures with ADO, where the `CommandType` has been set correctly to `adCmdStoredProc`, calls to stored procedures would fail. ([Bug#15635](#))
- File DSNs could not be saved. ([Bug#12019](#))
- `SQLColumns()` returned no information for tables that had a column named using a reserved word. ([Bug#9539](#))

E.3.33. Changes in MySQL Connector/ODBC 3.51.11 (28 January 2005)

Bugs fixed:

- `mysql_list_dbcolumns()` and `insert_fields()` were retrieving all rows from a table. Fixed the queries generated by these functions to return no rows. ([Bug#8198](#))
- `SQLGetTypeInfo()` returned `tinyblob` for `SQL_VARBINARY` and nothing for `SQL_BINARY`. Fixed to return `varbinary` for `SQL_VARBINARY`, `binary` for `SQL_BINARY`, and `longblob` for `SQL_LONGVARBINARY`. ([Bug#8138](#))

E.4. MySQL Connector/NET Change History

E.4.1. Changes in MySQL Connector/NET 5.3.0 (Not yet released)

Bugs fixed:

- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerateschema="true"`. (Bug#39072)
- The Connector/NET installer program ended prematurely without reporting the specific error. (Bug#39019)
- When called with an incorrect password the `MembershipProvider.GetPassword()` method threw a `MySQLException` instead of a `MembershipPasswordException`. (Bug#38939)
- Possible overflow in `MySqlPacket.ReadLong()`. (Bug#36997)
- The `TokenizeSql` method was adding query overhead and causing high CPU utilization for larger queries. (Bug#36836)

E.4.2. Changes in MySQL Connector/NET 5.2.4 (Not yet released)

Bugs fixed:

- When using `ProfileProvider`, attempting to update a previously saved property failed. (Bug#39330)
- Reading a negative time value greater than -01:00:00 returned the absolute value of the original time value. (Bug#39294)
- Inserting a negative time value (negative `TimeSpan`) into a `Time` column through the use of `MySqlParameter` caused `MySQLException` to be thrown. (Bug#39275)
- When a data connection was created in the server explorer of Visual Studio 2008 Team, an error was generated when trying to expand stored procedures that had parameters. (Bug#39252)
- The Web Provider did not work at all on a remote host, and did not create a database when using `autogenerateschema="true"`. (Bug#39072)
- Connector/NET called hashed password methods not supported in Mono 2.0 Preview 2. (Bug#38895)

E.4.3. Changes in MySQL Connector/NET 5.2.3 (19 August 2008)

Functionality added or changed:

- Error string was returned after a 28000 second `wait_timeout`. This has been changed to generate a `ConnectionState.Closed` event. (Bug#38119)
- Changed how the procedure schema collection is retrieved. If the connection string contains “`use procedure bodies=true`” then a `SELECT` is performed on the `mysql.proc` table directly, as this is up to 50 times faster than the current Information Schema implementation. If the connection string contains “`use procedure bodies=false`”, then the Information Schema collection is queried. (Bug#36694)
- Changed how the procedure schema collection is retrieved. If `use procedure bodies=true` then the `mysql.proc` table is selected directly as this is up to 50 times faster than the current `information_schema` implementation. If `use procedure bodies=false`, then the `information_schema` collection is queried. (Bug#36694)
- String escaping functionality has been moved from the `MySqlString` class to the `MySqlHelper` class, where it can be accessed by the `EscapeString` method. (Bug#36205)

Bugs fixed:

- The `GetOrdinal()` method failed to return the ordinal if the column name string contained an accent. (Bug#38721)
- Connector/Net uninstaller did not clean up all installed files. (Bug#38534)
- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. (Bug#38276)
- The provider did not silently create the user if the user did not exist. (Bug#38243)
- Executing a command that resulted in a fatal exception did not close the connection. (Bug#37991)
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data

that should be inserted is corrupted and no error is thrown. ([Bug#37968](#))

- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

The original connection string:

```
host=localhost;database=test;uid=*****;pwd=*****;
connect timeout=25; auto enlist=false;pooling=false;
```

The connection string after after closing `MySqlDataReader`:

```
host=localhost;database=test;uid=*****;pwd=*****;
connect timeout=25;auto enlist=false;pooling=false;
Allow User Variables=True;Allow User Variables=False;
Allow User Variables=True;Allow User Variables=False;
```

([Bug#37955](#))

- Unnecessary network traffic was generated for the normal case where the web provider schema was up to date. ([Bug#37469](#))
- `MySqlReader.GetOrdinal()` performance enhancements break existing functionality. ([Bug#37239](#))
- The `autogenerateschema` option produced tables with incorrect collations. ([Bug#36444](#))
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. ([Bug#35459](#))
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. ([Bug#33322](#))
- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types (`ENUM`) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. ([Bug#30603](#))

E.4.4. Changes in MySQL Connector/NET 5.2.2 (12 May 2008)

Bugs fixed:

- Product documentation incorrectly stated '?' is the preferred parameter marker. ([Bug#37349](#))
- An incorrect value for a bit field would returned in a multi-row query if a preceding value for the field returned `NULL`. ([Bug#36313](#))
- Tables with `GEOMETRY` field types would return an unknown datatype exception. ([Bug#36081](#))
- When using the `MySQLProfileProvider`, setting profile details and then reading back saved data would result in the default values being returned instead of the updated values. ([Bug#36000](#))
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. ([Bug#35619](#))
- The `DbCommandBuilder.QuoteIdentifier` method was not implemented. ([Bug#35492](#))
- When using encrypted passwords, the `GetPassword()` function would return the wrong string. ([Bug#35336](#))
- An error would be raised when calling `GetPassword()` with a `NULL` value. ([Bug#35332](#))
- When retrieving data where a field has been identified as containing a GUID value, the incorrect value would be returned when a previous row contained a `NULL` value for that field. ([Bug#35041](#))
- Using the `TableAdapter Wizard` would fail when generating commands that used stored procedures due to the change in supported parameter characters. ([Bug#34941](#))
- When creating a new stored procedured, the new parameter code which allows the use of the @ symbol would interfere with the specification of a `DEFINER`. ([Bug#34940](#))
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. ([Bug#34460](#))

- There was a high level of contention in the connection pooling code that could lead to delays when opening connections and submitting queries. The connection pooling code has been modified to try and limit the effects of the contention issue. ([Bug#34001](#))
- Using the [TableAdaptor](#) wizard in combination with a suitable [SELECT](#) statement, only the associated [INSERT](#) statement would also be created, rather than the required [DELETE](#) and [UPDATE](#) statements. ([Bug#31338](#))
- Fixed problem in datagrid code related to creating a new table. This problem may have been introduced with .NET 2.0 SP1.
- Fixed profile provider that would throw an exception if you were updating a profile that already existed.

E.4.5. Changes in MySQL Connector/NET 5.2.1 (27 February 2008)

Bugs fixed:

- When using the provider to generate or update users and passwords, the password checking algorithm would not validate the password strength or requirements correctly. ([Bug#34792](#))
- When executing statements that used stored procedures and functions, the new parameter code could fail to identify the correct parameter format. ([Bug#34699](#))
- The installer would fail to the DDEX provider binary if the Visual Studio 2005 component was not selected. The result would lead to Connector/NET not loading properly when using the interface to a MySQL server within Visual Studio. ([Bug#34674](#))
- A number issues were identified in the case, connection and schema areas of the code for [MembershipProvider](#), [RoleProvider](#), [ProfileProvider](#). ([Bug#34495](#))
- When using web providers, the Connector/NET would check the schema and cache the application id, even when the connection string had been set. The effect would be to break the membership provider list. ([Bug#34451](#))
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. ([Bug#34448](#))
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. ([Bug#34359](#))
- A race condition could occur within the procedure cache resulting the cache contents overflowing beyond the configured cache size. ([Bug#34338](#))
- Fixed problem with Visual Studio 2008 integration that caused pop-up menus on server explorer nodes to not function
- The provider code has been updated to fix a number of outstanding issues.

E.4.6. Changes in MySQL Connector/NET 5.2.0 (11 February 2008)

Functionality added or changed:

- Performing [GetValue\(\)](#) on a field [TINYINT\(1\)](#) returned a [BOOLEAN](#). While not a bug, this caused problems in software that expected an [INT](#) to be returned. A new connection string option [Treat Tiny As Boolean](#) has been added with a default value of [true](#). If set to [false](#) the provider will treat [TINYINT\(1\)](#) as [INT](#). ([Bug#34052](#))
- Added support for [DbDataAdapter UpdateBatchSize](#). Batching is fully supported including collapsing inserts down into the multi-value form if possible.
- DDEX provider now works under Visual Studio 2008 beta 2.
- Added [ClearPool](#) and [ClearAllPools](#) features.

Bugs fixed:

- Some speed improvements have been implemented in the [TokenizeSql](#) process used to identify elements of SQL statements. ([Bug#34220](#))
- When accessing tables from different databases within the same [TransactionScope](#), the same user/password combination would be used for each database connection. Connector/NET does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information.

[Bug#34204](#)

- The status of connections reported through the state change handler was not being updated correctly. ([Bug#34082](#))
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. ([Bug#34000](#))
- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be updated properly. ([Bug#33909](#))
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This lead to updated connection string options not being recognized if they were of a different case than the existing cached values. ([Bug#31433](#))
- Column name metadata was not using the character set as defined within the connection string being used. ([Bug#31185](#))
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. ([Bug#31090](#))
- Commands executed from within the state change handler would fail with a `NULL` exception. ([Bug#30964](#))
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. ([Bug#30116](#))
- Using compression in the MySQL connection with Connector/NET would be slower than using native (uncompressed) communication. ([Bug#27865](#))
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. ([Bug#26344](#))

E.4.7. Changes in MySQL Connector/NET 5.1.7 (21 August 2008)

Bugs fixed:

- There was a short circuit evaluation error in the `MySqlCommand.CheckState()` method. When the statement `connection == null` was true a `NullReferenceException` was thrown and not the expected `InvalidOperationException`. ([Bug#38276](#))
- Executing a command that resulted in a fatal exception did not close the connection. ([Bug#37991](#))
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

The original connection string:

```
host=localhost;database=test;uid=****;pwd=****;
connect timeout=25; auto enlist=false;pooling=false;
```

The connection string after closing `MySqlDataReader`:

```
host=localhost;database=test;uid=****;pwd=****;
connect timeout=25;auto enlist=false;pooling=false;
Allow User Variables=True;Allow User Variables=False;
Allow User Variables=True;Allow User Variables=False;
```

[Bug#37955](#)

- As `MySqlDbType.DateTime` is not available in `VB.Net` the warning `THE DATETIME ENUM VALUE IS OBSOLETE` was always shown during compilation. ([Bug#37406](#))
- An unknown `MySqlErrorCode` was encountered when opening a connection with an incorrect password. ([Bug#37398](#))
- Documentation incorrectly stated that “the DataColumn class in .NET 1.0 and 1.1 does not allow columns with type of UInt16, UInt32, or UInt64 to be autoincrement columns”. ([Bug#37350](#))
- `SemaphoreFullException` is generated when application is closed. ([Bug#36688](#))
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. ([Bug#35459](#))
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. ([Bug#33322](#))

- Using the MySQL Visual Studio plugin and a MySQL 4.1 server, certain field types ([ENUM](#)) would not be identified correctly. Also, when looking for tables, the plugin would list all tables matching a wildcard pattern of the database name supplied in the connection string, instead of only tables within the specified database. ([Bug#30603](#))

E.4.8. Changes in MySQL Connector/NET 5.1.6 (12 May 2008)

Bugs fixed:

- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. ([Bug#36432](#))
- An incorrect value for a bit field would be returned in a multi-row query if a preceding value for the field returned `NULL`. ([Bug#36313](#))
- The `MembershipProvider` will raise an exception when the connection string is configured with `enablePasswordRetrieval = true` and `RequireQuestionAndAnswer = false`. ([Bug#36159](#))
- When calling `GetNumberOfUsersOnline` an exception is raised on the submitted query due to a missing parameter. ([Bug#36157](#))
- Tables with `GEOMETRY` field types would return an unknown datatype exception. ([Bug#36081](#))
- When creating a connection, setting the `ConnectionString` property of `MySqlConnection` to `NULL` would throw an exception. ([Bug#35619](#))
- The `DbCommandBuilder.QuoteIdentifier` method was not implemented. ([Bug#35492](#))
- When using `SqlDataSource` to open a connection, the connection would not automatically be closed when access had completed. ([Bug#34460](#))
- Attempting to use an isolation level other than the default with a transaction scope would use the default isolation level. ([Bug#34448](#))
- When altering a stored procedure within Visual Studio, the parameters to the procedure could be lost. ([Bug#34359](#))
- A race condition could occur within the procedure cache resulting in the cache contents overflowing beyond the configured cache size. ([Bug#34338](#))
- Using the `TableAdaptor` wizard in combination with a suitable `SELECT` statement, only the associated `INSERT` statement would also be created, rather than the required `DELETE` and `UPDATE` statements. ([Bug#31338](#))

E.4.9. Changes in MySQL Connector/NET 5.1.5 (Not yet released)

Functionality added or changed:

- Performing `GetValue()` on a field `TINYINT(1)` returned a `BOOLEAN`. While not a bug, this caused problems in software that expected an `INT` to be returned. A new connection string option `Treat Tiny As Boolean` has been added with a default value of `true`. If set to `false` the provider will treat `TINYINT(1)` as `INT`. ([Bug#34052](#))

Bugs fixed:

- Some speed improvements have been implemented in the `TokenizeSql` process used to identify elements of SQL statements. ([Bug#34220](#))
- When accessing tables from different databases within the same `TransactionScope`, the same user/password combination would be used for each database connection. Connector/NET does not handle multiple connections within the same transaction scope. An error is now returned if you attempt this process, instead of using the incorrect authorization information. ([Bug#34204](#))
- The status of connections reported through the state change handler was not being updated correctly. ([Bug#34082](#))
- Incorporated some connection string cache optimizations sent to us by Maxim Mass. ([Bug#34000](#))
- In an open connection where the server had disconnected unexpectedly, the status information of the connection would not be

updated properly. ([Bug#33909](#))

- Connector/NET would fail to compile properly with `nant`. ([Bug#33508](#))
- Problem with membership provider would mean that `FindUserByEmail` would fail with a `MySqlException` because it was trying to add a second parameter with the same name as the first. ([Bug#33347](#))
- Using compression in the MySQL connection with Connector/NET would be slower than using native (uncompressed) communication. ([Bug#27865](#))

E.4.10. Changes in MySQL Connector/NET 5.1.4 (20 November 2007)

Bugs fixed:

- Setting the size of a string parameter after the value could cause an exception. ([Bug#32094](#))
- Creation of parameter objects with non-input direction using a constructor would fail. This was caused by some old legacy code preventing their use. ([Bug#32093](#))
- A date string could be returned incorrectly by `MySqlDateTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. ([Bug#32010](#))
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. ([Bug#31930](#))
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. ([Bug#31731](#))
- Connector/NET would incorrectly report success when enlisting in a distributed transaction, although distributed transactions are not supported. ([Bug#31703](#))
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This led to updated connection string options not being recognized if they were of a different case than the existing cached values. ([Bug#31433](#))
- Trying to use a connection that was not open could return an ambiguous and misleading error message. ([Bug#31262](#))
- Column name metadata was not using the character set as defined within the connection string being used. ([Bug#31185](#))
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. ([Bug#31090](#))
- Commands executed from within the state change handler would fail with a `NULL` exception. ([Bug#30964](#))
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. ([Bug#30233](#))
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. ([Bug#30116](#))
- Column types with only 1-bit (such as `BOOLEAN` and `TINYINT(1)`) were not returned as boolean fields. ([Bug#27959](#))
- When accessing certain statements, the command would timeout before the command completed. Because this cannot always be controlled through the individual command timeout options, a `default command timeout` has been added to the connection string options. ([Bug#27958](#))
- The server error code was not updated in the `Data[]` hash, which prevented `DbProviderFactory` users from accessing the server error code. ([Bug#27436](#))
- The `MySqlDbType.Datetime` has been replaced with `MySqlDbType.DateTime`. The old format has been obsoleted. ([Bug#26344](#))
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. ([Bug#13991](#))

E.4.11. Changes in MySQL Connector/NET 5.1.3 (21 September 2007)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug#30204)
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. (Bug#30077)
- The Saudi Hijri calendar was not supported. (Bug#29931)
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. (Bug#29526)
- Connecting to a MySQL server earlier than version 4.1 would raise a `NullException`. (Bug#29476)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug#29409)
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. (Bug#29312)
- An exception would be thrown when using the Manage Role functionality within the web administrator to assign a role to a user. (Bug#29236)
- Using the membership/role providers when `validationKey` or `decryptionKey` parameters are set to `AutoGenerate`, an exception would be raised when accessing the corresponding values. (Bug#29235)
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. (Bug#29124)
- Using the same connection string multiple times would result in `Database=dbname` appearing multiple times in the resulting string. (Bug#29123)
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that uses the `SELECT` statement would terminate the query/TableAdapter wizard. (Bug#29098)
- Using `TransactionScope` would cause an `InvalidOperationException`. (Bug#28709)

E.4.12. Changes in MySQL Connector/NET 5.1.2 (18 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Bugs fixed:

- Log messages would be truncated to 300 bytes. (Bug#28706)
- Creating a user would fail due to the application name being set incorrectly. (Bug#28648)
- *Visual Studio Plugin*: Adding a new query based on a stored procedure that used a `UPDATE`, `INSERT` or `DELETE` statement would terminate the query/TableAdapter wizard. (Bug#28536)
- *Visual Studio Plugin*: Query Builder would fail to show `TINYTEXT` columns, and any columns listed after a `TINYTEXT` column correctly. (Bug#28437)
- Accessing the results from a large query when using data compression in the connection would fail to return all the data. (Bug#28204)
- *Visual Studio Plugin*: Update commands would not be generated correctly when using the TableAdapter wizard. (Bug#26347)

E.4.13. Changes in MySQL Connector/NET 5.1.1 (23 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. (Bug#28448)
- Installation of the Connector/NET on Windows would fail if VisualStudio had not already been installed. (Bug#28260)

- Connector/NET would look for the wrong table when executing `User.IsRole()`. ([Bug#28251](#))
- Building a connection string within a tight loop would show slow performance. ([Bug#28167](#))
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySQLCommandBuilder` to obtain the parameter information. ([Bug#27679](#))
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. ([Bug#27668](#))
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in an exception. ([Bug#23342](#))
- Fixed password property on `MySQLConnectionStringBuilder` to use `PasswordPropertyText` attribute. This causes dots to show instead of actual password text.

E.4.14. Changes in MySQL Connector/NET 5.1.0 (01 May 2007)

Functionality added or changed:

- Now compiles for .NET CF 2.0.
- Rewrote stored procedure parsing code using a new SQL tokenizer. Really nasty procedures including nested comments are now supported.
- `GetSchema` will now report objects relative to the currently selected database. What this means is that passing in null as a database restriction will report objects on the currently selected database only.
- Added Membership and Role provider contributed by Sean Wright (thanks!).

E.4.15. Changes in MySQL Connector/NET 5.0.10 (Not yet released)

Bugs fixed:

- Executing a command that resulted in a fatal exception did not close the connection. ([Bug#37991](#))
- When a prepared insert query is run that contains an `UNSIGNED TINYINT` in the parameter list, the complete query and data that should be inserted is corrupted and no error is thrown. ([Bug#37968](#))
- In a .NET application MySQL Connector/NET modifies the connection string so that it contains several occurrences of the same option with different values. This is illustrated by the example that follows.

The original connection string:

```
host=localhost;database=test;uid=****;pwd=****;  
connect timeout=25; auto enlist=false;pooling=false;
```

The connection string after closing `MySQLDataReader`:

```
host=localhost;database=test;uid=****;pwd=****;  
connect timeout=25;auto enlist=false;pooling=false;  
Allow User Variables=True;Allow User Variables=False;  
Allow User Variables=True;Allow User Variables=False;
```

([Bug#37955](#))

- When creating a connection pool, specifying an invalid IP address will cause the entire application to crash, instead of providing an exception. ([Bug#36432](#))
- `GetSchema` did not work correctly when querying for a collection, if using a non-English locale. ([Bug#35459](#))
- When reading back a stored double or single value using the .NET provider, the value had less precision than the one stored. ([Bug#33322](#))

E.4.16. Changes in MySQL Connector/NET 5.0.9 (Not yet released)

Bugs fixed:

- The `DbCommandBuilder.QuoteIdentifier` method was not implemented. ([Bug#35492](#))
- Setting the size of a string parameter after the value could cause an exception. ([Bug#32094](#))
- Creation of parameter objects with non-input direction using a constructor would fail. This was caused by some old legacy code preventing their use. ([Bug#32093](#))
- A date string could be returned incorrectly by `MySqlDateTime.ToString()` when the date returned by MySQL was `0000-00-00 00:00:00`. ([Bug#32010](#))
- A syntax error in a set of batch statements could leave the data adapter in a state that appears hung. ([Bug#31930](#))
- Installing over a failed uninstall of a previous version could result in multiple clients being registered in the `machine.config`. This would prevent certain aspects of the MySQL connection within Visual Studio to work properly. ([Bug#31731](#))
- Data cached from the connection string could return invalid information because the internal routines were not using case-sensitive semantics. This led to updated connection string options not being recognized if they were of a different case than the existing cached values. ([Bug#31433](#))
- Column name metadata was not using the character set as defined within the connection string being used. ([Bug#31185](#))
- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. ([Bug#31090](#))
- Commands executed from within the state change handler would fail with a `NULL` exception. ([Bug#30964](#))
- When running a stored procedure multiple times on the same connection, the memory usage could increase indefinitely. ([Bug#30116](#))
- The server error code was not updated in the `Data[]` hash, which prevented `DbProviderFactory` users from accessing the server error code. ([Bug#27436](#))
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. ([Bug#13991](#))

E.4.17. Changes in MySQL Connector/NET 5.0.8 (21 August 2007)

Note

This version introduces a new installer technology.

Bugs fixed:

- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. ([Bug#30233](#))
- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. ([Bug#30204](#))
- A `DATE` field would be updated with a date/time value, causing a `MySqlDataAdapter.Update()` exception. ([Bug#30077](#))
- Fixed bug where Connector/Net was hand building some date time patterns rather than using the patterns provided under `CultureInfo`. This caused problems with some calendars that do not support the same ranges as Gregorian.. ([Bug#29931](#))
- Calling `SHOW CREATE PROCEDURE` for routines with a hyphen in the catalog name produced a syntax error. ([Bug#29526](#))
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server became available while the application was still running. ([Bug#29409](#))
- A `FormatException` error would be raised if a parameter had not been found, instead of `Resources.ParameterMustBeDefined`. ([Bug#29312](#))
- Certain operations would not check the `UsageAdvisor` setting, causing log messages from the Usage Advisor even when it was disabled. ([Bug#29124](#))

- Using the same connection string multiple times would result in `Database=dbname` appearing multiple times in the resulting string. (Bug#29123)
- Log messages would be truncated to 300 bytes. (Bug#28706)
- Accessing the results from a large query when using data compression in the connection will fail to return all the data. (Bug#28204)
- Fixed problem where `MySqlConnection.BeginTransaction` checked the drivers status var before checking if the connection was open. The result was that the driver could report an invalid condition on a previously opened connection.
- Fixed problem where we were not closing prepared statement handles when commands are disposed. This could lead to using up all prepared statement handles on the server.
- Fixed the database schema collection so that it works on servers that are not properly respecting the `lower_case_table_names` setting.
- Fixed problem where any attempt to not read all the records returned from a select where each row of the select is greater than 1024 bytes would hang the driver.
- Fixed problem where a command timing out just after it actually finished would cause an exception to be thrown on the command timeout thread which would then be seen as an unhandled exception.
- Fixed some serious issues with command timeout and cancel that could present as exceptions about thread ownership. The issue was that not all queries cancel the same. Some produce resultsets while others don't. `ExecuteReader` had to be changed to check for this.

E.4.18. Changes in MySQL Connector/NET 5.0.7 (18 May 2007)

Bugs fixed:

- Running the statement `SHOW PROCESSLIST` would return columns as byte arrays instead of native columns. (Bug#28448)
- Building a connection string within a tight loop would show slow performance. (Bug#28167)
- Using logging (with the `logging=true` parameter to the connection string) would not generate a log file. (Bug#27765)
- The `UNSIGNED` flag for parameters in a stored procedure would be ignored when using `MySqlCommandBuilder` to obtain the parameter information. (Bug#27679)
- Using `MySQLDataAdapter.FillSchema()` on a stored procedure would raise an exception: `Invalid attempt to access a field before calling Read()`. (Bug#27668)
- If you close an open connection with an active transaction, the transaction is not automatically rolled back. (Bug#27289)
- When cloning an open `MySqlClient.MySqlConnection` with the `Persist Security Info=False` option set, the cloned connection is not usable because the security information has not been cloned. (Bug#27269)
- Enlisting a null transaction would affect the current connection object, such that further enlistment operations to the transaction are not possible. (Bug#26754)
- Attempting to change the `Connection Protocol` property within a `PropertyGrid` control would raise an exception. (Bug#26472)
- The `characterset` property would not be identified during a connection (also affected Visual Studio Plugin). (Bug#26147, Bug#27240)
- The `CreateFormat` column of the `DataTypes` collection did not contain a format specification for creating a new column type. (Bug#25947)
- `DATETIME` fields from versions of MySQL before 4.1 would be incorrectly parsed, resulting in an exception. (Bug#23342)

E.4.19. Changes in MySQL Connector/NET 5.0.6 (22 March 2007)

Bugs fixed:

- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. ([Bug#27253](#))
- `DESCRIBE` SQL statement returns byte arrays rather than data on MySQL versions older than 4.1.15. ([Bug#27221](#))
- `cmd.Parameters.RemoveAt("Id")` will cause an error if the last item is requested. ([Bug#27187](#))
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. ([Bug#27135](#))
- Exception thrown when using large values in `UInt64` parameters. ([Bug#27093](#))
- MySQL Visual Studio Plugin 1.1.2 does not work with Connector/Net 5.0.5. ([Bug#26960](#))

E.4.20. Changes in MySQL Connector/NET 5.0.5 (07 March 2007)

Functionality added or changed:

- Reverted behavior that required parameter names to start with the parameter marker. We apologize for this back and forth but we mistakenly changed the behavior to not match what `SqlClient` supports. We now support using either syntax for adding parameters however we also respond exactly like `SqlClient` in that if you ask for the index of a parameter using a syntax different from when you added the parameter, the result will be -1.
- Assembly now properly appears in the Visual Studio 2005 Add/Remove Reference dialog.
- Fixed problem that prevented use of `SchemaOnly` or `SingleRow` command behaviors with stored procedures or prepared statements.
- Added `MySqlParameterCollection.AddWithValue` and marked the `Add(name, value)` method as obsolete.
- Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- Fixed problem with parameter name hashing where the hashes were not getting updated when parameters were removed from the collection.
- Fixed problem with calling stored functions when a return parameter was not given.
- Added `Use Procedure Bodies` connection string option to allow calling procedures without using procedure metadata.

Bugs fixed:

- `MySqlConnection.GetSchema` fails with `NullReferenceException` for Foreign Keys. ([Bug#26660](#))
- Connector/NET would fail to install under Windows Vista. ([Bug#26430](#))
- Opening a connection would be slow due to hostname lookup. ([Bug#26152](#))
- Incorrect values/formats would be applied when the `OldSyntax` connection string option was used. ([Bug#25950](#))
- Registry would be incorrectly populated with installation locations. ([Bug#25928](#))
- Times with negative values would be returned incorrectly. ([Bug#25912](#))
- Returned data types of a `DataTypes` collection do not contain the right correct CLR Datatype. ([Bug#25907](#))
- `GetSchema` and `DataTypes` would throw an exception due to an incorrect table name. ([Bug#25906](#))
- `MySqlConnection` throws an exception when connecting to MySQL v4.1.7. ([Bug#25726](#))
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. ([Bug#25651](#))
- When closing and then re-opening a connection to a database, the character set specification is lost. ([Bug#25614](#))
- Filling a table schema through a stored procedure triggers a runtime error. ([Bug#25609](#))
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, datatype. ([Bug#25605](#))
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. ([Bug#25603](#))

- The `UpdateRowSource.FirstReturnedRecord` method does not work. ([Bug#25569](#))
- When connecting to a MySQL Server earlier than version 4.1, the connection would hang when reading data. ([Bug#25458](#))
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. ([Bug#25443](#))
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. ([Bug#24957](#))
- When connecting to a server, the return code from the connection could be zero, even though the hostname was incorrect. ([Bug#24802](#))
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlConnection.GetConnection`. ([Bug#24373](#))
- Connector/NET would not compile properly when used with Mono 1.2. ([Bug#24263](#))
- Applications would crash when calling with `CommandType` set to `StoredProcedure`.

E.4.21. Changes in MySQL Connector/NET 5.0.4 (Not released)

This is a new Beta development release, fixing recently discovered bugs.

E.4.22. Changes in MySQL Connector/NET 5.0.3 (05 January 2007)

Functionality added or changed:

- Usage Advisor has been implemented. The Usage Advisor checks your queries and will report if you are using the connection inefficiently.
- PerfMon hooks have been added to monitor the stored procedure cache hits and misses.
- The `MySqlCommand` object now supports asynchronous query methods. This is implemented using the `BeginExecuteNonQuery` and `EndExecuteNonQuery` methods.
- Metadata from stored procedures and stored function execution are cached.
- The `CommandBuilder.DeriveParameters` function has been updated to the procedure cache.
- The `ViewColumns.GetSchema` collection has been updated.
- Improved speed and performance by re-architecting certain sections of the code.
- Support for the embedded server and client library have been removed from this release. Support will be added back to a later release.
- The `ShapZipLib` library has been replaced with the deflate support provided within .NET 2.0.
- SSL support has been updated.

Bugs fixed:

- Additional text added to error message ([Bug#25178](#))
- An exception would be raised, or the process would hang, if `SELECT` privileges on a database were not granted and a stored procedure was used. ([Bug#25033](#))
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. ([Bug#25013](#))
- Using `Driver.IsTooOld()` would return the wrong value. ([Bug#24661](#))
- When using a `DBNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DBNull.Value`. ([Bug#24565](#))
- Stored procedure executions are not thread safe. ([Bug#23905](#))

- Deleting a connection to a disconnected server when using the Visual Studio Plugin would cause an assertion failure. ([Bug#23687](#))
- Nested transactions (which are unsupported) do not raise an error or warning. ([Bug#22400](#))

E.4.23. Changes in MySQL Connector/NET 5.0.2 (06 November 2006)

Functionality added or changed:

- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string properties:

```
ignore prepare=false
```

The default value of this property is true.

Bugs fixed:

- One system where IPv6 was enabled, Connector/NET would incorrectly resolve hostnames. ([Bug#23758](#))
- Column names with accented characters were not parsed properly causing malformed column names in result sets. ([Bug#23657](#))
- An exception would be thrown when calling `GetSchemaTable` and `fields` was null. ([Bug#23538](#))
- A `System.FormatException` exception would be raised when invoking a stored procedure with an `ENUM` input parameter. ([Bug#23268](#))
- During installation, an antivirus error message would be raised (indicating a malicious script problem). ([Bug#23245](#))
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/NET 5.0.2 must be installed. ([Bug#23071](#))
- Using Windows Vista (RC2) as a non-privileged user would raise a `Registry key 'Global' access denied`. ([Bug#22882](#))
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. ([Bug#18186](#))
- Connector/NET did not work as a data source for the `SqlDataSource` object used by ASP.NET 2.0. ([Bug#16126](#))

E.4.24. Changes in MySQL Connector/NET 5.0.1 (01 October 2006)

Bugs fixed:

- Connector/NET on a Turkish operating system, may fail to execute certain SQL statements correctly. ([Bug#22452](#))
- Starting a transaction on a connection created by `MySQL.Data.MySqlClient.MySqlClientFactory`, using `BeginTransaction` without specifying an isolation level, causes the SQL statement to fail with a syntax error. ([Bug#22042](#))
- The `MySqlException` class is now derived from the `DbException` class. ([Bug#21874](#))
- The `#` would not be accepted within column/table names, even though it was valid. ([Bug#21521](#))

- You can now install the Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug#19994)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a Connector/Net exception. (Bug#18391)
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySQLConversionException` exception would be raised. (Bug#11991)
- An `MySQL.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). (Bug#9619)
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. (Bug#7248)
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

E.4.25. Changes in MySQL Connector/NET 5.0.0 (08 August 2006)

Functionality added or changed:

- Replaced use of `ICSharpCode` with .NET 2.0 internal deflate support.
- Refactored test suite to test all protocols in a single pass.
- Added usage advisor warnings for requesting column values by the wrong type.
- Reimplemented `PacketReader/PacketWriter` support into `MySQLStream` class.
- Reworked connection string classes to be simpler and faster.
- Added procedure metadata caching.
- Added internal implementation of SHA1 so we don't have to distribute the `OpenNetCF` on mobile devices.
- Implemented `MySQLClientFactory` class.
- Added `perfmon` hooks for stored procedure cache hits and misses.
- Implemented classes and interfaces for ADO.Net 2.0 support.
- Added Async query methods.
- Implemented Usage Advisor.
- Completely refactored how column values are handled to avoid boxing in some cases.
- Implemented `MySQLConnectionStringBuilder` class.

Bugs fixed:

- `CommandText`: Question mark in comment line is being parsed as a parameter. (Bug#6214)

E.4.26. Changes in MySQL Connector/NET 1.0.11 (Not yet released)

Bugs fixed:

- Attempting to utilize MySQL Connector .Net version 1.0.10 throws a fatal exception under Mono when pooling is enabled. (Bug#33682)
- Setting the size of a string parameter after the value could cause an exception. (Bug#32094)
- Creation of parameter objects with non-input direction using a constructor would fail. This was caused by some old legacy code preventing their use. (Bug#32093)

- Memory usage could increase and decrease significantly when updating or inserting a large number of rows. (Bug#31090)
- Commands executed from within the state change handler would fail with a `NULL` exception. (Bug#30964)
- Extracting data through XML functions within a query returns the data as `System.Byte[]`. This was due to Connector/NET incorrectly identifying `BLOB` fields as binary, rather than text. (Bug#30233)
- Using compression in the MySQL connection with Connector/NET would be slower than using native (uncompressed) communication. (Bug#27865)
- Changing the connection string of a connection to one that changes the parameter marker after the connection had been assigned to a command but before the connection is opened could cause parameters to not be found. (Bug#13991)

E.4.27. Changes in MySQL Connector/NET 1.0.10 (24 August 2007)

Bugs fixed:

- An incorrect `ConstraintException` could be raised on an `INSERT` when adding rows to a table with a multiple-column unique key index. (Bug#30204)
- The availability of a MySQL server would not be reset when using pooled connections (`pooling=true`). This would lead to the server being reported as unavailable, even if the server become available while the application was still running. (Bug#29409)
- Publisher listed in "Add/Remove Programs" is not consistent with other MySQL products. (Bug#27253)
- `MySqlParameterCollection` and parameters added with `Insert` method can not be retrieved later using `ParameterName`. (Bug#27135)
- `BINARY` and `VARBINARY` columns would be returned as a string, not binary, datatype. (Bug#25605)
- A critical `ConnectionPool` error would result in repeated `System.NullReferenceException`. (Bug#25603)
- When a `MySqlConversionException` is raised on a remote object, the client application would receive a `SerializationException` instead. (Bug#24957)
- High CPU utilization would be experienced when there is no idle connection waiting when using pooled connections through `MySqlConnection.GetConnection`. (Bug#24373)

E.4.28. Changes in MySQL Connector/NET 1.0.9 (02 February 2007)

Functionality added or changed:

- The `ICSharpCode ZipLib` is no longer used by the Connector, and is no longer distributed with it.
- **Important change:** Binaries for .NET 1.0 are no longer supplied with this release. If you need support for .NET 1.0, you must build from source.
- Improved `CommandBuilder.DeriveParameters` to first try and use the procedure cache before querying for the stored procedure metadata. Return parameters created with `DeriveParameters` now have the name `RETURN_VALUE`.
- An `Ignore Prepare` option has been added to the connection string options. If enabled, prepared statements will be disabled application-wide. The default for this option is true.
- Implemented a stored procedure cache. By default, the connector caches the metadata for the last 25 procedures that are seen. You can change the number of procedures that are cached by using the `procedure cache` connection string.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/NET 5.0.2 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string properties:

```
ignore prepare=false
```

The default value of this property is true.

Bugs fixed:

- Times with negative values would be returned incorrectly. (Bug#25912)
- `MySqlConnection` throws a `NullReferenceException` and `ArgumentNullException` when connecting to MySQL v4.1.7. (Bug#25726)
- `SELECT` did not work correctly when using a `WHERE` clause containing a UTF-8 string. (Bug#25651)
- When closing and then re-opening a connection to a database, the character set specification is lost. (Bug#25614)
- Trying to fill a table schema through a stored procedure triggers a runtime error. (Bug#25609)
- Using `ExecuteScalar()` with more than one query, where one query fails, will hang the connection. (Bug#25443)
- Additional text added to error message. (Bug#25178)
- When adding parameter objects to a command object, if the parameter direction is set to `ReturnValue` before the parameter is added to the command object then when the command is executed it throws an error. (Bug#25013)
- When connecting to a server, the return code from the connection could be zero, even though the hostname was incorrect. (Bug#24802)
- Using `Driver.IsTooOld()` would return the wrong value. (Bug#24661)
- When using a `DBNull.Value` as the value for a parameter value, and then later setting a specific value type, the command would fail with an exception because the wrong type was implied from the `DBNull.Value`. (Bug#24565)
- Stored procedure executions are not thread safe. (Bug#23905)
- The `CommandBuilder` would mistakenly add insert parameters for a table column with auto incrementation enabled. (Bug#23862)
- One system where IPv6 was enabled, Connector/NET would incorrectly resolve hostnames. (Bug#23758)
- Nested transactions do not raise an error or warning. (Bug#22400)
- An `System.OverflowException` would be raised when accessing a varchar field over 255 bytes. Bug (#23749)
- Within Mono, using the `PreparedStatement` interface could result in an error due to a `BitArray` copying error. (Bug 18186)

E.4.29. Changes in MySQL Connector/NET 1.0.8 (20 October 2006)

Functionality added or changed:

- Stored procedures are now cached.
- The method for retrieving stored procedured metadata has been changed so that users without `SELECT` privileges on the `mysql.proc` table can use a stored procedure.

Bugs fixed:

- Connector/NET on a Turkish operating system, may fail to execute certain SQL statements correctly. (Bug#22452)
- The `#` would not be accepted within column/table names, even though it was valid. (Bug#21521)
- Calling `Close` on a connection after calling a stored procedure would trigger a `NullReferenceException`. (Bug#20581)
- You can now install the Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. (Bug#19994)
- The `DiscoverParameters` function would fail when a stored procedure used a `NUMERIC` parameter type. (Bug#19515)

- When running a query that included a date comparison, a `DateReader` error would be raised. (Bug#19481)
- `IDataRecord.GetString` would raise `NullPointerException` for null values in returned rows. Method now throws `SqlNullValueException`. (Bug#19294)
- Parameter substitution in queries where the order of parameters and table fields did not match would substitute incorrect values. (Bug#19261)
- Submitting an empty string to a command object through `prepare` raises an `System.IndexOutOfRangeException`, rather than a Connector/Net exception. (Bug#18391)
- An exception would be raised when using an output parameter to a `System.String` value. (Bug#17814)
- CHAR type added to `MySqlDbType`. (Bug#17749)
- A `SELECT` query on a table with a date with a value of '0000-00-00' would hang the application. (Bug#17736)
- The `CommandBuilder` ignored `Unsigned` flag at Parameter creation. (Bug#17375)
- When working with multiple threads, character set initialization would generate errors. (Bug#17106)
- When using an unsigned 64-bit integer in a stored procedure, the unsigned bit would be lost stored. (Bug#16934)
- `DataReader` would show the value of the previous row (or last row with non-null data) if the current row contained a `datetime` field with a null value. (Bug#16884)
- Unsigned data types were not properly supported. (Bug#16788)
- The connection string parser did not allow single or double quotes in the password. (Bug#16659)
- The `MySqlDateTime` class did not contain constructors. (Bug#15112)
- Called `MySqlCommandBuilder.DeriveParameters` for a stored procedure that has no paramers would cause an application crash. (Bug#15077)
- Using `ExecuteScalar` with a datetime field, where the value of the field is "0000-00-00 00:00:00", a `MySqlConversionException` exception would be raised. (Bug#11991)
- An `MySql.Data.Types.MySqlConversionException` would be raised when trying to update a row that contained a date field, where the date field contained a zero value (0000-00-00 00:00:00). (Bug#9619)
- When using `MySqlDataAdapter`, connections to a MySQL server may remain open and active, even though the use of the connection has been completed and the data received. (Bug#8131)
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first.` (Bug#7248)
- Incorrect field/data lengths could be returned for `VARCHAR` UTF8 columns. Bug (#14592)

E.4.30. Changes in MySQL Connector/NET 1.0.7 (21 November 2005)

Bugs fixed:

- Unsigned `tinyint` (NET byte) would lead to and incorrectly determined parameter type from the parameter value. (Bug#18570)
- A `#42000Query was empty` exception occurred when executing a query built with `MySqlCommandBuilder`, if the query string ended with a semicolon. (Bug#14631)
- The parameter collection object's `Add()` method added parameters to the list without first checking to see whether they already existed. Now it updates the value of the existing parameter object if it exists. (Bug#13927)
- Added support for the `cp932` character set. (Bug#13806)
- Calling a stored procedure where a parameter contained special characters (such as '@') would produce an exception. Note that `ANSI_QUOTES` had to be enabled to make this possible. (Bug#13753)
- The `Ping()` method did not update the `State` property of the `Connection` object. (Bug#13658)

- Implemented the `MySqlCommandBuilder.DeriveParameters` method that is used to discover the parameters for a stored procedure. ([Bug#13632](#))
- A statement that contained multiple references to the same parameter could not be prepared. ([Bug#13541](#))

E.4.31. Changes in MySQL Connector/NET 1.0.6 (03 October 2005)

Bugs fixed:

- Connector/NET 1.0.5 could not connect on Mono. ([Bug#13345](#))
- Serializing a parameter failed if the first value passed in was `NULL`. ([Bug#13276](#))
- Field names that contained the following characters caused errors: `() % < > /` ([Bug#13036](#))
- The `nant` build sequence had problems. ([Bug#12978](#))
- The Connector/NET 1.0.5 installer would not install alongside Connector/NET 1.0.4. ([Bug#12835](#))

E.4.32. Changes in MySQL Connector/NET 1.0.5 (29 August 2005)

Bugs fixed:

- Connector/NET could not connect to MySQL 4.1.14. ([Bug#12771](#))
- With multiple hosts in the connection string, Connector/NET would not connect to the last host in the list. ([Bug#12628](#))
- The `ConnectionString` property could not be set when a `MySqlConnection` object was added with the designer. ([Bug#12551](#), [Bug#8724](#))
- The `cp1250` character set was not supported. ([Bug#11621](#))
- A call to a stored procedure caused an exception if the stored procedure had no parameters. ([Bug#11542](#))
- Certain malformed queries would trigger a `Connection must be valid and open` error message. ([Bug#11490](#))
- Trying to use a stored procedure when `Connection.Database` was not populated generated an exception. ([Bug#11450](#))
- Connector/NET interpreted the new decimal data type as a byte array. ([Bug#11294](#))
- Added support to call a stored function from Connector/NET. ([Bug#10644](#))
- Connection could fail when .NET thread pool had no available worker threads. ([Bug#10637](#))
- Calling `MySqlConnection.clone` when a connection string had not yet been set on the original connection would generate an error. ([Bug#10281](#))
- Decimal parameters caused syntax errors. ([Bug#10152](#), [Bug#11550](#), [Bug#10486](#))
- Parameters were not recognized when they were separated by linefeeds. ([Bug#9722](#))
- The `MySqlCommandBuilder` class could not handle queries that referenced tables in a database other than the default database. ([Bug#8382](#))
- Trying to read a `TIMESTAMP` column generated an exception. ([Bug#7951](#))
- Connector/NET could not work properly with certain regional settings. (WL#8228)

E.4.33. Changes in MySQL Connector/NET 1.0.4 (20 January 2005)

Bugs fixed:

- `MySqlReader.GetInt32` throws exception if column is unsigned. ([Bug#7755](#))

- Quote character `\222` not quoted in `EscapeString`. (Bug#7724)
- `GetBytes` is working no more. (Bug#7704)
- `MySqlDataReader.GetString(index)` returns non-Null value when field is `Null`. (Bug#7612)
- Clone method bug in `MySqlCommand`. (Bug#7478)
- Problem with Multiple resultsets. (Bug#7436)
- `MySqlAdapter.Fill` method throws error message `Non-negative number required`. (Bug#7345)
- `MySqlCommand.Connection` returns an `IDbConnection`. (Bug#7258)
- Calling prepare causing exception. (Bug#7243)
- Fixed problem with shared memory connections.
- Added or filled out several more topics in the API reference documentation.
- Fixed another small problem with prepared statements.
- Fixed problem that causes named pipes to not work with some blob functionality.

E.4.34. Changes in MySQL Connector/NET 1.0.3 (12 October 2004)

Bugs fixed:

- Invalid query string when using inout parameters (Bug#7133)
- Inserting `DateTime` causes `System.InvalidCastException` to be thrown. (Bug#7132)
- `MySqlDateTime` in Databases sorting by Text, not Date. (Bug#7032)
- Exception stack trace lost when re-throwing exceptions. (Bug#6983)
- Errors in parsing stored procedure parameters. (Bug#6902)
- `InvalidCast` when using `DATE_ADD`-function. (Bug#6879)
- Int64 Support in `MySqlCommand` Parameters. (Bug#6863)
- Test suite fails with MySQL 4.0 because of case sensitivity of table names. (Bug#6831)
- `MySqlDataReader.GetChar(int i)` throws `IndexOutOfRangeException` exception. (Bug#6770)
- Integer "out" parameter from stored procedure returned as string. (Bug#6668)
- An Open Connection has been Closed by the Host System. (Bug#6634)
- Fixed Invalid character set index: 200. (Bug#6547)
- Connections now do not have to give a database on the connection string.
- Installer now includes options to install into GAC and create `START MENU` items.
- Fixed major problem with detecting null values when using prepared statements.
- Fixed problem where multiple resultsets having different numbers of columns would cause a problem.
- Added `ServerThread` property to `MySqlConnection` to expose server thread id.
- Added Ping method to `MySqlConnection`.
- Changed the name of the test suite to `MySql.Data.Tests.dll`.
- Now `SHOW COLLATION` is used upon connection to retrieve the full list of charset ids.
- Made MySQL the default named pipe name.

E.4.35. Changes in MySQL Connector/NET 1.0.2 (15 November 2004)

Bugs fixed:

- Fixed Objects not being disposed ([Bug#6649](#))
- Fixed Charset-map for UCS-2 ([Bug#6541](#))
- Fixed Zero date "0000-00-00" is returned wrong when filling Dataset ([Bug#6429](#))
- Fixed double type handling in MySqlParameter(string parameterName, object value) ([Bug#6428](#))
- Fixed Installation directory ignored using custom installation ([Bug#6329](#))
- Fixed #HY000 Illegal mix of collations (latin1_swedish_ci,IMPLICIT) and (utf8_general_ ([Bug#6322](#))
- Added the TableEditor CS and VB sample
- Added charset connection string option
- Fixed problem with MySqlBinary where string values could not be used to update extended text columns
- Provider is now using character set specified by server as default
- Updated the installer to include the new samples
- Fixed problem where setting command text leaves the command in a prepared state
- Fixed Long inserts take very long time (Bu #5453)
- Fixed problem where calling stored procedures might cause an "Illegal mix of collations" problem.

E.4.36. Changes in MySQL Connector/NET 1.0.1 (27 October 2004)

Bugs fixed:

- Fixed IndexOutOfBounds when reading BLOB with DataReader with GetString(index) ([Bug#6230](#))
- Fixed GetBoolean returns wrong values ([Bug#6227](#))
- Fixed Method TokenizeSql() uses only a limited set of valid characters for parameters ([Bug#6217](#))
- Fixed NET Connector source missing resx files ([Bug#6216](#))
- Fixed System.OverflowException when using YEAR datatype ([Bug#6036](#))
- Fixed MySqlDateTime sets IsZero property on all subseq.records after first zero found ([Bug#6006](#))
- Fixed serializing of floating point parameters (double, numeric, single, decimal) ([Bug#5900](#))
- Fixed missing Reference in DbType setter ([Bug#5897](#))
- Fixed Parsing the ';' char ([Bug#5876](#))
- Fixed DBNull Values causing problems with retrieving/updating queries. ([Bug#5798](#))
- IsNullable error ([Bug#5796](#))
- Fixed problem where MySqlParameterCollection.Add() would throw unclear exception when given a null value ([Bug#5621](#))
- Fixed construtor initialize problems in MySqlCommand() ([Bug#5613](#))
- Fixed Yet Another "object reference not set to an instance of an object" ([Bug#5496](#))
- Fixed Can't display Chinese correctly ([Bug#5288](#))
- Fixed MySqlDataReader and 'show tables from ...' behavior ([Bug#5256](#))
- Fixed problem in PacketReader where it could try to allocate the wrong buffer size in EnsureCapacity

- Fixed problem where using old syntax while using the interfaces caused problems
- Fixed [Bug#5458](#) Calling GetChars on a longtext column throws an exception
- Added test case for resetting the command text on a prepared command
- Fixed [Bug#5388](#) DataReader reports all rows as NULL if one row is NULL
- Fixed problem where connection lifetime on the connect string was not being respected
- Fixed [Bug#5602](#) Possible bug in MySqlConnection(string, object) constructor
- Field buffers being reused to decrease memory allocations and increase speed
- Fixed [Bug#5392](#) MySqlCommand sees "?" as parameters in string literals
- Added Aggregate function test (wasn't really a bug)
- Using PacketWriter instead of Packet for writing to streams
- Implemented SequentialAccess
- Fixed problem with ConnectionInternal where a key might be added more than once
- Fixed Russian character support as well
- Fixed [Bug#5474](#) cannot run a stored procedure populating mysqlcommand.parameters
- Fixed problem where connector was not issuing a CMD_QUIT before closing the socket
- Fixed problem where Min Pool Size was not being respected
- Refactored compression code into CompressedStream to clean up NativeDriver
- CP1252 is now used for Latin1 only when the server is 4.1.2 and later
- Fixed [Bug#5469](#) Setting DbType throws NullReferenceException
- Virtualized driver subsystem so future releases could easily support client or embedded server support

E.4.37. Changes in MySQL Connector/NET 1.0.0 (01 September 2004)

Bugs fixed:

- Thai encoding not correctly supported. ([Bug#3889](#))
- Bumped version number to 1.0.0 for beta 1 release.
- Removed all of the XML comment warnings.
- Added [COPYING.rtf](#) file for use in installer.
- Updated many of the test cases.
- Fixed problem with using compression.
- Removed some last references to ByteFX.

E.4.38. Changes in MySQL Connector/NET Version 0.9.0 (30 August 2004)

- Added test fixture for prepared statements.
- All type classes now implement a [SerializeBinary](#) method for sending their data to a [PacketWriter](#).
- Added [PacketWriter](#) class that will enable future low-memory large object handling.
- Fixed many small bugs in running prepared statements and stored procedures.

- Changed command so that an exception will not be thrown in executing a stored procedure with parameters in old syntax mode.
- `SingleRow` behavior now working right even with limit.
- `GetBytes` now only works on binary columns.
- Logger now truncates long sql commands so blob columns don't blow out our log.
- host and database now have a default value of "" unless otherwise set.
- Connection Timeout seems to be ignored. (Bug#5214)
- Added test case for bug# 5051: GetSchema not working correctly.
- Fixed problem where `GetSchema` would return false for `IsUnique` when the column is key.
- `MySqlDataReader` `GetXXX` methods now using the field level `MySqlValue` object and not performing conversions.
- `DataReader` returning `NULL` for time column. (Bug#5097)
- Added test case for `LOAD DATA LOCAL INFILE`.
- Added replacetext custom nant task.
- Added `CommandBuilderTest` fixture.
- Added Last One Wins feature to `CommandBuilder`.
- Fixed persist security info case problem.
- Fixed `GetBool` so that 1, true, "true", and "yes" all count as true.
- Make parameter mark configurable.
- Added the "old syntax" connection string parameter to allow use of @ parameter marker.
- `MySqlCommandBuilder`. (Bug#4658)
- `ByteFX.MySqlClient` caches passwords if `Persist Security Info` is false. (Bug#4864)
- Updated license banner in all source files to include FLOSS exception.
- Added new `.Types` namespace and implementations for most current `MySQL` types.
- Added `MySqlField41` as a subclass of `MySqlField`.
- Changed many classes to now use the new `.Types` types.
- Changed type `enum int` to `Int32`, `short` to `Int16`, and `bigint` to `Int64`.
- Added dummy types `UInt16`, `UInt32`, and `UInt64` to allow an unsigned parameter to be made.
- Connections are now reset when they are pulled from the connection pool.
- Refactored auth code in driver so it can be used for both auth and reset.
- Added `UserReset` test in `PoolingTests.cs`.
- Connections are now reset using `COM_CHANGE_USER` when pulled from the pool.
- Implemented `SingleResultSet` behavior.
- Implemented support of unicode.
- Added char set mappings for utf-8 and ucs-2.
- Time fields overflow using bytfx .net mysql driver (Bug#4520)
- Modified time test in data type test fixture to check for time spans where hours > 24.
- Wrong string with backslash escaping in `ByteFx.Data.MySqlClient.MySqlParameter`. (Bug#4505)

- Added code to Parameter test case TestQuoting to test for backslashes.
- `MySQLCommandBuilder` fails with multi-word column names. (Bug#4486)
- Fixed bug in `TokenizeSql` where underscore would terminate character capture in parameter name.
- Added test case for spaces in column names.
- `MySqlDataReader.GetBytes` don't works correctly. (Bug#4324)
- Added `GetBytes()` test case to `DataReader` test fixture.
- Now reading all server variables in `InternalConnection.Configure` into `Hashtable`.
- Now using `string[]` for index map in `CharSetMap`.
- Added CRInSQL test case for carriage returns in SQL.
- Setting `maxPacketSize` to default value in `Driver.ctor`.
- Setting `MySqlDbType` on a parameter doesn't set generic type. (Bug#4442)
- Removed obsolete data types `Long` and `LongLong`.
- Overflow exception thrown when using "use pipe" on connection string. (Bug#4071)
- Changed "use pipe" keyword to "pipe name" or just "pipe".
- Allow reading multiple resultsets from a single query.
- Added flags attribute to `ServerStatusFlags` enum.
- Changed name of `ServerStatus` enum to `ServerStatusFlags`.
- Inserted data row doesn't update properly.
- Error processing show create table. (Bug#4074)
- Change `Packet.ReadLenInteger` to `ReadPackedLong` and added `packet.ReadPackedInteger` that always reads integers packed with 2,3,4.
- Added `syntax.cs` test fixture to test various SQL syntax bugs.
- Improper handling of time values. Now time value of 00:00:00 is not treated as null. (Bug#4149)
- Moved all test suite files into `TestSuite` folder.
- Fixed bug where null column would move the result packet pointer backward.
- Added new nant build script.
- Clear tablename so it will be regen'ed properly during the next `GenerateSchema`. (Bug#3917)
- `GetValues` was always returning zero and was also always trying to copy all fields rather than respecting the size of the array passed in. (Bug#3915)
- Implemented shared memory access protocol.
- Implemented prepared statements for MySQL 4.1.
- Implemented stored procedures for MySQL 5.0.
- Renamed `MySqlInternalConnection` to `InternalConnection`.
- SQL is now parsed as chars, fixes problems with other languages.
- Added logging and allow batch connection string options.
- `RowUpdating` event not set when setting the `DataAdapter` property. (Bug#3888)
- Fixed bug in char set mapping.

- Implemented 4.1 authentication.
- Improved open/auth code in driver.
- Improved how connection bits are set during connection.
- Database name is now passed to server during initial handshake.
- Changed namespace for client to `MySql.Data.MySqlClient`.
- Changed assembly name of client to `MySql.Data.dll`.
- Changed license text in all source files to GPL.
- Added the `MySqlClient.build` Nant file.
- Removed the mono batch files.
- Moved some of the unused files into notused folder so nant build file can use wildcards.
- Implemented shared memory access.
- Major revamp in code structure.
- Prepared statements now working for MySQL 4.1.1 and later.
- Finished implementing auth for 4.0, 4.1.0, and 4.1.1.
- Changed namespace from `MySQL.Data.MySQLClient` back to `MySql.Data.MySqlClient`.
- Fixed bug in `CharSetMapping` where it was trying to use text names as ints.
- Changed namespace to `MySQL.Data.MySQLClient`.
- Integrated auth changes from UC2004.
- Fixed bug where calling any of the `GetXXX` methods on a datareader before or after reading data would not throw the appropriate exception (thanks Luca Morelli).
- Added `TimeSpan` code in `parameter.cs` to properly serialize a timespan object to mysql time format (thanks Gianluca Colombo).
- Added `TimeStamp` to parameter serialization code. Prevented `DataAdapter` updates from working right (thanks Michael King).
- Fixed a misspelling in `MySqlHelper.cs` (thanks Patrick Kristiansen).

E.4.39. Changes in MySQL Connector/NET Version 0.76

- Driver now using charset number given in handshake to create encoding.
- Changed command editor to point to `MySqlClient.Design`.
- Fixed bug in `Version.isAtLeast`.
- Changed `DBConnectionString` to support changes done to `MySqlConnectionString`.
- Removed `SqlCommandEditor` and `DataAdapterPreviewDialog`.
- Using new long return values in many places.
- Integrated new `CompressedStream` class.
- Changed `ConnectionString` and added attributes to allow it to be used in `MySqlClient.Design`.
- Changed `packet.cs` to support newer lengths in `ReadLenInteger`.
- Changed other classes to use new properties and fields of `MySqlConnectionString`.
- `ConnectionInternal` is now using PING to see whether the server is alive.

- Moved toolbox bitmaps into resource folder.
- Changed `field.cs` to allow values to come directly from row buffer.
- Changed to use the new driver.Send syntax.
- Using a new packet queueing system.
- Started work handling the "broken" compression packet handling.
- Fixed bug in `StreamCreator` where failure to connect to a host would continue to loop infinitely (thanks Kevin Casella).
- Improved connectstring handling.
- Moved designers into Pro product.
- Removed some old commented out code from `command.cs`.
- Fixed a problem with compression.
- Fixed connection object where an exception throw prior to the connection opening would not leave the connection in the connecting state (thanks Chris Cline).
- Added GUID support.
- Fixed sequence out of order bug (thanks Mark Reay).

E.4.40. Changes in MySQL Connector/NET Version 0.75

- Enum values now supported as parameter values (thanks Philipp Sumi).
- Year datatype now supported.
- Fixed compression.
- Fixed bug where a parameter with a `TimeSpan` as the value would not serialize properly.
- Fixed bug where default constructor would not set default connection string values.
- Added some XML comments to some members.
- Work to fix/improve compression handling.
- Improved `ConnectionString` handling so that it better matches the standard set by `SqlClient`.
- A `MySqlException` is now thrown if a username is not included in the connection string.
- Localhost is now used as the default if not specified on the connection string.
- An exception is now thrown if an attempt is made to set the connection string while the connection is open.
- Small changes to `ConnectionString` docs.
- Removed `MultiHostStream` and `MySqlStream`. Replaced it with `Common/StreamCreator`.
- Added support for Use Pipe connection string value.
- Added Platform class for easier access to platform utility functions.
- Fixed small pooling bug where new connection was not getting created after `IsAlive` fails.
- Added `Platform.cs` and `StreamCreator.cs`.
- Fixed `Field.cs` to properly handle 4.1 style timestamps.
- Changed `Common.Version` to `Common.DBVersion` to avoid name conflict.
- Fixed `field.cs` so that text columns return the right field type.
- Added `MySqlError` class to provide some reference for error codes (thanks Geert Veenstra).

E.4.41. Changes in MySQL Connector/NET Version 0.74

- Added Unix socket support (thanks Mohammad DAMT).
- Only calling `Thread.Sleep` when no data is available.
- Improved escaping of quote characters in parameter data.
- Removed misleading comments from `parameter.cs`.
- Fixed pooling bug.
- Fixed `ConnectionString` editor dialog (thanks marco p (pomarc)).
- `UserId` now supported in connection strings (thanks Jeff Neeley).
- Attempting to create a parameter that is not input throws an exception (thanks Ryan Gregg).
- Added much documentation.
- Checked in new `MultiHostStream` capability. Big thanks to Dan Guisinger for this. he originally submitted the code and idea of supporting multiple machines on the connect string.
- Added a lot of documentation.
- Fixed speed issue with 0.73.
- Changed to `Thread.Sleep(0)` in `MySqlDataStream` to help optimize the case where it doesn't need to wait (thanks Todd German).
- Repopulating the idlepools to `MinPoolSize`.
- Fixed `MySqlPool` deadlock condition as well as stupid bug where `CreateNewPooledConnection` was not ever adding new connections to the pool. Also fixed `MySqlStream.ReadBytes` and `ReadByte` to not use `TicksPerSecond` which does not appear to always be right. (thanks Matthew J. Peddlesden)
- Fix for precision and scale (thanks Matthew J. Peddlesden).
- Added `Thread.Sleep(1)` to stream reading methods to be more cpu friendly (thanks Sean McGinnis).
- Fixed problem where `ExecuteReader` would sometime return null (thanks Lloyd Dupont).
- Fixed major bug with null field handling (thanks Naucki).
- Enclosed queries for `max_allowed_packet` and `characterset` inside try catch (and set defaults).
- Fixed problem where socket was not getting closed properly (thanks Steve!).
- Fixed problem where `ExecuteNonQuery` was not always returning the right value.
- Fixed `InternalConnection` to not use `@@session.max_allowed_packet` but use `@@max_allowed_packet`. (Thanks Miguel)
- Added many new XML doc lines.
- Fixed sql parsing to not send empty queries (thanks Rory).
- Fixed problem where the reader was not unpeeking the packet on close.
- Fixed problem where user variables were not being handled (thanks Sami Vaaraniemi).
- Fixed loop checking in the `MySqlPool` (thanks Steve M. Brown)
- Fixed `ParameterCollection.Add` method to match `SqlClient` (thanks Joshua Mouch).
- Fixed `ConnectionString` parsing to handle no and yes for boolean and not lowercase values (thanks Naucki).
- Added `InternalConnection` class, changes to pooling.
- Implemented Persist Security Info.

- Added `security.cs` and `version.cs` to project
- Fixed `DateTime` handling in `Parameter.cs` (thanks Burkhard Perkens-Golomb).
- Fixed parameter serialization where some types would throw a cast exception.
- Fixed `DataReader` to convert all returned values to prevent casting errors (thanks Keith Murray).
- Added code to `Command.ExecuteReader` to return null if the initial SQL statement throws an exception (thanks Burkhard Perkens-Golomb).
- Fixed `ExecuteScalar` bug introduced with restructure.
- Restructure to allow for `LOCAL DATA INFILE` and better sequencing of packets.
- Fixed several bugs related to restructure.
- Early work done to support more secure passwords in Mysql 4.1. Old passwords in 4.1 not supported yet.
- Parameters appearing after system parameters are now handled correctly (Adam M. (adamml)).
- Strings can now be assigned directly to blob fields (Adam M.).
- Fixed float parameters (thanks Pent).
- Improved Parameter constructor and `ParameterCollection.Add` methods to better match `SqlCommand` (thanks Joshua Mouch).
- Corrected `Connection.CreateCommand` to return a `MySqlCommand` type.
- Fixed connection string designer dialog box problem (thanks Abraham Guyt).
- Fixed problem with sending commands not always reading the response packet (thanks Joshua Mouch).
- Fixed parameter serialization where some blobs types were not being handled (thanks Sean McGinnis).
- Removed spurious `MessageBox.show` from `DataReader` code (thanks Joshua Mouch).
- Fixed a nasty bug in the split sql code (thanks everyone!).

E.4.42. Changes in MySQL Connector/NET Version 0.71

- Fixed bug in `MySqlStream` where too much data could attempt to be read (thanks Peter Belbin)
- Implemented `HasRows` (thanks Nash Pherson).
- Fixed bug where tables with more than 252 columns cause an exception (thanks Joshua Kessler).
- Fixed bug where SQL statements ending in `;` would cause a problem (thanks Shane Krueger).
- Fixed bug in driver where error messages were getting truncated by 1 character (thanks Shane Krueger).
- Made `MySqlException` serializable (thanks Mathias Hasselmann).

E.4.43. Changes in MySQL Connector/NET Version 0.70

- Updated some of the character code pages to be more accurate.
- Fixed problem where readers could be opened on connections that had readers open.
- Moved test to separate assembly `MySqlClientTests`.
- Fixed stupid problem in driver with sequence out of order (Thanks Peter Belbin).
- Added some pipe tests.
- Increased default max pool size to 50.

- Compiles with Mono 0-24.
- Fixed connection and data reader dispose problems.
- Added `String` datatype handling to parameter serialization.
- Fixed sequence problem in driver that occurred after thrown exception (thanks Burkhard Perens-Golomb).
- Added support for `CommandBehavior.SingleRow` to `DataReader`.
- Fixed command sql processing so quotes are better handled (thanks Theo Spears).
- Fixed parsing of double, single, and decimal values to account for non-English separators. You still have to use the right syntax if you using hard coded sql, but if you use parameters the code will convert floating point types to use '.' appropriately internal both into the server and out.
- Added `MySQLStream` class to simplify timeouts and driver coding.
- Fixed `DataReader` so that it is closed properly when the associated connection is closed. [thanks smishra]
- Made client more `SqlClient` compliant so that `DataReaders` have to be closed before the connection can be used to run another command.
- Improved `DBNull.Value` handling in the fields.
- Added several unit tests.
- Fixed `MySqlException` base class.
- Improved driver coding
- Fixed bug where `NextResult` was returning false on the last resultset.
- Added more tests for MySQL.
- Improved casting problems by equating unsigned 32bit values to `Int64` and unsigned 16bit values to `Int32`, and so forth.
- Added new constructor for `MySQLParameter` for (name, type, size, srccol)
- Fixed bug in `MySQLDataReader` where it didn't check for null fieldlist before returning field count.
- Started adding `MySQLClient` unit tests (added `MySQLClient/Tests` folder and some test cases).
- Fixed some things in Connection String handling.
- Moved `INIT_DB` to `MySQLPool`. I may move it again, this is in preparation of the conference.
- Fixed bug inside `CommandBuilder` that prevented inserts from happening properly.
- Reworked some of the internals so that all three execute methods of `Command` worked properly.
- Fixed many small bugs found during benchmarking.
- The first cut of `CoonnectionPooling` is working. "min pool size" and "max pool size" are respected.
- Work to enable multiple resultsets to be returned.
- Character sets are handled much more intelligently now. The driver queries MySQL at startup for the default character set. That character set is then used for conversions if that code page can be loaded. If not, then the default code page for the current OS is used.
- Added code to save the inferred type in the name,value constructor of `Parameter`.
- Also, inferred type if value of null parameter is changed using `Value` property.
- Converted all files to use proper Camel case. MySQL is now `MySql` in all files. `PgSQL` is now `PgSql`.
- Added attribute to `PgSql` code to prevent designer from trying to show.
- Added `MySQLDbType` property to `Parameter` object and added proper conversion code to convert from `DbType` to `MySQLDbType`).

- Removed unused `ObjectToString` method from `MySQLParameter.cs`.
- Fixed `Add(..)` method in `ParameterCollection` so that it doesn't use `Add(name, value)` instead.
- Fixed `IndexOf` and `Contains` in `ParameterCollection` to be aware that parameter names are now stored without `@`.
- Fixed `Command.ConvertSQLToBytes` so it only allows characters that can be in MySQL variable names.
- Fixed `DataReader` and `Field` so that blob fields read their data from `Field.cs` and `GetBytes` works right.
- Added simple query builder editor to `CommandText` property of `MySQLCommand`.
- Fixed `CommandBuilder` and `Parameter` serialization to account for Parameters not storing `@` in their names.
- Removed `MySQLFieldType` enum from `Field.cs`. Now using `MySQLDbType` enum.
- Added `Designer` attribute to several classes to prevent designer view when using VS.Net.
- Fixed Initial catalog typo in `ConnectionString` designer.
- Removed 3 parameter constructor for `MySQLParameter` that conflicted with (name, type, value).
- Changed `MySQLParameter` so `paramName` is now stored without leading `@` (this fixed null inserts when using designer).
- Changed `TypeConverter` for `MySQLParameter` to use the constructor with all properties.

E.4.44. Changes in MySQL Connector/NET Version 0.68

- Fixed sequence issue in driver.
- Added `DbParametersEditor` to make parameter editing more like `SqlClient`.
- Fixed `Command` class so that parameters can be edited using the designer
- Update connection string designer to support `Use Compression` flag.
- Fixed string encoding so that European characters will work correctly.
- Creating base classes to aid in building new data providers.
- Added support for UID key in connection string.
- Field, parameter, command now using `DBNull.Value` instead of null.
- `CommandBuilder` using `DBNull.Value`.
- `CommandBuilder` now builds insert command correctly when an `auto_insert` field is not present.
- Field now uses `typeof` keyword to return `System.Types` (performance).

E.4.45. Changes in MySQL Connector/NET Version 0.65

- `MySQLCommandBuilder` now implemented.
- Transaction support now implemented (not all table types support this).
- `GetSchemaTable` fixed to not use `xsd` (for Mono).
- Driver is now Mono-compatible.
- TIME data type now supported.
- More work to improve Timestamp data type handling.
- Changed signatures of all classes to match corresponding `SqlClient` classes.

E.4.46. Changes in MySQL Connector/NET Version 0.60

- Protocol compression using SharpZipLib (www.icsharpcode.net).
- Named pipes on Windows now working properly.
- Work done to improve [Timestamp](#) data type handling.
- Implemented [IEnumerable](#) on [DataReader](#) so [DataGrid](#) would work.

E.4.47. Changes in MySQL Connector/NET Version 0.50

- Speed increased dramatically by removing bugging network sync code.
- Driver no longer buffers rows of data (more ADO.Net compliant).
- Conversion bugs related to [TIMESTAMP](#) and [DATETIME](#) fields fixed.

E.5. MySQL Visual Studio Plugin Change History

Note

As of Connector/NET 5.1.2 (14 June 2007), the Visual Studio Plugin is part of the main Connector/NET package. For the change history for the Visual Studio Plugin, see [Section E.4, "MySQL Connector/NET Change History"](#).

E.5.1. Changes in MySQL Visual Studio Plugin 1.0.3 (Not yet released)

Bugs fixed:

- Running queries based on a stored procedure would cause the data set designer to terminate. (Bugs #26364)
- DataSet wizard would show all tables instead of only the tables available within the selected database. (Bugs #26348)

E.5.2. Changes in MySQL Visual Studio Plugin 1.0.2 (Not yet released)

Bugs fixed:

- The Add Connection dialog of the Server Explorer would freeze when accessing databases with capitalized characters in their name. (Bug#24875)
- Creating a connection through the Server Explorer when using the Visual Studio Plugin would fail. The installer for the Visual Studio Plugin has been updated to ensure that Connector/NET 5.0.2 must be installed. (Bug#23071)

E.5.3. Changes in MySQL Visual Studio Plugin 1.0.1 (4 October 2006)

This is a bug fix release to resolve an incompatibility issue with Connector/NET 5.0.1.

It is critical that this release only be used with Connector/NET 5.0.1. After installing Connector/NET 5.0.1, you will need to make a small change in your machine.config file. This file should be located at `%win%\Microsoft.Net\Framework\v2.0.50727\CONFIG\machine.config` (`%win%` should be the location of your Windows folder). Near the bottom of the file you will see a line like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data" />
```

It needs to be changed to be like this:

```
<add name="MySQL Data Provider" invariant="MySql.Data.MySqlClient"
description=".Net Framework Data Provider for MySQL"
type="MySql.Data.MySqlClient.MySqlClientFactory, MySql.Data,
Version=5.0.1.0, Culture=neutral, PublicKeyToken=c5687fc88969c44d" />
```

E.5.4. Changes in MySQL Visual Studio Plugin 1.0.0 (4 October 2006)

Bugs fixed:

- Ability to work with MySQL objects (tables, views, stored procedures, etc) from within Server Explorer.
- DDEX (Data Designer Extensibility) compatibility.

E.6. MySQL Connector/J Change History

E.6.1. Changes in MySQL Connector/J 5.1.x

E.6.1.1. Changes in MySQL Connector/J 5.1.7 (Not yet released)

Bugs fixed:

- Incorrect result is returned from `isAfterLast()` in streaming `ResultSet` when using `setFetchSize(Integer.MIN_VALUE)`. (Bug#35170)

E.6.1.2. Changes in MySQL Connector/J 5.1.6 (07 March 2008)

Functionality added or changed:

- Multiple result sets were not supported when using streaming mode to return data. Both normal statements and the result sets from stored procedures now return multiple results sets, with the exception of result sets using registered `OUTPUT` parameters. (Bug#33678)
- XAConnections and datasources have been updated to the JDBC-4.0 standard.
- The profiler event handling has been made extensible via the `profilerEventHandler` connection property.
- Add the `verifyServerCertificate` property. If set to "false" the driver will not verify the server's certificate when `useSSL` is set to "true"

When using this feature, the keystore parameters should be specified by the `clientCertificateKeyStore*` properties, rather than system properties, as the JSSE doesn't it straightforward to have a non-verifying trust store and the "default" key store.

Bugs fixed:

- `DatabaseMetaData.getColumns()` returns incorrect `COLUMN_SIZE` value for `SET` column. (Bug#36830)
- When trying to read `Time` values like "00:00:00" with `ResultSet.getTime(int)` an exception is thrown. (Bug#36051)
- JDBC connection URL parameters is ignored when using `MysqlConnectionPoolDataSource`. (Bug#35810)
- When `useServerPrepStmts=true` and slow query logging is enabled, the connector throws a `NullPointerException` when it encounters a slow query. (Bug#35666)
- When using the keyword "loadbalance" in the connection string and trying to perform load balancing between two databases, the driver appears to hang. (Bug#35660)
- JDBC data type getter method was changed to accept only column name, whereas previously it accepted column label. (Bug#35610)
- Prepared statements from pooled connections caused a `NullPointerException` when `closed()` under JDBC-4.0. (Bug#35489)

- In calling a stored function returning a `bigint`, an exception is encountered beginning:

```
java.sql.SQLException: java.lang.NumberFormatException: For input string:
```

followed by the text of the stored function starting after the argument list. (Bug#35199)

- The JDBC driver uses a different method for evaluating column names in `resultSetmetadata.getColumnName()` and when looking for a column in `resultSet.getObject(columnName)`. This causes Hibernate to fail in queries where the two methods yield different results, for example in queries that use alias names:

```
SELECT column AS aliasName from table
```

([Bug#35150](#))

- `MysqlConnectionPoolDataSource` does not support `ReplicationConnection`. Notice that we implemented `com.mysql.jdbc.Connection` for `ReplicationConnection`, however, only accessors from `ConnectionProperties` are implemented (not the mutators), and they return values from the currently active connection. All other methods from `com.mysql.jdbc.Connection` are implemented, and operate on the currently active connection, with the exception of `resetServerState()` and `changeUser()`. ([Bug#34937](#))
- `ResultSet.getTimestamp()` returns incorrect values for month/day of `TIMESTAMPS` when using server-side prepared statements (not enabled by default). ([Bug#34913](#))
- `RowDataStatic` doesn't always set the metadata in `ResultSetRow`, which can lead to failures when unpacking `DATE`, `TIME`, `DATETIME` and `TIMESTAMP` types when using absolute, relative, and previous result set navigation methods. ([Bug#34762](#))
- When calling `isValid()` on an active connection, if the timeout is non-zero then the `Connection` is invalidated even if the `Connection` is valid. ([Bug#34703](#))
- It was not possible to truncate a `BLOB` using `Blob.truncate()` when using 0 as an argument. ([Bug#34677](#))
- When using a cursor fetch for a statement, the internal prepared statement could cause a memory leak until the connection was closed. The internal prepared statement is now deleted when the corresponding result set is closed. ([Bug#34518](#))
- When retrieving the column type name of a geometry field, the driver would return `UNKNOWN` instead of `GEOMETRY`. ([Bug#34194](#))
- Statements with batched values do not return correct values for `getGeneratedKeys()` when `rewriteBatchedStatements` is set to `true`, and the statement has an `ON DUPLICATE KEY UPDATE` clause. ([Bug#34093](#))
- The internal class `ResultSetInternalMethods` referenced the non-public class `com.mysql.jdbc.CachedResultSetMetaData`. ([Bug#33823](#))
- A `NullPointerException` could be raised when using client-side prepared statements and enabled the prepared statement cache using the `cachePrepStmts`. ([Bug#33734](#))
- Using server side cursors and cursor fetch, the table metadata information would return the data type name instead of the column name. ([Bug#33594](#))
- `ResultSet.getTimestamp()` would throw a `NullPointerException` instead of a `SQLException` when called on an empty `ResultSet`. ([Bug#33162](#))
- Load balancing connection using best response time would incorrectly "stick" to hosts that were down when the connection was first created.

We solve this problem with a black list that is used during the picking of new hosts. If the black list ends up including all configured hosts, the driver will retry for a configurable number of times (the `retriesAllDown` configuration property, with a default of 120 times), sleeping 250ms between attempts to pick a new connection.

We've also went ahead and made the balancing strategy extensible. To create a new strategy, implement the interface `com.mysql.jdbc.BalanceStrategy` (which also includes our standard "extension" interface), and tell the driver to use it by passing in the class name via the `loadBalanceStrategy` configuration property. ([Bug#32877](#))

- During a Daylight Savings Time (DST) switchover, there was no way to store two timestamp/datetime values, as the hours end up being the same when sent as the literal that MySQL requires.

Note that to get this scenario to work with MySQL (since it doesn't support per-value timezones), you need to configure your server (or session) to be in UTC, and tell the driver not to use the legacy date/time code by setting `useLegacyDatetimeCode` to "false". This will cause the driver to always convert to/from the server and client timezone consistently.

This bug fix also fixes [Bug#15604](#), by adding entirely new date/time handling code that can be switched on by `useLegacyDatetimeCode` being set to "false" as a JDBC configuration property. For Connector/J 5.1.x, the default is "true", in trunk and beyond it will be "false" (i.e. the old date/time handling code will be deprecated) ([Bug#32577](#), [Bug#15604](#))

- When unpacking rows directly, we don't hand off error message packets to the internal method which decodes them correctly,

so no exception is raised, and the driver then hangs trying to read rows that aren't there. This tends to happen when calling stored procedures, as normal SELECTs won't have an error in this spot in the protocol unless an I/O error occurs. (Bug#32246)

- When using a connection from `ConnectionPoolDataSource`, some `Connection.prepareStatement()` methods would return null instead of the prepared statement. (Bug#32101)
- Using `CallableStatement.setNull()` on a stored function would throw an `ArrayIndexOutOfBoundsException` exception when setting the last parameter to null. (Bug#31823)
- `MysqlValidConnectionChecker` doesn't properly handle connections created using `ReplicationConnection`. (Bug#31790)
- Retrieving the server version information for an active connection could return invalid information if the default character encoding on the host was not ASCII compatible. (Bug#31192)
- Further fixes have been made to this bug in the event that a node is non-responsive. Connector/J will now try a different random node instead of waiting for the node to recover before continuing. (Bug#31053)
- `ResultSet` returned by `Statement.getGeneratedKeys()` is not closed automatically when statement that created it is closed. (Bug#30508)
- `DatabaseMetadata.getColumns()` doesn't return the correct column names if the connection character isn't UTF-8. A bug in MySQL server compounded the issue, but was fixed within the MySQL 5.0 release cycle. The fix includes changes to all the sections of the code that access the server metadata. (Bug#20491)
- Fixed `ResultSetMetadata.getColumnNames()` for result sets returned from `Statement.getGeneratedKeys()` - it was returning null instead of "GENERATED_KEY" as in 5.0.x.

E.6.1.3. Changes in MySQL Connector/J 5.1.5 (09 October 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query via `SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information via a public interface).
- Support for JDBC-4.0 XML processing via JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Added `autoSlowLog` configuration property, overrides `slowQueryThreshold*` properties, driver determines slow queries by those that are slower than $5 * \text{stddev}$ of the mean query time (outside the 96% percentile).

Bugs fixed:

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. (Bug#28256)

E.6.1.4. Changes in MySQL Connector/J 5.1.4 (Not Released)

Only released internally.

E.6.1.5. Changes in MySQL Connector/J 5.1.3 (10 September 2007)

The following features are new, compared to the 5.0 series of Connector/J

- Support for JDBC-4.0 `NCHAR`, `NVARCHAR` and `NCLOB` types.
- JDBC-4.0 support for setting per-connection client information (which can be viewed in the comments section of a query via

`SHOW PROCESSLIST` on a MySQL server, or can be extended to support custom persistence of the information via a public interface).

- Support for JDBC-4.0 XML processing via JAXP interfaces to DOM, SAX and StAX.
- JDBC-4.0 standardized unwrapping to interfaces that include vendor extensions.

Functionality added or changed:

- Connector/J now connects using an initial character set of `utf-8` solely for the purpose of authentication to allow user names or database names in any character set to be used in the JDBC connection URL. ([Bug#29853](#))
- Added two configuration parameters:
 - `blobsAreStrings` — Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
 - `functionsNeverReturnBlobs` — Should the driver always treat data from functions returning BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Setting `rewriteBatchedStatements` to `true` now causes CallableStatements with batched arguments to be re-written in the form "CALL (...); CALL (...); ..." to send the batch in as few client-server round trips as possible.
- The driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.
- The data (and how it's stored) for `ResultSet` rows are now behind an interface which allows us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Added experimental support for statement "interceptors" via the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`. Implement this interface to be placed "in between" query execution, so that it can be influenced (currently experimental).
- The driver will automatically adjust the server session variable `net_write_timeout` when it determines its been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (The configuration property is named `netTimeoutForStreamingResults`, with a unit of seconds, the value '0' means the driver will not try and adjust this value).
- JDBC-4.0 ease-of-development features including auto-registration with the `DriverManager` via the service provider mechanism, standardized Connection validity checks and categorized `SQLExceptions` based on recoverability/retry-ability and class of the underlying error.
- `Statement.setQueryTimeout()`s now affect the entire batch for batched statements, rather than the individual statements that make up the batch.
- Errors encountered during `Statement/PreparedStatement/CallableStatement.executeBatch()` when `rewriteBatchStatements` has been set to `true` now return `BatchUpdateExceptions` according to the setting of `continueBatchOnError`.

If `continueBatchOnError` is set to `true`, the update counts for the "chunk" that were sent as one unit will all be set to `EXECUTE_FAILED`, but the driver will attempt to process the remainder of the batch. You can determine which "chunk" failed by looking at the update counts returned in the `BatchUpdateException`.

If `continueBatchOnError` is set to "false", the update counts returned will contain all updates up-to and including the failed "chunk", with all counts for the failed "chunk" set to `EXECUTE_FAILED`.

Since MySQL doesn't return multiple error codes for multiple-statements, or for multi-value `INSERT/REPLACE`, it is the application's responsibility to handle determining which item(s) in the "chunk" actually failed.

- New methods on `com.mysql.jdbc.Statement`: `setLocalInfileInputStream()` and `getLocalInfileInputStream()`:
 - `setLocalInfileInputStream()` sets an `InputStream` instance that will be used to send data to the MySQL server for a `LOAD DATA LOCAL INFILE` statement rather than a `FileInputStream` or `URLInputStream` that represents the path given as an argument to the statement.

This stream will be read to completion upon execution of a `LOAD DATA LOCAL INFILE` statement, and will automatically be closed by the driver, so it needs to be reset before each call to `execute*()` that would cause the MySQL server to request data to fulfill the request for `LOAD DATA LOCAL INFILE`.

If this value is set to `NULL`, the driver will revert to using a `FileInputStream` or `URLInputStream` as required.

- `getLocalInfileInputStream()` returns the `InputStream` instance that will be used to send data in response to a `LOAD DATA LOCAL INFILE` statement.

This method returns `NULL` if no such stream has been set via `setLocalInfileInputStream()`.

- Setting `useBlobToStoreUTF8OutsideBMP` to `true` tells the driver to treat `[MEDIUM/LONG]BLOB` columns as `[LONG]VARCHAR` columns holding text encoded in UTF-8 that has characters outside the BMP (4-byte encodings), which MySQL server can't handle natively.

Set `utf8OutsideBmpExcludedColumnNamePattern` to a regex so that column names matching the given regex will still be treated as `BLOBs`. The regex must follow the patterns used for the `java.util.regex` package. The default is to exclude no columns, and include all columns.

Set `utf8OutsideBmpIncludedColumnNamePattern` to specify exclusion rules to `utf8OutsideBmpExcludedColumnNamePattern`. The regex must follow the patterns used for the `java.util.regex` package.

Bugs fixed:

- `setObject(int, Object, int, int)` delegate in `PreparedStatementWrapper` delegates to wrong method. (Bug#30892)
- NPE with null column values when `padCharsWithSpace` is set to true. (Bug#30851)
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. (Bug#30664)
- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug#30550)
- Closing a load-balanced connection would cause a `ClassCastException`. (Bug#29852)
- Connection checker for JBoss didn't use same method parameters via reflection, causing connections to always seem "bad". (Bug#29106)
- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3-5.0.5 and 65 for versions newer than 5.0.5. (Bug#28972)
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

The fix involves changing the behavior of `noAccessToProcedureBodies`, in that the driver will now report all parameters as "IN" parameters but allow callers to call `registerOutParameter()` on them without throwing an exception. (Bug#28689)

- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug#27915)
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug#27867)
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version ≥ 4.1 . (Bug#27182)
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug#21116)
- Specifying a "validation query" in your connection pool that starts with `"/ * ping * /"` _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a `ReplicationConnection` or a `LoadBalancedConnection`, will send the ping across all active connections.

E.6.1.6. Changes in MySQL Connector/J 5.1.2 (29 June 2007)

This is a new Beta development release, fixing recently discovered bugs.

Functionality added or changed:

- Setting the configuration property `rewriteBatchedStatements` to `true` will now cause the driver to rewrite batched prepared statements with more than 3 parameter sets in a batch into multi-statements (separated by ";") if they are not plain (that is, without `SELECT` or `ON DUPLICATE KEY UPDATE` clauses) `INSERT` or `REPLACE` statements.

E.6.1.7. Changes in MySQL Connector/J 5.1.1 (22 June 2007)

This is a new Alpha development release, adding new features and fixing recently discovered bugs.

Functionality added or changed:

- **Incompatible Change:** Pulled vendor-extension methods of `Connection` implementation out into an interface to support `java.sql.Wrapper` functionality from `ConnectionPoolDataSource`. The vendor extensions are javadoc'd in the `com.mysql.jdbc.Connection` interface.

For those looking further into the driver implementation, it is not an API that is used for plugability of implementations inside our driver (which is why there are still references to `ConnectionImpl` throughout the code).

We've also added server and client `prepareStatement()` methods that cover all of the variants in the JDBC API.

`Connection.serverPrepare(String)` has been re-named to `Connection.serverPrepareStatement()` for consistency with `Connection.clientPrepareStatement()`.

- Row navigation now causes any streams/readers open on the result set to be closed, as in some cases we're reading directly from a shared network packet and it will be overwritten by the "next" row.
- Made it possible to retrieve prepared statement parameter bindings (to be used in `StatementInterceptors`, primarily).
- Externalized the descriptions of connection properties.
- The data (and how it's stored) for `ResultSet` rows are now behind an interface which allows us (in some cases) to allocate less memory per row, in that for "streaming" result sets, we re-use the packet used to read rows, since only one row at a time is ever active.
- Similar to `Connection`, we pulled out vendor extensions to `Statement` into an interface named `com.mysql.Statement`, and moved the `Statement` class into `com.mysql.StatementImpl`. The two methods (javadoc'd in `com.mysql.Statement` are `enableStreamingResults()`, which already existed, and `disableStreamingResults()` which sets the statement instance back to the fetch size and result set type it had before `enableStreamingResults()` was called.
- Driver now picks appropriate internal row representation (whole row in one buffer, or individual byte[]s for each column value) depending on heuristics, including whether or not the row has `BLOB` or `TEXT` types and the overall row-size. The threshold for row size that will cause the driver to use a buffer rather than individual byte[]s is configured by the configuration property `largeRowSizeThreshold`, which has a default value of 2KB.
- Added experimental support for statement "interceptors" via the `com.mysql.jdbc.StatementInterceptor` interface, examples are in `com/mysql/jdbc/interceptors`.

Implement this interface to be placed "in between" query execution, so that you can influence it. (currently experimental).

`StatementInterceptors` are "chainable" when configured by the user, the results returned by the "current" interceptor will be passed on to the next on in the chain, from left-to-right order, as specified by the user in the JDBC configuration property `statementInterceptors`.

- See the sources (fully javadoc'd) for `com.mysql.jdbc.StatementInterceptor` for more details until we iron out the API and get it documented in the manual.
- Setting `rewriteBatchedStatements` to `true` now causes `CallableStatements` with batched arguments to be rewritten in the form `CALL (...); CALL (...); ...` to send the batch in as few client-server round trips as possible.

E.6.1.8. Changes in MySQL Connector/J 5.1.0 (11 April 2007)

This is the first public alpha release of the current Connector/J 5.1 development branch, providing an insight to upcoming features. Although some of these are still under development, this release includes the following new features and changes (in comparison to the current Connector/J 5.0 production release):

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

Note

The disabling of server-side prepared statements does not affect the operation of the connector. However, if you use the `useTimezone=true` connection option and use client-side prepared statements (instead of server-side prepared statements) you should also set `useSSPSCompatibleTimezoneShift=true`.

Functionality added or changed:

- Refactored `CommunicationsException` into a JDBC-3.0 version, and a JDBC-4.0 version (which extends `SQLRecoverableException`, now that it exists).

Note

This change means that if you were catching `com.mysql.jdbc.CommunicationsException` in your applications instead of looking at the `SQLState` class of `08`, and are moving to Java 6 (or newer), you need to change your imports to that exception to be `com.mysql.jdbc.exceptions.jdbc4.CommunicationsException`, as the old class will not be instantiated for communications link-related errors under Java 6.

- Added support for JDBC-4.0 categorized `SQLExceptions`.
- Added support for JDBC-4.0's `NCLOB`, and `NCHAR/NVARCHAR` types.
- `com.mysql.jdbc.java6.javac` — full path to your Java-6 `javac` executable
- Added support for JDBC-4.0's `SQLXML` interfaces.
- Re-worked Ant buildfile to build JDBC-4.0 classes separately, as well as support building under Eclipse (since Eclipse can't mix/match JDKs).

To build, you must set `JAVA_HOME` to J2SDK-1.4.2 or Java-5, and set the following properties on your Ant command line:

- `com.mysql.jdbc.java6.javac` — full path to your Java-6 `javac` executable
- `com.mysql.jdbc.java6.rt.jar` — full path to your Java-6 `rt.jar` file
- New feature — driver will automatically adjust session variable `net_write_timeout` when it determines it has been asked for a "streaming" result, and resets it to the previous value when the result set has been consumed. (configuration property is named `netTimeoutForStreamingResults` value and has a unit of seconds, the value `0` means the driver will not try and adjust this value).
- Added support for JDBC-4.0's client information. The backend storage of information provided via `Connection.setClientInfo()` and retrieved by `Connection.getClientInfo()` is pluggable by any class that implements the `com.mysql.jdbc.JDBC4ClientInfoProvider` interface and has a no-args constructor.

The implementation used by the driver is configured using the `clientInfoProvider` configuration property (with a default of value of `com.mysql.jdbc.JDBC4CommentClientInfoProvider`, an implementation which lists the client information as a comment prepended to every query sent to the server).

This functionality is only available when using Java-6 or newer.

- `com.mysql.jdbc.java6.rt.jar` — full path to your Java-6 `rt.jar` file
- Added support for JDBC-4.0's `Wrapper` interface.

E.6.2. Changes in MySQL Connector/J 5.0.x

E.6.2.1. Changes in MySQL Connector/J 5.0.8 (09 October 2007)

Functionality added or changed:

- `blobsAreStrings` — Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- Added two configuration parameters:
 - `blobsAreStrings` — Should the driver always treat BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
 - `functionsNeverReturnBlobs` — Should the driver always treat data from functions returning BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- `functionsNeverReturnBlobs` — Should the driver always treat data from functions returning BLOBs as Strings. Added specifically to work around dubious metadata returned by the server for `GROUP BY` clauses. Defaults to false.
- XAConnections now start in auto-commit mode (as per JDBC-4.0 specification clarification).
- Driver will now fall back to sane defaults for `max_allowed_packet` and `net_buffer_length` if the server reports them incorrectly (and will log this situation at `WARN` level, since it's actually an error condition).

Bugs fixed:

- Connections established using URLs of the form `jdbc:mysql:loadbalance://` weren't doing failover if they tried to connect to a MySQL server that was down. The driver now attempts connections to the next "best" (depending on the load balance strategy in use) server, and continues to attempt connecting to the next "best" server every 250 milliseconds until one is found that is up and running or 5 minutes has passed.

If the driver gives up, it will throw the last-received `SQLException`. (Bug#31053)
- `setObject(int, Object, int, int)` delegate in `PreparedStatementWrapper` delegates to wrong method. (Bug#30892)
- NPE with null column values when `padCharsWithSpace` is set to true. (Bug#30851)
- Collation on `VARBINARY` column types would be misidentified. A fix has been added, but this fix only works for MySQL server versions 5.0.25 and newer, since earlier versions didn't consistently return correct metadata for functions, and thus results from subqueries and functions were indistinguishable from each other, leading to type-related bugs. (Bug#30664)
- An `ArithmeticException` or `NullPointerException` would be raised when the batch had zero members and `rewriteBatchedStatements=true` when `addBatch()` was never called, or `executeBatch()` was called immediately after `clearBatch()`. (Bug#30550)
- Closing a load-balanced connection would cause a `ClassCastException`. (Bug#29852)
- Connection checker for JBoss didn't use same method parameters via reflection, causing connections to always seem "bad". (Bug#29106)

- `DatabaseMetaData.getTypeInfo()` for the types `DECIMAL` and `NUMERIC` will return a precision of 254 for server versions older than 5.0.3, 64 for versions 5.0.3-5.0.5 and 65 for versions newer than 5.0.5. (Bug#28972)
- `CallableStatement.executeBatch()` doesn't work when connection property `noAccessToProcedureBodies` has been set to `true`.

The fix involves changing the behavior of `noAccessToProcedureBodies`, in that the driver will now report all parameters as "IN" parameters but allow callers to call `registerOutParameter()` on them without throwing an exception. (Bug#28689)

- When a connection is in read-only mode, queries that are wrapped in parentheses were incorrectly identified DML statements. (Bug#28256)
- `UNSIGNED` types not reported via `DBMD.getTypeInfo()`, and capitalization of type names is not consistent between `DBMD.getColumns()`, `RSMD.getColumnTypeName()` and `DBMD.getTypeInfo()`.

This fix also ensures that the precision of `UNSIGNED MEDIUMINT` and `UNSIGNED BIGINT` is reported correctly via `DBMD.getColumns()`. (Bug#27916)

- `DatabaseMetaData.getColumns()` doesn't contain `SCOPE_*` or `IS_AUTOINCREMENT` columns. (Bug#27915)
- Schema objects with identifiers other than the connection character aren't retrieved correctly in `ResultSetMetadata`. (Bug#27867)
- Cached metadata with `PreparedStatement.execute()` throws `NullPointerException`. (Bug#27412)
- `Connection.getServerCharacterEncoding()` doesn't work for servers with version ≥ 4.1 . (Bug#27182)
- The automated SVN revisions in `DBMD.getDriverVersion()`. The SVN revision of the directory is now inserted into the version information during the build. (Bug#21116)
- Specifying a "validation query" in your connection pool that starts with `"/ * ping * /"` _exactly_ will cause the driver to instead send a ping to the server and return a fake result set (much lighter weight), and when using a `ReplicationConnection` or a `LoadBalancedConnection`, will send the ping across all active connections.

E.6.2.2. Changes in MySQL Connector/J 5.0.7 (20 July 2007)

Functionality added or changed:

- The driver will now automatically set `useServerPrepStmts` to `true` when `useCursorFetch` has been set to `true`, since the feature requires server-side prepared statements in order to function.
- `tcpKeepAlive` - Should the driver set `SO_KEEPALIVE` (default `true`)?
- Give more information in `EOFExceptions` thrown out of `MysqlIO` (how many bytes the driver expected to read, how many it actually read, say that communications with the server were unexpectedly lost).
- Driver detects when it is running in a ColdFusion MX server (tested with version 7), and uses the configuration bundle `coldFusion`, which sets `useDynamicCharsetInfo` to `false` (see previous entry), and sets `useLocalSessionState` and `autoReconnect` to `true`.
- `tcpNoDelay` - Should the driver set `SO_TCP_NODELAY` (disabling the Nagle Algorithm, default `true`)?
- Added configuration property `slowQueryThresholdNanos` - if `useNanosForElapsedTime` is set to `true`, and this property is set to a non-zero value the driver will use this threshold (in nanosecond units) to determine if a query was slow, instead of using millisecond units.
- `tcpRcvBuf` - Should the driver set `SO_RCV_BUF` to the given value? The default value of '0', means use the platform default value for this property.
- Setting `useDynamicCharsetInfo` to `false` now causes driver to use static lookups for collations as well (makes `ResultSetMetadata.isCaseSensitive()` much more efficient, which leads to performance increase for ColdFusion, which calls this method for every column on every table it sees, it appears).
- Added configuration properties to allow tuning of TCP/IP socket parameters:
 - `tcpNoDelay` - Should the driver set `SO_TCP_NODELAY` (disabling the Nagle Algorithm, default `true`)?
 - `tcpKeepAlive` - Should the driver set `SO_KEEPALIVE` (default `true`)?
 - `tcpRcvBuf` - Should the driver set `SO_RCV_BUF` to the given value? The default value of '0', means use the platform default value for this property.
 - `tcpSndBuf` - Should the driver set `SO_SND_BUF` to the given value? The default value of '0', means use the platform default value for this property.
 - `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for `java.net.Socket.setTrafficClass()` for more information.
- Setting the configuration parameter `useCursorFetch` to `true` for MySQL-5.0+ enables the use of cursors that allow Connector/J to save memory by fetching result set rows in chunks (where the chunk size is set by calling `setFetchSize()` on a `Statement` or `ResultSet`) by using fully-materialized cursors on the server.
- `tcpSndBuf` - Should the driver set `SO_SND_BUF` to the given value? The default value of '0', means use the platform default value for this property.
- `tcpTrafficClass` - Should the driver set traffic class or type-of-service fields? See the documentation for `java.net.Socket.setTrafficClass()` for more information.

- Added new debugging functionality - Setting configuration property `includeInnoDBStatusInDeadlockExceptions` to `true` will cause the driver to append the output of `SHOW ENGINE INNODB STATUS` to deadlock-related exceptions, which will enumerate the current locks held inside InnoDB.
- Added configuration property `useNanosForElapsedTime` - for profiling/debugging functionality that measures elapsed time, should the driver try to use nanoseconds resolution if available (requires JDK >= 1.5)?

Note

If `useNanosForElapsedTime` is set to `true`, and this property is set to "0" (or left default), then elapsed times will still be measured in nanoseconds (if possible), but the slow query threshold will be converted from milliseconds to nanoseconds, and thus have an upper bound of approximately 2000 milliseconds (as that threshold is represented as an integer, not a long).

Bugs fixed:

- Don't send any file data in response to `LOAD DATA LOCAL INFILE` if the feature is disabled at the client side. This is to prevent a malicious server or man-in-the-middle from asking the client for data that the client is not expecting. Thanks to Jan Kneschke for discovering the exploit and Andrey "Poohie" Hristov, Konstantin Osipov and Sergei Golubchik for discussions about implications and possible fixes. ([Bug#29605](#))
- Parser in client-side prepared statements runs to end of statement, rather than end-of-line for '#' comments. Also added support for '--' single-line comments. ([Bug#28956](#))
- Parser in client-side prepared statements eats character following '/' if it's not a multi-line comment. ([Bug#28851](#))
- `PreparedStatement.getMetaData()` for statements containing leading one-line comments is not returned correctly.

As part of this fix, we also overhauled detection of DML for `executeQuery()` and `SELECT`s for `executeUpdate()` in plain and prepared statements to be aware of the same types of comments. ([Bug#28469](#))

E.6.2.3. Changes in MySQL Connector/J 5.0.6 (15 May 2007)

Functionality added or changed:

- Added an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment (This is not for master-slave replication. For that, we suggest you look at [ReplicationConnection](#) or [lbpool](#)).

If the JDBC URL starts with `jdbc:mysql:loadbalance://host-1,host-2,...host-n`, the driver will create an implementation of `java.sql.Connection` that load balances requests across a series of MySQL JDBC connections to the given hosts, where the balancing takes place after transaction commit.

Therefore, for this to work (at all), you must use transactions, even if only reading data.

Physical connections to the given hosts will not be created until needed.

The driver will invalidate connections that it detects have had communication errors when processing a request. A new connection to the problematic host will be attempted the next time it is selected by the load balancing algorithm.

There are two choices for load balancing algorithms, which may be specified by the `loadBalanceStrategy` JDBC URL configuration property:

- `random` — the driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- `bestResponseTime` — the driver will route the request to the host that had the best response time for the previous transaction.
- `bestResponseTime` — the driver will route the request to the host that had the best response time for the previous transaction.
- Added configuration property `padCharsWithSpace` (defaults to `false`). If set to `true`, and a result set column has the `CHAR` type and the value does not fill the amount of characters specified in the DDL for the column, the driver will pad the remaining characters with space (for ANSI compliance).
- When `useLocalSessionState` is set to `true` and connected to a MySQL-5.0 or later server, the JDBC driver will now

determine whether an actual `commit` or `rollback` statement needs to be sent to the database when `Connection.commit()` or `Connection.rollback()` is called.

This is especially helpful for high-load situations with connection pools that always call `Connection.rollback()` on connection check-in/check-out because it avoids a round-trip to the server.

- Added configuration property `useDynamicCharsetInfo`. If set to `false` (the default), the driver will use a per-connection cache of character set information queried from the server when necessary, or when set to `true`, use a built-in static mapping that is more efficient, but isn't aware of custom character sets or character sets implemented after the release of the JDBC driver.

Note

This only affects the `padCharsWithSpace` configuration property and the `ResultSetMetaData.getColumnDisplayWidth()` method.

- New configuration property, `enableQueryTimeouts` (default `true`).

When enabled, query timeouts set via `Statement.setQueryTimeout()` use a shared `java.util.Timer` instance for scheduling. Even if the timeout doesn't expire before the query is processed, there will be memory used by the `TimerTask` for the given timeout which won't be reclaimed until the time the timeout would have expired if it hadn't been cancelled by the driver. High-load environments might want to consider disabling this functionality. (this configuration property is part of the `maxPerformance` configuration bundle).

- Give better error message when "streaming" result sets, and the connection gets clobbered because of exceeding `net_write_timeout` on the server.
- `random` — the driver will pick a random host for each request. This tends to work better than round-robin, as the randomness will somewhat account for spreading loads where requests vary in response time, while round-robin can sometimes lead to overloaded nodes if there are variations in response times across the workload.
- `com.mysql.jdbc.[NonRegistering]Driver` now understands URLs of the format `jdbc:mysql:replication://` and `jdbc:mysql:loadbalance://` which will create a `ReplicationConnection` (exactly like when using `[NonRegistering]ReplicationDriver`) and an experimental load-balanced connection designed for use with SQL nodes in a MySQL Cluster/NDB environment, respectively.

In an effort to simplify things, we're working on deprecating multiple drivers, and instead specifying different core behavior based upon JDBC URL prefixes, so watch for `[NonRegistering]ReplicationDriver` to eventually disappear, to be replaced with `com.mysql.jdbc.[NonRegistering]Driver` with the new URL prefix.

- Fixed issue where a failed-over connection would let an application call `setReadOnly(false)`, when that call should be ignored until the connection is reconnected to a writable master unless `failoverReadOnly` had been set to `false`.
- Driver will now use `INSERT INTO ... VALUES (DEFAULT)` form of statement for updatable result sets for `ResultSet.insertRow()`, rather than pre-populating the insert row with values from `DatabaseMetaData.getColumns()` (which results in a `SHOW FULL COLUMNS` on the server for every result set). If an application requires access to the default values before `insertRow()` has been called, the JDBC URL should be configured with `populateInsertRowWithDefaultValues` set to `true`.

This fix specifically targets performance issues with ColdFusion and the fact that it seems to ask for updatable result sets no matter what the application does with them.

- More intelligent initial packet sizes for the "shared" packets are used (512 bytes, rather than 16K), and initial packets used during handshake are now sized appropriately as to not require reallocation.

Bugs fixed:

- More useful error messages are generated when the driver thinks a result set is not updatable. (Thanks to Ashley Martens for the patch). ([Bug#28085](#))
- `Connection.getTransactionIsolation()` uses `"SHOW VARIABLES LIKE"` which is very inefficient on MySQL-5.0+ servers. ([Bug#27655](#))
- Fixed issue where calling `getGeneratedKeys()` on a prepared statement after calling `execute()` didn't always return the generated keys (`executeUpdate()` worked fine however). ([Bug#27655](#))
- `CALL /* ... */ some_proc()` doesn't work. As a side effect of this fix, you can now use `/* */` and `#` comments when preparing statements using client-side prepared statement emulation.

If the comments happen to contain parameter markers (?), they will be treated as belonging to the comment (that is, not recognized) rather than being a parameter of the statement.

Note

The statement when sent to the server will contain the comments as-is, they're not stripped during the process of preparing the `PreparedStatement` or `CallableStatement`.

([Bug#27400](#))

- `ResultSet.get*()` with a column index < 1 returns misleading error message. ([Bug#27317](#))
- Using `ResultSet.get*()` with a column index less than 1 returns a misleading error message. ([Bug#27317](#))
- Comments in DDL of stored procedures/functions confuse procedure parser, and thus metadata about them can not be created, leading to inability to retrieve said metadata, or execute procedures that have certain comments in them. ([Bug#26959](#))
- Fast date/time parsing doesn't take into account `00:00:00` as a legal value. ([Bug#26789](#))
- `PreparedStatement` is not closed in `BlobFromLocator.getBytes()`. ([Bug#26592](#))
- When the configuration property `useCursorFetch` was set to `true`, sometimes server would return new, more exact metadata during the execution of the server-side prepared statement that enables this functionality, which the driver ignored (using the original metadata returned during `prepare()`), causing corrupt reading of data due to type mismatch when the actual rows were returned. ([Bug#26173](#))
- `CallableStatements` with `OUT/INOUT` parameters that are "binary" (`BLOB`, `BIT`, `(VAR)BINARY`, `JAVA_OBJECT`) have extra 7 bytes. ([Bug#25715](#))
- Whitespace surrounding storage/size specifiers in stored procedure parameters declaration causes `NumberFormatException` to be thrown when calling stored procedure on JDK-1.5 or newer, as the Number classes in JDK-1.5+ are whitespace intolerant. ([Bug#25624](#))
- Client options not sent correctly when using SSL, leading to stored procedures not being able to return results. Thanks to Don Cohen for the bug report, testcase and patch. ([Bug#25545](#))
- `Statement.setMaxRows()` is not effective on result sets materialized from cursors. ([Bug#25517](#))
- `BIT(> 1)` is returned as `java.lang.String` from `ResultSet.getObject()` rather than `byte[]`. ([Bug#25328](#))

E.6.2.4. Changes in MySQL Connector/J 5.0.5 (02 March 2007)

Functionality added or changed:

- Usage Advisor will now issue warnings for result sets with large numbers of rows. You can configure the trigger value by using the `resultSetSizeThreshold` parameter, which has a default value of 100.
- The `rewriteBatchedStatements` feature can now be used with server-side prepared statements.
- **Important change:** Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

- Improved speed of `datetime` parsing for ResultSets that come from plain or non-server-side prepared statements. You can enable old implementation with `useFastDateParsing=false` as a configuration parameter.
- Usage Advisor now detects empty results sets and does not report on columns not referenced in those empty sets.
- Fixed logging of XA commands sent to server, it's now configurable via `logXaCommands` property (defaults to `false`).
- Added configuration property `localSocketAddress`, which is the hostname or IP address given to explicitly configure the interface that the driver will bind the client side of the TCP/IP connection to when connecting.

- We've added a new configuration option `treatUtilDateAsTimestamp`, which is `false` by default, as (1) We already had specific behavior to treat `java.util.Date` as a `java.sql.Timestamp` because it's useful to many folks, and (2) that behavior will very likely be required for drivers JDBC-post-4.0.

Bugs fixed:

- Connection property `socketFactory` wasn't exposed via correctly named mutator/accessor, causing data source implementations that use JavaBean naming conventions to set properties to fail to set the property (and in the case of SJAS, fail silently when trying to set this parameter). (Bug#26326)
- A query execution which timed out did not always throw a `MySQLTimeoutException`. (Bug#25836)
- Storing a `java.util.Date` object in a BLOB column would not be serialized correctly during `setObject`. (Bug#25787)
- Timer instance used for `Statement.setQueryTimeout()` created per-connection, rather than per-VM, causing memory leak. (Bug#25514)
- `EscapeProcessor` gets confused by multiple backslashes. We now push the responsibility of syntax errors back on to the server for most escape sequences. (Bug#25399)
- `INOUT` parameters in `CallableStatements` get doubly-escaped. (Bug#25379)
- When using the `rewriteBatchedStatements` connection option with `PreparedStatement.executeBatch()` an internal memory leak would occur. (Bug#25073)
- Fixed issue where field-level for metadata from `DatabaseMetaData` when using `INFORMATION_SCHEMA` didn't have references to current connections, sometimes leading to Null Pointer Exceptions (NPEs) when introspecting them via `ResultSetMetaData`. (Bug#25073)
- `StringUtils.indexOfIgnoreCaseRespectQuotes()` isn't case-insensitive on the first character of the target. This bug also affected `rewriteBatchedStatements` functionality when prepared statements did not use uppercase for the `VALUES` clause. (Bug#25047)
- Client-side prepared statement parser gets confused by in-line comments `/*...*/` and therefore cannot rewrite batch statements or reliably detect the type of statements when they are used. (Bug#25025)
- Results sets from `UPDATE` statements that are part of multi-statement queries would cause an `SQLException` error, "Result is from UPDATE". (Bug#25009)
- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. (Bug#24840)
- Using `DatabaseMetaData.getSQLKeywords()` does not return a all of the of the reserved keywords for the current MySQL version. Current implementation returns the list of reserved words for MySQL 5.1, and does not distinguish between versions. (Bug#24794)
- Calling `Statement.cancel()` could result in a Null Pointer Exception (NPE). (Bug#24721)
- Using `setFetchSize()` breaks prepared `SHOW` and other commands. (Bug#24360)
- Calendars and timezones are now lazily instantiated when required. (Bug#24351)
- Using `DATETIME` columns would result in time shifts when `useServerPrepStmts` was true. The reason was due to different behavior when using client-side compared to server-side prepared statements and the `useJDBCCompliantTimezoneShift` option. This is now fixed if moving from server-side prepared statements to client-side prepared statements by setting `useSSPSCompatibleTimezoneShift` to `true`, as the driver can't tell if this is a new deployment that never used server-side prepared statements, or if it is an existing deployment that is switching to client-side prepared statements from server-side prepared statements. (Bug#24344)
- Connector/J now returns a better error message when server doesn't return enough information to determine stored procedure/function parameter types. (Bug#24065)
- A connection error would occur when connecting to a MySQL server with certain character sets. Some collations/character sets reported as "unknown" (specifically `cias` variants of existing character sets), and inability to override the detected server character set. (Bug#23645)
- Inconsistency between `getSchemas` and `INFORMATION_SCHEMA`. (Bug#23304)
- `DatabaseMetaData.getSchemas()` doesn't return a `TABLE_CATALOG` column. (Bug#23303)

- When using a JDBC connection URL that is malformed, the `NonRegisteringDriver.getPropertyInfo` method will throw a Null Pointer Exception (NPE). (Bug#22628)
- Some exceptions thrown out of `StandardSocketFactory` were needlessly wrapped, obscuring their true cause, especially when using socket timeouts. (Bug#21480)
- When using a server-side prepared statement the driver would send timestamps to the server using nanoseconds instead of milliseconds. (Bug#21438)
- When using server-side prepared statements and timestamp columns, value would be incorrectly populated (with nanoseconds, not microseconds). (Bug#21438)
- `ParameterMetaData` throws `NullPointerException` when prepared SQL has a syntax error. Added `generateSimpleParameterMetadata` configuration property, which when set to `true` will generate metadata reflecting `VARCHAR` for every parameter (the default is `false`, which will cause an exception to be thrown if no parameter metadata for the statement is actually available). (Bug#21267)
- Fixed an issue where `XADataSources` couldn't be bound into JNDI, as the `DataSourceFactory` didn't know how to create instances of them.

Other changes:

- Avoid static synchronized code in JVM class libraries for dealing with default timezones.
- Performance enhancement of initial character set configuration, driver will only send commands required to configure connection character set session variables if the current values on the server do not match what is required.
- Re-worked stored procedure parameter parser to be more robust. Driver no longer requires `BEGIN` in stored procedure definition, but does have requirement that if a stored function begins with a label directly after the "returns" clause, that the label is not a quoted identifier.
- Throw exceptions encountered during timeout to thread calling `Statement.execute*()`, rather than `RuntimeException`.
- Changed cached result set metadata (when using `cacheResultSetMetadata=true`) to be cached per-connection rather than per-statement as previously implemented.
- Reverted back to internal character conversion routines for single-byte character sets, as the ones internal to the JVM are using much more CPU time than our internal implementation.
- When extracting foreign key information from `SHOW CREATE TABLE` in `DatabaseMetaData`, ignore exceptions relating to tables being missing (which could happen for cross-reference or imported-key requests, as the list of tables is generated first, then iterated).
- Fixed some Null Pointer Exceptions (NPEs) when cached metadata was used with `UpdatableResultSets`.
- Take `localSocketAddress` property into account when creating instances of `CommunicationsException` when the underlying exception is a `java.net.BindException`, so that a friendlier error message is given with a little internal diagnostics.
- Fixed cases where `ServerPreparedStatements` weren't using cached metadata when `cacheResultSetMetadata=true` was used.
- Use a `java.util.TreeMap` to map column names to ordinal indexes for `ResultSet.findColumn()` instead of a `HashMap`. This allows us to have case-insensitive lookups (required by the JDBC specification) without resorting to the many transient object instances needed to support this requirement with a normal `HashMap` with either case-adjusted keys, or case-insensitive keys. (In the worst case scenario for lookups of a 1000 column result set, `TreeMaps` are about half as fast wall-clock time as a `HashMap`, however in normal applications their use gives many orders of magnitude reduction in transient object instance creation which pays off later for CPU usage in garbage collection).
- When using cached metadata, skip field-level metadata packets coming from the server, rather than reading them and discarding them without creating `com.mysql.jdbc.Field` instances.

E.6.2.5. Changes in MySQL Connector/J 5.0.4 (20 October 2006)

Bugs fixed:

- `DBMD.getColumns()` does not return expected `COLUMN_SIZE` for the SET type, now returns length of largest possible set disregarding whitespace or the `","` delimiters to be consistent with the ODBC driver. ([Bug#22613](#))
- Added new `_ci` collations to `CharsetMapping` - `utf8_unicode_ci` not working. ([Bug#22456](#))
- Driver was using milliseconds for `Statement.setQueryTimeout()` when specification says argument is to be in seconds. ([Bug#22359](#))
- Workaround for server crash when calling stored procedures via a server-side prepared statement (driver now detects prepare(stored procedure) and substitutes client-side prepared statement). ([Bug#22297](#))
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). ([Bug#22290](#))
- Newlines causing whitespace to span confuse procedure parser when getting parameter metadata for stored procedures. ([Bug#22024](#))
- When using `information_schema` for metadata, `COLUMN_SIZE` for `getColumns()` is not clamped to range of `java.lang.Integer` as is the case when not using `information_schema`, thus leading to a truncation exception that isn't present when not using `information_schema`. ([Bug#21544](#))
- Column names don't match metadata in cases where server doesn't return original column names (column functions) thus breaking compatibility with applications that expect 1-1 mappings between `findColumn()` and `rsmd.getColumnname()`, usually manifests itself as "Can't find column ()" exceptions. ([Bug#21379](#))
- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'.
- Fixed configuration property `jdbcCompliantTruncation` was not being used for reads of result set values.
- `DatabaseMetaData` correctly reports `true` for `supportsCatalog*` methods.
- Driver now supports `{call sp}` (without `()`) if procedure has no arguments).

E.6.2.6. Changes in MySQL Connector/J 5.0.3 (26 July 2006)

Functionality added or changed:

- Added configuration option `noAccessToProcedureBodies` which will cause the driver to create basic parameter metadata for `CallableStatements` when the user does not have access to procedure bodies via `SHOW CREATE PROCEDURE` or selecting from `mysql.proc` instead of throwing an exception. The default value for this option is `false`

Bugs fixed:

- Fixed `Statement.cancel()` causes `NullPointerException` if underlying connection has been closed due to server failure. ([Bug#20650](#))
- If the connection to the server has been closed due to a server failure, then the cleanup process will call `Statement.cancel()`, triggering a `NullPointerException`, even though there is no active connection. ([Bug#20650](#))

E.6.2.7. Changes in MySQL Connector/J 5.0.2 (11 July 2006)

Bugs fixed:

- `MySQLXAConnection.recover(int flags)` now allows combinations of `XAResource.TMSTARTRSCAN` and `TMENDRSCAN`. To simulate the "scanning" nature of the interface, we return all prepared XIDs for `TMSTARTRSCAN`, and no new XIDs for calls with `TMNOFLAGS`, or `TMENDRSCAN` when not in combination with `TMSTARTRSCAN`. This change was made for API compliance, as well as integration with IBM WebSphere's transaction manager. ([Bug#20242](#))
- Fixed `MySQLValidConnectionChecker` for JBoss doesn't work with `MySQLXADataSources`. ([Bug#20242](#))
- Added connection/datasource property `pingGlobalTxToPhysicalConnection` (defaults to `false`). When set to `true`, when using `XAConnections`, the driver ensures that operations on a given XID are always routed to the same physical connection. This allows the `XAConnection` to support `XA START ... JOIN` after `XA END` has been called, and is also a workaround for transaction managers that don't maintain thread affinity for a global transaction (most either always maintain thread affinity, or have it as a configuration option). ([Bug#20242](#))

- Better caching of character set converters (per-connection) to remove a bottleneck for multibyte character sets. ([Bug#20242](#))
- Fixed `ConnectionProperties` (and thus some subclasses) are not serializable, even though some J2EE containers expect them to be. ([Bug#19169](#))
- Fixed driver fails on non-ASCII platforms. The driver was assuming that the platform character set would be a superset of MySQL's `latin1` when doing the handshake for authentication, and when reading error messages. We now use Cp1252 for all strings sent to the server during the handshake phase, and a hard-coded mapping of the `language` system variable to the character set that is used for error messages. ([Bug#18086](#))
- Fixed can't use `XAConnection` for local transactions when no global transaction is in progress. ([Bug#17401](#))

E.6.2.8. Changes in MySQL Connector/J 5.0.1 (Not Released)

Not released due to a packaging error

E.6.2.9. Changes in MySQL Connector/J 5.0.0 (22 December 2005)

Bugs fixed:

- Added support for Connector/MXJ integration via url subprotocol `jdbc:mysql:mxj://...` ([Bug#14729](#))
- Idle timeouts cause `XAConnections` to whine about rolling themselves back. ([Bug#14729](#))
- When fix for [Bug#14562](#) was merged from 3.1.12, added functionality for `CallableStatement`'s parameter metadata to return correct information for `.getParameterClassName()`. ([Bug#14729](#))
- Added service-provider entry to `META-INF/services/java.sql.Driver` for JDBC-4.0 support. ([Bug#14729](#))
- Fuller synchronization of `Connection` to avoid deadlocks when using multithreaded frameworks that multithread a single connection (usually not recommended, but the JDBC spec allows it anyways), part of fix to [Bug#14972](#). ([Bug#14729](#))
- Moved all `SQLException` constructor usage to a factory in `SQLException` (ground-work for JDBC-4.0 `SQLState`-based exception classes). ([Bug#14729](#))
- Removed Java5-specific calls to `BigDecimal` constructor (when result set value is `'', (int)0` was being used as an argument indirectly via method return value. This signature doesn't exist prior to Java5.) ([Bug#14729](#))
- Implementation of `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL-5.0.0 or newer server, require a separate connection to issue the `KILL QUERY` statement, and in the case of `setQueryTimeout()` creates an additional thread to handle the timeout functionality.

Note: Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeExceptions` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead. ([Bug#14729](#))

- Return "[VAR]BINARY" for `RSMD.getColumnTypeName()` when that is actually the type, and it can be distinguished (MySQL-4.1 and newer). ([Bug#14729](#))
- Attempt detection of the MySQL type `BINARY` (it's an alias, so this isn't always reliable), and use the `java.sql.Types.BINARY` type mapping for it.
- Added unit tests for `XADatasource`, as well as friendlier exceptions for XA failures compared to the "stock" `XAException` (which has no messages).
- If the connection `useTimezone` is set to `true`, then also respect time zone conversions in escape-processed string literals (for example, `"{ts ...}"` and `"{t ...}"`).
- Don't allow `.setAutoCommit(true)`, or `.commit()` or `.rollback()` on an XA-managed connection as per the JDBC specification.
- `XADatasource` implemented (ported from 3.2 branch which won't be released as a product). Use `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` as your datasource class name in your application server to utilize XA transactions in MySQL-5.0.10 and newer.
- Moved `-bin-g.jar` file into separate `debug` subdirectory to avoid confusion.
- Return original column name for `RSMD.getColumnNames()` if the column was aliased, alias name for `.getColumnLabel()` (if aliased), and original table name for `.getTableName()`. Note this only works for MySQL-4.1

and newer, as older servers don't make this information available to clients.

- Setting `useJDBCCompliantTimezoneShift=true` (it's not the default) causes the driver to use GMT for *all* `TIMESTAMP/DATETIME` time zones, and the current VM time zone for any other type that refers to time zones. This feature can not be used when `useTimezone=true` to convert between server and client time zones.
- `PreparedStatement.setString()` didn't work correctly when `sql_mode` on server contained `NO_BACKSLASH_ESCAPES` and no characters that needed escaping were present in the string.
- Add one level of indirection of internal representation of `CallableStatement` parameter metadata to avoid class not found issues on JDK-1.3 for `ParameterMetadata` interface (which doesn't exist prior to JDBC-3.0).

E.6.3. Changes in MySQL Connector/J 3.1.x

E.6.3.1. Changes in MySQL Connector/J 3.1.15 (Not yet released)

Important change: Due to a number of issues with the use of server-side prepared statements, Connector/J 5.0.5 has disabled their use by default. The disabling of server-side prepared statements does not affect the operation of the connector in any way.

To enable server-side prepared statements you must add the following configuration property to your connector string:

```
useServerPrepStmts=true
```

The default value of this property is `false` (that is, Connector/J does not use server-side prepared statements).

Bugs fixed:

- Specifying `US-ASCII` as the character set in a connection to a MySQL 4.1 or newer server does not map correctly. ([Bug#24840](#))

E.6.3.2. Changes in MySQL Connector/J 3.1.14 (10-19-2006)

Bugs fixed:

- Check and store value for `continueBatchOnError` property in constructor of `Statements`, rather than when executing batches, so that `Connections` closed out from underneath statements don't cause `NullPointerExceptions` when it's required to check this property. ([Bug#22290](#))
- Fixed [Bug#18258](#) - `DatabaseMetaData.getTables()`, `columns()` with bad catalog parameter threw exception rather than return empty result set (as required by spec). ([Bug#22290](#))
- Driver now sends numeric 1 or 0 for client-prepared statement `setBoolean()` calls instead of '1' or '0'. ([Bug#22290](#))
- Fixed bug where driver would not advance to next host if `roundRobinLoadBalance=true` and the last host in the list is down. ([Bug#22290](#))
- Driver issues truncation on write exception when it shouldn't (due to sending big decimal incorrectly to server with server-side prepared statement). ([Bug#22290](#))
- Fixed bug when calling stored functions, where parameters weren't numbered correctly (first parameter is now the return value, subsequent parameters if specified start at index "2"). ([Bug#22290](#))
- Removed logger autodetection altogether, must now specify logger explicitly if you want to use a logger other than one that logs to `STDERR`. ([Bug#21207](#))
- `DDriver` throws `NPE` when tracing prepared statements that have been closed (in `asSQL()`). ([Bug#21207](#))
- `ResultSet.getSomeInteger()` doesn't work for `BIT(>1)`. ([Bug#21062](#))
- Escape of quotes in client-side prepared statements parsing not respected. Patch covers more than bug report, including `NO_BACKSLASH_ESCAPES` being set, and stacked quote characters forms of escaping (that is, " or ""). ([Bug#20888](#))
- Fixed can't pool server-side prepared statements, exception raised when re-using them. ([Bug#20687](#))
- Fixed `Updatable` result set that contains a `BIT` column fails when server-side prepared statements are used. ([Bug#20485](#))

- Fixed updatable result set throws `ClassCastException` when there is row data and `moveToInsertRow()` is called. ([Bug#20479](#))
- Fixed `ResultSet.getShort()` for UNSIGNED TINYINT returns incorrect values when using server-side prepared statements. ([Bug#20306](#))
- `ReplicationDriver` does not always round-robin load balance depending on URL used for slaves list. ([Bug#19993](#))
- Fixed calling `toString()` on `ResultSetMetaData` for driver-generated (that is, from `DatabaseMetaData` method calls, or from `getGeneratedKeys()`) result sets would raise a `NullPointerException`. ([Bug#19993](#))
- Connection fails to localhost when using timeout and IPv6 is configured. ([Bug#19726](#))
- `ResultSet.getFloatFromString()` can't retrieve values near `Float.MIN/MAX_VALUE`. ([Bug#18880](#))
- Fixed memory leak with `profileSQL=true`. ([Bug#16987](#))
- Fixed `NullPointerException` in `MySQLDataSourceFactory` due to `Reference` containing `RefAddr`s with null content. ([Bug#16791](#))

E.6.3.3. Changes in MySQL Connector/J 3.1.13 (26 May 2006)

Bugs fixed:

- Fixed `PreparedStatement.setObject(int, Object, int)` doesn't respect scale of `BigDecimal`s. ([Bug#19615](#))
- Fixed `ResultSet.isNull()` returns incorrect value when extracting native string from server-side prepared statement generated result set. ([Bug#19282](#))
- Fixed invalid classname returned for `ResultSetMetaData.getColumnClassName()` for `BIGINT` type. ([Bug#19282](#))
- Fixed case where driver wasn't reading server status correctly when fetching server-side prepared statement rows, which in some cases could cause warning counts to be off, or multiple result sets to not be read off the wire. ([Bug#19282](#))
- Fixed data truncation and `getWarnings()` only returns last warning in set. ([Bug#18740](#))
- Fixed aliased column names where length of name > 251 are corrupted. ([Bug#18554](#))
- Improved performance of retrieving `BigDecimal`, `Time`, `Timestamp` and `Date` values from server-side prepared statements by creating fewer short-lived instances of `Strings` when the native type is not an exact match for the requested type. ([Bug#18496](#))
- Added performance feature, re-writing of batched executes for `Statement.executeBatch()` (for all DML statements) and `PreparedStatement.executeBatch()` (for INSERTs with VALUE clauses only). Enable by using "rewrite-BatchedStatements=true" in your JDBC URL. ([Bug#18041](#))
- Fixed issue where server-side prepared statements don't cause truncation exceptions to be thrown when truncation happens. ([Bug#18041](#))
- Fixed `CallableStatement.registerOutParameter()` not working when some parameters pre-populated. Still waiting for feedback from JDBC experts group to determine what correct parameter count from `getMetaData()` should be, however. ([Bug#17898](#))
- Fixed calling `clearParameters()` on a closed prepared statement causes NPE. ([Bug#17587](#))
- Map "latin1" on MySQL server to CP1252 for MySQL > 4.1.0. ([Bug#17587](#))
- Added additional accessor and mutator methods on `ConnectionProperties` so that `DataSource` users can use same naming as regular URL properties. ([Bug#17587](#))
- Fixed `ResultSet.isNull()` not always reset correctly for booleans when done via conversion for server-side prepared statements. ([Bug#17450](#))
- Fixed `Statement.getGeneratedKeys()` throws `NullPointerException` when no query has been processed. ([Bug#17099](#))
- Fixed updatable result set doesn't return `AUTO_INCREMENT` values for `insertRow()` when multiple column primary keys are used. (the driver was checking for the existence of single-column primary keys and an autoincrement value > 0 instead of a straightforward `isAutoIncrement()` check). ([Bug#16841](#))

- `DBMD.getColumns()` returns wrong type for `BIT`. (Bug#15854)
- `lib-nodist` directory missing from package breaks out-of-box build. (Bug#15676)
- Fixed issue with `ReplicationConnection` incorrectly copying state, doesn't transfer connection context correctly when transitioning between the same read-only states. (Bug#15570)
- No "dos" character set in MySQL > 4.1.0. (Bug#15544)
- `INOUT` parameter does not store `IN` value. (Bug#15464)
- `PreparedStatement.setObject()` serializes `BigInteger` as object, rather than sending as numeric value (and is thus not complementary to `.getObject()` on an `UNSIGNED LONG` type). (Bug#15383)
- Fixed issue where driver was unable to initialize character set mapping tables. Removed reliance on `.properties` files to hold this information, as it turns out to be too problematic to code around class loader hierarchies that change depending on how an application is deployed. Moved information back into the `CharsetMapping` class. (Bug#14938)
- Exception thrown for new decimal type when using updatable result sets. (Bug#14609)
- Driver now aware of fix for `BIT` type metadata that went into MySQL-5.0.21 for server not reporting length consistently. (Bug#13601)
- Added support for Apache Commons logging, use "com.mysql.jdbc.log.CommonsLogger" as the value for the "logger" configuration property. (Bug#13469)
- Fixed driver trying to call methods that don't exist on older and newer versions of Log4j. The fix is not trying to auto-detect presence of log4j, too many different incompatible versions out there in the wild to do this reliably.

If you relied on autodetection before, you will need to add "logger=com.mysql.jdbc.log.Log4JLogger" to your JDBC URL to enable Log4J usage, or alternatively use the new "CommonsLogger" class to take care of this. (Bug#13469)
- LogFactory now prepends "com.mysql.jdbc.log" to log class name if it can't be found as-specified. This allows you to use "short names" for the built-in log factories, for example "logger=CommonsLogger" instead of "logger=com.mysql.jdbc.log.CommonsLogger". (Bug#13469)
- `ResultSet.getShort()` for `UNSIGNED TINYINT` returned wrong values. (Bug#11874)

E.6.3.4. Changes in MySQL Connector/J 3.1.12 (30 November 2005)

Bugs fixed:

- Process escape tokens in `Connection.prepareStatement(...)`. You can disable this behavior by setting the JDBC URL configuration property `processEscapeCodesForPrepStmts` to `false`. (Bug#15141)
- Usage advisor complains about unreferenced columns, even though they've been referenced. (Bug#15065)
- Driver incorrectly closes streams passed as arguments to `PreparedStatements`. Reverts to legacy behavior by setting the JDBC configuration property `autoClosePstmtStreams` to `true` (also included in the 3-0-Compat configuration "bundle"). (Bug#15024)
- Deadlock while closing server-side prepared statements from multiple threads sharing one connection. (Bug#14972)
- Unable to initialize character set mapping tables (due to J2EE classloader differences). (Bug#14938)
- Escape processor replaces quote character in quoted string with string delimiter. (Bug#14909)
- `DatabaseMetaData.getColumns()` doesn't return `TABLE_NAME` correctly. (Bug#14815)
- `storesMixedCaseIdentifiers()` returns `false` (Bug#14562)
- `storesLowerCaseIdentifiers()` returns `true` (Bug#14562)
- `storesMixedCaseQuotedIdentifiers()` returns `false` (Bug#14562)
- `storesMixedCaseQuotedIdentifiers()` returns `true` (Bug#14562)
- If `lower_case_table_names=0` (on server):

- `storesLowerCaseIdentifiers()` returns `false`
 - `storesLowerCaseQuotedIdentifiers()` returns `false`
 - `storesMixedCaseIdentifiers()` returns `true`
 - `storesMixedCaseQuotedIdentifiers()` returns `true`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`
- (Bug#14562)
- `storesUpperCaseIdentifiers()` returns `false` (Bug#14562)
 - `storesUpperCaseQuotedIdentifiers()` returns `true` (Bug#14562)
 - If `lower_case_table_names=1` (on server):
 - `storesLowerCaseIdentifiers()` returns `true`
 - `storesLowerCaseQuotedIdentifiers()` returns `true`
 - `storesMixedCaseIdentifiers()` returns `false`
 - `storesMixedCaseQuotedIdentifiers()` returns `false`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`
- (Bug#14562)
- `storesLowerCaseQuotedIdentifiers()` returns `true` (Bug#14562)
 - Fixed `DatabaseMetaData.stores*Identifiers()`:
 - If `lower_case_table_names=0` (on server):
 - `storesLowerCaseIdentifiers()` returns `false`
 - `storesLowerCaseQuotedIdentifiers()` returns `false`
 - `storesMixedCaseIdentifiers()` returns `true`
 - `storesMixedCaseQuotedIdentifiers()` returns `true`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`
 - If `lower_case_table_names=1` (on server):
 - `storesLowerCaseIdentifiers()` returns `true`
 - `storesLowerCaseQuotedIdentifiers()` returns `true`
 - `storesMixedCaseIdentifiers()` returns `false`
 - `storesMixedCaseQuotedIdentifiers()` returns `false`
 - `storesUpperCaseIdentifiers()` returns `false`
 - `storesUpperCaseQuotedIdentifiers()` returns `true`
- (Bug#14562)
- `storesMixedCaseIdentifiers()` returns `true` (Bug#14562)
 - `storesLowerCaseQuotedIdentifiers()` returns `false` (Bug#14562)

- Java type conversion may be incorrect for `MEDIUMINT`. (Bug#14562)
- `storesLowerCaseIdentifiers()` returns `false` (Bug#14562)
- Added configuration property `useGmtMillisForDatetimes` which when set to `true` causes `ResultSet.getDate()`, `ResultSet.getTimestamp()` to return correct millis-since GMT when `ResultSet.getTime()` is called on the return value (currently default is `false` for legacy behavior). (Bug#14562)
- Extraneous sleep on `autoReconnect`. (Bug#13775)
- Reconnect during middle of `executeBatch()` should not occur if `autoReconnect` is enabled. (Bug#13255)
- `maxQuerySizeToLog` is not respected. Added logging of bound values for `execute()` phase of server-side prepared statements when `profileSQL=true` as well. (Bug#13048)
- OpenOffice expects `DBMD.supportsIntegrityEnhancementFacility()` to return `true` if foreign keys are supported by the datasource, even though this method also covers support for check constraints, which MySQL *doesn't* have. Setting the configuration property `overrideSupportsIntegrityEnhancementFacility` to `true` causes the driver to return `true` for this method. (Bug#12975)
- Added `com.mysql.jdbc.testsuite.url.default` system property to set default JDBC url for testsuite (to speed up bug resolution when I'm working in Eclipse). (Bug#12975)
- `logSlowQueries` should give better info. (Bug#12230)
- Don't increase timeout for failover/reconnect. (Bug#6577)
- Fixed client-side prepared statement bug with embedded `?` characters inside quoted identifiers (it was recognized as a placeholder, when it was not).
- Don't allow `executeBatch()` for `CallableStatements` with registered `OUT/INOUT` parameters (JDBC compliance).
- Fall back to platform-encoding for `URLDecoder.decode()` when parsing driver URL properties if the platform doesn't have a two-argument version of this method.

E.6.3.5. Changes in MySQL Connector/J 3.1.11 (07 October 2005)

Bugs fixed:

- The configuration property `sessionVariables` now allows you to specify variables that start with the “@” sign. (Bug#13453)
- URL configuration parameters don't allow “&” or “=” in their values. The JDBC driver now parses configuration parameters as if they are encoded using the application/x-www-form-urlencoded format as specified by `java.net.URLDecoder` (<http://java.sun.com/j2se/1.5.0/docs/api/java/net/URLDecoder.html>).
If the “%” character is present in a configuration property, it must now be represented as `%25`, which is the encoded form of “%” when using application/x-www-form-urlencoded encoding. (Bug#13453)
- Workaround for Bug#13374: `ResultSet.getStatement()` on closed result set returns `NULL` (as per JDBC 4.0 spec, but not backward-compatible). Set the connection property `retainStatementAfterResultSetClose` to `true` to be able to retrieve a `ResultSet`'s statement after the `ResultSet` has been closed via `ResultSet.getStatement()` (the default is `false`, to be JDBC-compliant and to reduce the chance that code using JDBC leaks `Statement` instances). (Bug#13277)
- `ResultSetMetaData` from `Statement.getGeneratedKeys()` caused a `NullPointerException` to be thrown whenever a method that required a connection reference was called. (Bug#13277)
- Backport of `VAR[BINARY|CHAR] [BINARY]` types detection from 5.0 branch. (Bug#13277)
- Fixed `NullPointerException` when converting `catalog` parameter in many `DatabaseMetaDataMethods` to `byte[]`s (for the result set) when the parameter is `null`. (`null` isn't technically allowed by the JDBC specification, but we've historically allowed it). (Bug#13277)
- Backport of `Field` class, `ResultSetMetaData.getColumnClassName()`, and `ResultSet.getObject(int)` changes from 5.0 branch to fix behavior surrounding `VARCHAR BINARY/VARBINARY` and related types. (Bug#13277)
- Read response in `MysqlIO.sendFileToServer()`, even if the local file can't be opened, otherwise next query issued will fail, because it's reading the response to the empty `LOAD DATA INFILE` packet sent to the server. (Bug#13277)

- When `gatherPerfMetrics` is enabled for servers older than 4.1.0, a `NullPointerException` is thrown from the constructor of `ResultSet` if the query doesn't use any tables. (Bug#13043)
 - `java.sql.Types.OTHER` returned for `BINARY` and `VARBINARY` columns when using `DatabaseMetaData.getColumns()`. (Bug#12970)
 - `ServerPreparedStatement.getBinding()` now checks if the statement is closed before attempting to reference the list of parameter bindings, to avoid throwing a `NullPointerException`. (Bug#12970)
 - Tokenizer for `=` in URL properties was causing `sessionVariables=...` to be parameterized incorrectly. (Bug#12753)
 - `cp1251` incorrectly mapped to `win1251` for servers newer than 4.0.x. (Bug#12752)
 - `getExportedKeys()` (Bug#12541)
 - Specifying a catalog works as stated in the API docs. (Bug#12541)
 - Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties. (Bug#12541)
 - `getIndexInfo()` (Bug#12541)
 - `getProcedures()` (and thus indirectly `getProcedureColumns()`) (Bug#12541)
 - `getImportedKeys()` (Bug#12541)
 - Specifying `" "` means “current” catalog, even though this isn't quite JDBC spec compliant, it's there for legacy users. (Bug#12541)
 - `getCrossReference()` (Bug#12541)
 - Added `Connection.isMasterConnection()` for clients to be able to determine if a multi-host master/slave connection is connected to the first host in the list. (Bug#12541)
 - `getColumns()` (Bug#12541)
 - Handling of catalog argument in `DatabaseMetaData.getIndexInfo()`, which also means changes to the following methods in `DatabaseMetaData`:
 - `getBestRowIdentifier()`
 - `getColumns()`
 - `getCrossReference()`
 - `getExportedKeys()`
 - `getImportedKeys()`
 - `getIndexInfo()`
 - `getPrimaryKeys()`
 - `getProcedures()` (and thus indirectly `getProcedureColumns()`)
 - `getTables()`
- The `catalog` argument in all of these methods now behaves in the following way:
- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties.
 - Specifying `" "` means “current” catalog, even though this isn't quite JDBC spec compliant, it's there for legacy users.
 - Specifying a catalog works as stated in the API docs.
 - Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances). (Bug#12541)
 - `getBestRowIdentifier()` (Bug#12541)

- Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances). (Bug#12541)
- `getTables()` (Bug#12541)
- `getPrimaryKeys()` (Bug#12541)
- `Connection.prepareCall()` is database name case-sensitive (on Windows systems). (Bug#12417)
- `explainSlowQueries` hangs with server-side prepared statements. (Bug#12229)
- Properties shared between master and slave with replication connection. (Bug#12218)
- Geometry types not handled with server-side prepared statements. (Bug#12104)
- `maxPerformance.properties` mis-spells “elideSetAutoCommits”. (Bug#11976)
- `ReplicationConnection` won't switch to slave, throws “Catalog can't be null” exception. (Bug#11879)
- `Pstmt.setObject(..., Types.BOOLEAN)` throws exception. (Bug#11798)
- Escape tokenizer doesn't respect stacked single quotes for escapes. (Bug#11797)
- `GEOMETRY` type not recognized when using server-side prepared statements. (Bug#11797)
- Foreign key information that is quoted is parsed incorrectly when `DatabaseMetaData` methods use that information. (Bug#11781)
- The `sendBlobChunkSize` property is now clamped to `max_allowed_packet` with consideration of stream buffer size and packet headers to avoid `PacketTooBigExceptions` when `max_allowed_packet` is similar in size to the default `sendBlobChunkSize` which is 1M. (Bug#11781)
- `CallableStatement.clearParameters()` now clears resources associated with `INOUT/OUTPUT` parameters as well as `INPUT` parameters. (Bug#11781)
- Fixed regression caused by fix for Bug#11552 that caused driver to return incorrect values for unsigned integers when those integers were within the range of the positive signed type. (Bug#11663)
- Moved source code to Subversion repository. (Bug#11663)
- Incorrect generation of testcase scripts for server-side prepared statements. (Bug#11663)
- Fixed statements generated for testcases missing `;` for “plain” statements. (Bug#11629)
- Spurious `!` on console when character encoding is `utf8`. (Bug#11629)
- `StringUtils.getBytes()` doesn't work when using multi-byte character encodings and a length in `characters` is specified. (Bug#11614)
- `DBMD.storesLower/Mixed/UpperIdentifiers()` reports incorrect values for servers deployed on Windows. (Bug#11575)
- Reworked `Field` class, `*Buffer`, and `MySQLIO` to be aware of field lengths $>$ `Integer.MAX_VALUE`. (Bug#11498)
- Escape processor didn't honor strings demarcated with double quotes. (Bug#11498)
- Updated `DBMD.supportsCorrelatedQueries()` to return `true` for versions $>$ 4.1, `supportsGroupByUnrelated()` to return `true` and `getResultSetHoldability()` to return `HOLD_CURSORS_OVER_COMMIT`. (Bug#11498)
- Lifted restriction of changing streaming parameters with server-side prepared statements. As long as `all` streaming parameters were set before execution, `.clearParameters()` does not have to be called. (due to limitation of client/server protocol, prepared statements can not reset *individual* stream data on the server side). (Bug#11498)
- `ResultSet.moveToCurrentRow()` fails to work when preceded by a call to `ResultSet.moveToInsertRow()`. (Bug#11190)
- `VARBINARY` data corrupted when using server-side prepared statements and `.setBytes()`. (Bug#11115)
- `Statement.getWarnings()` fails with NPE if statement has been closed. (Bug#10630)
- Only get `char[]` from SQL in `PreparedStatement.ParseInfo()` when needed. (Bug#10630)

E.6.3.6. Changes in MySQL Connector/J 3.1.10 (23 June 2005)

Bugs fixed:

- Initial implementation of `ParameterMetadata` for `PreparedStatement.getParameterMetadata()`. Only works fully for `CallableStatements`, as current server-side prepared statements return every parameter as a `VARCHAR` type.
- Fixed connecting without a database specified raised an exception in `MySqlIO.changeDatabaseTo()`.

E.6.3.7. Changes in MySQL Connector/J 3.1.9 (22 June 2005)

Bugs fixed:

- Production package doesn't include JBoss integration classes. ([Bug#11411](#))
- Removed nonsensical “costly type conversion” warnings when using usage advisor. ([Bug#11411](#))
- Fixed `PreparedStatement.setClob()` not accepting `null` as a parameter. ([Bug#11360](#))
- Connector/J dumping query into `SQLException` twice. ([Bug#11360](#))
- `autoReconnect` ping causes exception on connection startup. ([Bug#11259](#))
- `Connection.setCatalog()` is now aware of the `useLocalSessionState` configuration property, which when set to `true` will prevent the driver from sending `USE . . .` to the server if the requested catalog is the same as the current catalog. ([Bug#11115](#))
- `3-0-Compat` — Compatibility with Connector/J 3.0.x functionality ([Bug#11115](#))
- `maxPerformance` — maximum performance without being reckless ([Bug#11115](#))
- `solarisMaxPerformance` — maximum performance for Solaris, avoids syscalls where it can ([Bug#11115](#))
- Added `maintainTimeStats` configuration property (defaults to `true`), which tells the driver whether or not to keep track of the last query time and the last successful packet sent to the server's time. If set to `false`, removes two syscalls per query. ([Bug#11115](#))
- `VARBINARY` data corrupted when using server-side prepared statements and `ResultSet.getBytes()`. ([Bug#11115](#))
- Added the following configuration bundles, use one or many via the `useConfigs` configuration property:
 - `maxPerformance` — maximum performance without being reckless
 - `solarisMaxPerformance` — maximum performance for Solaris, avoids syscalls where it can
 - `3-0-Compat` — Compatibility with Connector/J 3.0.x functionality([Bug#11115](#))
- Try to handle `OutOfMemoryErrors` more gracefully. Although not much can be done, they will in most cases close the connection they happened on so that further operations don't run into a connection in some unknown state. When an OOM has happened, any further operations on the connection will fail with a “Connection closed” exception that will also list the OOM exception as the reason for the implicit connection close event. ([Bug#10850](#))
- Setting `cachePrepStmts=true` now causes the `Connection` to also cache the check the driver performs to determine if a prepared statement can be server-side or not, as well as caches server-side prepared statements for the lifetime of a connection. As before, the `prepStmtCacheSize` parameter controls the size of these caches. ([Bug#10850](#))
- Don't send `COM_RESET_STMT` for each execution of a server-side prepared statement if it isn't required. ([Bug#10850](#))
- 0-length streams not sent to server when using server-side prepared statements. ([Bug#10850](#))
- Driver detects if you're running MySQL-5.0.7 or later, and does not scan for `LIMIT ?[, ?]` in statements being prepared, as the server supports those types of queries now. ([Bug#10850](#))
- Reorganized directory layout. Sources now are in `src` folder. Don't pollute parent directory when building, now output goes to `./build`, distribution goes to `./dist`. ([Bug#10496](#))

- Added support/bug hunting feature that generates `.sql` test scripts to `STDERR` when `autoGenerateTestcaseScript` is set to `true`. (Bug#10496)
- `SQLException` is thrown when using property `characterSetResults` with `cp932` or `eucjpm`s. (Bug#10496)
- The datatype returned for `TINYINT(1)` columns when `tinyIntIsBit=true` (the default) can be switched between `Types.BOOLEAN` and `Types.BIT` using the new configuration property `transformedBitIsBoolean`, which defaults to `false`. If set to `false` (the default), `DatabaseMetaData.getColumns()` and `ResultSetMetaData.getColumnType()` will return `Types.BOOLEAN` for `TINYINT(1)` columns. If `true`, `Types.BOOLEAN` will be returned instead. Regardless of this configuration property, if `tinyIntIsBit` is enabled, columns with the type `TINYINT(1)` will be returned as `java.lang.Boolean` instances from `ResultSet.getObject(...)`, and `ResultSetMetaData.getColumnClassName()` will return `java.lang.Boolean`. (Bug#10485)
- `SQLException` thrown when retrieving `YEAR(2)` with `ResultSet.getString()`. The driver will now always treat `YEAR` types as `java.sql.Date`s and return the correct values for `getString()`. Alternatively, the `yearIsDateType` connection property can be set to `false` and the values will be treated as `SHORTS`. (Bug#10485)
- Driver doesn't support `{?=CALL(...)}` for calling stored functions. This involved adding support for function retrieval to `DatabaseMetaData.getProcedures()` and `getProcedureColumns()` as well. (Bug#10310)
- Unsigned `SMALLINT` treated as signed for `ResultSet.getInt()`, fixed all cases for `UNSIGNED` integer values and server-side prepared statements, as well as `ResultSet.getObject()` for `UNSIGNED TINYINT`. (Bug#10156)
- Made `ServerPreparedStatement.asSql()` work correctly so auto-explain functionality would work with server-side prepared statements. (Bug#10155)
- Double quotes not recognized when parsing client-side prepared statements. (Bug#10155)
- Made JDBC2-compliant wrappers public in order to allow access to vendor extensions. (Bug#10155)
- `DatabaseMetaData.supportsMultipleOpenResults()` now returns `true`. The driver has supported this for some time, DBMD just missed that fact. (Bug#10155)
- Cleaned up logging of profiler events, moved code to dump a profiler event as a string to `com.mysql.jdbc.log.LogUtils` so that third parties can use it. (Bug#10155)
- Made `enableStreamingResults()` visible on `com.mysql.jdbc.jdbc2.optional.StatementWrapper`. (Bug#10155)
- Actually write manifest file to correct place so it ends up in the binary jar file. (Bug#10144)
- Added `createDatabaseIfNotExist` property (default is `false`), which will cause the driver to ask the server to create the database specified in the URL if it doesn't exist. You must have the appropriate privileges for database creation for this to work. (Bug#10144)
- Memory leak in `ServerPreparedStatement` if `serverPrepare()` fails. (Bug#10144)
- `com.mysql.jdbc.PreparedStatement.ParseInfo` does unnecessary call to `toCharArray()`. (Bug#9064)
- Driver now correctly uses CP932 if available on the server for Windows-31J, CP932 and MS932 java encoding names, otherwise it resorts to SJIS, which is only a close approximation. Currently only MySQL-5.0.3 and newer (and MySQL-4.1.12 or .13, depending on when the character set gets backported) can reliably support any variant of CP932.
- Overhaul of character set configuration, everything now lives in a properties file.

E.6.3.8. Changes in MySQL Connector/J 3.1.8 (14 April 2005)

Bugs fixed:

- Should accept `null` for catalog (meaning use current) in DBMD methods, even though it's not JDBC-compliant for legacy's sake. Disable by setting connection property `nullCatalogMeansCurrent` to `false` (which will be the default value in C/J 3.2.x). (Bug#9917)
- Fixed driver not returning `true` for `-1` when `ResultSet.getBoolean()` was called on result sets returned from server-side prepared statements. (Bug#9778)
- Added a `Manifest.MF` file with implementation information to the `.jar` file. (Bug#9778)
- More tests in `Field.isOpaqueBinary()` to distinguish opaque binary (that is, fields with type `CHAR(n)` and `CHARAC-`

- TER SET BINARY) from output of various scalar and aggregate functions that return strings. (Bug#9778)
- `DBMD.getTables()` shouldn't return tables if views are asked for, even if the database version doesn't support views. (Bug#9778)
 - Should accept `null` for name patterns in DBMD (meaning “%”), even though it isn't JDBC compliant, for legacy's sake. Disable by setting connection property `nullNamePatternMatchesAll` to `false` (which will be the default value in C/J 3.2.x). (Bug#9769)
 - Then fallback to our `STDERR` logging. (Bug#9704)
 - The performance metrics feature now gathers information about number of tables referenced in a SELECT. (Bug#9704)
 - The logging system is now automatically configured. If the value has been set by the user, via the URL property `logger` or the system property `com.mysql.jdbc.logger`, then use that, otherwise, autodetect it using the following steps:
 1. Log4j, if it's available,
 2. Then JDK1.4 logging,
 3. Then fallback to our `STDERR` logging.(Bug#9704)
 - Then JDK1.4 logging, (Bug#9704)
 - Log4j, if it's available, (Bug#9704)
 - `Statement.getMoreResults()` could throw NPE when existing result set was `.close()`d. (Bug#9704)
 - Stored procedures with `DECIMAL` parameters with storage specifications that contained “,” in them would fail. (Bug#9682)
 - `PreparedStatement.setObject(int, Object, int type, int scale)` now uses scale value for `BigDecimal` instances. (Bug#9682)
 - Added support for the c3p0 connection pool's (<http://c3p0.sf.net/>) validation/connection checker interface which uses the lightweight `COM_PING` call to the server if available. To use it, configure your c3p0 connection pool's `connectionTesterClassName` property to use `com.mysql.jdbc.integration.c3p0.MysqlConnectionTester`. (Bug#9320)
 - `PreparedStatement.getMetaData()` inserts blank row in database under certain conditions when not using server-side prepared statements. (Bug#9320)
 - Better detection of `LIMIT` inside/outside of quoted strings so that the driver can more correctly determine whether a prepared statement can be prepared on the server or not. (Bug#9320)
 - `Connection.canHandleAsPreparedStatement()` now makes “best effort” to distinguish `LIMIT` clauses with placeholders in them from ones without in order to have fewer false positives when generating work-arounds for statements the server cannot currently handle as server-side prepared statements. (Bug#9320)
 - Fixed `build.xml` to not compile `log4j` logging if `log4j` not available. (Bug#9320)
 - Added finalizers to `ResultSet` and `Statement` implementations to be JDBC spec-compliant, which requires that if not explicitly closed, these resources should be closed upon garbage collection. (Bug#9319)
 - Stored procedures with same name in different databases confuse the driver when it tries to determine parameter counts/types. (Bug#9319)
 - A continuation of Bug#8868, where functions used in queries that should return non-string types when resolved by temporary tables suddenly become opaque binary strings (work-around for server limitation). Also fixed fields with type of `CHAR(n) CHARACTER SET BINARY` to return correct/matching classes for `RSMD.getColumnClassName()` and `ResultSet.getObject()`. (Bug#9236)
 - Cannot use `UTF-8` for `characterSetResults` configuration property. (Bug#9206)
 - `PreparedStatement.addBatch()` doesn't work with server-side prepared statements and streaming `BINARY` data. (Bug#9040)
 - `ServerPreparedStatements` now correctly “stream” `BLOB/CLOB` data to the server. You can configure the threshold chunk size using the JDBC URL property `blobSendChunkSize` (the default is 1MB). (Bug#8868)
 - `DATE_FORMAT()` queries returned as `BLOBs` from `getObject()`. (Bug#8868)

- Server-side session variables can be preset at connection time by passing them as a comma-delimited list for the connection property `sessionVariables`. (Bug#8868)
- `BlobFromLocator` now uses correct identifier quoting when generating prepared statements. (Bug#8868)
- Fixed regression in `ping()` for users using `autoReconnect=true`. (Bug#8868)
- Check for empty strings (' ') when converting `CHAR/VARCHAR` column data to numbers, throw exception if `emptyString-sConvertToZero` configuration property is set to `false` (for backward-compatibility with 3.0, it is now set to `true` by default, but will most likely default to `false` in 3.2). (Bug#8803)
- `DATA_TYPE` column from `DBMD.getBestRowIdentifier()` causes `ArrayIndexOutOfBoundsException` when accessed (and in fact, didn't return any value). (Bug#8803)
- `DBMD.supportsMixedCase*Identifiers()` returns wrong value on servers running on case-sensitive filesystems. (Bug#8800)
- `DBMD.supportsResultSetConcurrency()` not returning `true` for forward-only/read-only result sets (we obviously support this). (Bug#8792)
- Fixed `ResultSet.getTime()` on a `NULL` value for server-side prepared statements throws NPE.
- Made `Connection.ping()` a public method.
- Added support for new precision-math `DECIMAL` type in MySQL 5.0.3 and up.
- Fixed `DatabaseMetaData.getTables()` returning views when they were not asked for as one of the requested table types.

E.6.3.9. Changes in MySQL Connector/J 3.1.7 (18 February 2005)

Bugs fixed:

- `PreparedStatement` not creating streaming result sets. (Bug#8487)
- Don't pass `NULL` to `String.valueOf()` in `ResultSet.getNativeConvertToString()`, as it stringifies it (that is, returns `null`), which is not correct for the method in question. (Bug#8487)
- Fixed NPE in `ResultSet.realClose()` when using usage advisor and result set was already closed. (Bug#8428)
- `ResultSet.getString()` doesn't maintain format stored on server, bug fix only enabled when `noDatetimeString-Sync` property is set to `true` (the default is `false`). (Bug#8428)
- Added support for `BIT` type in MySQL-5.0.3. The driver will treat `BIT(1-8)` as the JDBC standard `BIT` type (which maps to `java.lang.Boolean`), as the server does not currently send enough information to determine the size of a bitfield when `< 9` bits are declared. `BIT(>9)` will be treated as `VARBINARY`, and will return `byte[]` when `getObject()` is called. (Bug#8424)
- Added `useLocalSessionState` configuration property, when set to `true` the JDBC driver trusts that the application is well-behaved and only sets autocommit and transaction isolation levels using the methods provided on `java.sql.Connection`, and therefore can manipulate these values in many cases without incurring round-trips to the database server. (Bug#8424)
- Added `enableStreamingResults()` to `Statement` for connection pool implementations that check `Statement.setFetchSize()` for specification-compliant values. Call `Statement.setFetchSize(>=0)` to disable the streaming results for that statement. (Bug#8424)
- `ResultSet.getBigDecimal()` throws exception when rounding would need to occur to set scale. The driver now chooses a rounding mode of "half up" if non-rounding `BigDecimal.setScale()` fails. (Bug#8424)
- Fixed synchronization issue with `ServerPreparedStatement.serverPrepare()` that could cause deadlocks/crashes if connection was shared between threads. (Bug#8096)
- Emulated locators corrupt binary data when using server-side prepared statements. (Bug#8096)
- Infinite recursion when "falling back" to master in failover configuration. (Bug#7952)
- Disable multi-statements (if enabled) for MySQL-4.1 versions prior to version 4.1.10 if the query cache is enabled, as the server returns wrong results in this configuration. (Bug#7952)

- Removed `dontUnpackBinaryResults` functionality, the driver now always stores results from server-side prepared statements as is from the server and unpacks them on demand. (Bug#7952)
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. (Bug#7952)
- Added `holdResultsOpenOverStatementClose` property (default is `false`), that keeps result sets open over `statement.close()` or new execution on same statement (suggested by Kevin Burton). (Bug#7715)
- Detect new `sql_mode` variable in string form (it used to be integer) and adjust quoting method for strings appropriately. (Bug#7715)
- Timestamps converted incorrectly to strings with server-side prepared statements and updatable result sets. (Bug#7715)
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug#7686)
- Choose correct “direction” to apply time adjustments when both client and server are in GMT time zone when using `ResultSet.get(..., cal)` and `PreparedStatement.set(..., cal)`. (Bug#4718)
- Remove `_binary` introducer from parameters used as in/out parameters in `CallableStatement`. (Bug#4718)
- Always return `byte[]`s for output parameters registered as `*BINARY`. (Bug#4718)
- By default, the driver now scans SQL you are preparing via all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this by passing `emulateUnsupportedPstmts=false` in your JDBC URL. (Bug#4718)
- Added `dontTrackOpenResources` option (default is `false`, to be JDBC compliant), which helps with memory use for non-well-behaved apps (that is, applications that don't close `Statement` objects when they should). (Bug#4718)
- Send correct value for “boolean” `true` to server for `PreparedStatement.setObject(n, "true", Types.BIT)`. (Bug#4718)
- Fixed bug with Connection not caching statements from `prepareStatement()` when the statement wasn't a server-side prepared statement. (Bug#4718)

E.6.3.10. Changes in MySQL Connector/J 3.1.6 (23 December 2004)

Bugs fixed:

- `DBMD.getProcedures()` doesn't respect catalog parameter. (Bug#7026)
- Fixed hang on `SocketInputStream.read()` with `Statement.setMaxRows()` and multiple result sets when driver has to truncate result set directly, rather than tacking a `LIMIT n` on the end of it.

E.6.3.11. Changes in MySQL Connector/J 3.1.5 (02 December 2004)

Bugs fixed:

- Use 1MB packet for sending file for `LOAD DATA LOCAL INFILE` if that is `< max_allowed_packet` on server. (Bug#6537)
- `SUM()` on `DECIMAL` with server-side prepared statement ignores scale if zero-padding is needed (this ends up being due to conversion to `DOUBLE` by server, which when converted to a string to parse into `BigDecimal`, loses all “padding” zeros). (Bug#6537)
- Use `DatabaseMetaData.getIdentifierQuoteString()` when building DBMD queries. (Bug#6537)
- Use our own implementation of buffered input streams to get around blocking behavior of `java.io.BufferedInputStream`. Disable this with `useReadAheadInput=false`. (Bug#6399)
- Make auto-deserialization of `java.lang.Objects` stored in `BLOB` columns configurable via `autoDeserialize` property (defaults to `false`). (Bug#6399)
- `ResultSetMetaData.getColumnDisplaySize()` returns incorrect values for multi-byte charsets. (Bug#6399)

- Re-work `Field.isOpaqueBinary()` to detect `CHAR(n) CHARACTER SET BINARY` to support fixed-length binary fields for `ResultSet.getObject()`. (Bug#6399)
- Failing to connect to the server when one of the addresses for the given host name is IPV6 (which the server does not yet bind on). The driver now loops through *all* IP addresses for a given host, and stops on the first one that `accepts()` a `socket.connect()`. (Bug#6348)
- Removed unwanted new `Throwable()` in `ResultSet` constructor due to bad merge (caused a new object instance that was never used for every result set created). Found while profiling for Bug#6359. (Bug#6225)
- `ServerSidePreparedStatement` allocating short-lived objects unnecessarily. (Bug#6225)
- Use null-safe-equals for key comparisons in updatable result sets. (Bug#6225)
- Fixed too-early creation of `StringBuffer` in `EscapeProcessor.escapeSQL()`, also return `String` when escaping not needed (to avoid unnecessary object allocations). Found while profiling for Bug#6359. (Bug#6225)
- `UNSIGNED BIGINT` unpacked incorrectly from server-side prepared statement result sets. (Bug#5729)
- Added experimental configuration property `dontUnpackBinaryResults`, which delays unpacking binary result set values until they're asked for, and only creates object instances for non-numerical values (it is set to `false` by default). For some usecase/jvm combinations, this is friendlier on the garbage collector. (Bug#5706)
- Don't throw exceptions for `Connection.releaseSavepoint()`. (Bug#5706)
- Inefficient detection of pre-existing string instances in `ResultSet.getNativeString()`. (Bug#5706)
- Use a per-session `Calendar` instance by default when decoding dates from `ServerPreparedStatements` (set to old, less performant behavior by setting property `dynamicCalendars=true`). (Bug#5706)
- Fixed batched updates with server prepared statements weren't looking if the types had changed for a given batched set of parameters compared to the previous set, causing the server to return the error "Wrong arguments to mysql_stmt_execute()". (Bug#5235)
- Handle case when string representation of timestamp contains trailing "." with no numbers following it. (Bug#5235)
- Server-side prepared statements did not honor `zeroDateTimeBehavior` property, and would cause class-cast exceptions when using `ResultSet.getObject()`, as the all-zero string was always returned. (Bug#5235)
- Fix comparisons made between string constants and dynamic strings that are converted with either `toUpperCase()` or `toLowerCase()` to use `Locale.ENGLISH`, as some locales "override" case rules for English. Also use `StringUtils.indexIgnoreCase()` instead of `.toUpperCase().indexOf()`, avoids creating a very short-lived transient `String` instance.

E.6.3.12. Changes in MySQL Connector/J 3.1.4 (04 September 2004)

Bugs fixed:

- Fixed `ServerPreparedStatement` to read prepared statement metadata off the wire, even though it's currently a placeholder instead of using `MySQLIO.clearInputStream()` which didn't work at various times because data wasn't available to read from the server yet. This fixes sporadic errors users were having with `ServerPreparedStatements` throwing `ArrayIndexOutOfBoundsException`. (Bug#5032)
- Added three ways to deal with all-zero datetimes when reading them from a `ResultSet`: `exception` (the default), which throws an `SQLException` with an `SQLState` of `S1009`; `convertToNull`, which returns `NULL` instead of the date; and `round`, which rounds the date to the nearest closest value which is `'0001-01-01'`. (Bug#5032)
- The driver is more strict about truncation of numerics on `ResultSet.get*()`, and will throw an `SQLException` when truncation is detected. You can disable this by setting `jdbcCompliantTruncation` to `false` (it is enabled by default, as this functionality is required for JDBC compliance). (Bug#5032)
- You can now use URLs in `LOAD DATA LOCAL INFILE` statements, and the driver will use Java's built-in handlers for retrieving the data and sending it to the server. This feature is not enabled by default, you must set the `allowUrlInLocalInfile` connection property to `true`. (Bug#5032)
- `ResultSet.getObject()` doesn't return type `Boolean` for pseudo-bit types from prepared statements on 4.1.x (shortcut for avoiding extra type conversion when using binary-encoded result sets obscured test in `getObject()` for "pseudo" bit type). (Bug#5032)

- Use `com.mysql.jdbc.Message`'s classloader when loading resource bundle, should fix sporadic issues when the caller's classloader can't locate the resource bundle. (Bug#5032)
- `ServerPreparedStatement` dealing with return of `DECIMAL` type don't work. (Bug#5012)
- Track packet sequence numbers if `enablePacketDebug=true`, and throw an exception if packets received out-of-order. (Bug#4689)
- `ResultSet.isNull()` does not work for primitives if a previous `null` was returned. (Bug#4689)
- Optimized integer number parsing, enable "old" slower integer parsing using JDK classes via `useFastIntParsing=false` property. (Bug#4642)
- Added `useOnlyServerErrorMessages` property, which causes message text in exceptions generated by the server to only contain the text sent by the server (as opposed to the `SQLState`'s "standard" description, followed by the server's error message). This property is set to `true` by default. (Bug#4642)
- `ServerPreparedStatement.execute*`() sometimes threw `ArrayIndexOutOfBoundsException` when unpacking field metadata. (Bug#4642)
- Connector/J 3.1.3 beta does not handle integers correctly (caused by changes to support unsigned reads in `Buffer.readInt()` -> `Buffer.readShort()`). (Bug#4510)
- Added support in `DatabaseMetaData.getTables()` and `getTableTypes()` for views, which are now available in MySQL server 5.0.x. (Bug#4510)
- `ResultSet.getObject()` returns wrong type for strings when using prepared statements. (Bug#4482)
- Calling `MysqlPooledConnection.close()` twice (even though an application error), caused NPE. Fixed. (Bug#4482)

E.6.3.13. Changes in MySQL Connector/J 3.1.3 (07 July 2004)

Bugs fixed:

- Support new time zone variables in MySQL-4.1.3 when `useTimezone=true`. (Bug#4311)
- Error in retrieval of `mediumint` column with prepared statements and binary protocol. (Bug#4311)
- Support for unsigned numerics as return types from prepared statements. This also causes a change in `ResultSet.getObject()` for the `bigint unsigned` type, which used to return `BigDecimal` instances, it now returns instances of `java.lang.BigInteger`. (Bug#4311)
- Externalized more messages (on-going effort). (Bug#4119)
- Null bitmask sent for server-side prepared statements was incorrect. (Bug#4119)
- Added constants for MySQL error numbers (publicly accessible, see `com.mysql.jdbc.MysqlErrorNumbers`), and the ability to generate the mappings of vendor error codes to `SQLStates` that the driver uses (for documentation purposes). (Bug#4119)
- Added packet debugging code (see the `enablePacketDebug` property documentation). (Bug#4119)
- Use SQL Standard SQL states by default, unless `useSqlStateCodes` property is set to `false`. (Bug#4119)
- Mangle output parameter names for `CallableStatements` so they will not clash with user variable names.
- Added support for `INOUT` parameters in `CallableStatements`.

E.6.3.14. Changes in MySQL Connector/J 3.1.2 (09 June 2004)

Bugs fixed:

- Don't enable server-side prepared statements for server version 5.0.0 or 5.0.1, as they aren't compatible with the '4.1.2+' style that the driver uses (the driver expects information to come back that isn't there, so it hangs). (Bug#3804)
- `getWarnings()` returns `SQLWarning` instead of `DataTruncation`. (Bug#3804)

- `getProcedureColumns()` doesn't work with wildcards for procedure name. (Bug#3540)
- `getProcedures()` does not return any procedures in result set. (Bug#3539)
- Fixed `DatabaseMetaData.getProcedures()` when run on MySQL-5.0.0 (output of `SHOW PROCEDURE STATUS` changed between 5.0.0 and 5.0.1. (Bug#3520)
- Added `connectionCollation` property to cause driver to issue `set collation_connection=...` query on connection init if default collation for given charset is not appropriate. (Bug#3520)
- `DBMD.getSQLStateType()` returns incorrect value. (Bug#3520)
- Correctly map output parameters to position given in `prepareCall()` versus order implied during `registerOutParameter()`. (Bug#3146)
- Cleaned up detection of server properties. (Bug#3146)
- Correctly detect initial character set for servers \geq 4.1.0. (Bug#3146)
- Support placeholder for parameter metadata for server \geq 4.1.2. (Bug#3146)
- Added `gatherPerformanceMetrics` property, along with properties to control when/where this info gets logged (see docs for more info).
- Fixed case when no parameters could cause a `NullPointerException` in `CallableStatement.setOutputParameters()`.
- Enabled callable statement caching via `cacheCallableStmts` property.
- Fixed sending of split packets for large queries, enabled nio ability to send large packets as well.
- Added `.toString()` functionality to `ServerPreparedStatement`, which should help if you're trying to debug a query that is a prepared statement (it shows SQL as the server would process).
- Added `logSlowQueries` property, along with `slowQueriesThresholdMillis` property to control when a query should be considered "slow."
- Removed wrapping of exceptions in `MysqlIO.changeUser()`.
- Fixed stored procedure parameter parsing info when size was specified for a parameter (for example, `char()`, `varchar()`).
- `ServerPreparedStatements` weren't actually de-allocating server-side resources when `.close()` was called.
- Fixed case when no output parameters specified for a stored procedure caused a bogus query to be issued to retrieve out parameters, leading to a syntax error from the server.

E.6.3.15. Changes in MySQL Connector/J 3.1.1 (14 February 2004)

Bugs fixed:

- Use DocBook version of docs for shipped versions of drivers. (Bug#2671)
- `NULL` fields were not being encoded correctly in all cases in server-side prepared statements. (Bug#2671)
- Fixed rare buffer underflow when writing numbers into buffers for sending prepared statement execution requests. (Bug#2671)
- Fixed `ConnectionProperties` that weren't properly exposed via accessors, cleaned up `ConnectionProperties` code. (Bug#2623)
- Class-cast exception when using scrolling result sets and server-side prepared statements. (Bug#2623)
- Merged unbuffered input code from 3.0. (Bug#2623)
- Enabled streaming of result sets from server-side prepared statements. (Bug#2606)
- Server-side prepared statements were not returning datatype `YEAR` correctly. (Bug#2606)
- Fixed charset conversion issue in `getTables()`. (Bug#2502)
- Implemented multiple result sets returned from a statement or stored procedure. (Bug#2502)

- Implemented `Connection.prepareCall()`, and `DatabaseMetaData.getProcedures()` and `getProcedureColumns()`. (Bug#2359)
- Merged prepared statement caching, and `.getMetaData()` support from 3.0 branch. (Bug#2359)
- Fixed off-by-1900 error in some cases for years in `TimeUtil.fastDate/TimeCreate()` when unpacking results from server-side prepared statements. (Bug#2359)
- Reset `long binary` parameters in `ServerPreparedStatement` when `clearParameters()` is called, by sending `COM_RESET_STMT` to the server. (Bug#2359)
- `NULL` values for numeric types in binary encoded result sets causing `NullPointerExceptions`. (Bug#2359)
- Display where/why a connection was implicitly closed (to aid debugging). (Bug#1673)
- `DatabaseMetaData.getColumns()` is not returning correct column ordinal info for non-'%' column name patterns. (Bug#1673)
- Fixed `NullPointerException` in `ServerPreparedStatement.setTimestamp()`, as well as year and month discrepancies in `ServerPreparedStatement.setTimestamp()`, `setDate()`. (Bug#1673)
- Added ability to have multiple database/JVM targets for compliance and regression/unit tests in `build.xml`. (Bug#1673)
- Fixed sending of queries larger than 16M. (Bug#1673)
- Merged fix of datatype mapping from MySQL type `FLOAT` to `java.sql.Types.REAL` from 3.0 branch. (Bug#1673)
- Fixed NPE and year/month bad conversions when accessing some datetime functionality in `ServerPreparedStatements` and their resultant result sets. (Bug#1673)
- Added named and indexed input/output parameter support to `CallableStatement`. MySQL-5.0.x or newer. (Bug#1673)
- `CommunicationsException` implemented, that tries to determine why communications was lost with a server, and displays possible reasons when `.getMessage()` is called. (Bug#1673)
- Detect collation of column for `RSMD.isCaseSensitive()`. (Bug#1673)
- Optimized `Buffer.readLenByteArray()` to return shared empty byte array when length is 0.
- Fix support for table aliases when checking for all primary keys in `UpdatableResultSet`.
- Unpack “unknown” data types from server prepared statements as `Strings`.
- Implemented `Statement.getWarnings()` for MySQL-4.1 and newer (using `SHOW WARNINGS`).
- Ensure that warnings are cleared before executing queries on prepared statements, as-per JDBC spec (now that we support warnings).
- Correctly initialize datasource properties from JNDI Refs, including explicitly specified URLs.
- Implemented long data (Blobs, Clobs, InputStreams, Readers) for server prepared statements.
- Deal with 0-length tokens in `EscapeProcessor` (caused by callable statement escape syntax).
- `DatabaseMetaData` now reports `supportsStoredProcedures()` for MySQL versions $\geq 5.0.0$
- Support for `mysql_change_user()`. See the `changeUser()` method in `com.mysql.jdbc.Connection`.
- Removed `useFastDates` connection property.
- Support for NIO. Use `useNIO=true` on platforms that support NIO.
- Check for closed connection on delete/update/insert row operations in `UpdatableResultSet`.
- Support for transaction savepoints (MySQL $\geq 4.0.14$ or 4.1.1).
- Support “old” `profileSql` capitalization in `ConnectionProperties`. This property is deprecated, you should use `profileSQL` if possible.
- Fixed character encoding issues when converting bytes to ASCII when MySQL doesn't provide the character set, and the JVM is set to a multi-byte encoding (usually affecting retrieval of numeric values).

- Centralized setting of result set type and concurrency.
- Fixed bug with `UpdatableResultSets` not using client-side prepared statements.
- Default result set type changed to `TYPE_FORWARD_ONLY` (JDBC compliance).
- Fixed `IllegalAccessError` to `Calendar.getTimeInMillis()` in `DateTimeValue` (for JDK < 1.4).
- Allow contents of `PreparedStatement.setBlob()` to be retained between calls to `.execute*()`.
- Fixed stack overflow in `Connection.prepareCall()` (bad merge).
- Refactored how connection properties are set and exposed as `DriverPropertyInfo` as well as `Connection` and `DataSource` properties.
- Reduced number of methods called in average query to be more efficient.
- Prepared `Statements` will be re-prepared on auto-reconnect. Any errors encountered are postponed until first attempt to re-execute the re-prepared statement.

E.6.3.16. Changes in MySQL Connector/J 3.1.0 (18 February 2003)

Bugs fixed:

- Added `useServerPrepStmts` property (default `false`). The driver will use server-side prepared statements when the server version supports them (4.1 and newer) when this property is set to `true`. It is currently set to `false` by default until all bind/fetch functionality has been implemented. Currently only DML prepared statements are implemented for 4.1 server-side prepared statements.
- Added `requireSSL` property.
- Track open `Statements`, close all when `Connection.close()` is called (JDBC compliance).

E.6.4. Changes in MySQL Connector/J 3.0.x

E.6.4.1. Changes in MySQL Connector/J 3.0.17 (23 June 2005)

Bugs fixed:

- Workaround for server [Bug#9098](#): Default values of `CURRENT_*` for `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` columns can't be distinguished from `string` values, so `UpdatableResultSet.moveToInsertRow()` generates bad SQL for inserting default values. ([Bug#8812](#))
- `NON_UNIQUE` column from `DBMD.getIndexInfo()` returned inverted value. ([Bug#8812](#))
- `EUCKR` charset is sent as `SET NAMES euc_kr` which MySQL-4.1 and newer doesn't understand. ([Bug#8629](#))
- Added support for the `EUC_JP_Solaris` character encoding, which maps to a MySQL encoding of `euc_jpms` (backported from 3.1 branch). This only works on servers that support `euc_jpms`, namely 5.0.3 or later. ([Bug#8629](#))
- Use hex escapes for `PreparedStatement.setBytes()` for double-byte charsets including "aliases" `Windows-31J`, `CP934`, `MS932`. ([Bug#8629](#))
- `DatabaseMetaData.supportsSelectForUpdate()` returns correct value based on server version. ([Bug#8629](#))
- Which requires hex escaping of binary data when using multi-byte charsets with prepared statements. ([Bug#8064](#))
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly. ([Bug#7952](#))
- Backported `SQLState` codes mapping from Connector/J 3.1, enable with `useSqlStateCodes=true` as a connection property, it defaults to `false` in this release, so that we don't break legacy applications (it defaults to `true` starting with Connector/J 3.1). ([Bug#7686](#))
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. ([Bug#7686](#))

- `MS932`, `SHIFT_JIS`, and `Windows_31J` not recognized as aliases for `sjis`. (Bug#7607)
- Handle streaming result sets with more than 2 billion rows properly by fixing wraparound of row number counter. (Bug#7601)
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug#7601)
- Escape sequence `{fn convert(..., type)}` now supports ODBC-style types that are prepended by `SQL_`. (Bug#7601)
- Statements created from a pooled connection were returning physical connection instead of logical connection when `getConnection()` was called. (Bug#7316)
- Support new protocol type `MYSQL_TYPE_VARCHAR`. (Bug#7081)
- Added `useOldUTF8Behavior` configuration property, which causes JDBC driver to act like it did with MySQL-4.0.x and earlier when the character encoding is `utf-8` when connected to MySQL-4.1 or newer. (Bug#7081)
- `DatabaseMetaData.getIndexInfo()` ignored `unique` parameter. (Bug#7081)
- `PreparedStatement.fixDecimalExponent()` adding extra `+`, making number unparseable by MySQL server. (Bug#7061)
- `PreparedStatements` don't encode Big5 (and other multi-byte) character sets correctly in static SQL strings. (Bug#7033)
- Connections starting up failed-over (due to down master) never retry master. (Bug#6966)
- Adding `CP943` to aliases for `sjis`. (Bug#6549, Bug#7607)
- `Timestamp/Time` conversion goes in the wrong “direction” when `useTimeZone=true` and server time zone differs from client time zone. (Bug#5874)

E.6.4.2. Changes in MySQL Connector/J 3.0.16 (15 November 2004)

Bugs fixed:

- Made `TINYINT(1)` -> `BIT/Boolean` conversion configurable via `tinyIntIsBit` property (default `true` to be JDBC compliant out of the box). (Bug#5664)
- Off-by-one bug in `Buffer.readString(string)`. (Bug#5664)
- `ResultSet.updateByte()` when on insert row throws `ArrayOutOfBoundsException`. (Bug#5664)
- Fixed regression where `useUnbufferedInput` was defaulting to `false`. (Bug#5664)
- `ResultSet.getTimestamp()` on a column with `TIME` in it fails. (Bug#5664)
- Fixed `DatabaseMetaData.getTypes()` returning incorrect (this is, non-negative) scale for the `NUMERIC` type. (Bug#5664)
- Only set `character_set_results` during connection establishment if server version \geq 4.1.1. (Bug#5664)
- Fixed `ResultSetMetaData.isReadOnly()` to detect non-writable columns when connected to MySQL-4.1 or newer, based on existence of “original” table and column names.
- Re-issue character set configuration commands when re-using pooled connections and/or `Connection.changeUser()` when connected to MySQL-4.1 or newer.

E.6.4.3. Changes in MySQL Connector/J 3.0.15 (04 September 2004)

Bugs fixed:

- `ResultSet.getMetaData()` should not return incorrectly initialized metadata if the result set has been closed, but should instead throw an `SQLException`. Also fixed for `getRow()` and `getWarnings()` and traversal methods by calling `checkClosed()` before operating on instance-level fields that are nullified during `.close()`. (Bug#5069)
- Use `_binary` introducer for `PreparedStatement.setBytes()` and `set*Stream()` when connected to MySQL-4.1.x or newer to avoid misinterpretation during character conversion. (Bug#5069)

- Parse new time zone variables from 4.1.x servers. ([Bug#5069](#))
- `ResultSet` should release `Field[]` instance in `.close()`. ([Bug#5022](#))
- `RSMD.getPrecision()` returning 0 for non-numeric types (should return max length in chars for non-binary types, max length in bytes for binary types). This fix also fixes mapping of `RSMD.getColumnType()` and `RSMD.getColumnTypeName()` for the BLOB types based on the length sent from the server (the server doesn't distinguish between TINYBLOB, BLOB, MEDIUMBLOB or LONGBLOB at the network protocol level). ([Bug#4880](#))
- “Production” is now “GA” (General Availability) in naming scheme of distributions. ([Bug#4860](#), [Bug#4138](#))
- `DBMD.getColumns()` returns incorrect JDBC type for unsigned columns. This affects type mappings for all numeric types in the `RSMD.getColumnType()` and `RSMD.getColumnTypeNames()` methods as well, to ensure that “like” types from `DBMD.getColumns()` match up with what `RSMD.getColumnType()` and `getColumnTypeNames()` return. ([Bug#4860](#), [Bug#4138](#))
- Calling `.close()` twice on a `PooledConnection` causes NPE. ([Bug#4808](#))
- `DOUBLE` mapped twice in `DBMD.getTypeInfo()`. ([Bug#4742](#))
- Added FLOSS license exemption. ([Bug#4742](#))
- Removed redundant calls to `checkRowPos()` in `ResultSet`. ([Bug#4334](#))
- Failover for `autoReconnect` not using port numbers for any hosts, and not retrying all hosts.

Warning

This required a change to the `SocketFactory connect()` method signature, which is now `public Socket connect(String host, int portNumber, Properties props)`; therefore, any third-party socket factories will have to be changed to support this signature.

([Bug#4334](#))

- Logical connections created by `MysqlConnectionPoolDataSource` will now issue a `rollback()` when they are closed and sent back to the pool. If your application server/connection pool already does this for you, you can set the `rollbackOnPooledClose` property to `false` to avoid the overhead of an extra `rollback()`. ([Bug#4334](#))
- `StringUtil.escapeEasternUnicodeByteStream` was still broken for GBK. ([Bug#4010](#))

E.6.4.4. Changes in MySQL Connector/J 3.0.14 (28 May 2004)

Bugs fixed:

- Fixed URL parsing error.

E.6.4.5. Changes in MySQL Connector/J 3.0.13 (27 May 2004)

Bugs fixed:

- `No Database Selected` when using `MysqlConnectionPoolDataSource`. ([Bug#3920](#))
- `PreparedStatement.getGeneratedKeys()` method returns only 1 result for batched insertions. ([Bug#3873](#))
- Using a `MySQLDataSource` without server name fails. ([Bug#3848](#))

E.6.4.6. Changes in MySQL Connector/J 3.0.12 (18 May 2004)

Bugs fixed:

- Inconsistent reporting of data type. The server still doesn't return all types for *BLOBs *TEXT correctly, so the driver won't return those correctly. ([Bug#3570](#))
- `UpdatableResultSet` not picking up default values for `moveToInsertRow()`. ([Bug#3557](#))

- Not specifying database in URL caused `MalformedURLException` exception. (Bug#3554)
- Auto-convert MySQL encoding names to Java encoding names if used for `characterEncoding` property. (Bug#3554)
- Use `junit.textui.TestRunner` for all unit tests (to allow them to be run from the command line outside of Ant or Eclipse). (Bug#3554)
- Added encoding names that are recognized on some JVMs to fix case where they were reverse-mapped to MySQL encoding names incorrectly. (Bug#3554)
- Made `StringRegressionTest` 4.1-unicode aware. (Bug#3520)
- Fixed regression in `PreparedStatement.setString()` and eastern character encodings. (Bug#3520)
- `DBMD.getSQLStateType()` returns incorrect value. (Bug#3520)
- Renamed `StringUtils.escapeSJISByteStream()` to more appropriate `escapeEasternUnicodeByteStream()`. (Bug#3511)
- `StringUtils.escapeSJISByteStream()` not covering all eastern double-byte charsets correctly. (Bug#3511)
- Return creating statement for `ResultSets` created by `getGeneratedKeys()`. (Bug#2957)
- Use `SET character_set_results` during initialization to allow any charset to be returned to the driver for result sets. (Bug#2670)
- Don't truncate `BLOB` or `CLOB` values when using `setBytes()` and/or `setBinary/CharacterStream()`. (Bug#2670)
- Dynamically configure character set mappings for field-level character sets on MySQL-4.1.0 and newer using `SHOW COLLATION` when connecting. (Bug#2670)
- Map `binary` character set to `US-ASCII` to support `DATETIME` charset recognition for servers \geq 4.1.2. (Bug#2670)
- Use `charsetnr` returned during connect to encode queries before issuing `SET NAMES` on MySQL \geq 4.1.0. (Bug#2670)
- Add helper methods to `ResultSetMetaData` (`getColumnCharacterEncoding()` and `getColumnCharacterSet()`) to allow end-users to see what charset the driver thinks it should be using for the column. (Bug#2670)
- Only set `character_set_results` for MySQL \geq 4.1.0. (Bug#2670)
- Allow `url` parameter for `MysqlDataSource` and `MysqlConnectionPool DataSource` so that passing of other properties is possible from inside appservers.
- Don't escape SJIS/GBK/BIG5 when using MySQL-4.1 or newer.
- Backport documentation tooling from 3.1 branch.
- Added `failOverReadOnly` property, to allow end-user to configure state of connection (read-only/writable) when failed over.
- Allow `java.util.Date` to be sent in as parameter to `PreparedStatement.setObject()`, converting it to a `Timestamp` to maintain full precision. (Bug#103)
- Add unsigned attribute to `DatabaseMetaData.getColumns()` output in the `TYPE_NAME` column.
- Map duplicate key and foreign key errors to `SQLState` of `23000`.
- Backported “change user” and “reset server state” functionality from 3.1 branch, to allow clients of `MysqlConnectionPoolDataSource` to reset server state on `getConnection()` on a pooled connection.

E.6.4.7. Changes in MySQL Connector/J 3.0.11 (19 February 2004)

Bugs fixed:

- Return `java.lang.Double` for `FLOAT` type from `ResultSetMetaData.getColumnClassName()`. (Bug#2855)
- Return `[B` instead of `java.lang.Object` for `BINARY`, `VARBINARY` and `LONGVARBINARY` types from `ResultSetMetaData.getColumnClassName()` (JDBC compliance). (Bug#2855)

- Issue connection events on all instances created from a `ConnectionPoolDataSource`. (Bug#2855)
- Return `java.lang.Integer` for `TINYINT` and `SMALLINT` types from `ResultSetMetaData.getColumnClassName()`. (Bug#2852)
- Added `useUnbufferedInput` parameter, and now use it by default (due to JVM issue <http://developer.java.sun.com/developer/bugParade/bugs/4401235.html>) (Bug#2578)
- Fixed failover always going to last host in list. (Bug#2578)
- Detect `on/off` or `1, 2, 3` form of `lower_case_table_names` value on server. (Bug#2578)
- `AutoReconnect` time was growing faster than exponentially. (Bug#2447)
- Trigger a `SET NAMES utf8` when encoding is forced to `utf8` or `utf-8` via the `characterEncoding` property. Previously, only the Java-style encoding name of `utf-8` would trigger this.

E.6.4.8. Changes in MySQL Connector/J 3.0.10 (13 January 2004)

Bugs fixed:

- Enable caching of the parsing stage of prepared statements via the `cachePrepStmts`, `prepStmtCacheSize`, and `prepStmtCacheSqlLimit` properties (disabled by default). (Bug#2006)
- Fixed security exception when used in Applets (applets can't read the system property `file.encoding` which is needed for `LOAD DATA LOCAL INFILE`). (Bug#2006)
- Speed up parsing of `PreparedStatements`, try to use one-pass whenever possible. (Bug#2006)
- Fixed exception `Unknown character set 'danish'` on connect with JDK-1.4.0 (Bug#2006)
- Fixed mappings in `SQLException` to report deadlocks with `SQLStates` of `41000`. (Bug#2006)
- Removed static synchronization bottleneck from instance factory method of `SingleByteCharsetConverter`. (Bug#2006)
- Removed static synchronization bottleneck from `PreparedStatement.setTimestamp()`. (Bug#2006)
- `ResultSet.findColumn()` should use first matching column name when there are duplicate column names in `SELECT` query (JDBC-compliance). (Bug#2006)
- `maxRows` property would affect internal statements, so check it for all statement creation internal to the driver, and set to 0 when it is not. (Bug#2006)
- Use constants for `SQLStates`. (Bug#2006)
- Map charset `ko18_ru` to `ko18r` when connected to MySQL-4.1.0 or newer. (Bug#2006)
- Ensure that `Buffer.writeString()` saves room for the `\0`. (Bug#2006)
- `ArrayIndexOutOfBoundsException` when parameter number == number of parameters + 1. (Bug#1958)
- Connection property `maxRows` not honored. (Bug#1933)
- Statements being created too many times in `DBMD.extractForeignKeyFromCreateTable()`. (Bug#1925)
- Support escape sequence `{fn convert ... }`. (Bug#1914)
- Implement `ResultSet.updateClob()`. (Bug#1913)
- Autoreconnect code didn't set catalog upon reconnect if it had been changed. (Bug#1913)
- `ResultSet.getObject()` on `TINYINT` and `SMALLINT` columns should return Java type `Integer`. (Bug#1913)
- Added more descriptive error message `Server Configuration Denies Access to DataSource`, as well as retrieval of message from server. (Bug#1913)
- `ResultSetMetaData.isCaseSensitive()` returned wrong value for `CHAR/VARCHAR` columns. (Bug#1913)
- Added `alwaysClearStream` connection property, which causes the driver to always empty any remaining data on the input

stream before each query. (Bug#1913)

- `DatabaseMetaData.getSystemFunction()` returning bad function `VResultsSion`. (Bug#1775)
- Foreign Keys column sequence is not consistent in `DatabaseMetaData.getImported/Exported/CrossReference()`. (Bug#1731)
- Fix for `ArrayIndexOutOfBoundsException` exception when using `Statement.setMaxRows()`. (Bug#1695)
- Subsequent call to `ResultSet.updateFoo()` causes NPE if result set is not updatable. (Bug#1630)
- Fix for 4.1.1-style authentication with no password. (Bug#1630)
- Cross-database updatable result sets are not checked for updatability correctly. (Bug#1592)
- `DatabaseMetaData.getColumns()` should return `Types.LONGVARCHAR` for MySQL `LONGTEXT` type. (Bug#1592)
- Fixed regression of `Statement.getGeneratedKeys()` and `REPLACE` statements. (Bug#1576)
- Barge blobs and split packets not being read correctly. (Bug#1576)
- Backported fix for aliased tables and `UpdatableResultSets` in `checkUpdatability()` method from 3.1 branch. (Bug#1534)
- “Friendlier” exception message for `PacketTooLargeException`. (Bug#1534)
- Don't count quoted IDs when inside a 'string' in `PreparedStatement` parsing. (Bug#1511)

E.6.4.9. Changes in MySQL Connector/J 3.0.9 (07 October 2003)

Bugs fixed:

- `ResultSet.get/setString` mashing char 127. (Bug#1247)
- Added property to “clobber” streaming results, by setting the `clobberStreamingResults` property to `true` (the default is `false`). This will cause a “streaming” `ResultSet` to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server. (Bug#1247)
- Added `com.mysql.jdbc.util.BaseBugReport` to help creation of testcases for bug reports. (Bug#1247)
- Backported authentication changes for 4.1.1 and newer from 3.1 branch. (Bug#1247)
- Made `databaseName`, `portNumber`, and `serverName` optional parameters for `MysqlDataSourceFactory`. (Bug#1246)
- Optimized `CLOB.setCharacterStream()`. (Bug#1131)
- Fixed `CLOB.truncate()`. (Bug#1130)
- Fixed deadlock issue with `Statement.setMaxRows()`. (Bug#1099)
- `DatabaseMetaData.getColumns()` getting confused about the keyword “set” in character columns. (Bug#1099)
- Clip +/- INF (to smallest and largest representative values for the type in MySQL) and NaN (to 0) for `setDouble/setFloat()`, and issue a warning on the statement when the server does not support +/- INF or NaN. (Bug#884)
- Don't fire connection closed events when closing pooled connections, or on `PooledConnection.getConnection()` with already open connections. (Bug#884)
- Double-escaping of `'\'` when charset is SJIS or GBK and `'\'` appears in non-escaped input. (Bug#879)
- When emptying input stream of unused rows for “streaming” result sets, have the current thread `yield()` every 100 rows in order to not monopolize CPU time. (Bug#879)
- Issue exception on `ResultSet.getXXX()` on empty result set (wasn't caught in some cases). (Bug#848)
- Don't hide messages from exceptions thrown in I/O layers. (Bug#848)
- Fixed regression in large split-packet handling. (Bug#848)

- Better diagnostic error messages in exceptions for “streaming” result sets. ([Bug#848](#))
- Don't change timestamp TZ twice if `useTimezone==true`. ([Bug#774](#))
- Don't wrap `SQLExceptions` in `RowDataDynamic`. ([Bug#688](#))
- Don't try and reset isolation level on reconnect if MySQL doesn't support them. ([Bug#688](#))
- The `insertRow` in an `UpdatableResultSet` is now loaded with the default column values when `moveToInsertRow()` is called. ([Bug#688](#))
- `DatabaseMetaData.getColumns()` wasn't returning `NULL` for default values that are specified as `NULL`. ([Bug#688](#))
- Change default statement type/concurrency to `TYPE_FORWARD_ONLY` and `CONCUR_READ_ONLY` (spec compliance). ([Bug#688](#))
- Fix `UpdatableResultSet` to return values for `getXXX()` when on insert row. ([Bug#675](#))
- Support `InnoDB` constraint names when extracting foreign key information in `DatabaseMetaData` (implementing ideas from Parwinder Sekhon). ([Bug#664](#), [Bug#517](#))
- Backported 4.1 protocol changes from 3.1 branch (server-side SQL states, new field information, larger client capability flags, connect-with-database, and so forth). ([Bug#664](#), [Bug#517](#))
- `refreshRow` didn't work when primary key values contained values that needed to be escaped (they ended up being doubly escaped). ([Bug#661](#))
- Fixed `ResultSet.previous()` behavior to move current position to before result set when on first row of result set. ([Bug#496](#))
- Fixed `Statement` and `PreparedStatement` issuing bogus queries when `setMaxRows()` had been used and a `LIMIT` clause was present in the query. ([Bug#496](#))
- Faster date handling code in `ResultSet` and `PreparedStatement` (no longer uses `Date` methods that synchronize on static calendars).
- Fixed test for end of buffer in `Buffer.readString()`.

E.6.4.10. Changes in MySQL Connector/J 3.0.8 (23 May 2003)

Bugs fixed:

- Fixed SJIS encoding bug, thanks to Naoto Sato. ([Bug#378](#))
- Fix problem detecting server character set in some cases. ([Bug#378](#))
- Allow multiple calls to `Statement.close()`. ([Bug#378](#))
- Return correct number of generated keys when using `REPLACE` statements. ([Bug#378](#))
- Unicode character `0xFFFF` in a string would cause the driver to throw an `ArrayOutOfBoundsException`. ([Bug#378](#))
- Fix row data decoding error when using *very* large packets. ([Bug#378](#))
- Optimized row data decoding. ([Bug#378](#))
- Issue exception when operating on an already closed prepared statement. ([Bug#378](#))
- Optimized usage of `EscapeProcessor`. ([Bug#378](#))
- Use JVM charset with filenames and `LOAD DATA [LOCAL] INFILE`.
- Fix infinite loop with `Connection.cleanup()`.
- Changed Ant target `compile-core` to `compile-driver`, and made testsuite compilation a separate target.
- Fixed result set not getting set for `Statement.executeUpdate()`, which affected `getGeneratedKeys()` and `getUpdateCount()` in some cases.
- Return list of generated keys when using multi-value `INSERTS` with `Statement.getGeneratedKeys()`.

- Allow bogus URLs in `Driver.getPropertyInfo()`.

E.6.4.11. Changes in MySQL Connector/J 3.0.7 (08 April 2003)

Bugs fixed:

- Fixed charset issues with database metadata (charset was not getting set correctly).
- You can now toggle profiling on/off using `Connection.setProfileSql(boolean)`.
- 4.1 Column Metadata fixes.
- Fixed `MysqlPooledConnection.close()` calling wrong event type.
- Fixed `StringIndexOutOfBoundsException` in `PreparedStatement.setClob()`.
- `IOExceptions` during a transaction now cause the `Connection` to be closed.
- Remove synchronization from `Driver.connect()` and `Driver.acceptsUrl()`.
- Fixed missing conversion for `YEAR` type in `ResultSetMetaData.getColumnTypeName()`.
- Updatable `ResultSets` can now be created for aliased tables/columns when connected to MySQL-4.1 or newer.
- Fixed `LOAD DATA LOCAL INFILE` bug when file > `max_allowed_packet`.
- Don't pick up indexes that start with `pri` as primary keys for `DBMD.getPrimaryKeys()`.
- Ensure that packet size from `alignPacketSize()` does not exceed `max_allowed_packet` (JVM bug)
- Don't reset `Connection.isReadOnly()` when autoReconnecting.
- Fixed escaping of `0x5c ('\\')` character for GBK and Big5 charsets.
- Fixed `ResultSet.getTimestamp()` when underlying field is of type `DATE`.
- Throw `SQLExceptions` when trying to do operations on a forcefully closed `Connection` (that is, when a communication link failure occurs).

E.6.4.12. Changes in MySQL Connector/J 3.0.6 (18 February 2003)

Bugs fixed:

- Backported 4.1 charset field info changes from Connector/J 3.1.
- Fixed `Statement.setMaxRows()` to stop sending `LIMIT` type queries when not needed (performance).
- Fixed `DBMD.getTypeInfo()` and `DBMD.getColumns()` returning different value for precision in `TEXT` and `BLOB` types.
- Fixed `SQLExceptions` getting swallowed on initial connect.
- Fixed `ResultSetMetaData` to return "" when catalog not known. Fixes `NullPointerExceptions` with Sun's `CachedRowSet`.
- Allow ignoring of warning for “non transactional tables” during rollback (compliance/usability) by setting `ignoreNonTxTables` property to `true`.
- Clean up `Statement` query/method mismatch tests (that is, `INSERT` not allowed with `.executeQuery()`).
- Fixed `ResultSetMetaData.isWritable()` to return correct value.
- More checks added in `ResultSet` traversal method to catch when in closed state.
- Implemented `Blob.setBytes()`. You still need to pass the resultant `Blob` back into an updatable `ResultSet` or `PreparedStatement` to persist the changes, because MySQL does not support “locators”.

- Add “window” of different `NULL` sorting behavior to `DBMD.nullsAreSortedAtStart` (4.0.2 to 4.0.10, true; otherwise, no).

E.6.4.13. Changes in MySQL Connector/J 3.0.5 (22 January 2003)

Bugs fixed:

- Fixed `ResultSet.isBeforeFirst()` for empty result sets.
- Added missing `LONGTEXT` type to `DBMD.getColumns()`.
- Implemented an empty `TypeMap` for `Connection.getTypeMap()` so that some third-party apps work with MySQL (IBM WebSphere 5.0 Connection pool).
- Added update options for foreign key metadata.
- Fixed `Buffer.fastSkipLenString()` causing `ArrayIndexOutOfBoundsException` exceptions with some queries when unpacking fields.
- Quote table names in `DatabaseMetaData.getColumns()`, `getPrimaryKeys()`, `getIndexInfo()`, `getBestRowIdentifier()`.
- Retrieve `TX_ISOLATION` from database for `Connection.getTransactionIsolation()` when the MySQL version supports it, instead of an instance variable.
- Greatly reduce memory required for `setBinaryStream()` in `PreparedStatement`.

E.6.4.14. Changes in MySQL Connector/J 3.0.4 (06 January 2003)

Bugs fixed:

- Streamlined character conversion and `byte[]` handling in `PreparedStatement` for `setByte()`.
- Fixed `PreparedStatement.executeBatch()` parameter overwriting.
- Added quoted identifiers to database names for `Connection.setCatalog`.
- Added support for 4.0.8-style large packets.
- Reduce memory footprint of `PreparedStatement` by sharing outbound packet with `MySQLIO`.
- Added `strictUpdates` property to allow control of amount of checking for “correctness” of updatable result sets. Set this to `false` if you want faster updatable result sets and you know that you create them from `SELECT` statements on tables with primary keys and that you have selected all primary keys in your query.
- Added support for quoted identifiers in `PreparedStatement` parser.

E.6.4.15. Changes in MySQL Connector/J 3.0.3 (17 December 2002)

Bugs fixed:

- Allow user to alter behavior of `Statement/PreparedStatement.executeBatch()` via `continueBatchOnError` property (defaults to `true`).
- More robust escape tokenizer: Recognize `--` comments, and allow nested escape sequences (see `test-suite.EscapeProcessingTest`).
- Fixed `Buffer.isLastDataPacket()` for 4.1 and newer servers.
- `NamedPipeSocketFactory` now works (only intended for Windows), see `README` for instructions.
- Changed `charsToByte` in `SingleByteCharConverter` to be non-static.
- Use non-aliased table/column names and database names to fully qualify tables and columns in `UpdatableResultSet` (requires MySQL-4.1 or newer).

- `LOAD DATA LOCAL INFILE ...` now works, if your server is configured to allow it. Can be turned off with the `allowLoadLocalInfile` property (see the [README](#)).
- Implemented `Connection.nativeSQL()`.
- Fixed `ResultSetMetaData.getColumnTypeName()` returning `BLOB` for `TEXT` and `TEXT` for `BLOB` types.
- Fixed charset handling in `Fields.java`.
- Because of above, implemented `ResultSetMetaData.isAutoIncrement()` to use `Field.isAutoIncrement()`.
- Substitute '?' for unknown character conversions in single-byte character sets instead of '\\0'.
- Added `CLIENT_LONG_FLAG` to be able to get more column flags (`isAutoIncrement()` being the most important).
- Honor `lower_case_table_names` when enabled in the server when doing table name comparisons in `DatabaseMetaData` methods.
- `DBMD.getImported/ExportedKeys()` now handles multiple foreign keys per table.
- More robust implementation of updatable result sets. Checks that *all* primary keys of the table have been selected.
- Some MySQL-4.1 protocol support (extended field info from selects).
- Check for connection closed in more `Connection` methods (`createStatement`, `prepareStatement`, `setTransactionIsolation`, `setAutoCommit`).
- Fixed `ResultSetMetaData.getPrecision()` returning incorrect values for some floating-point types.
- Changed `SingleByteCharConverter` to use lazy initialization of each converter.

E.6.4.16. Changes in MySQL Connector/J 3.0.2 (08 November 2002)

Bugs fixed:

- Implemented `Clob.setString()`.
- Added `com.mysql.jdbc.MiniAdmin` class, which allows you to send `shutdown` command to MySQL server. This is intended to be used when “embedding” Java and MySQL server together in an end-user application.
- Added SSL support. See [README](#) for information on how to use it.
- All `DBMD` result set columns describing schemas now return `NULL` to be more compliant with the behavior of other JDBC drivers for other database systems (MySQL does not support schemas).
- Use `SHOW CREATE TABLE` when possible for determining foreign key information for `DatabaseMetaData`. Also allows cascade options for `DELETE` information to be returned.
- Implemented `Clob.setCharacterStream()`.
- Failover and `autoReconnect` work only when the connection is in an `autoCommit(false)` state, in order to stay transaction-safe.
- Fixed `DBMD.supportsResultSetConcurrency()` so that it returns `true` for `ResultSet.TYPE_SCROLL_INSENSITIVE` and `ResultSet.CONCUR_READ_ONLY` or `ResultSet.CONCUR_UPDATABLE`.
- Implemented `Clob.setAsciiStream()`.
- Removed duplicate code from `UpdatableResultSet` (it can be inherited from `ResultSet`, the extra code for each method to handle updatability I thought might someday be necessary has not been needed).
- Fixed `UnsupportedEncodingException` thrown when “forcing” a character encoding via properties.
- Fixed incorrect conversion in `ResultSet.getLong()`.
- Implemented `ResultSet.updateBlob()`.
- Removed some not-needed temporary object creation by smarter use of `Strings` in `EscapeProcessor`, `Connection` and `DatabaseMetaData` classes.

- Escape `0x5c` character in strings for the SJIS charset.
- `PreparedStatement` now honors stream lengths in `setBinary/Ascii/Character Stream()` unless you set the connection property `useStreamLengthsInPrepStmts` to `false`.
- Fixed issue with updatable result sets and `PreparedStatements` not working.
- Fixed start position off-by-1 error in `Clob.getSubString()`.
- Added `connectTimeout` parameter that allows users of JDK-1.4 and newer to specify a maximum time to wait to establish a connection.
- Fixed various non-ASCII character encoding issues.
- Fixed `ResultSet.isLast()` for empty result sets (should return `false`).
- Added driver property `useHostsInPrivileges`. Defaults to `true`. Affects whether or not `@hostname` will be used in `DBMD.getColumn/TablePrivileges`.
- Fixed `ResultSet.setFetchDirection(FETCH_UNKNOWN)`.
- Added `queriesBeforeRetryMaster` property that specifies how many queries to issue when failed over before attempting to reconnect to the master (defaults to 50).
- Fixed issue when calling `Statement.setFetchSize()` when using arbitrary values.
- Properly restore connection properties when `autoReconnecting` or failing-over, including `autoCommit` state, and isolation level.
- Implemented `Clob.truncate()`.

E.6.4.17. Changes in MySQL Connector/J 3.0.1 (21 September 2002)

Bugs fixed:

- Charsets now automatically detected. Optimized code for single-byte character set conversion.
- Fixed `ResultSetMetaData.isSigned()` for `TINYINT` and `BIGINT`.
- Fixed `RowDataStatic.getAt()` off-by-one bug.
- Fixed `ResultSet.getRow()` off-by-one bug.
- Massive code clean-up to follow Java coding conventions (the time had come).
- Implemented `ResultSet.getCharacterStream()`.
- Added limited `Clob` functionality (`ResultSet.getClob()`, `PreparedStatement.setClob()`, `PreparedStatement.setObject(Clob)`).
- `Connection.isClosed()` no longer “pings” the server.
- `Connection.close()` issues `rollback()` when `getAutoCommit()` is `false`.
- Added `socketTimeout` parameter to URL.
- Added `LOCAL TEMPORARY` to table types in `DatabaseMetaData.getTableTypes()`.
- Added `paranoid` parameter, which sanitizes error messages by removing “sensitive” information from them (such as hostnames, ports, or usernames), as well as clearing “sensitive” data structures when possible.

E.6.4.18. Changes in MySQL Connector/J 3.0.0 (31 July 2002)

Bugs fixed:

- General source-code cleanup.

- The driver now only works with JDK-1.2 or newer.
- Fix and sort primary key names in `DBMetaData` (SF bugs 582086 and 582086).
- `ResultSet.getTimestamp()` now works for `DATE` types (SF bug 559134).
- Float types now reported as `java.sql.Types.FLOAT` (SF bug 579573).
- Support for streaming (row-by-row) result sets (see [README](#)) Thanks to Doron.
- Testsuite now uses Junit (which you can get from <http://www.junit.org>).
- JDBC Compliance: Passes all tests besides stored procedure tests.
- `ResultSet.getDate/Time/Timestamp` now recognizes all forms of invalid values that have been set to all zeros by MySQL (SF bug 586058).
- Added multi-host failover support (see [README](#)).
- Repackaging: New driver name is `com.mysql.jdbc.Driver`, old name still works, though (the driver is now provided by MySQL-AB).
- Support for large packets (new addition to MySQL-4.0 protocol), see [README](#) for more information.
- Better checking for closed connections in `Statement` and `PreparedStatement`.
- Performance improvements in string handling and field metadata creation (lazily instantiated) contributed by Alex Twisleton-Wykeham-Fiennes.
- JDBC-3.0 functionality including `Statement/PreparedStatement.getGeneratedKeys()` and `ResultSet.getURL()`.
- Overall speed improvements via controlling transient object creation in `MySQLIO` class when reading packets.
- **!!! LICENSE CHANGE !!!** The driver is now GPL. If you need non-GPL licenses, please contact me [<mark@mysql.com>](mailto:mark@mysql.com).
- Performance enhancements: Driver is now 50–100% faster in most situations, and creates fewer temporary objects.

E.6.5. Changes in MySQL Connector/J 2.0.x

E.6.5.1. Changes in MySQL Connector/J 2.0.14 (16 May 2002)

Bugs fixed:

- `ResultSet.getDouble()` now uses code built into JDK to be more precise (but slower).
- Fixed typo for `relaxAutoCommit` parameter.
- `LogicalHandle.isClosed()` calls through to physical connection.
- Added SQL profiling (to `STDERR`). Set `profileSql=true` in your JDBC URL. See [README](#) for more information.
- `PreparedStatement` now releases resources on `.close()`. (SF bug 553268)
- More code cleanup.
- Quoted identifiers not used if server version does not support them. Also, if server started with `--ansi` or `--sql-mode=ANSI_QUOTES`, “” will be used as an identifier quote character, otherwise “'” will be used.

E.6.5.2. Changes in MySQL Connector/J 2.0.13 (24 April 2002)

Bugs fixed:

- Fixed unicode chars being read incorrectly. (SF bug 541088)
- Faster blob escaping for `PrepStmt`.

- Added `setURL()` to `MySQLXADataSource`. (SF bug 546019)
- Added `set/getPortNumber()` to `DataSource(s)`. (SF bug 548167)
- `PreparedStatement.toString()` fixed. (SF bug 534026)
- More code cleanup.
- Rudimentary version of `Statement.getGeneratedKeys()` from JDBC-3.0 now implemented (you need to be using JDK-1.4 for this to work, I believe).
- `DBMetaData.getIndexInfo()` - bad PAGES fixed. (SF BUG 542201)
- `ResultSetMetaData.getColumnClassName()` now implemented.

E.6.5.3. Changes in MySQL Connector/J 2.0.12 (07 April 2002)

Bugs fixed:

- Fixed `testsuite.Traversal afterLast()` bug, thanks to Igor Lastric.
- Added new types to `getTypeInfo()`, fixed existing types thanks to Al Davis and Kid Kalanon.
- Fixed time zone off-by-1-hour bug in `PreparedStatement` (538286, 528785).
- Added identifier quoting to all `DatabaseMetaData` methods that need them (should fix 518108).
- Added support for `BIT` types (51870) to `PreparedStatement`.
- `ResultSet.insertRow()` should now detect `auto_increment` fields in most cases and use that value in the new row. This detection will not work in multi-valued keys, however, due to the fact that the MySQL protocol does not return this information.
- Relaxed synchronization in all classes, should fix 520615 and 520393.
- `DataSources` - fixed `setUrl` bug (511614, 525565), wrong datasource class name (532816, 528767).
- Added support for `YEAR` type (533556).
- Fixes for `ResultSet` updatability in `PreparedStatement`.
- `ResultSet`: Fixed updatability (values being set to `null` if not updated).
- Added `getTable/ColumnPrivileges()` to `DBMD` (fixes 484502).
- Added `getIdleFor()` method to `Connection` and `MysqlLogicalHandle`.
- `ResultSet.refreshRow()` implemented.
- Fixed `getRow()` bug (527165) in `ResultSet`.
- General code cleanup.

E.6.5.4. Changes in MySQL Connector/J 2.0.11 (27 January 2002)

Bugs fixed:

- Full synchronization of `Statement.java`.
- Fixed missing `DELETE_RULE` value in `DBMD.getImported/ExportedKeys()` and `getCrossReference()`.
- More changes to fix `Unexpected end of input stream` errors when reading `BLOB` values. This should be the last fix.

E.6.5.5. Changes in MySQL Connector/J 2.0.10 (24 January 2002)

Bugs fixed:

- Fixed null-pointer-exceptions when using `MySQLConnectionPoolDataSource` with Websphere 4 (bug 505839).
- Fixed spurious `Unexpected end of input stream` errors in `MySQLIO` (bug 507456).

E.6.5.6. Changes in MySQL Connector/J 2.0.9 (13 January 2002)

Bugs fixed:

- Fixed extra memory allocation in `MySQLIO.readPacket()` (bug 488663).
- Added detection of network connection being closed when reading packets (thanks to Todd Lizambri).
- Fixed casting bug in `PreparedStatement` (bug 488663).
- `DataSource` implementations moved to `org.gjt.mm.mysql.jdbc2.optional` package, and (initial) implementations of `PooledConnectionDataSource` and `XADataSource` are in place (thanks to Todd Wolff for the implementation and testing of `PooledConnectionDataSource` with IBM WebSphere 4).
- Fixed quoting error with escape processor (bug 486265).
- Removed concatenation support from driver (the `||` operator), as older versions of VisualAge seem to be the only thing that use it, and it conflicts with the logical `||` operator. You will need to start `mysqld` with the `--ansi` flag to use the `||` operator as concatenation (bug 491680).
- `Ant` build was corrupting included `jar` files, fixed (bug 487669).
- Report batch update support through `DatabaseMetaData` (bug 495101).
- Implementation of `DatabaseMetaData.getExported/ImportedKeys()` and `getCrossReference()`.
- Fixed off-by-one-hour error in `PreparedStatement.setTimestamp()` (bug 491577).
- Full synchronization on methods modifying instance and class-shared references, driver should be entirely thread-safe now (please let me know if you have problems).

E.6.5.7. Changes in MySQL Connector/J 2.0.8 (25 November 2001)

Bugs fixed:

- `XADataSource/ConnectionPoolDataSource` code (experimental)
- `DatabaseMetaData.getPrimaryKeys()` and `getBestRowIdentifier()` are now more robust in identifying primary keys (matches regardless of case or abbreviation/full spelling of `Primary Key` in `Key_type` column).
- Batch updates now supported (thanks to some inspiration from Daniel Rall).
- `PreparedStatement.setAnyNumericType()` now handles positive exponents correctly (adds `+` so MySQL can understand it).

E.6.5.8. Changes in MySQL Connector/J 2.0.7 (24 October 2001)

Bugs fixed:

- Character sets read from database if `useUnicode=true` and `characterEncoding` is not set. (thanks to Dmitry Vereshchagin)
- Initial transaction isolation level read from database (if available). (thanks to Dmitry Vereshchagin)
- Fixed `PreparedStatement` generating SQL that would end up with syntax errors for some queries.
- `PreparedStatement.setCharacterStream()` now implemented
- Capitalize type names when `capitalizeTypeNames=true` is passed in URL or properties (for `WebObjects`). (thanks to Anjo Krank)

- `ResultSet.getBlob()` now returns `null` if column value was `null`.
- Fixed `ResultSetMetaData.getPrecision()` returning one less than actual on newer versions of MySQL.
- Fixed dangling socket problem when in high availability (`autoReconnect=true`) mode, and finalizer for `Connection` will close any dangling sockets on GC.
- Fixed time zone issue in `PreparedStatement.setTimestamp()`. (thanks to Erik Olofsson)
- `PreparedStatement.setDouble()` now uses full-precision doubles (reverting a fix made earlier to truncate them).
- Fixed `DatabaseMetaData.supportsTransactions()`, and `supportsTransactionIsolationLevel()` and `getTypeInfo()` `SQL_DATETIME_SUB` and `SQL_DATA_TYPE` fields not being readable.
- Updatable result sets now correctly handle `NULL` values in fields.
- `PreparedStatement.setBoolean()` will use 1/0 for values if your MySQL version is 3.21.23 or higher.
- Fixed `ResultSet.isAfterLast()` always returning `false`.

E.6.5.9. Changes in MySQL Connector/J 2.0.6 (16 June 2001)

Bugs fixed:

- Fixed `PreparedStatement` parameter checking.
- Fixed case-sensitive column names in `ResultSet.java`.

E.6.5.10. Changes in MySQL Connector/J 2.0.5 (13 June 2001)

Bugs fixed:

- `ResultSet.insertRow()` works now, even if not all columns are set (they will be set to `NULL`).
- Added `Byte` to `PreparedStatement.setObject()`.
- Fixed data parsing of `TIMESTAMP` values with 2-digit years.
- Added `ISOLATION` level support to `Connection.setIsolationLevel()`
- `DatabaseMetaData.getCrossReference()` no longer `ArrayIndexOOB`.
- `ResultSet.getBoolean()` now recognizes `-1` as `true`.
- `ResultSet` has `+/-Inf/inf` support.
- `getObject()` on `ResultSet` correctly does `TINYINT->Byte` and `SMALLINT->Short`.
- Fixed `ResultSetMetaData.getColumnTypeName` for `TEXT/BLOB`.
- Fixed `ArrayIndexOutOfBoundsException` when sending large `BLOB` queries. (Max size packet was not being set)
- Fixed `NPE` on `PreparedStatement.executeUpdate()` when all columns have not been set.
- Fixed `ResultSet.getBlob()` `ArrayIndex` out-of-bounds.

E.6.5.11. Changes in MySQL Connector/J 2.0.3 (03 December 2000)

Bugs fixed:

- Fixed composite key problem with updatable result sets.
- Faster ASCII string operations.
- Fixed off-by-one error in `java.sql.Blob` implementation code.

- Fixed incorrect detection of `MAX_ALLOWED_PACKET`, so sending large blobs should work now.
- Added detection of `-/+INF` for doubles.
- Added `ultraDevHack` URL parameter, set to `true` to allow (broken) Macromedia UltraDev to use the driver.
- Implemented `getBigDecimal()` without scale component for JDBC2.

E.6.5.12. Changes in MySQL Connector/J 2.0.1 (06 April 2000)

Bugs fixed:

- Columns that are of type `TEXT` now return as `Strings` when you use `getObject()`.
- Cleaned up exception handling when driver connects.
- Fixed `RSMD.isWritable()` returning wrong value. Thanks to Moritz Maass.
- `DatabaseMetaData.getPrimaryKeys()` now works correctly with respect to `key_seq`. Thanks to Brian Slesinsky.
- Fixed many JDBC-2.0 traversal, positioning bugs, especially with respect to empty result sets. Thanks to Ron Smits, Nick Brook, Cessar Garcia and Carlos Martinez.
- No escape processing is done on `PreparedStatement` anymore per JDBC spec.
- Fixed some issues with updatability support in `ResultSet` when using multiple primary keys.

E.6.5.13. Changes in MySQL Connector/J 2.0.0pre5 (21 February 2000)

- Fixed Bad Handshake problem.

E.6.5.14. Changes in MySQL Connector/J 2.0.0pre4 (10 January 2000)

- Fixes to `ResultSet` for `insertRow()` - Thanks to Cesar Garcia
- Fix to Driver to recognize JDBC-2.0 by loading a JDBC-2.0 class, instead of relying on JDK version numbers. Thanks to John Baker.
- Fixed `ResultSet` to return correct row numbers
- `Statement.getUpdateCount()` now returns rows matched, instead of rows actually updated, which is more SQL-92 like.

10-29-99

- `Statement/PreparedStatement.getMoreResults()` bug fixed. Thanks to Noel J. Bergman.
- Added `Short` as a type to `PreparedStatement.setObject()`. Thanks to Jeff Crowder
- Driver now automatically configures maximum/preferred packet sizes by querying server.
- Autoreconnect code uses fast ping command if server supports it.
- Fixed various bugs with respect to packet sizing when reading from the server and when alloc'ing to write to the server.

E.6.5.15. Changes in MySQL Connector/J 2.0.0pre (17 August 1999)

- Now compiles under JDK-1.2. The driver supports both JDK-1.1 and JDK-1.2 at the same time through a core set of classes. The driver will load the appropriate interface classes at runtime by figuring out which JVM version you are using.
- Fixes for result sets with all nulls in the first row. (Pointed out by Tim Endres)

- Fixes to column numbers in SQLExceptions in ResultSet (Thanks to Blas Rodriguez Somoza)
- The database no longer needs to be specified to connect. (Thanks to Christian Motschke)

E.6.6. Changes in MySQL Connector/J 1.2b (04 July 1999)

- Better Documentation (in progress), in doc/mm.doc/book1.html
- DBMD now allows null for a column name pattern (not in spec), which it changes to '%'
- DBMD now has correct types/lengths for getXXX().
- ResultSet.getDate(), getTime(), and getTimestamp() fixes. (contributed by Alan Wilken)
- EscapeProcessor now handles \{ \} and { or } inside quotes correctly. (thanks to Alik for some ideas on how to fix it)
- Fixes to properties handling in Connection. (contributed by Juho Tikkala)
- ResultSet.getObject() now returns null for NULL columns in the table, rather than bombing out. (thanks to Ben Grosman)
- ResultSet.getObject() now returns Strings for types from MySQL that it doesn't know about. (Suggested by Chris Perdue)
- Removed DataInput/Output streams, not needed, 1/2 number of method calls per IO operation.
- Use default character encoding if one is not specified. This is a work-around for broken JVMs, because according to spec, EVERY JVM must support "ISO8859_1", but they don't.
- Fixed Connection to use the platform character encoding instead of "ISO8859_1" if one isn't explicitly set. This fixes problems people were having loading the character- converter classes that didn't always exist (JVM bug). (thanks to Fritz Elfert for pointing out this problem)
- Changed MySQLIO to re-use packets where possible to reduce memory usage.
- Fixed escape-processor bugs pertaining to { } inside quotes.

E.6.7. Changes in MySQL Connector/J 1.2.x and lower

E.6.7.1. Changes in MySQL Connector/J 1.2a (14 April 1999)

- Fixed character-set support for non-Javasoft JVMs (thanks to many people for pointing it out)
- Fixed ResultSet.getBoolean() to recognize 'y' & 'n' as well as '1' & '0' as boolean flags. (thanks to Tim Pizey)
- Fixed ResultSet.getTimestamp() to give better performance. (thanks to Richard Swift)
- Fixed getByte() for numeric types. (thanks to Ray Bellis)
- Fixed DatabaseMetaData.getTypeInfo() for DATE type. (thanks to Paul Johnston)
- Fixed EscapeProcessor for "fn" calls. (thanks to Piyush Shah at locomotive.org)
- Fixed EscapeProcessor to not do extraneous work if there are no escape codes. (thanks to Ryan Gustafson)
- Fixed Driver to parse URLs of the form "jdbc:mysql://host:port" (thanks to Richard Lobb)

E.6.7.2. Changes in MySQL Connector/J 1.1i (24 March 1999)

- Fixed Timestamps for PreparedStatements
- Fixed null pointer exceptions in RSMD and RS
- Re-compiled with jikes for valid class files (thanks ms!)

E.6.7.3. Changes in MySQL Connector/J 1.1h (08 March 1999)

- Fixed escape processor to deal with unmatched { and } (thanks to Craig Coles)
- Fixed escape processor to create more portable (between DATETIME and TIMESTAMP types) representations so that it will work with BETWEEN clauses. (thanks to Craig Longman)
- MysqlIO.quit() now closes the socket connection. Before, after many failed connections some OS's would run out of file descriptors. (thanks to Michael Brinkman)
- Fixed NullPointerException in Driver.getPropertyInfo. (thanks to Dave Potts)
- Fixes to MysqlDefs to allow all *text fields to be retrieved as Strings. (thanks to Chris at Leverage)
- Fixed setDouble in PreparedStatement for large numbers to avoid sending scientific notation to the database. (thanks to J.S. Ferguson)
- Fixed getScale() and getPrecision() in RSMD. (contrib'd by James Klicman)
- Fixed getObject() when field was DECIMAL or NUMERIC (thanks to Bert Hobbs)
- DBMD.getTables() bombed when passed a null table-name pattern. Fixed. (thanks to Richard Lobb)
- Added check for "client not authorized" errors during connect. (thanks to Hannes Wallnoefer)

E.6.7.4. Changes in MySQL Connector/J 1.1g (19 February 1999)

- Result set rows are now byte arrays. Blobs and Unicode work bidirectionally now. The useUnicode and encoding options are implemented now.
- Fixes to PreparedStatement to send binary set by setXXXStream to be sent untouched to the MySQL server.
- Fixes to getDriverPropertyInfo().

E.6.7.5. Changes in MySQL Connector/J 1.1f (31 December 1998)

- Changed all ResultSet fields to Strings, this should allow Unicode to work, but your JVM must be able to convert between the character sets. This should also make reading data from the server be a bit quicker, because there is now no conversion from StringBuffer to String.
- Changed PreparedStatement.streamToString() to be more efficient (code from Uwe Schaefer).
- URL parsing is more robust (throws SQL exceptions on errors rather than NullPointerExceptions)
- PreparedStatement now can convert Strings to Time/Date values via setObject() (code from Robert Currey).
- IO no longer hangs in Buffer.readInt(), that bug was introduced in 1.1d when changing to all byte-arrays for result sets. (Pointed out by Samo Login)

E.6.7.6. Changes in MySQL Connector/J 1.1b (03 November 1998)

- Fixes to DatabaseMetaData to allow both IBM VA and J-Builder to work. Let me know how it goes. (thanks to Jac Kersing)
- Fix to ResultSet.getBoolean() for NULL strings (thanks to Barry Lagerweij)
- Beginning of code cleanup, and formatting. Getting ready to branch this off to a parallel JDBC-2.0 source tree.
- Added "final" modifier to critical sections in MysqlIO and Buffer to allow compiler to inline methods for speed.

9-29-98

- If object references passed to setXXX() in PreparedStatement are null, setNull() is automatically called for you. (Thanks for the

suggestion goes to Erik Ostrom)

- setObject() in PreparedStatement will now attempt to write a serialized representation of the object to the database for objects of Types.OTHER and objects of unknown type.
- Util now has a static method readObject() which given a ResultSet and a column index will re-instantiate an object serialized in the above manner.

E.6.7.7. Changes in MySQL Connector/J 1.1 (02 September 1998)

- Got rid of "ugly hack" in MySQLIO.nextRow(). Rather than catch an exception, Buffer.isLastDataPacket() was fixed.
- Connection.getCatalog() and Connection.setCatalog() should work now.
- Statement.setMaxRows() works, as well as setting by property maxRows. Statement.setMaxRows() overrides maxRows set via properties or url parameters.
- Automatic re-connection is available. Because it has to "ping" the database before each query, it is turned off by default. To use it, pass in "autoReconnect=true" in the connection URL. You may also change the number of reconnect tries, and the initial timeout value via "maxReconnects=n" (default 3) and "initialTimeout=n" (seconds, default 2) parameters. The timeout is an exponential backoff type of timeout; for example, if you have initial timeout of 2 seconds, and maxReconnects of 3, then the driver will timeout 2 seconds, 4 seconds, then 16 seconds between each re-connection attempt.

E.6.7.8. Changes in MySQL Connector/J 1.0 (24 August 1998)

- Fixed handling of blob data in Buffer.java
- Fixed bug with authentication packet being sized too small.
- The JDBC Driver is now under the LPGL

8-14-98

- Fixed Buffer.readLenString() to correctly read data for BLOBS.
- Fixed PreparedStatement.stringToStream to correctly read data for BLOBS.
- Fixed PreparedStatement.setDate() to not add a day. (above fixes thanks to Vincent Partington)
- Added URL parameter parsing (?user=... and so forth).

E.6.7.9. Changes in MySQL Connector/J 0.9d (04 August 1998)

- Big news! New package name. Tim Endres from ICE Engineering is starting a new source tree for GNU GPL'd Java software. He's graciously given me the org.gjt.mm package directory to use, so now the driver is in the org.gjt.mm.mysql package scheme. I'm "legal" now. Look for more information on Tim's project soon.
- Now using dynamically sized packets to reduce memory usage when sending commands to the DB.
- Small fixes to getTypeInfo() for parameters, and so forth.
- DatabaseMetaData is now fully implemented. Let me know if these drivers work with the various IDEs out there. I've heard that they're working with JBuilder right now.
- Added JavaDoc documentation to the package.
- Package now available in .zip or .tar.gz.

E.6.7.10. Changes in MySQL Connector/J 0.9 (28 July 1998)

- Implemented getTypeInfo(). Connection.rollback() now throws an SQLException per the JDBC spec.

- Added PreparedStatement that supports all JDBC API methods for PreparedStatement including InputStreams. Please check this out and let me know if anything is broken.
- Fixed a bug in ResultSet that would break some queries that only returned 1 row.
- Fixed bugs in DatabaseMetaData.getTables(), DatabaseMetaData.getColumns() and DatabaseMetaData.getCatalogs().
- Added functionality to Statement that allows executeUpdate() to store values for IDs that are automatically generated for AUTO_INCREMENT fields. Basically, after an executeUpdate(), look at the SQLWarnings for warnings like "LAST_INSERTED_ID = 'some number', COMMAND = 'your SQL query'". If you are using AUTO_INCREMENT fields in your tables and are executing a lot of executeUpdate(s) on one Statement, be sure to clearWarnings() every so often to save memory.

E.6.7.11. Changes in MySQL Connector/J 0.8 (06 July 1998)

- Split MysqlIO and Buffer to separate classes. Some ClassLoaders gave an IllegalAccessException error for some fields in those two classes. Now mm.mysql works in applets and all classloaders. Thanks to Joe Ennis <jce@mail.boone.com> for pointing out the problem and working on a fix with me.

E.6.7.12. Changes in MySQL Connector/J 0.7 (01 July 1998)

- Fixed DatabaseMetadata problems in getColumns() and bug in switch statement in the Field constructor. Thanks to Costin Manolache <costin@tdiinc.com> for pointing these out.

E.6.7.13. Changes in MySQL Connector/J 0.6 (21 May 1998)

- Incorporated efficiency changes from Richard Swift <Richard.Swift@kanatek.ca> in [MysqlIO.java](#) and [ResultSet.java](#):
- We're now 15% faster than gwe's driver.
- Started working on [DatabaseMetaData](#).
- The following methods are implemented:
 - [getTables\(\)](#)
 - [getTableTypes\(\)](#)
 - [getColumns\(\)](#)
 - [getCatalogs\(\)](#)

E.7. MySQL Connector/MXJ Change History

E.7.1. Changes in MySQL Connector/MXJ 5.0.6 (04 May 2007)

Functionality added or changed:

- Updated internal jar file names to include version information and be more consistent with Connector/J jar naming. For example, [connector-mxj.jar](#) is now [mysql-connector-mxj-\\${mxj-version}.jar](#).
- Updated commercial license files.
- Added copyright notices to some classes which were missing them.
- Added [InitializeUser](#) and [QueryUtil](#) classes to support new feature.
- Added new tests for initial-user & expanded some existing tests.
- [ConnectorMXJUrlTestExample](#) and [ConnectorMXJObjectTestExample](#) now demonstrate the initialization of

user/password and creating the initial database (rather than using "test").

- Added new connection property `initialize-user` which, if set to `true` will remove the default, un-passworded anonymous and root users, and create the user/password from the connection url.
- Removed obsolete field `SimpleMysqldDynamicMBean.lastInvocation`.
- Clarified code in `DefaultsMap.entrySet()`.
- Removed obsolete `PatchedStandardSocketFactory` java file.
- Added `main(String[])` to `com/mysql/management/AllTestsSuite.java`.
- Errors reading `portFile` are now reported using `stacktrace(err)`, previously `System.err` was used.
- `portFile` now contains a new-line to be consistent with `pidFile`.
- Fixed where `versionString.trim()` was ignored.
- Removed references to `File.deleteOnExit`, a warning is printed instead.

Bugs fixed:

- Changed tests to shutdown mysqld prior to deleting files.
- Fixed port file to always be written to datadir.
- Added `os.name-os.arch` to resource directory mapping properties file.
- Swapped out commercial binaries for v5.0.40.
- Delete `portFile` on shutdown.
- Moved `platform-map.properties` into `db-files.jar`.
- Clarified the startup max wait numbers.
- Updated `build.xml` in preparation for next beta build.
- Removed `use-default-architecture` property replaced.
- Added null-check to deal with C/MXJ being loaded by the bootstrap classloaders with JVMs for which `getClassLoader()` returns null.
- Added robustness around reading portfile.
- Removed `PatchedStandardSocketFactory` (fixed in Connector/J 5.0.6).
- Refactored duplication from tests and examples to `QueryUtil`.
- Removed obsolete `InitializePasswordExample`

E.7.2. Changes in MySQL Connector/MXJ 5.0.5 (14 March 2007)

Bugs fixed:

- Moved `MysqldFactory` to main package.
- Reformatting: Added newlines some files which did not end in them.
- Swapped out commercial binaries for v5.0.36.
- Found and removed dynamic linking in `mysql_kill`; updated solution.
- Changed protected constructor of `SimpleMysqldDynamicMBean` from taking a `MysqldResource` to taking a `MysqldFactory`, in order to lay groundwork for addressing BUG discovered by Andrew Rubinger. See: [MySQL Forums](#) (Actual testing with JBoss, and filing a bug, is still required.)

- `build.xml`: `usage` now slightly more verbose; some reformatting.
- Now incorporates Reggie Bennett's `SafeTerminateProcess` and only calls the unsafe `TerminateProcess` as a final last resort.
- New windows `kill.exe` fixes bug where `mysqld` was being force terminated. Issue reported by bruno haleblan and others, see: [MySQL Forums](#).
- Replaced `Boolean.parseBoolean` with JDK 1.4 compliant `valueOf`.
- Changed `connector-mxj.properties` default `mysql` version to 5.0.37.
- In testing so far `mysqld` reliably shuts down cleanly much faster.
- Added testcase to `com.mysql.management.jmx.AcceptanceTest` which demonstrates that `dataDir` is a mutable MBean property.
- Updated `build.xml` in prep for next release.
- Changed `SimpleMysqldDynamicMBean` to create `MysqldResource` on demand in order to allow setting of `datadir`. (Rubinger bug groundwork).
- Clarified the synchronization of `MysqldResource` methods.
- `SIGHUP` is replaced with `MySQLShutdown<PID>` event.
- Clarified the immutability of `baseDir`, `dataDir`, `pidFile`, `portFile`.
- Added 5.1.15 binaries to the repository.
- Removed 5.1.14 binaries from the repository.
- Added `getDataDir()` to interface `MysqldResourceI`.
- Added 5.1.14 binaries to repository.
- Replaced windows `kill.exe` resource with re-written version specific to `mysqld`.
- Added Patched `StandardSocketFactory` from Connector/J 5-0 HEAD.
- Ensured 5.1.14 compatibility.
- Swapped out `gpl` binaries for v5.0.37.
- Removed 5.0.22 binaries from the repository.

E.7.3. Changes in MySQL Connector/MXJ 5.0.4 (28 January 2007)

Bugs fixed:

- Allow multiple calls to start server from URL connection on non-3306 port. ([Bug#24004](#))
- Updated `build.xml` to build to handle with different `gpl` and commercial `mysqld` version numbers.
- Only populate the options map from the help text if specifically requested or in the MBean case.
- Introduced property for Linux & WinXX to default to 32bit versions.
- Swapped out `gpl` binaries for v5.0.27.
- Swapped out commercial binaries for v5.0.32.
- Moved `mysqld` binary resourced into separate jar file NOTICE: `CLASSPATH` will now need to `connector-mxj-db-files.jar`.
- Minor test robustness improvements.
- Moved default version string out of java class into a text editable properties file (`connector-mxj.properties`) in the resources directory.

- Fixed test to be tolerant of `/tmp` being a symlink to `/foo/tmp`.

E.7.4. Changes in MySQL Connector/MXJ 5.0.3 (24 June 2006)

Bugs fixed:

- Removed unused imports, formatted code, made minor edits to tests.
- Removed "TeeOutputStream" - no longer needed.
- Swapped out the mysqld binaries for MySQL v5.0.22.

E.7.5. Changes in MySQL Connector/MXJ 5.0.2 (15 June 2006)

Bugs fixed:

- Replaced string parsing with JDBC connection attempt for determining if a mysqld is "ready for connections" `CLASSPATH` will now need to include Connector/J jar.
- "platform" directories replace spaces with underscores
- extracted array and list printing to ListToString utility class
- Swapped out the mysqld binaries for MySQL v5.0.21
- Added trace level logging with Aspect/J. `CLASSPATH` will now need to include `lib/aspectjrt.jar`
- reformatted code
- altered to be "basedir" rather than "port" oriented.
- help parsing test reflects current help options
- insulated users from problems with "." in basedir
- swapped out the mysqld binaries for MySQL v5.0.18
- Made tests more robust by deleting the `/tmp/test-c.mxj` directory before running tests.
- `ServerLauncherSocketFactory.shutdown` API change: now takes File parameter (basedir) instead of port.
- socket is now "mysql.sock" in datadir
- added ability to specify "mysql-version" as an url parameter
- Extended timeout for help string parsing, to avoid cases where the help text was getting prematurely flushed, and thus truncated.
- swapped out the mysqld binaries for MySQL v5.0.19
- `MysqldResource` now tied to `dataDir` as well as `basedir` (API CHANGE)
- moved PID file into datadir
- `ServerLauncherSocketFactory.shutdown` now works across JVMs.
- extracted `splitLines(String)` to `Str` utility class
- `ServerLauncherSocketFactory.shutdown(port)` no longer throws, only reports to `System.err`
- `ServerLauncherSocketFactory` now treats URL parameters in the form of `&server.foo=null` as `serverOptionMap.put("foo", null)`
- `ServerLauncherSocketFactory.shutdown` API change: now takes 2 File parameters (basedir, datadir)

E.7.6. Changes in MySQL Connector/MXJ 5.0.1 (Never released)

This was an internal only release.

E.7.7. Changes in MySQL Connector/MXJ 5.0.0 (09 December 2005)

Bugs fixed:

- Removed HelpOptionsParser's need to reference a MysqldResource.
- Reorganized utils into a single "Utils" collaborator.
- Minor test tweaks
- Altered examples and tests to use new Connector/J 5.0 URL syntax for for launching Connector/MXJ ("jdbc:mysql:mxj://")
- Swapped out the mysqld binaries for MySQL v5.0.16.
- Ditched "ClassUtil" (merged with Str).
- Minor refactorings for type casting and exception handling.

E.8. MySQL Proxy Change History

E.8.1. Changes in MySQL Proxy 0.6.0 (Not yet released)

Functionality added or changed:

- When using read/write splitting and the `rw-splitting.lua` example script, connecting a second user to the proxy returns an error message. ([Bug#30867](#))
- Added support in `read_query_result()` to overwrite the result-set.
- Added `--no-daemon` and `--pid-file`.
- Added hooks for `read_auth()`, `read_handshake()` and `read_auth_result()`.
- Added handling of `proxy.connection.backend_ndx` in `connect_server()` and `read_query()` to support read/write splitting.
- Added support for `proxy.response.packets`.
- Added testcases.
- Added `--no-proxy` to disable the proxy.
- Added support for listening UNIX sockets.
- Added a global lua-scope `proxy.global.*`.
- Added connection pooling.

Bugs fixed:

- Fixed assertion on `COM_BINLOG_DUMP`. ([Bug#29764](#))
- Fixed assertion on result-packets like `[field-len | fields | EOF | ERR]`. ([Bug#29732](#))
- Fixed assertion at login with empty password + empty default db. ([Bug#29719](#))
- Fixed assertion at `COM_SHUTDOWN`. ([Bug#29719](#))
- Fixed crash if `proxy.connection` is used in `connect_server()`.
- Fixed check for `glib2` to require at least 2.6.0.

- Fixed assertion when all backends are down and we try to connect.
- Fixed connection-stalling if `read_query_result()` throws an `assert()` ion.
- Fixed len-encoding on `proxy.resultsets`.
- Fixed compilation on win32.
- Fixed assertion when connecting to the MySQL 6.0.1.
- Fixed decoding of len-encoded ints for 3-byte notation.
- Fixed `inj.resultset.affected_rows` on `SELECT` queries.
- Fixed handling of (SQL) `NULL` in result-sets.
- Fixed mem-leak with `proxy.response.*` is used.

E.8.2. Changes in MySQL Proxy 0.5.1 (30 June 2007)

Functionality added or changed:

- Added `resultset.affected_rows` and `resultset.insert_id`.
- Changed `--proxy.profilng` to `--proxy-skip-profilng`.
- Added missing dependency to `libmysqlclient-dev` to the `INSTALL` file.
- Added `inj.query_time` and `inj.response_time` into the lua scripts.
- Added support for pre-4.1 passwords in a 4.1 connection.
- Added script examples for rewriting and injection.
- Added `proxy.VERSION`.
- Added support for UNIX sockets.
- Added protection against duplicate resultsets from a script.

Bugs fixed:

- Fixed mysql check in configure to die when `mysql.h` isn't detected.
- Fixed handling of duplicate ERR on `COM_CHANGE_USER` in MySQL 5.1.18+.
- Fixed compile error with MySQL 4.1.x on missing `COM_STMT_*`.
- Fixed crash on fields > 250 bytes when the resultset is inspected.
- Fixed warning if `connect_server()` is not provided.
- Fixed assertion when an error occurs at initial script exec time.
- Fixed assertion when `read_query_result()` is not provided when `PROXY_SEND_QUERY` is used.

E.8.3. Changes in MySQL Proxy 0.5.0 (19 June 2007)

This is the first beta release.

Bugs fixed:

- Added `automake/autoconf` support.
- Added `cmake` support.

Appendix F. Restrictions and Limits

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries or views.

F.1. Restrictions on Stored Routines and Triggers

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. Some of these restrictions apply to stored functions but not to stored procedures.

The restrictions for stored functions also apply to triggers.

Stored routines cannot contain arbitrary SQL statements. The following statements are disallowed:

- The table-maintenance statements `CHECK TABLE` and `OPTIMIZE TABLE`. This restriction is lifted beginning with MySQL 5.0.17.
- The locking statements `LOCK TABLES` and `UNLOCK TABLES`.
- `ALTER VIEW`. (Before MySQL 5.0.46, this restriction is enforced only for stored functions.)
- `LOAD DATA` and `LOAD TABLE`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`). Implication: You cannot use dynamic SQL within stored routines (where you construct dynamically statements as strings and then execute them). This restriction is lifted as of MySQL 5.0.13 for stored procedures; it still applies to stored functions and triggers.

In addition, SQL statements that are not permitted within prepared statements are also not permitted in stored routines. See [Section 12.7, “SQL Syntax for Prepared Statements”](#), for a list of statements supported as prepared statements. Statements not listed there are not supported for SQL prepared statements and thus are also not supported for stored routines unless noted otherwise in [Section 21.2, “Using Stored Routines \(Procedures and Functions\)”](#).

- Inserts cannot be delayed. `INSERT DELAYED` syntax is accepted but the statement is handled as a normal `INSERT`.

For stored functions (but not stored procedures), the following additional statements or operations are disallowed:

- Statements that perform explicit or implicit commit or rollback. Support for these statements is not required by the SQL standard, which states that each DBMS vendor may decide whether to allow them.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO var_list` clause and other statements such as `SHOW`, `EXPLAIN`, and `CHECK TABLE`. A function can process a result set either with `SELECT ... INTO var_list` or by using a cursor and `FETCH` statements. See [Section 12.8.3.3, “SELECT ... INTO Statement”](#).
- `FLUSH` statements.
- Before MySQL 5.0.10, stored functions created with `CREATE FUNCTION` must not contain references to tables, with limited exceptions. They may include some `SET` statements that contain table references, for example `SET a:= (SELECT MAX(id) FROM t)`, and `SELECT` statements that fetch values directly into variables, for example `SELECT i INTO var1 FROM t`.
- Stored functions cannot be used recursively.
- Within a stored function or trigger, it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- If you refer to a temporary table multiple times in a stored function under different aliases, a `Can't reopen table: 'tbl_name'` error occurs, even if the references occur in different statements within the function.
- A stored function acquires table locks before executing, to avoid inconsistency in the binary log due to mismatch of the order in which statements execute and when they appear in the log. Statements that invoke a function are recorded rather than the statements executed within the function. Consequently, stored functions that update the same underlying tables do not execute in parallel. In contrast, stored procedures do not acquire table-level locks. All statements executed within stored procedures are written to the binary log. See [Section 21.5, “Binary Logging of Stored Programs”](#).

Although some restrictions normally apply to stored functions and triggers but not to stored procedures, those restrictions do apply to stored procedures if they are invoked from within a stored function or trigger. For example, if you use `FLUSH` in a stored proced-

ure, that stored procedure cannot be called from a stored function or trigger.

It is possible for the same identifier to be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
  DECLARE i INT DEFAULT 0;
  SELECT i FROM t;
  BEGIN
    DECLARE i INT DEFAULT 1;
    SELECT i FROM t;
  END;
END;
```

In such cases the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column
- A routine parameter takes precedence over a table column
- A local variable in an inner block takes precedence over a local variable in an outer block

The behavior that variables take precedence over table columns is non-standard.

Use of stored routines can cause replication problems. This issue is discussed further in [Section 21.5, “Binary Logging of Stored Programs”](#).

`INFORMATION_SCHEMA` does not have a `PARAMETERS` table until MySQL 6.0, so applications that need to acquire routine parameter information at runtime must use workarounds such as parsing the output of `SHOW CREATE` statements or the `param_list` column of the `mysql.proc` table. `param_list` contents can be processed from within a stored routine, unlike the output from `SHOW`.

There are no stored routine debugging facilities.

Before MySQL 5.0.17, `CALL` statements cannot be prepared. This true both for server-side prepared statements and for SQL prepared statements.

`UNDO` handlers are not supported.

`FOR` loops are not supported.

To prevent problems of interaction between server threads, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. This means that while the statement executes, it will not see changes to routines performed by other threads.

For triggers, the following additional statements or operations are disallowed:

- Triggers currently are not activated by foreign key actions.
- The `RETURN` statement is disallowed in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not allowed on tables in the `mysql` database.

F.2. Restrictions on Server-Side Cursors

Server-side cursors are implemented beginning with the C API in MySQL 5.0.2 via the `mysql_stmt_attr_set()` function. A server-side cursor allows a result set to be generated on the server side, but not transferred to the client except for those rows that the client requests. For example, if a client executes a query but is only interested in the first row, the remaining rows are not transferred.

In MySQL, a server-side cursor is materialized into a temporary table. Initially, this is a `MEMORY` table, but is converted to a `MyISAM` table if its size reaches the value of the `max_heap_table_size` system variable. (Beginning with MySQL 5.0.14, the same temporary-table implementation also is used for cursors in stored routines.) One limitation of the implementation is that for a large result set, retrieving its rows through a cursor might be slow.

Cursors are read only; you cannot use a cursor to update rows.

`UPDATE WHERE CURRENT OF` and `DELETE WHERE CURRENT OF` are not implemented, because updatable cursors are not supported.

Cursors are non-holdable (not held open after a commit).

Cursors are asensitive.

Cursors are non-scrollable.

Cursors are not named. The statement handler acts as the cursor ID.

You can have open only a single cursor per prepared statement. If you need several cursors, you must prepare several statements.

You cannot use a cursor for a statement that generates a result set if the statement is not supported in prepared mode. This includes statements such as `CHECK TABLE`, `HANDLER READ`, and `SHOW BINLOG EVENTS`.

F.3. Restrictions on Subqueries

- In MySQL 5.0 before 5.0.36, if you compare a `NULL` value to a subquery using `ALL`, `ANY`, or `SOME`, and the subquery returns an empty result, the comparison might evaluate to the non-standard result of `NULL` rather than to `TRUE` or `FALSE`.
- A subquery's outer statement can be any one of: `SELECT`, `INSERT`, `UPDATE`, `DELETE`, `SET`, or `DO`.
- Subquery optimization for `IN` is not as effective as for the `=` operator or for the `IN(value_list)` operator.

A typical case for poor `IN` subquery performance is when the subquery returns a small number of rows but the outer query returns a large number of rows to be compared to the subquery result.

The problem is that, for a statement that uses an `IN` subquery, the optimizer rewrites it as a correlated subquery. Consider the following statement that uses an uncorrelated subquery:

```
SELECT ... FROM t1 WHERE t1.a IN (SELECT b FROM t2);
```

The optimizer rewrites the statement to a correlated subquery:

```
SELECT ... FROM t1 WHERE EXISTS (SELECT 1 FROM t2 WHERE t2.b = t1.a);
```

If the inner and outer queries return M and N rows, respectively, the execution time becomes on the order of $O(M \times N)$, rather than $O(M+N)$ as it would be for an uncorrelated subquery.

An implication is that an `IN` subquery can be much slower than a query written using an `IN(value_list)` operator that lists the same values that the subquery would return.

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

```
DELETE FROM t WHERE ... (SELECT ... FROM t ...);
UPDATE t ... WHERE col = (SELECT ... FROM t ...);
{INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
```

Exception: The preceding prohibition does not apply if you are using a subquery for the modified table in the `FROM` clause. Example:

```
UPDATE t ... WHERE col = (SELECT * FROM (SELECT ... FROM t...) AS _t ...);
```

Here the prohibition does not apply because the result from a subquery in the `FROM` clause is stored as a temporary table, so the relevant rows in `t` have already been selected by the time the update to `t` takes place.

- Row comparison operations are only partially supported:
 - For `expr IN (subquery)`, `expr` can be an n -tuple (specified via row constructor syntax) and the subquery can return rows of n -tuples.
 - For `expr op {ALL|ANY|SOME} (subquery)`, `expr` must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

In other words, for a subquery that returns rows of n -tuples, this is supported:

```
(val_1, ..., val_n) IN (subquery)
```

But this is not supported:

```
(val_1, ..., val_n) op {ALL|ANY|SOME} (subquery)
```

The reason for supporting row comparisons for `IN` but not for the others is that `IN` is implemented by rewriting it as a sequence of `=` comparisons and `AND` operations. This approach cannot be used for `ALL`, `ANY`, or `SOME`.

- Row constructors are not well optimized. The following two expressions are equivalent, but only the second can be optimized:

```
(col1, col2, ...) = (val1, val2, ...)
col1 = val1 AND col2 = val2 AND ...
```

- Subqueries in the `FROM` clause cannot be correlated subqueries. They are materialized (executed to produce a result set) before evaluating the outer query, so they cannot be evaluated per row of the outer query.
- The optimizer is more mature for joins than for subqueries, so in many cases a statement that uses a subquery can be executed more efficiently if you rewrite it as a join.

An exception occurs for the case where an `IN` subquery can be rewritten as a `SELECT DISTINCT` join. Example:

```
SELECT col FROM t1 WHERE id_col IN (SELECT id_col2 FROM t2 WHERE condition);
```

That statement can be rewritten as follows:

```
SELECT DISTINCT col FROM t1, t2 WHERE t1.id_col = t2.id_col AND condition;
```

But in this case, the join requires an extra `DISTINCT` operation and is not more efficient than the subquery.

- Possible future optimization: MySQL does not rewrite the join order for subquery evaluation. In some cases, a subquery could be executed more efficiently if MySQL rewrote it as a join. This would give the optimizer a chance to choose between more execution plans. For example, it could decide whether to read one table or the other first.

Example:

```
SELECT a FROM outer_table AS ot
WHERE a IN (SELECT a FROM inner_table AS it WHERE ot.b = it.b);
```

For that query, MySQL always scans `outer_table` first and then executes the subquery on `inner_table` for each row. If `outer_table` has a lot of rows and `inner_table` has few rows, the query probably will not be as fast as it could be.

The preceding query could be rewritten like this:

```
SELECT a FROM outer_table AS ot, inner_table AS it
WHERE ot.a = it.a AND ot.b = it.b;
```

In this case, we can scan the small table (`inner_table`) and look up rows in `outer_table`, which will be fast if there is an index on `(ot.a, ot.b)`.

- Possible future optimization: A correlated subquery is evaluated for each row of the outer query. A better approach is that if the outer row values do not change from the previous row, do not evaluate the subquery again. Instead, use its previous result.
- Possible future optimization: A subquery in the `FROM` clause is evaluated by materializing the result into a temporary table, and this table does not use indexes. This does not allow the use of indexes in comparison with other tables in the query, although that might be useful.
- Possible future optimization: If a subquery in the `FROM` clause resembles a view to which the merge algorithm can be applied, rewrite the query and apply the merge algorithm so that indexes can be used. The following statement contains such a subquery:

```
SELECT * FROM (SELECT * FROM t1 WHERE t1.t1_col) AS _t1, t2 WHERE t2.t2_col;
```

The statement can be rewritten as a join like this:

```
SELECT * FROM t1, t2 WHERE t1.t1_col AND t2.t2_col;
```

This type of rewriting would provide two benefits:

- It avoids the use of a temporary table for which no indexes can be used. In the rewritten query, the optimizer can use in-

dexes on `t1`.

- It gives the optimizer more freedom to choose between different execution plans. For example, rewriting the query as a join allows the optimizer to use `t1` or `t2` first.
- Possible future optimization: For `IN`, `= ANY`, `<> ANY`, `= ALL`, and `<> ALL` with uncorrelated subqueries, use an in-memory hash for a result or a temporary table with an index for larger results. Example:

```
SELECT a FROM big_table AS bt
WHERE non_key_field IN (SELECT non_key_field FROM table WHERE condition)
```

In this case, we could create a temporary table:

```
CREATE TABLE t (key (non_key_field))
(SELECT non_key_field FROM table WHERE condition)
```

Then, for each row in `big_table`, do a key lookup in `t` based on `bt.non_key_field`.

F.4. Restrictions on Views

View processing is not optimized:

- It is not possible to create an index on a view.
- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

Subqueries cannot be used in the `FROM` clause of a view. This limitation will be lifted in the future.

There is a general principle that you cannot modify a table and select from the same table in a subquery. See [Section F.3, “Restrictions on Subqueries”](#).

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);
UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case the view will be stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it “at the same time.” (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying `ALGORITHM = TEMPTABLE` in the view definition.)

You can use `DROP TABLE` or `ALTER TABLE` to drop or alter a table that is used in a view definition (which invalidates the view) and no warning results from the drop or alter operation. An error occurs later when the view is used.

A view definition is “frozen” by certain statements:

- If a statement prepared by `PREPARE` refers to a view, the view definition seen each time the statement is executed later will be the definition of the view at the time it was prepared. This is true even if the view definition is changed after the statement is prepared and before it is executed. Example:

```
CREATE VIEW v AS SELECT RAND();
PREPARE s FROM 'SELECT * FROM v';
ALTER VIEW v AS SELECT NOW();
EXECUTE s;
```

The result returned by the `EXECUTE` statement is a random number, not the current date and time.

- If a statement in a stored routine refers to a view, the view definition seen by the statement are its definition the first time that statement is executed. For example, this means that if the statement is executed in a loop, further iterations of the statement see the same view definition, even if the definition is changed later in the loop. Example:

```

CREATE VIEW v AS SELECT 1;
delimiter //
CREATE PROCEDURE p ()
BEGIN
  DECLARE i INT DEFAULT 0;
  WHILE i < 5 DO
    SELECT * FROM v;
    SET i = i + 1;
    ALTER VIEW v AS SELECT 2;
  END WHILE;
END;
//
delimiter ;
CALL p();

```

When the procedure `p()` is called, the `SELECT` returns 1 each time through the loop, even though the view definition is changed within the loop.

As of MySQL 5.0.46, `ALTER VIEW` is prohibited within stored routines, so this restriction does not apply.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. This includes views that have `UNION` in their definition. Currently, not all views that are theoretically updatable can be updated. The initial view implementation was deliberately written this way to get usable, updatable views into MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist:

- Updatable views with subqueries anywhere other than in the `WHERE` clause. Some views that have subqueries in the `SELECT` list may be updatable.
- You cannot use `UPDATE` to update more than one underlying table of a view that is defined as a join.
- You cannot use `DELETE` to update a view that is defined as a join.

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the `CREATE VIEW` and `SELECT` privileges), that user will be unable to call `SHOW CREATE VIEW` on that object unless the user is also granted the `SHOW VIEW` privilege.

That shortcoming can lead to problems backing up a database with `mysqldump`, which may fail due to insufficient privileges. This problem is described in [Bug#22062](#).

The workaround to the problem is for the administrator to manually grant the `SHOW VIEW` privilege to users who are granted `CREATE VIEW`, since MySQL doesn't grant it implicitly when views are created.

Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is disallowed.

F.5. Restrictions on XA Transactions

XA transaction support is limited to the `InnoDB` storage engine.

The MySQL XA implementation is for “external XA,” where a MySQL server acts as a Resource Manager and client programs act as Transaction Managers. “Internal XA” is not implemented. This would allow individual storage engines within a MySQL server to act as RMs, and the server itself to act as a TM. Internal XA is required for handling XA transactions that involve more than one storage engine. The implementation of internal XA is incomplete because it requires that a storage engine support two-phase commit at the table handler level, and currently this is true only for `InnoDB`.

For `XA START`, the `JOIN` and `RESUME` clauses are not supported.

For `XA END`, the `SUSPEND [FOR MIGRATE]` clause is not supported.

The requirement that the `bqual` part of the `xid` value be different for each XA transaction within a global transaction is a limitation of the current MySQL XA implementation. It is not part of the XA specification.

If an XA transaction has reached the `PREPARED` state and the MySQL server is killed (for example, with `kill -9` on Unix) or shuts down abnormally, the transaction can be continued after the server restarts. However, if the client reconnects and commits the transaction, the transaction will be absent from the binary log even though it has been committed. This means the data and the binary log have gone out of synchrony. An implication is that XA cannot be used safely together with replication.

It is possible that the server will roll back a pending XA transaction, even one that has reached the `PREPARED` state. This happens if a client connection terminates and the server continues to run, or if clients are connected and the server shuts down gracefully. (In the latter case, the server marks each connection to be terminated, and then rolls back the `PREPARED` XA transaction associated

with it.) It should be possible to commit or roll back a `PREPARED` XA transaction, but this cannot be done without changes to the binary logging mechanism.

F.6. Restrictions on Character Sets

- Identifiers are stored in `mysql` database tables (`user`, `db`, and so forth) using `utf8`, but identifiers can contain only characters in the Basic Multilingual Plane (BMP). Supplementary characters are not allowed in identifiers.
- The `ucs2` character sets has the following restrictions:
 - It cannot be used as a client character set, which means that it does not work for `SET NAMES` or `SET CHARACTER SET`. (See [Section 9.1.4, “Connection Character Sets and Collations”](#).)
 - It is currently not possible to use `LOAD DATA INFILE` to load data files that use this character set.
 - `FULLTEXT` indexes cannot be created on a column that this character set. However, you can perform `IN BOOLEAN MODE` searches on the column without an index.
- The `REGEXP` and `RLIKE` operators work in byte-wise fashion, so they are not multi-byte safe and may produce unexpected results with multi-byte character sets. In addition, these operators compare characters by their byte values and accented characters may not compare as equal even if a given collation treats them as equal.

F.7. Limits in MySQL

This section lists current limits in MySQL 5.0.

F.7.1. Limits of Joins

The maximum number of tables that can be referenced in a single join is 61. This also applies to the number of tables that can be referenced in the definition of a view.

F.7.2. The Maximum Number of Columns Per Table

There is a hard limit of 4096 columns per table, but the effective maximum may be less for a given table. The exact limit depends on several interacting factors, listed in the following discussion.

- Every table has a maximum row size of 65,535 bytes. This maximum applies to all storage engines, but a given engine might have additional constraints that result in a lower effective maximum row size.

The maximum row size constrains the number of columns because the total width of all columns cannot exceed this size. For example, `utf8` characters require up to three bytes per character, so for a `CHAR(255) CHARACTER SET utf8` column, the server must allocate $255 \times 3 = 765$ bytes per value. Consequently, a table cannot contain more than $65,535 / 765 = 85$ such columns.

Storage for variable-length columns includes length bytes, which are assessed against the row size. For example, a `VARCHAR(255) CHARACTER SET utf8` column takes two bytes to store the length of the value, so each value can take up to 767 bytes.

`BLOB` and `TEXT` columns count from one to four plus eight bytes each toward the row-size limit because their contents are stored separately.

Declaring columns `NULL` can reduce the maximum number of columns allowed. `NULL` columns require additional space in the row to record whether or not their values are `NULL`.

For `MyISAM` tables, each `NULL` column takes one bit extra, rounded up to the nearest byte. The maximum row length in bytes can be calculated as follows:

```
row length = 1
             + (sum of column lengths)
             + (number of NULL columns + delete_flag + 7)/8
             + (number of variable-length columns)
```

`delete_flag` is 1 for tables with static row format. Static tables use a bit in the row record for a flag that indicates whether the row has been deleted. `delete_flag` is 0 for dynamic tables because the flag is stored in the dynamic row header.

These calculations do not apply for `InnoDB` tables, for which storage size is no different for `NULL` columns than for `NOT NULL` columns.

The following statement to create table `t1` succeeds because the columns require $32,765 + 2$ bytes and $32,766 + 2$ bytes, which falls within the maximum row size of 65,535 bytes:

```
mysql> CREATE TABLE t1
-> (c1 VARCHAR(32765) NOT NULL, c2 VARCHAR(32766) NOT NULL);
Query OK, 0 rows affected (0.01 sec)
```

The following statement to create table `t2` fails because the columns are `NULL` and require additional space that causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t2
-> (c1 VARCHAR(32765) NULL, c2 VARCHAR(32766) NULL);
ERROR 1118 (42000): Row size too large. The maximum row size for the
used table type, not counting BLOBs, is 65535. You have to change some
columns to TEXT or BLOBs
```

- Each table has an `.frm` file that contains the table definition. The `.frm` file size limit is fixed at 64KB. If a table definition reaches this size, no more columns can be added. The expression that checks information to be stored in the `.frm` file against the limit looks like this:

```
if (info_length+(ulong) create_fields.elements*FCOMP+288+
    n_length+int_length+com_length > 65535L || int_count > 255)
```

The relevant factors in this expression are:

- `info_length` is space needed for “screens.” This is related to MySQL's Unireg heritage.
- `create_fields.elements` is the number of columns.
- `FCOMP` is 17.
- `n_length` is the total length of all column names, including one byte per name as a separator.
- `int_length` is related to the list of values for SET and ENUM columns.
- `com_length` is the total length of column and table comments.

Thus, using long column names can reduce the maximum number of columns, as can the inclusion of `ENUM` or `SET` columns, or use of column or table comments.

- Individual storage engines might impose additional restrictions that limit table column count. Examples:
 - `InnoDB` allows no more than 1000 columns.
 - `InnoDB` restricts row size to something less than half a database page (approximately 8000 bytes), not including `VARBINARY`, `VARCHAR`, `BLOB`, or `TEXT` columns.
 - Different `InnoDB` storage formats (`COMPRESSED`, `REDUNDANT`) use different amounts of page header and trailer data, which affects the amount of storage available for rows.

F.7.3. Windows Platform Limitations

The following limitations apply only to the Windows platform:

- The number of open file descriptors on Windows is limited to a maximum of 2048, which may limit the ability to open a large number of tables simultaneously. This limit is due to the compatibility functions used to open files on Windows that use the POSIX compatibility layer.

This limitation will also cause problems if you try to set `max_open_files` to a value greater than the 2048 file limit.

- On Windows 32-bit platforms it is not possible to use more than 2GB of RAM within a single process, including MySQL. This is because the physical address limit on Windows 32-bit is 4GB and the default setting within Windows is to split the virtual address space between kernel (2GB) and user/applications (2GB).

To use more memory than this you will need to use a 64-bit version of Windows.

- When using `MyISAM` tables, you cannot use aliases within Windows link to the data files on another volume and then link back to the main MySQL `datadir` location.

This facility is often used to move the data and index files to a RAID or other fast solution, while retaining the main `.FRM` files in the default data directory configured with the `datadir` option.

- The timers within MySQL used on Windows are of a lower precision than the timers used on Linux. For most situations you may not notice a difference, but the delay implied by a call to `SLEEP()` on Windows and Linux may differ slightly due to the differences in precision.
- There is no 64-bit OLEDB Provider for ODBC (MSDASQL) in any 64-bit Windows operating system up to and including Windows Vista. In practical terms this means that you can't use the MySQL ODBC driver from ADO and other users of OLEDB.

Appendix G. Credits

This appendix lists the developers, contributors, and supporters that have helped to make MySQL what it is today.

G.1. Developers at MySQL AB

These are the developers that are or have been employed by MySQL AB to work on the [MySQL](#) database software, roughly in the order they started to work with us. Following each developer is a small list of the tasks that the developer is responsible for, or the accomplishments they have made. All developers are involved in support.

- Michael (Monty) Widenius
 - Lead developer and main author of the MySQL server ([mysqld](#)).
 - New functions for the string library.
 - Most of the [mysys](#) library.
 - The [ISAM](#) and [MyISAM](#) libraries (B-tree index file handlers with index compression and different record formats).
 - The [HEAP](#) library. A memory table system with our superior full dynamic hashing. In use since 1981 and published around 1984.
 - The [replace](#) program (take a look at it, it's **COOL!**).
 - Connector/ODBC (MyODBC), the ODBC driver for Windows.
 - Fixing bugs in MIT-pthreads to get it to work for MySQL Server. And also Unireg, a curses-based application tool with many utilities.
 - Porting of [mSQL](#) tools like [msqlperl](#), [DBD/DBI](#), and [DB2mysql](#).
 - Most of [crash-me](#) and the foundation for the MySQL benchmarks.
- David Axmark
 - Initial main writer of the **Reference Manual**, including enhancements to [texi2html](#).
 - Automatic Web site updating from the manual.
 - Initial Autoconf, Automake, and Libtool support.
 - Licensing.
 - Parts of all the text files. (Nowadays only the [README](#) is left. The rest ended up in the manual.)
 - Lots of testing of new features.
 - Our in-house Free Software legal expert.
 - Mailing list maintainer (who never has the time to do it right...).
 - Our original portability code (now more than 10 years old). Nowadays only some parts of [mysys](#) are left.
 - Someone for Monty to call in the middle of the night when he just got that new feature to work.
 - Chief "Open Sourcerer" (MySQL community relations).
- Jani Tolonen
 - [mysqlimport](#)
 - A lot of extensions to the command-line clients.
 - [PROCEDURE ANALYSE\(\)](#)
- Sinisa Milivojevic (now in support)
 - Compression (with [zlib](#)) in the client/server protocol.

- Perfect hashing for the lexical analyzer phase.
- Multi-row `INSERT`
- `mysqldump -e` option
- `LOAD DATA LOCAL INFILE`
- `SQL_CALC_FOUND_ROWS SELECT` option
- `--max-user-connections=...` option
- `net_read` and `net_write_timeout`
- `GRANT/REVOKE` and `SHOW GRANTS FOR`
- New client/server protocol for 4.0
- `UNION` in 4.0
- Multiple-table `DELETE/UPDATE`
- Subqueries in the `FROM` clause (4.1).
- User resources management
- Initial developer of the `MySQL++` C++ API and the `MySQLGUI` client.
- Tonu Samuel (past developer)
 - VIO interface (the foundation for the encrypted client/server protocol).
 - MySQL Filesystem (a way to use MySQL databases as files and directories).
 - The `CASE` expression.
 - The `MD5()` and `COALESCE()` functions.
 - `RAID` support for `MyISAM` tables.
- Sasha Pachev (past developer)
 - Initial implementation of replication (up to version 4.0).
 - `SHOW CREATE TABLE`.
 - `mysql-bench`
- Matt Wagner
 - MySQL test suite.
 - Webmaster (until 2002).
- Miguel Solorzano (now in support)
 - Win32 development and release builds.
 - Windows NT server code.
 - WinMySQLAdmin
- Timothy Smith (now in development)
 - Dynamic character sets support.
 - `configure`, RPMs and other parts of the build system.
 - Initial developer of `libmysqld`, the embedded server.
- Sergei Golubchik

- Full-text search.
- Added keys to the [MERGE](#) library.
- Precision math.
- Jeremy Cole (past developer)
 - Proofreading and editing this fine manual.
 - [ALTER TABLE ... ORDER BY](#)
 - [UPDATE ... ORDER BY](#)
 - [DELETE ... ORDER BY](#)
- Indrek Siitan
 - Designing/programming of our Web interface.
 - Author of our newsletter management system.
- Jorge del Conde (past developer)
 - [MySQLCC \(MySQL Control Center\)](#)
 - Win32 development
 - Initial implementation of the Web site portals.
- Venu Anuganti (past developer)
 - MyODBC 3.51
 - New client/server protocol for 4.1 (for prepared statements).
- Arjen Lentz (also handled community, 2004-2006; now works in Support)
 - Maintainer of the MySQL Reference Manual (2001-2004).
 - Preparing the O'Reilly printed edition of the manual (2002).
- Alexander (Bar) Barkov, Alexey (Holyfoot) Botchkov, and Ramil Kalimullin
 - Spatial data (GIS) and R-Trees implementation for 4.1
 - Unicode and character sets for 4.1; documentation for same
- Oleksandr (Sanja) Byelkin
 - Query cache in 4.0
 - Implementation of subqueries (4.1).
 - Implementation of views (5.0).
- Aleksey (Walrus) Kishkin and Alexey (Ranger) Stroganov
 - Benchmarks design and analysis.
 - Maintenance of the MySQL test suite.
- Zak Greant (past employee)
 - Open Source advocate, MySQL community relations.
- Carsten Pedersen
 - The MySQL Certification program.
- Lenz Grimmer

- Production (build and release) engineering.
- Peter Zaitsev
 - [SHA1\(\)](#), [AES_ENCRYPT\(\)](#) and [AES_DECRYPT\(\)](#) functions.
 - Debugging, cleaning up various features.
- Alexander (Salle) Keremidarski
 - Support.
 - Debugging.
- Per-Erik Martin
 - Lead developer for stored procedures (5.0).
- Jim Winstead
 - Former lead Web developer.
 - Improving server, fixing bugs.
- Mark Matthews
 - Connector/J driver (Java).
- Peter Gulutzan
 - SQL standards compliance.
 - Documentation of existing MySQL code/algorithms.
 - Character set documentation.
- Guilhem Bichot
 - Replication, from [MySQL](#) version 4.0.
 - Fixed handling of exponents for [DECIMAL](#).
 - Author of [mysql_tableinfo](#).
 - Backup (in 5.1).
- Antony T. Curtis
 - Porting of the MySQL Database software to OS/2.
- Mikael Ronstrom
 - Much of the initial work on NDB Cluster until 2000. Roughly half the code base at that time. Transaction protocol, node recovery, system restart and restart code and parts of the API functionality.
 - Lead Architect, developer, debugger of NDB Cluster 1994-2004
 - Lots of optimizations
- Jonas Orelan
 - On-line Backup
 - The automatic test environment of MySQL Cluster
 - Portability Library for NDB Cluster
 - Lots of other things
- Pekka Nouisiainen

- Ordered index implementation of MySQL Cluster
- BLOB support in MySQL Cluster
- Charset support in MySQL Cluster
- Martin Skold
 - Unique index implementation of MySQL Cluster
 - Integration of NDB Cluster into MySQL
- Magnus Svensson
 - The test framework for MySQL Cluster
 - Integration of NDB Cluster into MySQL
- Tomas Ulin
 - Lots of work on configuration changes for simple installation and use of MySQL Cluster
- Konstantin Osipov
 - Prepared statements.
 - Cursors.
- Dmitri Lenev
 - Time zone support.
 - Triggers (in 5.0).

G.2. Contributors to MySQL

Although MySQL AB owns all copyrights in the [MySQL server](#) and the [MySQL manual](#), we wish to recognize those who have made contributions of one kind or another to the [MySQL distribution](#). Contributors are listed here, in somewhat random order:

- Gianmassimo Vigazzola <qwerg@mbx.vol.it> or <qwerg@tin.it>

The initial port to Win32/NT.

- Per Eric Olsson

For more or less constructive criticism and real testing of the dynamic record format.

- Irena Pancirov <irena@mail.yacc.it>

Win32 port with Borland compiler. [mysqlshutdown.exe](#) and [mysqlwatch.exe](#)

- David J. Hughes

For the effort to make a shareware SQL database. At TcX, the predecessor of MySQL AB, we started with [mSQL](#), but found that it couldn't satisfy our purposes so instead we wrote an SQL interface to our application builder Unireg. [mysqladmin](#) and [mysql](#) client are programs that were largely influenced by their [mSQL](#) counterparts. We have put a lot of effort into making the MySQL syntax a superset of [mSQL](#). Many of the API's ideas are borrowed from [mSQL](#) to make it easy to port free [mSQL](#) programs to the MySQL API. The MySQL software doesn't contain any code from [mSQL](#). Two files in the distribution ([client/insert_test.c](#) and [client/select_test.c](#)) are based on the corresponding (non-copyrighted) files in the [mSQL](#) distribution, but are modified as examples showing the changes necessary to convert code from [mSQL](#) to MySQL Server. ([mSQL](#) is copyrighted David J. Hughes.)

- Patrick Lynch

For helping us acquire <http://www.mysql.com/>.

- Fred Lindberg

For setting up gmail to handle the MySQL mailing list and for the incredible help we got in managing the MySQL mailing lists.

- Igor Romanenko <igor@frog.kiev.ua>
[mysqldump](#) (previously [msqldump](#), but ported and enhanced by Monty).
- Yuri Dario
For keeping up and extending the MySQL OS/2 port.
- Tim Bunce
Author of [mysqlhotcopy](#).
- Zarko Mocnik <zarko.mocnik@dem.si>
Sorting for Slovenian language.
- "TAMITO" <tommy@valley.ne.jp>
The [_MB](#) character set macros and the [ujis](#) and [sjis](#) character sets.
- Joshua Chamas <joshua@chamas.com>
Base for concurrent insert, extended date syntax, debugging on NT, and answering on the MySQL mailing list.
- Yves Carlier <Yves.Carlier@rug.ac.be>
[mysqlaccess](#), a program to show the access rights for a user.
- Rhys Jones <rhys@wales.com> (And GWE Technologies Limited)
For one of the early JDBC drivers.
- Dr Xiaokun Kelvin ZHU <X.Zhu@brad.ac.uk>
Further development of one of the early JDBC drivers and other MySQL-related Java tools.
- James Cooper <pixel@organic.com>
For setting up a searchable mailing list archive at his site.
- Rick Mehalick <Rick_Mehalick@i-o.com>
For [xmysql](#), a graphical X client for MySQL Server.
- Doug Sisk <sisk@wix.com>
For providing RPM packages of MySQL for Red Hat Linux.
- Diemand Alexander V. <axeld@vial.ethz.ch>
For providing RPM packages of MySQL for Red Hat Linux-Alpha.
- Antoni Pamies Olive <toni@readysoft.es>
For providing RPM versions of a lot of MySQL clients for Intel and SPARC.
- Jay Bloodworth <jay@pathways.sde.state.sc.us>
For providing RPM versions for MySQL 3.21.
- David Sacerdote <davids@secnet.com>
Ideas for secure checking of DNS hostnames.
- Wei-Jou Chen <jou@nematic.ieo.nctu.edu.tw>
Some support for Chinese(BIG5) characters.
- Wei He <hewei@mail.ied.ac.cn>

- A lot of functionality for the Chinese(GBK) character set.
- Jan Pazdziora <adelton@fi.muni.cz>
Czech sorting order.
 - Zeev Suraski <bourbon@netvision.net.il>
`FROM_UNIXTIME()` time formatting, `ENCRYPT()` functions, and `bison` advisor. Active mailing list member.
 - Luuk de Boer <luuk@wxs.nl>
Ported (and extended) the benchmark suite to `DBI/DBD`. Have been of great help with `crash-me` and running benchmarks. Some new date functions. The `mysql_setpermission` script.
 - Alexis Mikhailov <root@medinf.chuvashia.su>
User-defined functions (UDFs); `CREATE FUNCTION` and `DROP FUNCTION`.
 - Andreas F. Bobak <bobak@relog.ch>
The `AGGREGATE` extension to user-defined functions.
 - Ross Wakelin <R.Wakelin@march.co.uk>
Help to set up InstallShield for MySQL-Win32.
 - Jethro Wright III <jetman@li.net>
The `libmysql.dll` library.
 - James Pereria <jpereira@iafrica.com>
Mysqlmanager, a Win32 GUI tool for administering MySQL Servers.
 - Curt Sampson <cjs@portal.ca>
Porting of MIT-pthreads to NetBSD/Alpha and NetBSD 1.3/i386.
 - Martin Ramsch <m.ramsch@computer.org>
Examples in the MySQL Tutorial.
 - Steve Harvey
For making `mysqlaccess` more secure.
 - Konark IA-64 Centre of Persistent Systems Private Limited
<http://www.pspl.co.in/konark/>. Help with the Win64 port of the MySQL server.
 - Albert Chin-A-Young.
Configure updates for Tru64, large file support and better TCP wrappers support.
 - John Birrell
Emulation of `pthread_mutex()` for OS/2.
 - Benjamin Pflugmann
Extended `MERGE` tables to handle `INSERTS`. Active member on the MySQL mailing lists.
 - Jocelyn Fournier
Excellent spotting and reporting innumerable bugs (especially in the MySQL 4.1 subquery code).
 - Marc Liyanage
Maintaining the Mac OS X packages and providing invaluable feedback on how to create Mac OS X PKGs.

- Robert Rutherford

Providing invaluable information and feedback about the QNX port.

- Previous developers of NDB Cluster

Lots of people were involved in various ways summer students, master thesis students, employees. In total more than 100 people so too many to mention here. Notable name is Ataullah Dabaghi who up until 1999 contributed around a third of the code base. A special thanks also to developers of the AXE system which provided much of the architectural foundations for NDB Cluster with blocks, signals and crash tracing functionality. Also credit should be given to those who believed in the ideas enough to allocate of their budgets for its development from 1992 to present time.

Other contributors, bugfinders, and testers: James H. Thompson, Maurizio Menghini, Wojciech Tryc, Luca Berra, Zarko Mocnik, Wim Bonis, Elmar Haneke, <jehamby@lightside>, <psmith@BayNetworks.com>, <duane@connect.com.au>, Ted Deppner <ted@psyber.com>, Mike Simons, Jaakko Hyvatti.

And lots of bug report/patches from the folks on the mailing list.

A big tribute goes to those that help us answer questions on the MySQL mailing lists:

- Daniel Koch <dkoch@amcity.com>

Irix setup.

- Luuk de Boer <luuk@wxs.nl>

Benchmark questions.

- Tim Sailer <tps@users.buoy.com>

DBD: :mysql questions.

- Boyd Lynn Gerber <gerberb@zenez.com>

SCO-related questions.

- Richard Mehalick <RM186061@shellus.com>

xmysql-related questions and basic installation questions.

- Zeev Suraski <bourbon@netvision.net.il>

Apache module configuration questions (log & auth), PHP-related questions, SQL syntax-related questions and other general questions.

- Francesc Guasch <frankie@citel.upc.es>

General questions.

- Jonathan J Smith <jsmith@wtp.net>

Questions pertaining to OS-specifics with Linux, SQL syntax, and other things that might need some work.

- David Sklar <sklar@student.net>

Using MySQL from PHP and Perl.

- Alistair MacDonald <A.MacDonald@uel.ac.uk>

Is flexible and can handle Linux and perhaps HP-UX. Tries to get users to use [mysqlbug](#).

- John Lyon <jlyon@imag.net>

Questions about installing MySQL on Linux systems, using either [.rpm](#) files or compiling from source.

- Lorvid Ltd. <lorvid@WOLFENET.com>

Simple billing/license/support/copyright issues.

- Patrick Sherrill <patrick@coconet.com>

ODBC and VisualC++ interface questions.

- Randy Harmon <rjharmon@uptimecomputers.com>

DBD, Linux, some SQL syntax questions.

G.3. Documenters and translators

The following people have helped us with writing the MySQL documentation and translating the documentation or error messages in MySQL.

- Paul DuBois

Ongoing help with making this manual correct and understandable. That includes rewriting Monty's and David's attempts at English into English as other people know it.

- Kim Aldale

Helped to rewrite Monty's and David's early attempts at English into English.

- Michael J. Miller Jr. <mke@terrapin.turbolift.com>

For the first MySQL manual. And a lot of spelling/language fixes for the FAQ (that turned into the MySQL manual a long time ago).

- Yan Cailin

First translator of the MySQL Reference Manual into simplified Chinese in early 2000 on which the Big5 and HK coded (<http://mysql.hitstar.com/>) versions were based. [Personal home page at linuxdb.yeah.net](#).

- Jay Flaherty <fty@mediapulse.com>

Big parts of the Perl DBI/DBD section in the manual.

- Paul Southworth <pauls@etext.org>, Ray Loyzaga <yar@cs.su.oz.au>

Proof-reading of the Reference Manual.

- Therrien Gilbert <gilbert@ican.net>, Jean-Marc Pouyot <jmp@scaltaire.fr>

French error messages.

- Petr Snajdr, <snajdr@pvt.net>

Czech error messages.

- Jaroslaw Lewandowski <jotel@itnet.com.pl>

Polish error messages.

- Miguel Angel Fernandez Roiz

Spanish error messages.

- Roy-Magne Mo <rmo@www.hivolda.no>

Norwegian error messages and testing of MySQL 3.21.xx.

- Timur I. Bakeyev <root@timur.tatarstan.ru>

Russian error messages.

- <brenno@dewinter.com> & Filippo Grassilli <phil@hyppo.com>

Italian error messages.

- Dirk Munzinger <dirk@trinity.saar.de>

German error messages.

- Billik Stefan <billik@sun.uniag.sk>

Slovak error messages.

- Stefan Saroiu <tzoompy@cs.washington.edu>

Romanian error messages.

- Peter Feher

Hungarian error messages.

- Roberto M. Serqueira

Portuguese error messages.

- Carsten H. Pedersen

Danish error messages.

- Arjen Lentz

Dutch error messages, completing earlier partial translation (also work on consistency and spelling).

G.4. Libraries used by and included with MySQL

The following is a list of the creators of the libraries we have included with the MySQL server source to make it easy to compile and install MySQL. We are very thankful to all individuals that have created these and it has made our life much easier.

- Fred Fish

For his excellent C debugging and trace library. Monty has made a number of smaller improvements to the library (speed and additional options).

- Richard A. O'Keefe

For his public domain string library.

- Henry Spencer

For his regex library, used in `WHERE column REGEXP regexp`.

- Chris Provenzano

Portable user level pthreads. From the copyright: This product includes software developed by Chris Provenzano, the University of California, Berkeley, and contributors. We are currently using version 1_60_beta6 patched by Monty (see [mit-pthreads/Changes-mysql](#)).

- Jean-loup Gailly and Mark Adler

For the zlib library (used on MySQL on Windows).

- Bjorn Benson

For his `safe_malloc` (memory checker) package which is used in when you build MySQL using one of the `BUILD/compile-*-debug` scripts, or manually set the `-DSAFE_MALLOC`.

- Free Software Foundation

The `readline` library (used by the `mysql` command-line client).

- The NetBSD foundation

The `libedit` package (optionally used by the `mysql` command-line client).

- www.netlib.org

MySQL incorporates work covered by the following copyright and permission notice:

The author of this software is David M. Gay.

Copyright (c) 1991, 2000, 2001 by Lucent Technologies.

Permission to use, copy, modify, and distribute this software for any purpose without fee is hereby granted, provided that this entire notice is included in all copies of any software which is or includes a copy or modification of this software and in all copies of the supporting documentation for such software.

THIS SOFTWARE IS BEING PROVIDED "AS IS", WITHOUT ANY EXPRESS OR IMPLIED WARRANTY. IN PARTICULAR, NEITHER THE AUTHOR NOR LUCENT MAKES ANY REPRESENTATION OR WARRANTY OF ANY KIND CONCERNING THE MERCHANTABILITY OF THIS SOFTWARE OR ITS FITNESS FOR ANY PARTICULAR PURPOSE.

G.5. Packages that support MySQL

The following is a list of creators/maintainers of some of the most important API/packages/applications that a lot of people use with MySQL.

We can't list every possible package here because the list would then be way to hard to maintain. For other packages, please refer to the software portal at <http://solutions.mysql.com/software/>.

- Tim Bunce, Alligator Descartes
For the [DBD](#) (Perl) interface.
- Andreas Koenig <a.koenig@mind.de>
For the Perl interface for MySQL Server.
- Jochen Wiedmann <wiedmann@neckar-alb.de>
For maintaining the Perl `DBD:mysql` module.
- Eugene Chan <eugene@acenet.com.sg>
For porting PHP for MySQL Server.
- Georg Richter
MySQL 4.1 testing and bug hunting. New PHP 5.0 `mysqli` extension (API) for use with MySQL 4.1 and up.
- Giovanni Maruzzelli <maruzz@matrice.it>
For porting iODBC (Unix ODBC).
- Xavier Leroy <Xavier.Leroy@inria.fr>
The author of LinuxThreads (used by the MySQL Server on Linux).

G.6. Tools that were used to create MySQL

The following is a list of some of the tools we have used to create MySQL. We use this to express our thanks to those that has created them as without these we could not have made MySQL what it is today.

- Free Software Foundation
From whom we got an excellent compiler ([gcc](#)), an excellent debugger ([gdb](#)) and the `libc` library (from which we have borrowed `strto.c` to get some code working in Linux).
- Free Software Foundation & The XEmacs development team
For a really great editor/environment used by almost everybody at MySQL AB.

- Julian Seward

Author of [valgrind](#), an excellent memory checker tool that has helped us find a lot of otherwise hard to find bugs in MySQL.

- Dorothea Lütkehaus and Andreas Zeller

For [DDD](#) (The Data Display Debugger) which is an excellent graphical front end to [gdb](#).

G.7. Supporters of MySQL

Although MySQL AB owns all copyrights in the [MySQL server](#) and the [MySQL manual](#), we wish to recognize the following companies, which helped us finance the development of the [MySQL server](#), such as by paying us for developing a new feature or giving us hardware for development of the [MySQL server](#).

- VA Linux / Andover.net

Funded replication.

- NuSphere

Editing of the MySQL manual.

- Stork Design studio

The MySQL Web site in use between 1998-2000.

- Intel

Contributed to development on Windows and Linux platforms.

- Compaq

Contributed to Development on Linux/Alpha.

- SWSOft

Development on the embedded [mysqld](#) version.

- FutureQuest
